ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac. , acre(s).	lat. , latitude.
agric. , agricultural.	lb. , pound(s).
ambas. , ambassador(s).	l. b. , left bank.
Amer. , American.	long. , longitude.
anc. , ancient.	m. , mile(s).
ann. , annual.	manuf. , manufacture(d).
arron. , arrondissement.	M.E. , Middle English.
A.-S. , Anglo-Saxon.	min. , minute(s).
A.V. , Authorised Version.	Mod. E. , Modern English.
b. , born.	m.p.h. , miles per hour.
Biog. Dic. , Biographical Dictionary.	mrkt tn. , market town.
bor. , borough.	MS., MSS. , manuscript(s).
bp. , birthplace.	mt. mts. , mount, mountain(s).
Brit. , British.	N. , north; northern.
c. , about.	N.T. , New Testament.
C. , Centigrade.	O.E. , Old English.
cap. , capital.	O.F. , Old French.
cent. , century (7th cent.).	O.T. , Old Testament.
chem. , chemistry.	oz. , ounce(s).
co. , county.	par. , parish.
com. , commune.	parl. , parliamentary.
cub. ft. , cubic feet.	pop. , population.
d. , died.	prin. , principal.
Dan. , Danish.	prof. , professor.
dept. , department.	prov. , province; provincial.
dimin. , diminutive.	pub. , published; publication.
dist. , district.	R. , riv., river.
div. , division.	R.A.F. , Royal Air Force.
E. , east; eastern.	r. b. , right bank.
eccles. , ecclesiastical.	rep. , republic.
ed. , edition; edited.	Rep. of Ireland , Eire.
educ. , educated.	R.N. , Royal Navy.
e.g. , for example.	Rom. , Roman.
Ency. Brit. , <i>Encyclopædia Britannica</i> .	r.p.m. , revolutions per minute.
Eng. , English.	R.V. , Revised Version.
estab. , established; establishment.	S. , south; southern.
fl. , flourished.	sec. , second(s).
Flem. , Flemish.	sev. , several.
fort. tn. , fortified town.	Sp. , Spanish.
Fr. , French.	sp. gr. , specific gravity.
ft. , foot.	sq. m. , square miles.
Ger. , German.	temp. , temperature.
Gk. , Greek.	ter. , territory.
gov. , government.	tn. , town.
Heb. , Hebrew.	trans. , translated; translation.
hist. , history.	trib. , tributary.
horticult. , horticultural.	U.K. , United Kingdom.
h.p. , horse-power.	U.N. , United Nations.
H.Q. , headquarters.	univ. , university.
hr(s) , hour(s).	U.N.O. , United Nations Organisation
in. , inch(es).	urb. , urban.
inhab. , inhabitant(s).	U.S.A. , United States of America.
is. , island(s).	vil. , village.
It. , Italian.	vol. , volume.
Jap. , Japanese.	W. , west; western.
jour. , journal.	Wm. , William.
Lat. , Latin.	yd(s) , yard(s).

Bar: 1. (until 16th cent. *rov*). Tn in the Vinnitsa Oblast of the Ukraine, 45 m. W. of Vinnitsa. Pop. (1926) 9500 (c. 1914, 23,000). *See* BAR, CONFEDERATION OF THE.

2. Seaport in Montenegro, Yugoslavia, on the Adriatic. It has anc't fortifications, and is the seat of a Rom. Catholic archbishopric. It is developing into a port of importance. Pop. 4000.

Bar, in law, term used to denote collectively those members of the legal profession who have the right to plead on behalf of suitors. It is also applied to the enclosed space in a court of justice where such members of the profession may plead, and to the prisoner's dock. A peremptory exception sufficient to stop a plaintiff's action either temporarily or permanently is also termed a B.

Bar, in heraldry, *see* HERALDRY, *Ordinaries* (2).

Bar, in meteorology, *see* METEOROLOGY.

Bar, Confederation of the, confederation of Polish nobles, formed in 1768, at the fortress of Bar, in Podolia, for the purpose of defending Poland against the Russians. After many victories it estab. a gov., and, ignoring the pro-Russian Polish king, sent envoys to the courts of Europe. Its power subsequently declined and it was dissolved in 1776.

Bar, Trial at, in Eng. legal procedure, form of trial before a full bench of judges. It was the usual mode of trial prior to the writ of *nisi prius* (Statute of Westminster, 1285), and is now the only survival of the old procedure. Such a trial takes place in the queen's bench div. before a bench of judges and only in cases of great importance, or when demanded on behalf of the Crown by the attorney-general. The trial of Col. Arthur Lynch for high treason, 1904, and the hearing of the petition of right, 1905, to decide the responsibility of the Brit. Gov. for claims against the Transvaal Rep. for acts done by it before or during the S. African War, took place 'at Bar.' The last recorded T. at B. was that of Roger Casement for treason in 1916 (*see* CASEMENT, SIR ROGER DAVID).

Bar Association, American, was formed in 1878, after the Civil war, at a time when, as a consequence of that war, the course of judicial decision in the S. states had been affected in that the prominent positions both at the Bar and Bench had been taken by N. and W. lawyers, and the S. jurisprudence had come to lose such distinctive character as it formerly had. The unification of Amer. law was assisted by the A. B. A., and of the 15 signatories of the call for the preliminary conference 3 came from the S. states. Its ann. meetings are opened by a presidential address in which are communicated 'the most noteworthy changes in statute law on points of general interest.' Its committee reports have had con-

siderable influence in the shaping of the course of legislation, and it has improved legal education. Its membership, about 28,000, is representative of the whole Amer. Bar, and its ann. meetings are attended by as many as 2000 delegates. The H.Q. of the A. B. A. are at 1140 N. Dearborn St., Chicago, 10.

Bar Council, or, more fully, the General Council of the Bar, is the accredited representative body of the Eng. Bar; its functions are to act in a consultative and advisory capacity, dealing with all matters affecting the profession, such as the proposal and criticism of legal reforms, matters of practice, conduct, etiquette, etc. The body consists of the attorney-general and solicitor-general for the time being, the ex-attorney- and solicitor-generals, together with 48 selected members of the Bar, not less than 12 'inner' barristers (queen's counsel) and not less than 21 'outer' barristers (juniors). The General Council was estab. in 1895, and replaced the Bar Committee, estab. 1883.

Bar Harbor, Hancock co., Maine, U.S.A., on the fashionable summer resort, Mt. Desert, an is. off the coast. It is a port of entry. Near by are a cancer laboratory and a marine biological laboratory. A forest fire destroyed most of the tn in 1947. Pop. 3864.

Baraba, wooded steppe area in SW. Siberia between the Irtysh and Ob', around the Lake Chany, traversed by the Trans-Siberian Railway. It has been colonised by Russians and Ukrainians since the 18th cent., and by Volga Germans since 1911. One of the main areas of Siberian dairy farming, it is now included in the Virgin Land campaign (q.v.).

Barabbas, or **Barabas** (Aramaic, 'son of the father'), the robber who was released instead of Christ by Pontius Pilate at the desire of the Jews. The MSS. contain certain evidence that his name was originally recorded as Jesus B., but the name Jesus was early expunged out of reverence for the name of Christ. If this is so, Pilate's challenge to the Jews in Matt. xxvii. 17 gains greatly in pungency, 'Whom will ye that I release unto you? Jesus B., or Jesus which is called Christ?' and especially so when the meaning of B.'s name is remembered, together with the claim of Christ to be the Son of the Father.

Barabara, *see* HERABERA.

Baracoa, seaport in Oriente prov. in E. Cuba. The first white settlement in Cuba, and cap. of the is. from 1512 to 1514, it is now the centre of the banana and coco-nut export trade, manufacturing coco-nut oil, cigars, and chocolate. Pop. 10,400.

Baradla Caverns, *see* AGGTELEK.

Baraguay-d'Hilliers, Achille, Comte (1795-1878), Fr. marshal, son of Louis B.-d'H., b. Paris; was a soldier almost from childhood; had his left hand carried away by a cannon-ball at the battle of

Barahona

Lelpzig. He took part in the Sp. and Algerian campaigns, and was promoted to the rank of lieutenant-general. He commanded the Baltic expedition, took Bomarsund in 1854, and won the battle of Melejuana in 1859.

Barahona de Soto, Luis (c. 1535-95), Sp. poet, whom Cervantes praises highly in *Don Quixote*. He wrote a continuation of Ariosto's *Orlando Furioso*, the first part of which bears the title *Las lágrimas de Angélica*. He also wrote satires, eclogues, epistles, odes, and 2 classical fables.

Baralippton, see SYLLOGISM.

'Baralong' Case, incident in the First World War. The Brit. armed auxiliary *Baralong*, disguised as a tramp steamer, sunk a Ger. U-boat which had torpedoed the *Nicosian*, an Amer. boat carrying cattlemen, Aug. 1915. The Ger. Gov. threatened ruthless Zeppelin warfare in retaliation, Dec. 1915.

Baranov, Baranof, or Sitka Island, is, in the Alexander Archipelago, Alaska, U.S.A. It is about 100 m. long, and its greatest breadth is 30 m. Coal and deposits of placer gold are found on it. The industries are fishing, fish processing, and lumbering. The cap. tn is Sitka (q.v.); pop. 2000.

Baranovich (Polish Baranowieze), tn in Brest Oblast of Belorussia, 90 m. S.W. of Minsk. Important railway junction (6 lines), and industrial centre. Pop. (1931) 30,000, before the war half Jewish. Cap. of B. Oblast 1939-54 (abolished).

Baranya County, see Pécs.

Baras Khotun, or Bars Khotan, City of the Tigers, formerly a large tn on the banks of the Kherlon, in the country of the Mongols; the ruins of the tn lie, according to Father Gerbillon, the only European who ever visited them, in 48° N. lat. and 113° 42' E. long. After the Moguls had been defeated and expelled from China, Toghon Timur, the Mogul emperor, built this tn as the future seat of the empire; he d. there in 1370.

Baratang, see under ANDAMAN ISLANDS.

Barataria 'country,' low-lying area of Louisiana, U.S.A., between New Orleans and B. Bay (35 m. away and 15 m. E. to W., 12 m. N. to S.), a lagoon of the Gulf of Mexico. With many waterways, oil and gas wells, and 'platform vils.' it is the centre of the Louisiana shrimp industry; there is also musk-rat trapping. Here the pirates under Jean Lafitte made their H.Q. c. 1810-15.

Baratier, Jean Philippe (1721-40), Ger. boy genius, b. Schwabach, near Nuremberg, was the son of François B., pastor of the Fr. Protestant church there. Before he was 5 years old he could speak Latin, French, and German, and could read Greek. At the age of 6 he began a 3-year course of Heb. study, reading the books of the Cabbalists, Talmudists, commentators, etc. At 9 he collected materials for a dictionary of rare Heb. and Chaldaic words, with philological notes. He took his M.A. at Halle at the age of 14 and was received into the Royal Academy at Berlin. He then studied law, after

Barb

which he turned to hist., philology, and antiquities, writing sev. historical works. He d., however, before he reached the age of 20.

Baratieri, Oreste (1841-1901), It. general, b. Condino, in the Tirol. He served under Garibaldi in Sicily, 1860; was appointed Governor of Eritrea, in Africa, 1891, where he adopted an aggressive policy, and, advancing into the interior, captured Kassala, 1894. In the following year he twice defeated Ras Mangasha, but was put to rout with great loss of life to his men by the army of Menelik near Adowa, 1896. He was tried before a court-martial and was censured, 1897; he left the army the same year, and pub. his defence, *Mémoire d'Africa*, 1892-96, 1898.

Barb, name of a breed of bloodstock, reared by the Moors of Barbary and Morocco, and introduced by them into Spain. They are not remarkable for beauty or symmetry, but their speed, patience, and endurance are unrivalled. Probably nearly every Eng. racehorse of note has a strain of the blood of this animal. There has always been much controversy over the origin of the B. Prof. Ridgeway's view is that the anct Libyan type of horse was the ancestor of the modern B. It seems certain that the Libyan horse of Livy's time is the ancestor of the Barbary horse found in its purest form in Morocco to-day. This animal is usually about 14 hands and resembles the Arab horse, except that it has a convex profile and a longer croup. In recent times Fr. and Eng. blood has been freely used in Algeria for crossing with the local B.s, and these have consequently lost their former type, except in Morocco. In Spain to-day the B. blood is predominant in Andalusia, Granada, and other S. regions. The usual colour of the Sp. B.s (which are also influenced by the anct Libyan B.) is bay, but there are greys and blacks. In N. Spain they are mostly grey and smaller than the Andalusian horses. There was formerly great controversy on the question of the true nature of the highly prized N. African blood in the Celtic pony, some believing it to be Arab, while others were of the opinion that it was the forbear of the B. and not the Arab horse that was crossed with the Celtic ponies of the Low Countries, and those of the cognate breed in SE. England. It is, however, evident that it was not until many cents. later that an indisputably pure-bred Arabian horse reached England (1616). Shakespeare often refers to them, e.g. Iago mentions a 'Barbary horse' (*Othello*, I. i.), and Osric in *Hamlet* says that 'the king hath wagered six Barbary horses.' It is recorded that Henry VIII received 2 pure-bred Sp. B.s of good quality from Ferdinand of Aragon, and some writers assume that such horses laid the foundations, on the female side, for the thoroughbred stock which was to follow. Much controversy, too, existed as to whether the famous Godolphin, which came to England in 1724, was an Arab or a B. By whatever means the horse was obtained,

Barbacena

it came eventually into the hands of Lord Godolphin, and became one of the 3 founders of Eng. bloodstock (the other 2 being the Beyerly Turk and the Darley Arabian). The Godolphin was a dark bay, about 14-3 hands. Maj. Lamb thinks that the horse was a B. because he 'probably came from Morocco' and had 'a distinctly B. appearance.' The strain of this great horse exercised much greater influence in earlier days than it does to-day, for the Darley Arabian is undoubtedly the ancestor of many more famous latter-day horses than is the Godolphin. On the other hand, other writers, including Lady Wentworth, consider that the Godolphin was not a B. at all, but an Arabian, and that 'the only genuine and contemporary picture painted from life by Wootton shows him to be a high-class Arab.' See W. Ridgeway, *The Origin and Influence of the Thoroughbred Horse*, 1905; A. J. R. Lamb, *The Story of the Horse*, 1938; Lady Wentworth, *Thoroughbred Racing Stock and its Ancestry*, 1938.

Barbacena, silk manuf. city in the state of Minas Geraes, Brazil, on the W. slope of the Serra Mantiqueira, 120 m. NNW. of Rio de Janeiro. Industrial centre and flower-growing area for the Rio market. Elevation about 3700 ft. Pop. 25,770.

Barbacoas, tn in Nariño dept, Colombia, 140 m. N. by E. of Jinto, on the Telembi, a trib. of the Patia, and navigable from the sea. Once a rich gold-mining centre, it now trades in agriculture, live-stock, and forest products. Pop. 3740.

Barbados, most easterly of the W. Indian Is.; it is 21 m. in length and 14 m. broad, and its total area is 166 sq. m., or rather larger than the Isle of Wight. Bridgetown is the cap., situated in lat. 13° 5' N. and long. 59° 41' W. The pop. of the is. is about 227,550, or over 1350 to the sq. m., the densest in the W. Indies. The is. is of coral formation, and almost encircled by coral reefs which are dangerous to navigation. The surface is flat except in the Scotland dist. in the NE. of the is. Much of the soil has little depth, although it is very fertile. This fertility is a result of successive eruptions of the Soufrière in St Vincent (q.v.), the ashes of which, carried by an upper current of air for a great distance, fell as lately as 1902 over the is. The first recorded fall was in May 1812 and is still spoken of as 'May dust.' B. has no natural harbour, but the open roadstead of Carlisle Bay is well sheltered and there is a small inner harbour or carenage protected by the molehead. There are no rivs. worthy of mention, the porous soil forming subterranean channels and wells which percolate to the sea below low-water mark. There are only 46 ac. of indigenous forest.

History. B. is generally supposed to have been visited in 1536 by Portuguese navigators, who called it Los B., after the bearded fig-trees there. The first Englishman to visit B. may have been Capt. Simon Gordan who claimed to have landed some time before 1627 and found the is. uninhabited. A ship commanded by Sir Thomas Warner visited the is. some time

Barbados

between 1620 and 1624, but did not land settlers. Capt. John Powell, commanding a ship belonging to Sir Wm Courteen, touched at B. in 1624 or 1625, but the first settlers were landed from the *William and John*, another ship sent by Courteen, in Feb. 1627. In 1625 the is. was included in the commission given to Sir Thomas Warner (see ST KITTS), under the patronage of the Earl of Carlisle, who, later, had a grant from Charles I of most of the Caribbean Is. The Earl of Marlborough, who had given his patronage to the Courteen expedition, opposed the grant, and a compromise was reached; but subsequently the Earl of Pembroke succeeded in obtaining a grant of the is. Carlisle, however, returned to B. and, his rights having been restored, he lost no time in consolidating his position by offering land to speculators who founded St Michael's Town, now Bridgetown. Eventually Carlisle's heir assigned his interest to Francis Lord Willoughby of Parham, who, however, while securing his own position under an Act of Parliament, acknowledged the king's right to dominion over the is. During the Civil war many royalist families fled to B. Cromwell sent a fleet under Adm. Sir George Ayscue to subjugate the is., and in 1652 Willoughby had to surrender the reins of gov. But on the Restoration Charles II gave honours to many prominent Royalists in B., in recognition of their loyalty and defiance of Cromwell. Lord Willoughby agitated for the restoration of his rights, and in 1665 the Privy Council allocated the profits derived from the is. between him, the gov. and the heirs of Marlborough and Carlisle. This involved raising a duty of 4½ per cent on all the is.'s exports, which cost the inhab. an enormous sum in the ensuing years, and in 1834 the is.'s legislature passed an Act remitting the duty, which, however, was only finally repealed in 1838 by an Act of the Imperial Parliament.

Crops, resources, climate, administration, etc. The is. is very highly cultivated; sugar is the staple product, nearly 70,000 ac. being devoted to sugarcane cultivation, of which some 46,000 ac. are under cane each year. The average ann. production of sugar and fancy molasses is equivalent to 168,000 tons of sugar. Other products are rum, coco-nuts, and cotton. Like most W. Indian is., B. suffered from the sugarcane crisis that followed the increased production of subsidised beet sugar. Petroleum is believed to exist and boring operations have been conducted in recent years, though without much success. B. is a popular tourist resort and the healthiest of all the W. Indian is. for Europeans; the great heat is moderated by the NE. trade winds, particularly from Jan. to May. The temp. varies from 75° F. to 83° F., and in the winter months the minimum mean temp. at night is as low as 68° F. The ann. rainfall is from 50 to about 75 in. Hurricanes and earthquakes occur, but not frequently. The is. is much favoured by residents in neighbouring colonies as a health resort. The

Barbados

is. is divided into 11 Church of England par., and is the see of the Bishop of B. The chief justice of the is. presides over the Superior Courts, and grand sessions are held every 4 months. The legislature comprises the governor, the executive council, and the executive committee, a nominated legislative council and a house of assembly of 24 members elected by universal adult suffrage for 5 years. Education is free in gov. elementary and senior (i.e. secondary) schools. Fees are charged in aided and independent schools. Codrington College, affiliated to the univ. of Durham, functions as a theological college. B. contributes also to the Univ. College of the W. Indies, which is situated in Jamaica. There are over 500 m. of main and secondary roads, and 10,000 m. of telephone line. B. is the trade mart for the Windward Is. which lie to the W. The chief exports are sugar, fancy molasses, and rum; the imports are cotton goods, chemical manures, rice, dried fish, and machinery. Bridgetown (q.v.) is the cap. and prin. tn; there is an airfield at Seawall (8 m. ESE.). Sam Lord's Castle, in the par. of St Philip, is one of the finest mansions in the Caribbean. It was built in 1820 for Samuel Hall Lord. Ragged Point, a lighthouse 15 m. from the cap., is generally the first landmark sighted on approaching B. S. Point lighthouse (7 m. from the cap.), built of iron, also commands an extensive ocean view. Welchman's Hall Gully and Cole's Cove are among the well-known natural features of the is. Other tns are Speightstown (pronounced Spikestown), 12 m. from the cap. and formerly a shipping place of importance, which is said to be built on the lands of one Wm Speight, a member of Governor Hawley's assembly in 1639; and The Hole or Hole Town on the W. coast, in which is a tercentenary monument commemorating the landing (unconfirmed by historical research) of a party from the *Olive Branch* in 1605.

See Sir Robert H. Schomburgk, *History of Barbados*, 1848; H. Darnell Davis, *Cavaliers and Roundheads in Barbados* (Georgetown), 1887; V. Harlow, *History of Barbados*, 1926, and *Christopher Codrington, 1668-1710*, 1928; Official Report, *Barbados, 1954 and 1955*, 1956.

Barbados Cherry, fruit of *Malpighia glabra*, resembling closely a cherry in size and appearance, but not in flavour. *M. urens* is the Cow Itch Cherry. They are found in the W. Indies.

Barbados Gooseberry, fruit of the *Pereskia aculeata*, is an oval, yellow, edible fruit which grows on a W. Indian cactus. The plant on which it grows has thick, flat leaves with hard spines and the flowers are showy and white.

Barbados Leg, another name for *Elephantiasis Arabum*.

Barbados Pride, see CAESALPINIA.

Barbara, St, the subject of a legend which tells of her martyrdom under Maximinus Thrax (235-8). Patron saint of pyrotechnicians, artillerymen, and many other kinds of craftsmen; her feast is on 4 Dec.

Barbara, in formal logic, is the first word

Barbarian

of a useful and ingenious set of mnemonic lines which form a clue to the moods and their process of reduction in all the 4 figures. *Barbara* itself indicates that mood of the first figure which has all its propositions universal affirmatives. The lines are:

*Barbara, Celarent, Darii, Ferioque priors:
Cesare, Camestres, Festino, Baroco,
secundae:
Tertia Darapti, Disamis, Datisi, Felap-
ton,
Bocardo, Ferison, habet: quarta insuper
addit
Bramantip, Camenes, Dimaris, Fesapo,
Fresison.*

The words printed in ordinary type are real Lat. words, signifying that 4 moods, whose artificial names are *Barbara*, *Celarent*, *Darii*, and *Ferio* belong to the first figure; that 4 others belong to the second; 6 more to the third; while the fourth figure contains 5 moods. Each artificial name contains 3 vowels, which indicate the propositions forming a valid mood: thus *CElArEnt* signifies the mood of the first figure, which has E for a major premise, A for the minor, and E for the conclusion. The artificial words altogether contain exactly the combinations of vowels of the 24 valid moods selected out of the 44 possible ones. These mnemonic lines also contain indications of the mode in which each mood of the second, third, and fourth figures can be proved by *reduction* to a corresponding mood of the first figure. Logicians invented this curious system of artificial words at least 6 cents. ago. The device, however ingenious, is of a wholly unscientific character, but a knowledge of its construction and use has long been expected from the student of logic (q.v.).

Barbarea, genus of perennial herbs of the family Cruciferae, which are found in Europe, Asia, and America. *B. vulgaris*, yellow rocket, winter cress, or herb St Barbara, grows in Britain as a handsome border plant in gardens, and is used in spring salads. *B. praecox*, land cress, is common to France, Britain, and N. America and a salad plant.

Barbarian (Gk *barbaros*), term applied by the anc. Greeks to peoples who did not speak their language. The word is probably onomatopoeic, since it represents the babble of a foreign tongue to the more highly cultured Greek. To the Greeks the whole world was divided into Hellenes and B.s. The Romans were included by the Greeks in this general classification. At a later stage in the world's hist., when Rome had risen to power, the word was used to signify such peoples as did not share the culture and civilisation of Rome. Gradually the word ceased to denote only a difference of tongue, and came to mean a difference of manners, customs, and culture. Thus the tribes and peoples outside the boundaries of the Rom. Empire were known as the B.s. and they eventually encompassed the fall of Rome. In its present-day usage the word B. is applied almost exclusively with the meaning of lacking

Barbarossa

in culture and civilisation. Anything rough, savage, and uncouth is said to be barbaric, and the possessor of such qualities is held to be a B.

Barbarossa, see FREDERICK I (Holy Rom. Emperor).

Barbarossa, Horuk, or Aroodje, and **Khair-ed-Din**, names of 2 Turkish corsairs who terrorised the Mediterranean during the early part of the 16th cent. The first named was b. at Mitylene c. 1474. He served the emir of Tunis and became commander of his fleet. In 1515 he took Algiers, but 3 years later the Arabs secured the help of Spain, and Horuk was defeated and killed by Gomarez, near Oran. His younger brother, Khair-ed-Din, took command, and with help from the Sultan Solymán II he captured Algiers (1519) and Tunis (1534). In 1536 he was appointed chief admiral of the Turkish fleet, and carried on his piratical warfare up and down the Mediterranean, both on land and at sea, plundering Port Mahon (Minorca), the Ionian Is., and Dalmatia and defeating the Christian powers in sev. sea fights. He obtained victories over the fleet of Emperor Charles V in the Gulf of Arta (1538), near Crete (1540), and off Algiers (1541). In 1543 he helped the French to regain Nice, and made a triumphal return to Constantinople, where he d. in 1546.

Barbaroux, Charles Jean Marie (1767-1794), Fr. revolutionary. b. Marseilles. He became a lawyer. When the revolution broke out he soon became a prominent member of the Girondist party, and was a member of the Convention. Though he voted for Louis XVI's death, he was an ardent opponent of Robespierre. Eventually he fled from Paris and tried to organise a rebellion against the gov. He was arrested at Bordeaux, after an ineffectual attempt to shoot himself. He was guillotined on 25 July 1794.

Barbary, general name for the most northerly portion of Africa, from Egypt to the Atlantic, and from the N. frontier of the Sahara to the Mediterranean. It thus includes Morocco, Fez, Algeria, Tunis, and Tripoli, together with Barca and Fezza. The name B. is derived from the name of its anc. inhab., usually called Berbers or Kabyles. In anc. times this part of Africa prospered under the dominion of Carthage. After the fall of Carthage it was under Rom. rule, had many flourishing cities, and was regarded as the prin. granary of Rome. After being overrun by the N. barbarians at the fall of Rome it was subdued by the Saracens and fl. under their rule as much as at any period of its hist. But the Saracenic gov. gradually became a prey to disorder and B. sank into a degraded condition. A number of Turks and renegades acquired it, and subjected it to brutal despotism. Since they could not compete with the European powers in war, they carried on an extensive system of marauding; and the 'B. pirates' were the terror of the merchants of the region. They were suppressed finally at the conquest of Algiers by the French. The occupants of B. are principally

Barbed

Bedonins, Jews, Turks, and the Fr. colonists in Algeria. For a fuller description of the climate, produce, etc., see the various countries comprised in the name B.

Barbary Ape (*Macaca sylvana*), belonging to the family of Primates, Cercopithecidae, the only monkey found alive in a wild state in Europe. It is tailless, an agile tree-climber, and feeds on fruit. It is a native of N. Africa and the Rock of Gibraltar.

Barbary Pirates, see BERBERS.

Barbary Sheep, **Aoudad**, or **Udad** (*Ammotragus lervia*), species of bovid closely related to the goats. It has powerful horns and a goat-like odour, but is distinguished from goats by its longer tail and the mane of long hair on the throat and upper parts of the forelegs. Found in Barbary and Kordofan in N. Africa.

Barbastelle, species of bat, found in England, France, and Germany, with hairy cheeks and lips.

Barbastro, Sp. tn in the prov. of Huesca, on both banks of the Vero. It has a 16th-cent. castle, and is the centre of an agric. dist. Pop. 7000.

Barbauld, Anna Letitia (1743-1825), poetess, b. Kibworth Harcourt, Leics, a sister of John Aikin (q.v.). In 1773 she pub. a collection of miscellaneous poems, which was well received, and in the following year married Rochemont Barbauld, a Fr. Protestant and dissenting minister. They conducted a school first at Palgrave in Suffolk, then at Hampstead. Meanwhile Mrs B. pub. *Hymns in Prose for Children*, 1781, followed by *Evenings at Home*, 1796, and ed. *Selections from the English Essayists*, *The Letters of Samuel Richardson*, and a 50-vol. collection of the Brit. novelists, with an introductory essay, 1810. Her husband had d. insane in 1808, but she continued to live and work in London. See G. A. Ellis, *A Memoir, Letters, and a Selection from the Writings of Anna Letitia Barbauld*, 1874.

Barbecue (Sp. *barbacoa*, from the Haitian), name given to a framework placed over a fire, on which was placed meat, etc., to be dried or smoked. Later the framework developed into a kind of gridiron on which whole animals could be roasted. In Cuba B. is used for the upper floor of a house, where grain, etc., is stored, and in the U.S.A. it is used to denote an open-air feast on a large scale. A modified form of B. is being introduced into England.

Barbed, term used in heraldry for an arrow with a pointed or jagged head; also for the 5 green sepals which appear between the 5 petals of the conventional heraldic rose.

Barbed Wire Act, 1893. Act which enables a local authority to serve notice in writing requiring the occupier of land adjoining a highway to abate the nuisance caused by barbed wire fencing if it be likely to cause injury to persons or animals lawfully using the highway. If he fail to abate the nuisance, a court of summary jurisdiction, on application by the local

authority, may order him to do so, and on failure to comply, the authority may execute the order and recover the cost from the occupier.

Barbel (Lat. *barba*, beard), name applied to the genus of fish known as *Barbus*, of the family Cyprinidae, allied to the carp and goldfish. It has 4 soft appendages from its mouth, and the third ray of the dorsal fin is long, bony, and serrated. It lives in fresh, usually muddy, water in Asia, Africa, and Europe. *B. barbus*, common to Europe, is a large, coarse fish, weighing 15 to 18 lb.

Barbellion, W. N. P., pseudonym of Bruce Frederick Cummings (1889-1919), biologist and writer, b. and educ. in Devon, son of a journalist. He began work as an assistant at the Brit. Marine Biological Association's laboratory at Plymouth and, later, was appointed to the entomological dept at the Brit. Museum. He suffered from ill health throughout his life in London, succumbing to sclerosis soon after being compelled to resign through illness. His *Journal of a Disappointed Man* (with preface by H. G. Wells), which was pub. shortly before his death, describes his early passion for natural hist. It is one of the great psychological revelations in Eng. autobiography. Posthumous works are *Enjoying Life and other Literary Remains*, 1919, and *A Last Diary*, to which is prefixed a memoir by A. J. Cummings, 1920.

Barber, Margaret Fairless, see FAIRLESS, MICHAEL.

Barber, Samuel (1910-), Amer. composer, b. at Westchester, Penn., studied at Philadelphia. His works include the ballet *Medea*, choral music, 2 symphonies, violin and cello concertos, and 2 string quartets, an *Adagio* from the 1st having won fame arranged for string orchestra.

Barber (Lat. *barba*, beard, through M.E. and Anglo-Fr. *barbour*), one who is occupied in shaving, hairdressing, and trimming the beard, etc. In former times the B.s were joined with surgeons. In France the B.-surgeons were a distinct body under Louis XIV, and in England the B.s were incorporated in 1461. They were united with the company of surgeons in the time of Henry VIII, and were allowed to let blood and to draw teeth; they were not separated from the surgeons until 1745. The fillet round the B.'s 'pole' signifies the ribbon which was bound round the arm before bleeding.

Barber-surgeons, see ROYAL COLLEGE OF SURGEONS.

Barberini, It. family, originally from Florence, raised to a high rank among the Rom. nobility in consequence of the elevation of one of its members, Cardinal Maffeo Barberini, to the papal chair in 1623, when he assumed the name of Urban VIII (q.v.). Urban had 3 nephews, 2 of whom were made cardinals, and the third prefect of Rome, and they ultimately obtained the fief of Palestrina, which had formerly belonged to the Colonna family. The B. heiress eventually married a Colonna prince when the male line of the family died out in the

early 18th cent. In the palace of the B. at Palestrina is the celebrated mosaic taken out of the temple of Fortune at Praeneste. (See PALESTRINA.) The Palazzo B. at Rome is a vast structure, built by Bernini, and gives its name to the square before it. It contains a museum, a gallery of paintings, and a library, which was collected by Cardinal Francis B., one of the nephews of Urban VIII. The library is rich in valuable MSS.; its catalogue was printed at Rome in 1681, in 3 vols. folio.

Barberini Vase, see PORTLAND VASE.

Barberino di Mugello, It. tn. in Tuscany (q.v.), 16 m. N. of Florence (q.v.). It manufs. straw hats. At Cafaggiolo, near by, is a beautiful 15th-cent. villa of the Medici (q.v.). Pop. (com.) 13,000.

Barberry (*Berberis vulgaris*), species of Berberidaceae which is frequently found in Britain. The leaves of the shoot appear as spines having in their axils dwarf shoots which bear foliage leaves and flowers. The flowers grow on a long, pendent stalk; the berry is oval, and is sometimes made into jam. The presence of B. plants is productive of the fungus called rust which develops on grasses.

Barberton: 1. City in Ohio, U.S.A., near Akron. It manufs. matches, chemicals, porcelain, etc. Pop. 27,800.

2. Mining tn. of the Transvaal, situated 2878 ft above sea level on a side of the De Kaap valley. Gold was discovered in the De Kaap valley in 1875. It was a boom town in 1886 (white pop. 8000), and is now the centre of a prosperous agric. area, producing cotton, tobacco, citrus fruits, and most subtropical fruits. Formerly malarial, it is now a health resort. Asbestos, magnesite, nickel, and talc are mined locally. Pop.: White, 2070; Bantu, 3811; Coloured, 255; Asiatic, 292.

Barbesilum, see BARBEZIEUX.

Barbet (Lat. *barbatus*, bearded), name applied to various birds of the family Capitonidae common to tropical Africa, Asia, and America, because of the prominent stiff bristles about the mouth which assist them to catch insects. They are bright-coloured, and somewhat resemble the cuckoo in shape.

Barbette (Fr. dimin. of *barbe*), name given to the earthen terrace inside the parapet of a rampart, serving as a platform for cannon. This terrace has such an elevation that cannon can be fired over the parapet instead of through embrasures, thus giving a larger scope. When guns are thus mounted, they are said to be mounted in barbette. In the naval sense a B. is an armoured breastwork, fixed at no great height, behind which the heavy armament of a ship is mounted. The guns fire over the breastwork in the same way as over a B. on land, and are mounted on turntables, whilst the after-ends are protected by armoured hoods. The B. superseded other methods of firing heavy guns on board ship; the *Téméraire* in 1876 was the first Brit. iron-clad to be furnished with B.s.

Barbey d'Aurevilly, Jules Amédée (1808-89), Fr. novelist and critic, b.

Barbeyrac

Saint-Sauveur-le-Vicomte. In 1851 he went to Paris, where he helped to found the jour. *Le Réveil*. He was a sharp critic, opposed to the realistic trends of the 19th cent. Among his best novels are *Une Vieille Maîtresse*, 1851, *L'Ensorcelée*, 1854, and *Les Diaboliques* (short stories), 1874. His critical writings include *Les Œuvres et les hommes du XIX^e siècle*, 1861, *Portraits critiques*, 1863, and *Goethe et Diderot*, 1880. See J. Canu, *Barbeyrac d'Aureville*, 1945.

Barbeyrac, Jean (1674–1729), Fr. jurist, b. Béziers, of Calvinistic parents. He became teacher of *belles-lettres* in the Fr. college at Bern, 1697–1711; appointed by the senate of Bern to the chair of law and hist. at the academy of Lausanne, 1711; prof. of law at the univ. of Groningen, 1717, where he d. He made his reputation with *Traité du Jeu* (first ed. 1709). His other works include a trans. of Puffendorf's *Law of Nature and Nations*, 1712; a new version of Grotius's *De Jure Belli et Pacis*; and *Histoire des Anciens Traités*.

Barbezieux (anct. *Barbesillum*), Fr. tn in the dept of Charente, on a hill near the Tréfle. It has an old castle, now a museum and theatre. Eaux-de-vie, white wine, paper, and footwear are manuf. Pop. 4200.

Barbican, medieval fortification, usually a small round tower for the station of an advanced guard, placed just before the outward gate of the castle yard, or ballium. In cities or tns the B. was a watch-tower, placed at some important point of the circumvallation. It had sometimes a ditch and drawbridge of its own. The street of London called B. was so called because of its vicinity to a tower of this sort attached to the city wall. B. was a term likewise used for a hole in the wall of a city or castle, through which arrows and darts were shot.

Barbier, Antoine Alexandre (1765–1825), Fr. bibliographer, b. Coulommiers. He was a member of the council for the preservation of scientific and artistic objects of value. He was instrumental in saving from destruction many collections of books, which had been stored after the suppression of various civil and eccles. establs., and placing them in public libraries. He was librarian to Napoleon, and administrator of the Crown libraries until 1822.

Barbier, Henri Auguste (1805–82), Fr. poet, b. Paris. He was a voluminous writer, mainly of political satire. The work by which he is best known is his *Iambes*, 1831, a series of satirical poems in which he paints the life of his time in a rugged, forcible style. Amongst his other works may be mentioned *Lazare*, 1833, dealing with the oppressed condition of the Eng. people, and *Il Piano*, 1833, which is concerned with the misery of Italy.

Barbier, Paul Jules (1825–1901), Fr. dramatic author, b. Paris. He was first known as a poet. Later he wrote many dramas and comedies, often in collaboration with other authors, and his first 2 plays were performed at the Comédie

Barbiturates

Française. His best work was, however, done as a librettist; he wrote librettos for Thomas, Meyerbeer, and especially Gounod (*Faust*, *Roméo et Juliette*, *La Colombe*).

Barbieri, Francisco Asenjo (1823–94), Sp. composer and musicologist, b. Madrid. As a scholar he conducted researches into anct musical documents, especially the books of the players of the old Sp. instrument, the *viñuela*, and the *cancioneros* (collections of songs of the 15th and 16th cents). He pub. annotated transcriptions of the so-called *Cancionero de Palacio* and *Cancionero musical de Barbieri*, 1890. After a precarious existence in various humble musical employments he made a success as a composer of national comic operas. *El Barberillo de Lavapiés* and *Pan y Toros* have the greatest significance for Sp. music. In them, by far his most important work, 'he saved from oblivion a treasury of rhythmic and melodic elements characteristic of the national folk-lore of the 18th cent., thus laying the foundation of a distinctive national school' (Pedro Morales). Other comic operas are *El diablo cojuelo*, *Gloria y peluca*, *Los carboneros*, and *Un loro y una lechuga*.

Barbieri, Giovanni Francesco, see GUERCINO.

Barbirolli, Sir John (1899–), Eng. conductor, b. London, of It. and Fr. parentage. He was educ. at the Royal Academy of Music; made his first public appearance as violoncello soloist at Queen's Hall, 1911; toured Brit. Isles and Europe as member of the International String Quartet; founded and conducted B. Chamber Orchestra, 1925, and joined Brit. National Opera Co. as conductor, 1926. He was conductor and music director of New York Philharmonic Symphony Orchestra, 1937–42, and has been conductor of Hallé Orchestra, Manchester, since 1943. He has pub. sev. arrangements of old classical music. Knighted 1949.

Barbiton, name of a musical instrument in use among the ancients. It was a kind of lute.

Barbitone (Veronal), known chemically as diethyl barbituric acid,

is a widely used hypnotic or sleep-producing drug in doses of 5 gr. (0.3 gm.). It is not very poisonous, but it is excreted slowly from the body, and if the kidneys and bowels are not acting efficiently a dangerous accumulation may occur. It should be taken only under medical supervision. See also BARBITURATES. It is prepared by acting upon urea (q.v.) with diethylmalonic ester.

Barbiturates, salts and derivatives of barbituric acid. The numerous B. have generally the same properties but differ in dosage, length of action, and the margin of safety between the therapeutic dose and the poisonous dose. As a general rule the long-acting B. take effect slowly and short-acting quickly. The sodium salts are more soluble and therefore more rapid in action. Because of their

characteristics B. are classified into (1) *Long acting*. (2) *Intermediate acting*. (3) *Short acting*. (4) *Ultra short acting*. The first group includes barbitone (q.v.), phenobarbitone (q.v.), and methylphenobarbitone. Their action is not apparent for an hour or more and lasts for 6 to 10 hrs. The second group includes allobarbitone, butobarbitone, and amylobarbitone. They act within 30 min. and are effective for 5 to 6 hrs. They are not so prone to leave a 'hangover' as those of the first group and are widely used in the treatment of insomnia. In the third group are cyclobarbitone and pentobarbitone. They are usually effective within 15 min. and their action lasts for 2 to 3 hrs. They are often employed in pre-operative medication. In the fourth group are thiopentone and hexobarbitone. They are usually given by intravenous injection and their action is instantaneous and lasts up to 1 hr. These ultra-short-acting B. are used for anaesthetic purposes for minor operations, or as a means of inducing anaesthesia preparatory to using an inhalation anaesthetic in major operations (see ANAESTHESIA). The B. are effective sedatives and hypnotics and are given for insomnia, to allay anxiety, and to calm nervousness. They are given in epilepsy (q.v.). By themselves they have no effect on pain but are sometimes used in combination with analgesics when insomnia is due to pain. The B. are specific antidotes to poisoning by strychnine (q.v.). Barbiturate poisoning is characterised by headache, giddiness, and muscular twitching, followed by sleep which proceeds to coma. The breathing becomes shallow and slow and death may ensue from lung complications and respiratory failure. B. have a cumulative action and chronic poisoning may occur from prolonged administration. Symptoms of chronic poisoning are headache, visual disturbances, weakness, and anaemia. Mental and moral changes with depressive tendencies may be produced. The antidotes to acute barbiturate poisoning are respiratory stimulants, together with artificial respiration. Recently a drug called 'hemekride' has been found to be an effective antidote to barbiturate poisoning. In the case of poisoning from a long-acting barbiturate the stomach should be washed out. In chronic poisoning the drug should be stopped.

Barbizon, Fr. vil. near the forest of Fontainebleau, which gave its name to the Barbizon school of artists. This was a group of landscape painters (in outlook midway between the romantics and realists of the 19th cent.). Linked by friendship and poverty, and inspired by the Eng. landscapes (notably those of Constable shown in France in 1824), they turned their back on urban life and 'returned to nature' (c. 1830). Daubigny, Diaz, Dupré and Théodore Rousseau were the nucleus of the group but Corot and Millet (q.v.) became associated with them. Their beautiful pictures eventually gave B. great prestige and transformed the humble vil. into a flourishing 'art colony.'

Barbon, Praise-God, see BAREBONES PARLIAMENT.

Barbou, name of a family of Fr. printers, who long rendered themselves famous for the correctness as well as elegance of the works which issued from their presses.

Jean B., the first of the name who is known, was settled at Lyons, where he printed the works of Clément Marot, 1539. His descendants continued to exercise their art for more than 2 cents. His son, Hugh B., opened his press at Limoges, where his *Cicero's Letters to Atticus* was issued in 1580. Two brothers of a later generation settled in Paris, Jean-Joseph B. in 1704, and Joseph B. in 1717, the former dying in 1752 and the latter in 1727. It was between 1750 and 1790 when under the management of Joseph Gérard B., a nephew of the 2 brothers last mentioned, who had taken over the printing office from his Uncle Joseph's widow, that the press reached its highest point. He issued a series of classics which bears his name. The small format of the books rivalled the Elzevirs in elegance.

Barbour, John (c. 1320-95), Brit. poet. He took holy orders, and was promoted by King David II to the Archdeaconry of Aberdeen about the year 1356. He obtained permission from Edward III in 1357 to reside in Oxford for a time for the purpose of studying, and similar permission to study and travel in England was granted in 1365 and 1368. In 1373 he was clerk of audit to the household of King Robert II and later became one of the auditors of the exchequer. His fame rests on *The Brus*, which he completed about 1376. It is an epic poem, written in octosyllabic verse, recording the adventures of Robert the Bruce and his companion, Sir James Douglas. It is written with great spirit; the style is clear and simple and the language more 'modern' than that of his contemporaries. The Edinburgh ed. (1571) is the first printed copy extant. The best eds. are by Skeat (1870-7) (with corrections, 1893-4), and *Barbour's Bruce*, ed. by W. M. MacKenzie, 1909. See G. Neilson, *John Barbour, Poet and Translator*, 1900.

Barbuda, Is. of the Brit. W. Indies, situated in 17° 33' N. and 61° 43' W. It is 62 sq. m. in area, and is a dependency of Antigua, Leeward Is., being formerly in possession of the Codrington family (1691-1872). They gave their name to its only vil. It is densely wooded, and has a lagoon on the W. side. Produces sea is. cotton, sugar, pepper, and charcoal, and exports phosphate of lime and salt. There is good shooting and fishing. Pop. 980.

Barbusse, Henri (1874-1935), Fr. poet, novelist, and journalist. b. Asnières; in 1910 he became editor of *Je Sais Tout*. He served as an infantryman in the First World War, gaining the Croix de Guerre. After the war he joined the Communist party, and later became the editor of *L'Humanité*. His book *Le Feu*, 1916, was awarded the Prix Goncourt in 1917. It described his war experiences,

showing all the horrors of war. Other works: *Pleureuses* (poetry), 1895; *Les Suppliants*, 1903; *L'Enfer*, 1908; *Nous autres*, 1914; *La Lueur dans l'abîme*, 1920; *Les Enchaînements*, 1925; *Manifeste aux intellectuels*, 1927; *Staline*, 1934.

Barby, Ger. tn in the dist. of Magdeburg, on the Elbe (q.v.), 16 m. SE. of Magdeburg (q.v.). It is a mkt tn and has manufs. of agric. machinery. Pop. 8000.

Barcarolle, from *barcarola*, song in the Venetian dialect, sung by the gondoliers at Venice. Formerly most of the gondoliers

Barcelona: 1. Sp. prov. in Catalonia (q.v.), with a coastline on the Mediterranean. It is, in general, mountainous, the N. and centre of the prov. containing spurs of the Pyrenees (q.v.). Olives are grown, and the valleys and coastal plains produce fruit and vines. Area 2970 sq. m.; pop. 2,314,200.

2. (anc. **Barcino**; later **Barcinona**), Sp. seaport, cap. of the prov. of B., on the Mediterranean. It stands in a rich plain between the R.s Besos and Llobregat. B. was probably founded by the Carthaginians, and its name is said to derive

Paul Popper

BARCELONA

Puerta de la Paz and the Avenue of the Ramblas.

knew by heart the greater portion of *Jerusalem liberata* of Tasso, and sang it in alternate stanzas. The old B. was sung in parts, at stern and stern of the same boat. The term B. may also be used for an imitation of the song of a gondolier. The well-known airs *La biondina in gondolella* and *O pescator dell'onda* are pleasing specimens of this species of song. Three of Mendelssohn's *Songs without Words*, and Chopin's piano B. are famous examples of the B. Idealised as piano pieces, and Fauré wrote 13 of them. Sev. operas contain B.s where the situation is appropriate; the most famous if not the finest is that in Offenbach's *Tales of Hoffmann*.

Barcellona-Pozzo di Gotto, tn in Sicily (q.v.), 14 m. WSW. of Messina (q.v.). It lies on the fertile N. coastal plain, and is a centre for fruit, wine, cereals, and olive oil. There are also sulphur baths. Pop. 30,000.

from that of Hamilcar Barca (q.v.). It became a Rom. colony, and was conquered by the Visigoths (see **GOTHS**) in 415, and by the Moors in 713. In 762 it became an independent co.; the Catalan (see **CATALONIA**) dynasty originated here, and B. remained a cap. after the union of Catalonia with Aragón (q.v.). In the Middle Ages it was a great port, rivaling Venice and Genoa (see **CONSULATE OF THE SEA**), although later eclipsed for a time by Seville. In 1640 it revolted against Philip IV, and, later, against Philip V. It was taken by the English in 1706, by the French in 1714, and was occupied by the French again 1808-14. In more recent times it has been a centre of political agitation. It was involved in the Carlist (see **CARLISTS**) troubles, and experienced a Progressist insurrection in 1856 and a Federalist insurrection in 1874. In 1916 there were again disturbances, in 1923 there was a general strike,

and in 1925 B. was for a time under martial law. During the civil war of 1936-9 the city suffered through bombardment and blockade. Towards the end of 1937 it replaced Valencia as the cap. of the republican gov., and in Mar. 1938, concurrently with the advance of the insurgent troops on the Aragón front, was severely bombed from the air. This led to Anglo-Fr. protests. In Jan. 1939 republican resistance in Catalonia collapsed, and the republicans in B. surrendered on 26 Jan. B. is the second city of Spain. It was formerly surrounded by walls, but these were pulled down in the 19th cent., and the city replanned. The 'old tn' has narrow, irregular streets, the main axis of which is formed by the *Ramblas*, a series of successive tree-lined avenues. At the N. end of the *Ramblas* is the Plaza de Cataluña, the largest square in B., and the heart of the city. The 'new tn,' the *Ensanche*, on the N. side of the city, has wide, symmetrical streets and modern buildings. The third section of the city is composed of vils. which have become engulfed during the city's expansion. There is a beach at Barceloneta, near the port. There are many notable buildings, including a Gothic cathedral (begun 1298), the ancient palace of the Kings of Aragón, the 15th-cent. Palacio de Diputación, and the 14th-cent. monastery of Pedralbes. B. is the metropolis of Catalan literature and art, and has valuable libraries and museums. Its univ. (1450) and Madrid Univ. are the only univs. in the country permitted to grant doctorates. It is the leading commercial and industrial tn of Spain, and has, since the end of the Second World War, regained its great importance as a Mediterranean port. The prin. manufs are textiles, paper, machinery, and leather goods. Pop. 1,335,450.

3. City and port of Venezuela; the cap. of Anzotegui state. 12 m. by rail from Guanta on the Caribbean Sea; its port; a stock-raising and commercial centre, it has salt works and coal mines, and exports coffee, sugar, and cacao. Pop. 26,450.

Barchamps, Charles Melchior Artus, Marquis de (1760-93), Fr. Royalist leader in the revolt of La Vendée. He took part in the Amer. War of Independence. On the outbreak of the revolution he returned to his château and remained in retirement until the risings in La Vendée. To his military skill and judgment much of the success of the Vendéens was due. Dissensions broke out amongst them, and finally, at the battle between revolutionaries and royalists at Cholet in 1793, B. was mortally wounded.

Barhan, crescent-shaped sand dune characteristic of sandy wastes exposed to winds which remain constant in direction. A B. is crescentic in ground plan, the horns extending downwind. Individual B.s move down wind as sand grains are blown up the windward surfaces of the dunes and slip down the leesides. In this way dunes may obstruct communications in deserts and debouch on to fertile land or property. Dunes have been fixed by

the planting of suitable plants such as marram grass or tamarisk, but this is not always feasible.

Barcino, see **BARCELONA**.

Barcinona, see **BARCELONA**.

Barckhausia, Barkhausia, or Borkhausia (after Moritz Borkhausen, a German who pub. a botanical work in 1790), name now given to a section of *Crepis* of the Compositae; including *C. foetida*, Stinking Hawk's-beard; *C. taraxacifolia*, Beaked Hawk's-beard; and *C. setosa*, Bristly Hawk's-beard; all found in Britain, though only the first is a true native.

Barclay, Alexander (c. 1475-1552), poet, b. probably in Scotland, although most of his life was spent in England. He became chaplain of the college of Ottery St Mary, Devon, later a monk at Ely and Canterbury, and the rector of All Hallows, Lombard Street, London. His place in literature rests on *The Ship of Fools*, 1509, an adaptation in verse of Sebastian Brant's *Narrenschiff*, 1494, a satire on the social vices of the age. His other works are 5 *Eglogues*, c. 1514, the earliest Eng. pastorals, *The Myrrour of Good Manners*, 1523, and a trans. of Sallust's *Jugurtha*, together with other trans. See T. H. Jamieson (ed.), *The Ship of Fools* (2 vols), 1874; J. W. Fairholt (ed.), *The Citizen and Uplandishman* (5th eclogue), 1847; *The Myrrour of Good Manners*, Spenser Society reprint, 1885; A. Pompen, *The English Versions of the Ship of Fools*, 1925.

Barclay, Florence Louisa (1862-1921), novelist, b. Limpfield, Surrey; daughter of Samuel B. Charlesworth, rector of that par. In 1881 she married Charles Wright B., vicar of Little Amwell, Herts; she d. at Limpfield. Her works include *The Rosary*, 1909, *The Following of the Star*, 1911, *The Mistress of Shenstone*, 1911, *Through the Postern Gate*, 1912, *The Broken Halo*, 1913, *The Wall of Partition*, 1914, and *Returned Empty*, 1920. See life by one of her daughters.

Barclay, John (1582-1621), Brit. satirist, b. Franco, son of William B. (q.v.). He came to London with his father about 1603. His best-known works are the *Euphormionis Satyricon*, 1603-7, a Lat. satire in the manner of Petronius, directed against the Jesuits, and *Argenis*, a political romance somewhat on the lines of More's *Utopia*. He was subsequently reconciled to Catholicism, and d. in Rome. See Jules Dukas, *Satyricon*, Paris, 1880, and Dupond, *L'Argenis de Barclai*, Paris, 1875.

Barclay, John (1734-98), b. Perthshire, educ. at St Andrews; became assistant minister at Fettercairn, 1765. His opinions offended the Presbytery, which was supported by the General Assembly, and B. left the Church and founded the sect of the Bereans (q.v.). See memoir in collected works by Thomson and Macmillan, 1852.

Barclay, John (1758-1826), surgeon, nephew of the founder of the Bereans, b. Perthshire; studied medicine at St Andrews and Edinburgh; M.D., 1796. In 1797 he began to teach anatomy on his own account, and in 1804 his course of

lectures was 'recognised' by the College of Surgeons in Edinburgh. His lectures attained great popularity and his writings gave him a considerable reputation. They included *Muscular Motions of the Human Body*, 1808, and *Engravings Representing the Bones of the Human Skeleton*, 1819. He collected a valuable museum of human and comparative anatomy.

Barclay, Robert (1648-90), theologian, b. Gordonstown, Morayshire. His father, Col. David B. of Ury, had served under Gustavus Adolphus. Robert was educ. at the Scots College, Paris. Joining the Quaker Society with his father in 1666, he was a strong controversialist with opponents, and suffered persecution. His *Apology for the True Christian Divinity* (Lat. 1676, Eng. 1678) is a standard work of Quaker doctrine. He travelled with Penn and Fox, and was made nominal governor of the Quaker settlement of E. New Jersey by James II, 1682. He d. at the family estate of Ury. Life by M. C. Cadbury, 1912.

Barclay, Sir Thomas (1853-1941), lawyer, b. Dunfermline, educ. at Univ. College, London, and at the univs. of Paris and Jena. In 1876 he became Paris correspondent to *The Times*, was called to the Bar in 1881, and in the following year gave up journalism to practise Fr. law. His life was devoted to fostering amicable relations between Great Britain and other countries, and he travelled widely for that purpose. He founded the Franco-Scottish Society in 1895, and the International Brotherhood Alliance in 1905. He was knighted in 1904. He was an authority on international law, and his numerous works include *Problems of International Practice and Diplomacy*, 1907, *International Law and Practice*, 1917, *New Methods for Adjustment of International Disputes*, 1918, *Law and Usage of War*, 1918, *Collapse and Reconstruction*, 1919, and *Wisdom of Lang-sin*, 1927.

Barclay, William (1546-1608), Scottish jurist, father of John B. (q.v.), the author of *Argenis*, studied law under Cujas at Bourges, and became prof. of law at the univ. of Pont-à-Mousson. In 1605 he had a dispute with the Jesuits and went to England, but in 1604 was prof. of law at Angers, where he d. His chief legal work is *De Regno et Regali Potestate*, 1600; his attack on the temporal power of the Pope, *De Potestate Papae*, was ed. by his son, 1609, and was answered by Bellarmine's *De Potestate Summi Pontificis*, 1610.

Barclay de Tolly, Michael Andreas (1761-1818), Russian general, b. in Livonia, of an old Scottish family settled there in 17th cent.; distinguished himself against the Turks (1788), the Swedes (1790), and in Poland (1794). He fought (1806) as major-general at Pultusk and at Eylau, where he lost an arm. In 1808-9 he commanded in Finland, and his daring march across the ice of the Gulf of Bothnia and capture of Umeå are famous. Minister of War (1810-13), he and Bagration commanded the 2 armies

against Napoleon, 1812. He was superseded by Kutusov after his defeat at Smolensk and left the army. He resumed command at Dresden, Kulm, and Leipzig, and was made field marshal, 1814, and Prince Bogdanovich, 1815.

Barclays Bank, one of the 5 big banks or banking amalgamations of Great Britain. The nucleus of the present bank dates back to the 18th cent., the founder of the London business being John Freame, a goldsmith, whose son and successor, Joseph, took James Barclay, a brother-in-law, into partnership, since when the Barclay family have always had a member in the business. B. B. was registered in 1896 as Barclay & Co. Ltd, to acquire the banking businesses of Barclay, Bevan, Tritton, Bouverie & Co., and Ransom of London, and of Gurney & Co. of Norwich, some of which banks were founded in the 17th cent. Other concerns, such as United Counties Bank and the London and Provincial and South Western Bank, were absorbed during the First World War, and altogether over 40 banks have been merged in the amalgamation, the name being changed to the present style in 1917. B. B. also controls B. B. (Dominion, Colonial, and Overseas), which latter was incorporated in 1836 as the Colonial Bank and re-incorporated in 1925 under its present name. The bank does large business in overseas investments.

Bar-cochba, or **Bar-kokba**, Heb., 'son of a star' (Num. xxiv. 17), name of one Simon or Simeon, leader of the last Jewish revolt from Rome (AD 132-5). Nothing is known of his origin; the rabbi Aquiba recognised him as the Messiah. He was for a time successful, retaking Jerusalem. The Romans, under Julius Severus, captured Jerusalem (135), when B. was slain; the rebellion was ended with great slaughter at Bether. To later rabbinical writers he is known as Bar-coziba, 'son of deceit.'

Barcoo River, see COOPER'S CREEK.
Barcroft, Sir Joseph (1872-1947), physiologist, b. at Newry, Co. Down, and educ. at York and Cambridge; graduated 1893. He was lecturer and demonstrator at Cambridge for many years, and was appointed prof. of physiology, 1926-37. In 1941 he became director of the Unit of Animal Physiology, Agric. Research Council, and held this post until his death. B. devised an apparatus for analysis of the blood gases and did important research on the oxygen-carrying function of haemoglobin. He evolved the theory of the div. of the blood into circulating blood and depot blood, studied the physiology of the foetus, especially in sheep, and wrote *The Respiratory Function of the Blood*, 1914, *Features in the Architecture of Physiological Function*, 1934, and *Researches on Pre-Natal Life*, vol. 1, 1946. He was knighted in 1935. See life by K. J. Franklin, 1953.

Bard, name which Celtic peoples applied to their poets, singers, and minstrels. It appears in the form *bardoi* in Gk writers

as early as the 1st cent. BC, when poetry would seem to be associated with the religious education of the Druids. After the christianising of Britain and during the long struggle of the Welsh against the English the prophetic and exhortatory function of the Druid was taken up by the bard, and as the Romans invaded Anglesey under Suetonius Paulinus to suppress Druidism (the main source of unyielding resistance to Rome), so the Eng. kings Edward I and Henry IV made edicts against the Welsh B.s because of their influence on the native princes in their bitter struggle for independence. The 6th-cent. monk Gildas severely censures King Maelgwn Gwynedd for listening too much to the flattery of the B.s whom he regaled with mead and wine at his court. The laws of King Hywel Dda prove that in Wales, as early as the 10th cent., the B. was afforded a place of honour at the King's court. The Pencerdd, or chief B., won this privilege in some form of poetic contest which entitled the victor to a chair of honour among the royal officers for the rest of his life. Only a free man was eligible for the bardic office. His function was to praise God, to extol his lord's prowess in battle and his wisdom and generosity in peace, and to compose his elegy. When appointed, the king gave him the harp, which was the perquisite of his office. Next to the *Pencerdd* ranked the *Bardd Teulu*, or Bard of the Household, who entertained the Household Guards and lodged at their marshal's house, which was the biggest house next to that of the king. If the queen wished to be entertained in her apartment, the *Bardd Teulu* should sing her up to three songs quietly so as not to disturb the *Pencerdd* singing in hall!

The third grade mentioned in King Hywel's Code are the *Cerddorion*, or minstrels (*joculatores* according to the Lat. trans. of the Code). They would appear to be the ancestors of the jesters who were so popular in medieval halls. Tradition concerning the threefold order and official status of the Welsh B.s survived to the end of the Middle Ages, when the patronage of the independent princes was followed by the patronage of gentry of the royal blood. The B. was now given a *Ciers Clera*, or recognised circuit of the halls of a number of patrons once every three years, as he no longer resided as an official at one prince's court. He was expected to be an expert in the genealogy of the ancient houses on his circuit as well as a worthy poet.

Here mention must be made of an inferior sort of B.s or entertainers who also used to go about on begging circuits. They were called *lerwyr*, or *I' Glêr*, and they form the Welsh counterpart of the continental *Cleri* or *Clerici vagantes*, or *Goliardi*. Until the 16th cent. their work was not considered worth writing down, but there can be no doubt that they left their influence on the popular *penillion* or folk poetry of Wales.

The next official attempt at regularising the bardic order is that of the commissioned *Caerwys Eisteddfodau* of 1523

and 1568, which recognised and approved a system of bardic apprenticeship in three grades: (1) *Disgybl Ysbâs* (Student over a short space of time); (2) *Disgybl Disgyblaidd* (Disciplined student); (3) *Disgybl Pencerdddaidd* (Student for the title of Chief B.). Qualified students, after consultation with their teachers the Chief B.s, were licensed to make a circuit of the halls of the gentry at Christmas, Easter, and Whitsuntide. Any unqualified B.s going on circuit and begging patronage were henceforth to be counted 'vagrabonds.'

Despite these attempts at restoring order under royal warrant, the formal bardic system was already disintegrating, and the next cent. produced a new type of Welsh poet, the gentleman writer whose independence of patronage allowed him to sing occasional and satirical verse to his heart's content, grafting lively, contemporary language on to traditional archaic verse forms. These forms were revived and jealously guarded in their classical style by the antiquarian scholars and learned poets of the 18th cent. and they provide the strict alliterative pattern on which the Chair B. of the National Eisteddfod must sing his ode to this day. See *EISTEDDFOD* and *GORSEMD*.

Bardějov (Ger. *Bartfeld*), Czechoslovakia in the region of Prešov (q.v.), on the Tapola. The first general Protestant synod of Hungary met here. It has a 13th-cent. Gothic church and a 15th-cent. Rathaus, now a museum. There are chalybeate springs near by. Pop. 6600.

Bardesanes (AD 154-222) (*Bar Daisan*, son of Daisan, a riv.), called the 'last of the Gnostics,' Syrian theologian, b. Edessa. For some time he lived at the court of Abgar; but when Edessa was taken by Caracalla (217) he fled into Armenia. He maintained that evil was the revolt of matter against spirit, but held that the devil was an independent spirit. He denied the doctrine of the resurrection of the body, and preached that Christ's body was not living flesh, but an illusory likeness sent by God.

Bardi, lt. tn in Emilia-Romagna (q.v.), 31 m. SW. of Parma (q.v.). Pop. 7000.

Bardia, vil. on the N. coast of Africa, in the prov. of Cyrenaica, about 60 m. E. of Tobruk. It came into prominence during the Second World War when, on 19 Dec. 1940, a Brit. force captured it from the Italians. The Germans, however, retook it on 12 April 1941. B. was recaptured by the Allies in Nov. 1942.

Bardiū, Christoph Gottfried (1761-1808), Ger. philosopher, b. Blaubeuren in Württemberg. He became a prof. of philosophy at Stuttgart, and as an exponent of rational realism he anticipated Hegel and Schelling. His chief work, in which he criticised Kant, is the *Grundriss der Ersten Logik*, 1800.

Bardowiek, Ger. vil. in the Land of Lower Saxony (q.v.), 70 m. NNE. of Hanover (q.v.). It was a trading post estab. by Charlemagne (q.v.), and had a cathedral which was destroyed by Henry the Lion (q.v.) in 1189. The cathedral

ruins are incorporated in a 14th-cent. Gothic church. Pop. 2200.

Bardsey, is. off Caernarvonshire, N. Wales, about 2 m. long by 1 m. broad. It is only accessible on the SE. side, where there is a small well-sheltered harbour. B. (or Bards' Ey, the Isle of Bards) was, according to legend, the last retreat of the Welsh bards. There was formerly an abbey, which was suppressed by Henry VIII. Numerous graves lined with stone, a large building, said to have been the abbot's lodge, and a ruined chapel or oratory are the only remains. Pop. 14.

Barbones Parliament, name of the 'Little Parliament' (4 July to 12 Dec. 1653), summoned by Cromwell after his violent dissolution of the 'rump' of the Long Parliament. It consisted of selected nominees of the congregations in each co. Its unruliness and incapacity led to its dissolution at the request of the moderates. The name, given to it by its opponents, is due to the number for London, Praise-God Barbon or B. (c. 1596-1679), a rich leather-seller and 'fifth monarchy' man. He does not seem to have taken any prominent part in the parliament. See H. A. Glass, *The Barbones Parliament*, 1899.

Barège, gauze-like fabric, used for women's dresses. It is a mixture of silk and worsted, or cotton and worsted, and is generally produced in light colours. The best quality is manuf. in France, where it is called *crêpe-de-barège*, from the tn Barèges, where it was first made; also produced at Bagnères de Bigorre.

Barèges, Fr. spa. in the dept of Hautes-Pyrénées, on the Bastan. It has warm sulphur springs, a military hospital, and is a centre for winter sports. The fabric barège was originally made here. Pop. 200.

Barilly, one of the prin. cities (pop. 208,628) of Uttar Pradesh, India, and cap. of the former Rohilkhand. It is a centre of much industry and has a college of the first rank dating back a hundred years.

Barents, Willem (d. 1597), Dutch explorer and navigator. He made 3 voyages in search of the NE. passage in 1594-6, and d. in Novaya Zemlya. De Veer's *True Description of Three Voyages by the North East* (of Willem B.) was ed. by C. T. Becke for the Hakluyt Society in 1853.

Barents Sea, that part of the Arctic Ocean which lies between the European mainland, Novaya Zemlya, Zemlya Frantsa Iosifa, and Spitsbergen. Its average depth is 100 fathoms. See F. Nansen, *The Norwegian North Polar Expedition*, 1900-6.

Barentsøya (Barents Island), is. in the E. of the Spitsbergen Archipelago, named after Willem Barents (q.v.).

Barère de Vieuzac, Bertrand (1755-1841), Fr. revolutionary, b. Tarbes; he became a lawyer and was elected as deputy for Bigorre to the States-General, 1789, and reported the debates in his paper, the *Point du jour*. As deputy for Hautes-Pyrénées to the National Convention, 1792, he was at first moderate in

his views, but later voted for the death of the king. He closed his speech with the phrase, 'The tree of liberty does not grow if it be not watered with the blood of kings.' He was a member of the first and second Committees of Public Safety, 1793, first supporting Robespierre, but turning against him at his fall. He was imprisoned after the Terror, but escaped. He was employed by Napoleon, turned Royalist in 1814, was exiled as a régime in 1815, and allowed to return to France in 1830. He was the last survivor of the Committee of Public Safety. See his memoirs (Eng. trans.), 1896.

Baretti, Giuseppe (1719-89), It. writer, b. Turin. He came to London in 1751 as a teacher of Italian, he became secretary to the Royal Academy, and pub. the *Italian Library* (1757). He was a member of Dr Johnson's circle, and figures in Boswell's *Life*. His jour., *Frustra Letteraria* (Venice, 1763-5), was marked by bitter but independent criticism. His *Dictionary and Grammar of the Italian Language* was in use all through the 18th cent. He also wrote *Lettere Famigliari* and a *Discours sur Shakespeare* in which he defended him against the criticism of Voltaire.

Barfleur, Fr. seaport and resort in the dept of La Manche, 15 m. E. of Cherbourg on the Cotentin peninsula. It was an important harbour for the Channel passage to England in the Middle Ages. The *White Ship* sank off the port with Henry I's only son Wm. Off Cape B. was fought the first of the series of naval battles between Tourville and Russell, May 1692, known in Eng. hist. as the battle of La Hogue (q.v.). The Cape B. lighthouse is 233 ft high. Pop. 1000.

Barfurush, see BAROL.

Barga, It. tn in Tuscany (q.v.), 16 m. N. of Lucca (q.v.). It is in the Serchio valley, and has many unct. buildings, including a beautiful Romanesque cathedral. Paper is manuf. Pop. 10,000.

Bargagli, Scipione (1540-1612), It. writer, b. at Siena, in Tuscany, of a patrician family. He became distinguished as an elegant writer. B.'s prin. works are *I Trattenimenti* (Venice, 1587), which by some is called B.'s best novel; *Dell' Imprese* (Venice, 1594), concerning the origin and symbolic language of devices and mottoes in the ages of chivalry; and *Il Turamino, ovvero del Parlare e dello Scrivere Senese* (Siena, 1602), a dialogue on the dialects of Tuscany, especially that of Siena. B. wrote other minor works both in prose and verse.

Bargagli, Girolamo (1537-86), his brother, who was a prof. of law in his native city, wrote a book called *Dialogo dei Giochi che nelle Veggchie Sanesi si usano di fare* (Siena, 1572), which is an explanation of the numerous social games played in Italy among friendly parties.

Bargain and Sale, in law, a form of conveyance of real property now obsolete. It was one of the means by which an owner could avoid the feudal restrictions on the disposition of land. 'Livery of seisin,' i.e. actual open delivery of land, alone gave the legal title. If A bargained

to sell land to B, and B gave even nominal consideration, the courts gave B the equitable, i.e. beneficial, ownership. The Statute of Uses, 1535, transferred the legal title to the bargaineer, thus allowing an easy method of secret conveyance. To prevent this, by the Statute of Enrolments, 1835, all such conveyances were to be by deed publicly enrolled. This was also evaded by conveyance by 'lease and release.' The Real Property Act, 1845, did away with the necessity of both these forms.

Barge, term applied to large flat bottomed boats used for the carriage of

projecting roof of a gable, covering the rafters and protecting them from weather. When elaborately carved, as in the 14th and 15th cents., they form an ornamental feature of the roof. Original B.s of this date are sometimes to be seen on the gables of porches of churches and on lighthouses. The barge course is that part of the tiling of a roof which projects over the gable end of a building.

Barham, Charles Middleton, 1st Baron (1726-1813), admiral, b. Leith. He joined the navy in 1745 and became an admiral, 1795. He was made first lord of the admiralty 1805-6, and raised to

OXFORD UNIVERSITY COLLEGE BARGES

heavy goods on canals or rivers; for this purpose they are usually towed; when employed for the transshipment of cargo from larger vessels to shore, or vice versa, they are termed lighters; dumb B.s are steered with an oar and drift with the tide. The B.s of the Great Lakes and E. coast of N. America run to great size, carrying over 3000 tons of cargo. The state B. is an ornamented vessel with a compartment for passengers in the stern, and is rowed by a crew of 10 or more oars. In former days the Lord Mayor's procession was rowed on the Thames in his state B. with those of the different livery companies. The royal state B. is manned by the queen's water-men. The modern house-boat is a development of the B., but is moored permanently at a river bank. Similar are the B.s at Oxford used as the H.Q. of the college rowing clubs. B.s are also special boats carried by flagships for the personal use of flag officers.

Barge-board, board attached to the

peetrage. Much of Britain's naval reorganisation before Trafalgar was due to B.

Barham, Francis Foster (1808-71), theologian, b. near Penzance. He became an attorney and founded a mystical religion called Alism.

Barham, Richard Harris (1788-1845), humorous poet, b. Canterbury. Educ. at St Paul's and Brasenose College, Oxford, he was ordained in 1813, became a minor canon of St Paul's, 1821, and a priest in ordinary to the Chapels Royal with a city living, 1824. In 1837 he contributed to Bentley's *Miscellany* the first of his numerous tales in verse, *Ingoldsby Legends*, under the pseudonym of 'Thomas Ingoldsby.' The first collected series was pub. in 1840, second, 1842, and third, 1847, with a memoir. Their high spirits, amazing rhymes, and inexhaustible humour fully account for their lasting popularity. A plaque to B. in Burgate Street where he was b., was unveiled in

1930 by Dean Inge. See *Life and Letters* by his son, R. H. D. Barham, 1870.

'Barham,' The, Brit. battleship (31,000 tons), built in 1915. Flagship of 5th Battle Squadron in the battle of Jutland. She was reconitioned before the Second World War but was sunk in the Mediterranean off Sullom on 25 Nov. 1941.

Bar-Hebraeus, see ABULFARAJ.

Bari: 1. Prov. of Italy, in central Apulia (q.v.). In the N. there is a long coastal plain on the Adriatic. The S. of the prov. is a plateau. Cereals, wine, cotton, olives, and tobacco are produced. The prin. tns include Bari, Barletta, Bisceglie, Molfetta, and Altamura (qq.v.). Area 2020 sq. m.; pop. 1,241,000.

2. (Anct. **Barium**), It. seaport, cap. of the prov. of Bari, and chief tn of Apulia, 230 m. E. by S. of Rome (q.v.). It is on the Adriatic. B. was an important port under the Romans. It was subsequently in the hands of the Saracens (812), the Byzantine Empire (885), and the Normans under Robert Guiscard (qq.v.). In the 14th cent. it was an independent duchy, and it was annexed to the kingdom of Naples (q.v.) in 1558. During the Second World War the transmitting station at B. was bombed by the R.A.F. in 1940; there were further R.A.F. raids in 1941 and 1943, and a Ger. raid in late 1943, when the tn was being used as an allied base. There is a 12th-15th-cent. Romanesque archiepiscopal cathedral, sev. other fine medieval churches, and a 13th-cent. castle. The univ. was founded in 1924. B. is a commercial and industrial tn, with chemical, metallurgical, textile, and foodstuff manufs. Pop. 273,100.

Bariatinski, Alexander Ivanovich, Prince (1814-79), Russian general, served with distinction in the Caucasus, 1835 and 1845, and after successful campaigns, 1848-56, was made commander-in-chief and governor-general. Within 3 years he broke the back of Shamyl's resistance, taking his stronghold and finally the leader himself at Gumb, Darghestan, 1859. He was made field marshal, 1859, but, broken in health, retired, and d. in Geneva.

Barili, tn, W. coast of Cebu prov., Philippine Is. It is a fertile, wooded dist. growing coco-nuts and corn. It has also important fisheries. Pop. 27,267.

Barilla, Sp. name of an impure carbonate of soda imported into Britain from Spain, the Canary Is., Sicily, Italy, and France. It is obtained from the ashes of plants, especially *Salsola soda*, and is used in the manuf. of glass and soap.

Barinas, state of Venezuela E. of the Cordillera Merida. Cap. Barinas. Area 13,587 sq. m.; pop. 80,000.

Baring, name of a family of Eng. bankers and financiers, sev. members of which were distinguished as statesmen and administrators. There are 4 peerages in the family, the earldom of Cromer, and the baronies of Ashburton, Northbrook, and Revelstoke. John B. came from Bremen, in Germany, and started a cloth factory near Exeter. His son Francis (1740-1810) founded the banking house of B. Bros. in 1770, was director and

chairman (1792) of the E. India Co., supported Pitt in Parliament (1784-1806), and was made a baronet, 1793. At his death the firm was the first banking house in Europe. His eldest son, Sir Thomas (1772-1848), was a great art collector, and the firm was managed by his second son, Alexander (1774-1848), who extended its influence in America, was president of the Board of Trade, 1834, and made Baron Ashburton, 1835. He settled the Canada-Maine boundary question, 1842. At his death the management of the firm passed to Thomas (1799-1873), second son of Sir Thomas, and on his death to Edward (1828-97), son of Henry, third son of the founder of the firm, who was created Baron Revelstoke, 1885. It was during this period that the continued default of the Argentine Gov. involved the firm in such difficulties that a financial crisis ensued (1890), only relieved by the action of the Bank of England and the prin. London joint-stock banks, in taking over the enormous liabilities of the firm. B. Brothers was reorganised as a limited company. Sir Thomas B.'s eldest son, Sir Francis (1796-1866), was Chancellor of the Exchequer (1839-44), First Lord of the Admiralty (1849-52), and created Baron Northbrook, 1866; his son Thomas (1826-1904) was Viceroy of India (1872-1876) and First Lord of the Admiralty (1880-5). The youngest son of Henry B., a brother of the 1st Lord Revelstoke, was Evelyn (1841-1917), 1st Earl Cromer (q.v.).

Baring, Alexander and William, see ASHBURTON, ALEXANDER BARING, 1st BARON, and WILLIAM BARING, 2nd BARON.

Baring, Evelyn, see CROMER, EARL.
Baring, Maurice (1874-1945), novelist and poet, son of Lord Revelstoke, b. London. He was educ. at Eton and Trinity College, Cambridge, and in 1899 entered the diplomatic service. He held posts successively at Paris, Copenhagen, and Rome, but in 1904 decided to abandon diplomacy for a literary career. When the Russo-Jap. war broke out, however, he became war correspondent of the *Morning Post* in Manchuria; and was afterwards a special correspondent in Russia, Constantinople, and the Balkans. These experiences are described in *Letters from the Near East*, 1909, *The Puppet Show of Memory*, 1922, and in the novels *Tinker's Leave*, 1927, and *Friday's Business*, 1933. During the First World War he served in the Royal Flying Corps, becoming wing-commander, and was made chevalier of the Legion of Honour. He had already written some poetical plays, including *Gaston de Foix*, 1903, *Desiderio*, 1906, and *Diminutive Dramas*, 1911. Later came short stories, *Orpheus in Mayfair*, 1909, fairy tales, essays, and skits in profusion. His first novel, *Passing By*, appeared in 1921. The best of his subsequent novels are *Cal's Cradle*, 1925, *Daphne Adeane*, 1926, *The Coat without Seam*, 1929, *Robert Peckham*, 1930, and *The Lonely Lady of Dulwich*, 1934. During his journalistic career he became a Rom. Catholic. His knowledge

of foreign traditions, customs, and literature may be gathered from *A Year*

Russia, 1907, and *The Mainsprings of Russia*, 1914, as well as from his essays. His *Collected Poems* were pub. in 1925. He has been described as one of the most subtle and original writers of his time. See Dame E. Smyth, *Maurice Baring*, 1938, and L. Lovat, *Maurice Baring: a Postscript*, 1947.

Baring-Gould, Sabine (1834-1924), author, b. Exeter. Educ. at Clare College, Cambridge, he became rector of E. Mersea, Essex, 1871, and of Lew Trenchard, Devon, 1881. From 1854 onwards he wrote books on folklore, mythology, and customs, and of travel, such as the *Book of Were-Wolves*, 1865, *Curious Myths of the Middle Ages*, 1866, *Strange Survivals*, 1892, *Family Names and their Story*, 1910, and *Cliff Castles and Cave Duellings of Europe*, 1911. His theological works include *The Lives of the Saints* (17 vols.), 1872-89. From 1871 to 1873 he ed. the *Sacristy*, a quarterly devoted to the art and literature of the Church. His life of R. S. Hawker (q.v.), *The Vicar of Morwenstow*, 1875, was much criticised. His *Songs and Ballads of the West*, 1889-91, contains a valuable collection of folksongs. Of his novels the best known are *Mchalah*, 1880, *John Herring*, 1883, *Court Royal*, 1886, and *Nebo the Nailer*, 1902. He was also the author of the well-known hymns 'Onward, Christian Soldiers,' 'Now the day is over,' and others. His *Early Reminiscences* appeared in 1923. See S. M. Ellis, *Mainly Victorian*, 1925.

Baringo, Lake, in Kenya, about 40 m. N. of the equator. Its elevation is 3325 ft and its length about 16 m.

Baris, genus of coleopterous insects, belongs to the family Curculionidae, or weevils. It feeds on dead parts of trees, and is consequently not injurious in any way. *B. lignarius* feeds upon the elm-tree both in the larval state and that of the perfect insect. The little weevil selects a hollow tree, enters the dead wood under part first, lays its eggs, then dies, and its body thus blocks up the entrance and protects the young.

Barito, riv. of Indonesian Borneo, which flows southwards into the Java Sea, after a course of 550 m. It is navigable for some distance up; at high tide the bar at the mouth has over 12 ft of water.

Baritone, i.e. deep-sounding (Gk *barus*, heavy; *tonos*, tone), name of that range of the adult male voice which lies between a tenor and a bass. It is to be regarded as a high bass rather than a low tenor; compass about from the lower A on bass stave to F above the stave.

Barium, see BARI.

Barium, metallic element belonging to the group of alkaline earths. Symbol Ba; atomic number 56; atomic weight 137.36. In 1602 Casciorolus, a Bolognese shoemaker, investigated the properties of heavy spar, and noticed that it became phosphorescent in contact with ignited combustible matter. In 1774 Scheele discovered, in a sample of black oxide of

manganese, a new earth, which was afterwards identified with a constituent of heavy spar. This earth was called baryta (Gk *barus*, heavy) and was shown to be an oxide of a metal by Davy. He succeeded in producing an amalgam of the metallic B. with mercury, but no satisfactory isolation of the metal was accomplished until Guntz, in 1901, obtained an amalgam by electrolysis a saturated solution of B. chloride; the amalgam was heated in the electric arc to about 1000° C., and the B. obtained in the form of a soft, silver-white metal. B. is best produced by heating B. oxide with aluminium to 1400° C. under a high vacuum. The monoxide BaO is obtained by heating the carbonate or nitrate; further heating transforms the monoxide into the peroxide BaO₂. At a still higher temp. the additional oxygen is set free, so that by alternately lowering and raising the temp. oxygen may be absorbed and collected from the atmosphere. This action was the basis of Brin's oxygen process, now obsolete but very successful for a number of years. B. hydroxide is a white soluble powder; the solution is known as baryta water and readily absorbs carbon dioxide from the air. B. chloride is obtained by the action of hydrochloric acid on witherite (i.e. native B. carbonate, BaCO₃); it is used in the preparation of the artificial sulphate, which is used as a pigment under the name *blanc fixe*, or permanent white; the impurities in the air having no effect upon it. A mixture of B. sulphate and zinc sulphide forms the very important white pigment known as *Whitopone*. B. nitrate is a powerful oxidising agent, and like the chloride is used for the production of 'green fire' in pyrotechny. B. may be detected by the apple-green colour imparted to the Bunsen flame by the metal and its salts, and by the immediate precipitation of the salts by a solution of calcium sulphate. B. salts are very poisonous, causing death by paralysing the heart. In small doses they strengthen the muscular power of the heart, but are seldom employed.

Barium Sulphate, see BARYTES.

Bar-Jesus, see ELYMAS.

Barjols, Fr. tn in the dept of Var, with tanneries and shoe manufs. Pop. 2400.

Bark (ship), see BARQUE.

Bark, outside covering of the trunks and branches of trees, consisting of dried-up tissues, which often belong to different tissue systems, lying outside the active cork-cambium of stems. The first phellogen (cork-producing tissue) nearly always dies, and a second phellogen produces a cork layer cutting off the supply of water to the outside layers, and consequently aids in the formation of the B. It may be either scaly or ringed; in the first case only isolated patches of tissue have become B. and as the trunk of the tree increases in size the B. becomes torn in scales; in the second case concentric rings are formed and the B. forms a complete ring. Examples of the former are the pine, plane, and larch, of the latter, vine, clematis, birch, and honey-suckle.

The uses of B. are many and various. In savage lands, canoes, shields, baskets, and clothing are made of it. In tanning it is a most valuable object, and the *Quercus suber*, an oak of S. Europe and N. Africa, produces an outer covering which is rich in tannic acid. Sev. other varieties of oak, such as *Q. robur* and *Q. velutina*, are also much used, while *Acacia decurrens* and *Tauga canadensis*, or hemlock spruce, are other plants containing tannin. The bast fibres are employed in commerce, examples of which are flax, jute, and hemp. Medicinally B. is frequently noteworthy, the best known being cinchona; other kinds are angostura, cascara, cascarilla, and witch hazel. Cinnamon is obtained from B., the wild cherry is valued in cough mixtures, pomegranate B., or granatum, is used to expel tape-worms. Resins, gums, and balsams may be produced from various B.s.

Bark, Peruvian, see CINCHONA.

Bark-bed, bed of tanner's bark, 2 to 4 ft thick, in a brick pit of a hot-house, fermenting slowly and giving a steady heat for the rearing of tender plants. Now superseded by methods of hot water or electrical heating.

Bark-beetles, coleopterous insects of the family Bostrichidae, but the name is often given loosely to beetles of other families. They do much damage as they live on the bark of forest trees.

Barkal, or **Jebel Barkal**, flat-topped, isolated rock, rising precipitously from the desert on the r. b. of the Nile, some distance above the vil. now called Merowe. From its shape it was anciently considered to be the throne of Amen. In the New Kingdom Egyptian temples were built at B., and priests of Amen from Thebes founded Napata, eventually to be the cap. of the 25th dynasty (see EGYPT, History). There remain sev. ruined temples and many pyramids of this dynasty and its successors in the vicinity.

Barker, Benjamin (1776-1838), Eng. landscape painter, brother of Thomas B. (q.v.). He exhibited at the Royal Academy between 1800 and 1821. He pub. a set of 48 views engraved by Theodore Fielding.

Barker, Edmund Henry (1788-1839), scholar, b. Yorks; educ. at Trinity College, Cambridge. His chief work was the revision of Stephanus's *Thesaurus Graecae Linguae*, 1816-28, severely criticised by Blomfield. He d. in poverty.

Barker, Sir Ernest (1874-), historian and classical scholar, educ. at Manchester Grammar School and Balliol College, Oxford. In 1898 he was elected fellow of Merton College; in 1909 fellow and lecturer of St John's College; in 1913 fellow and lecturer of New College. In 1920 he went as principal to King's College, London. He remained at London Univ. until 1928, when he became prof. of political science at Cambridge (until 1939), also being elected fellow of Peterhouse. From 1947 to 1948 he was prof. of political science at Cologne Univ. His works include *The Political Thought of Plato and Aristotle*, 1906, *Political Thought in England from Herbert Spencer to To-day*, 1915, *Greek*

Political Theory, 1918, *The Crusades*, 1923, *Ideas and Ideals of the British Empire*, 1941, *The Character of England* (ed.), 1947, and *Principles of Social and Political Theory*, 1951. His *Age and Youth*, 1953, is autobiographical.

Barker, Harley Granville, see GRANVILLE-BARKER.

Barker, Sir Herbert Atkinson (1869-1950), manipulative surgeon, b. Southport. Educ. for the law, he early displayed such ability for manipulative surgery that he was placed under the tuition of Mr J. Atkinson, to whose practice he succeeded in 1904. Though he successfully treated over 40,000 cases of flat-foot, joint abnormalities, etc., he never received the formal recognition of the medical profession. He was knighted in 1922 for his services in the First World War. In 1936 he gave a demonstration of his methods before an audience of the Brit. Orthopaedic Association, and made a film for record purposes. He was elected manipulative surgeon to Noble's Hospital, Isle of Man, in 1941. His memoirs, *Leaves from my Life*, were published in 1927.

Barker, Robert (1730-1806), Irish artist, b. Ireland; settled in Edinburgh as a portrait painter. In 1788 he produced the first panorama, that of Edinburgh, following a suggestion of a Ger. architectural decorator, Breislig. He subsequently produced popular panoramas of London, and of naval battles of the time.

Barker, Thomas (1769-1847), Eng. landscape painter, b. near Pontypool, Monmouthshire. He was allowed facilities for copying the works of some Dutch and Flem. masters by a rich coach-builder of Bath named Spackman, who sent him to Rome for 4 years in 1790. He returned to England after this and settled at Bath. Few pictures of the Eng. school have been more widely known than 'The Woodman,' which was engraved by Bartolozzi. His landscapes and rustic scenes were popular, being engraved on china, linen, and pottery, though they were often imitative of the work of other artists, including Gainsborough (q.v.).

Barker, Thomas Jones (1815-82), painter, son of the above, b. Bath. After being given some education in art by his father, he went to Paris in 1834, and was a pupil of Horace Vernet for sev. years. He exhibited frequently at the Salon, his first picture there, 'Beauties of the Court of Charles II,' gaining him a gold medal. In 1840 he was awarded the cross of the Legion of Honour for painting 'The Bride of Death' for the youngest daughter of Louis-Philippe. In 1845 he returned to England, and painted the portraits of sev. eminent men, Disraeli amongst them. He went to the Franco-Ger. war, whence he obtained many subjects for pictures.

Barking, parl. and municipal bor. of Essex, England, situated on the R. Roding, 8 m. from London. A Benedictine double monastery founded here c. 670 by St Erkenwald, Bishop of London, became one of the richest in England. Destroyed by the Danes in 870, it was restored by King Edgar a cent. later, and

dissolved in 1539. The church of All Hallows B. (q.v.) belonged to it. The church of St Margaret, B. has some interesting monuments. Before modern development B. supplied London with vegetable produce. The chief industries are jute, rubber, and chemical manuf. One of the largest electricity generating stations in the U.K. is situated here. B. is a suffragan bishopric to St Albans; it returns one member to Parliament. Pop. 78,170.

Barking Deer, see MUNTJAC.

Barkla, Charles Glover (1877-1944), physicist, b. Widnes, Lancs, studied at Liverpool and Cambridge. Prof. at King's College, London (1909-14), and at Edinburgh (1914). Elected fellow of the Royal Society 1912, and awarded the Nobel prize in 1917 for his discovery of the characteristic X-rays emitted by the elements. He first showed that X-rays could be polarised by scattering and were therefore transverse waves.

Barkly, Sir Henry (1815-98), Scottish colonial administrator. In 1848 he became governor of Brit. Guiana, where he advocated the introduction of coolies and Chinese as labourers, and developed the colony by building railways. 1853-6, Governor of Jamaica; 1856, of Victoria; 1863, of Mauritius; 1870-6, of the Cape. He was knighted in 1853.

Barkly West, tn in the N. div. of Griqualand W., Cape Province, 25 m. as the crow flies from Kimberley. It is the cap. of the dist. of the same name, and possesses diamond mines, in which the 'river stones,' of great value, are found. It is situated at an elevation of 3630 ft. Pop. (Whites) 692.

Bar-kokba, see BAR-COCHBA.

Barkol, tn of Dzungaria, in Sinkiang, China, to the N. of the Gobi desert. Near to it is Lake Barkol, which is situated 5100 ft above sea level.

Barkway, anct. vill. of Herts, England, about 4 m. SSE. from Royston. At the time of the Conquest the lands were divided among 4 great lords into as many manors, and afterwards into 8 manors. It was privileged by Edward I to have a market on Thursday, but this has been discontinued. Pop. 600.

'Barlaam and Josaphat', Christian religious romance popular in the Middle Ages. The Gk version is attributed to St John Damascene (675-749), but modern writers have traced an original Sanskrit source from which the Christian version is derived through Manichean channels. The story has affinities with the life of Buddha, and the name Josaphat is a perversion of Bodhisat (see Bodhisattva myth under LAMAISM). B. and J. also embodies an abbreviated version of the *Apology* of Aristides and the story of the 3 caskets, used by Shakespeare in the plot of *The Merchant of Venice*. Both B. and J. were canonised by the E. and Rom. Churches. There is a text and trans. of the romance by G. R. Woodward and H. Mattingly. 1914.

Barlaeus, Casparus, or **Caspar van Baerle** (1584-1648), Dutch poet and historian, b. Antwerp. He studied theology at

Leyden, where he became prof. of logic in 1617. He wrote poems, chiefly in Latin, and a hist. of Brazil, which was then possessed partly by the Dutch.

Bar-le-Duc, Fr. tn, cap. of the dept of Meuse, on the Orain, and on the Marne-Rhine canal. Once cap. of the duchy of Bar, it has many fine old churches and mansions, and the remains of the ducal palace. The church of St-Étienne contains a curious sculpture of a skeleton. The Old Pretender (see STUART, JAMES EDWARD) lived here for some years, and the tn was the bp. of the 2nd Duke of Guise, Oudinot, Exelmans, and Raymond Poincaré (qq.v.). There are hosiery, metallurgical, and foodstuff manufs., and breweries. Pop. 15,500.

Barleria, genus of Acanthaceae found in the E. Indies. A few species grow in Eng. gardens and hothouses, and of these *B. lupulina*, with its large bracts resembling hops, and *B. prionitis*, a common swamp plant in Java, are the most remarkable.

Barletta, It. seaport, in Apulia (q.v.), on the Adriatic, 32 m. NW. of Bari (q.v.). It has a castle, and an archiepiscopal (B. and Trani, q.v.) cathedral, before which stands an antique bronze statue of the Emperor Honorius (q.v.). The tn is an important agric. centre, with a large trade in wine, and chemical and soap manufs. The *Disfida di Barletta* by Massimo d'Azeglio celebrates an incident during a siege of the tn by the French in 1503: a contest between 13 chosen knights of Italy and 13 of France. The Italians were victorious. Pop. 65,500.

Barley (*Hordeum*), cereal of anct. culture, which belongs to the family Gramineae. There are 4 unimportant species of B.-grass in the Brit. Isles. *H. vulgare* is the cultivated species, growing as far N. as 70°; it is the Scottish bere or bigg, and has its grains in 4 rows; *H. distichum* is a 2-rowed and *H. hexastichum* a 6-rowed variety. *H. coeleste*, the Siberian B., a variety with naked seeds, is cultivated in some parts of Europe, but the grain shakes off so easily as to render bad harvests frequent.

Formerly B. was considered to be of great value as a food in England, but now it is most often converted into malt for brewing and distilling. Ground down into B.-meal, it is used for bread-making in N. Europe, and is a food for pigs; it is also made into decoctions for invalids, especially those who have pulmonary complaints, and is extremely soothing in fevers. The varieties known as pot-B. and pearl-B. are very nutritious and wholesome, and may be used in broths, stews, puddings, and as a substitute for rice. The former kind is obtained by depriving the grain of its outer husk, the latter by rounding it and polishing it in the mill after the removal of the husk. In Scotland a peculiar dish, called sowens, is made of the bran, which is steeped in water and allowed to ferment for sev. days until it becomes acid. B. is a shallow-rooted crop and is best suited to light loams. The best quality B. is grown where these soils are associated with

moderate temps. and a moderate, well-distributed rainfall.

The development of this crop in the Commonwealth has shown an increasing trend since 1937, particularly in Canada and the U.K. The acreage under B. in 1953-4 in Commonwealth countries was 22,050,000, compared with an average of 13,580,000 in 1937-40. In fact, the acreages in Canada, the U.K., and Australia were doubled during this period. In 1953-4 they were: Canada, 8,911,000; India, 8,010,000; U.K., 2,226,000; and Australia, 1,803,000 ac. The area under B. in foreign countries (excluding China and the U.S.S.R.) for the same year was 82,200,000 ac. The Commonwealth produced 12,500,000 tons of B. in 1953-4 and foreign countries 33,100,000 tons. Production in the U.K. was 2,521,000 tons but 1,436,000 tons were also imported. The main sources of these imports were Canada (580,000 tons), Argentina (116,000 tons), and Australia (106,000 tons). Thus world production of B. is at a high level and much of it is centred in Commonwealth countries. The greater demand for B. since the war reflects not only its increased use as food in Europe but the large imports into Japan and Korea to supplement supplies of rice.

Barley-break, old Eng. country game which was popular in the 18th and 17th cents., referred to by Herrick, Sidney, Suckling, and Massinger, and still surviving with modifications in the N. of England and Scotland. It was played by 6 couples, 3 of each sex, placed in 3 adjoining plots of ground, the central one being called 'hell.' The middle couple, always united, had to attempt to catch the other couples as they changed places, these latter being allowed to 'break.' The name may have come from the stuck-yard in which it was played.

Barley Midge, dipterous insect of the family Cecidomyiidae, allied to the Hessian fly, or *Cecidomyia destructor*. It obtains its name from its destruction of barley, while the latter is a spoiler of wheat.

Barley-sugar, confection made with syrup prepared from sugar, hardened in moulds and generally twisted into spiral sticks. Originally the sugar was boiled in a decoction of barley.

Barleycorn, John, malt liquor personified and a familiar figure in old Eng. ballads and pamphlets. The song of J. B., from *The English Dancing Master*, 1651, is generally attributed to Robert Burns, but all that Burns did was to alter slightly various parts of it. Also a corn measure—the third part of an inch in length. The term barleycorn is used in old conveyances of land as a synonym for a nominal consideration.

Barlow, Jane (1857-1917), authoress, b. Clontarf, Dublin, where her father, the Rev. W. B., was vice-provost of Trinity College. Of her numerous sketches, novels, and tales of Irish life and character may be mentioned *Irish Idylls*, 1892, *Strangers at Lisconnel*, 1895, *Creel of Irish Stories*, 1897, *Irish Neighbours*, 1907, *Irish Ways*, 1908, *Mac's Adventures*, 1911,

Flaws, 1911, and *Doings and Dealings* 1913.

Barlow, Joel (1754-1812), Amer. politician and writer, b. Reading, Connecticut. He pub. his bombastic poem *The Vision of Columbus*, 1787, expanded into *The Columbiad*, 1807. He went to France, 1788, and became a violent republican. His best work is *Hasty Pudding*, a mock epic, 1793. He was Amer. consul at Algiers, 1795-7, and ambas. to France, 1811. He d. near Cracow on his way to visit Napoleon. See life by C. B. Todd, 1866, and M. C. Tylor, *Three Men of Letters*, 1895.

Barlow, Peter (1776-1862), mathematician, b. Norwich. From 1806 to 1848 he was prof. of mathematics at the Royal Military Academy, Woolwich. His pub. on pure mathematics include *Elementary Investigation of the Theory of Numbers*, 1811, and his *New Mathematical and Philosophical Dictionary* appeared in 1814. His studies in magnetic attraction, on which he pub. a treatise (1820), led to improvements in the compass, and the pattern he introduced remained in use till superseded by the Thomson compass in 1876.

Barlow, Thomas (1607-91), Eng. prelate, was fellow and tutor at Oxford, where he was noted as a keen controversialist and casuist. He was provost of Queen's College and Bodley's librarian, 1642 and 1660. He was made archdeacon of Oxford, 1661, and Bishop of Lincoln, 1675. He was the writer of innumerable pamphlets and books, and a violent opponent of Rom. Catholicism. Through all the political changes of his long life he managed to retain all his clerical benefices and preferments. His works include *Gunpowder Treason Popery, Exercitationes aliquot Metaphysicæ de Deo*, and *Concerning the Invocation of Saints*.

Barlow, Sir Thomas (1845-1945), physician, graduated in medicine in 1873 at London Univ., after being educ. at Owen's College, Manchester, and graduating in arts at London in 1867. Became fellow of the Royal College of Physicians in 1880; president, 1910-15. Became Holme Prof. of Clinical Medicine at Univ. College; fellow of the Royal Society; and president of the International Medical Congress (1913). He was physician to the households of Queen Victoria and King Edward VII, 1901-10, and physician extraordinary to King George V. He was also physician at the London Fever Hospital, and consulting physician to Univ. College Hospital, and Hospital for Sick Children, Great Ormond Street, London. His outstanding contribution to medical science was that which he made on infantile scurvy and its relation to rickets. This made his name known throughout the world—the condition, previously and improperly called scurvy-rickets, now being known as B.'s disease. The benefits which this contribution has conferred on children throughout the world are incalculable. He was created a baronet, 1900.

Barlow, Thomas Oldham (1824-89), line engraver and mezzotinter, made

R.A. 1881; he reproduced the works of his contemporaries, including Landseer, Turner, Millais.

Barlow, William Henry (1812-1902), engineer; he supported the use by engineers of the steel produced by the Bessemer process. The chief works on which he was engaged include the building of St Pancras station, London, the Clifton suspension bridge, and the Tay bridge.

Barmecides, or descendants of Barmak, a noble Persian family, who held positions of influence under the first 5 Abbasid caliphs and for about 50 years (752-804) directed the affairs of the caliphate: they were famous for their wise administration and patronage of learning. Khalid ibn Barmak was minister of Mansur, and his son Yahya tutor and later vizier to the great Harun al-Rashid, in whose reign the family reached their highest power and prosperity, his sons Fadl and Ja'far enjoying high favour. Their power appears to have drawn upon them the jealousy of Harun, and in 804 Fadl, Ja'far, and many members of the family were exterminated. The romantic story is that Harun discovered that Ja'far had betrayed the caliph's sister after a marriage which was to be purely formal. The mock banquet or proverbial Barmecide feast is well known from the *Arabian Nights* 'Barber's Tale.'

Barmen, see WUPPERTAL.

Barmouth, seaside resort, Merioneth, N. Wales, in Cardigan Bay, at the mouth of the Mawddach. Pop. 2500. Cader Idris lies across the Mawddach, and the vale of Llangollen and Dolgelly afford beautiful excursions.

Barn, see FARM.

Barnabas, St., native of Cyprus; by descent a Levite, his first name being Joses, or Joseph. The name of B. (son of consolation) was given to him by the apostles as appropriate to his character and works of charity. He is first mentioned in Scripture in Acts iv. 36. He it was who first introduced St Paul to the apostles. Later he induced him to leave Tarsus and come to Antioch. B. is supposed to have been martyred in Cyprus, but many traditions take him to Milan, Rome, and Alexandria. His feast is on 11 June.

Barnabas, The Epistle of St. The extant epistle consists of 2 parts, the first in Latin, the second in Greek. In the Greek some parts are missing. The first is an exhortation, an argument to constancy in the belief and profession of the Christian doctrine. The second contains moral instructions. The N.T. is not quoted in it. Origen and Clement of Alexandria believed it to be authentic, and Lardner was also of that opinion, but it is now believed to be pseudonymous, and written by a Christian writer somewhere about the year 120.

Barnabites, religious order, founded about the year 1530 under the name of Regular Clerks of the Congregation of St Paul; they are so called because they first met in 1538 in the cloister of St Barnabas at Milan. Their prin. object was the educ. of the young. They were

forbidden to accept preferment in the Church save at the express command of the Pope. The order spread to France, Germany, Austria, and Spain. They were suppressed during the time of the Fr. Revolution, but returned in 1850. In 1880 they were expelled from France, but there are still a few monasteries in the other countries mentioned.

Barnaby, Sir Nathaniel (1829-1915), naval architect, b. Chatham of a family of shipwrights. In 1854 he became an admiralty overseer, and from 1870 to 1885 was chief naval architect in the offices of the controllers of the navy. He pub. sev. works on shipbuilding.

Barnacle, Bernicle, marine attached crustaceans of the order Cirripedia. The common goose B. (*Lepas*) is attached by a stalk while *Balanus*, the acorn B., has no stalk. Typically there are 6 pairs of comb-like, biramous thoracic limbs which 'comb' the sea for food.

Barnacle Goose (*Branta leucopsis*), Arctic bird which visits Britain in winter. It receives its name from an anct fable that it was an offspring of the barnacle (q.v.). It is about 2 ft in length, weighs about 5 lb., is black and white in colour, marbled with blue and grey, the beak is black, streaked with red. It was bred in Britain by the Earl of Derby in 1834, and its flesh is used for food.

Barnard, Lady Anne (1750-1825), poetess, daughter of James Lindsay, 5th Earl of Balcarres, married in 1793 Andrew B. and went with him to Cape Town, where he was Colonial Secretary. On his death in 1807 she returned and settled in London. Her famous ballad of 'Auld Robin Gray' was written in 1771 and pub. anonymously; in 1823 she confessed the authorship to Sir Walter Scott. *South Africa a Century Ago*, 1901, is a collection of her letters from the Cape. See D. Fairbridge, *Lady Anne Barnard at the Cape of Good Hope*, 1924, and M. Masson, *Lady Anne Barnard*, 1948.

Barnard, Edward Emerson (1857-1923), Amer. astronomer, b. Nashville, Tennessee, in poor circumstances. He was apprenticed at the age of eight to a photographer, and when a mere child was fond of observing the heavenly bodies with a toy telescope. He discovered his first comet in 1881, and two years later secured a fellowship in the Vanderbilt Univ. and a post in the observatory. In 1887 he went to the Lick Observatory, and in June 1892 he discovered the fifth satellite of Jupiter. In 1897 he was transferred to Yerkes Observatory where he made many important discoveries, amongst which were the 'dark' nebulae, and he catalogued 182 of these. He discovered the swift-moving star in Ophiuchus known as 'Barnard's Star' which is a near neighbour of the sun, being only 6 light years distant, proper motion 10.30"—the greatest proper motion of any star—and magnitude 9.7. He also discovered a number of comets.

Barnard, Frederick (1846-96), artist, studied at Heatherley's Art School and in Paris. His first work was a set of charcoal drawings, 'The People of Paris.' He contributed to *Punch*, 1863-5, and was cartoonist to *Fun* for 2 years. His best-known work is his illustration of the household ed. of Dickens, 1871-9. He also illustrated Thackeray and *Pilgrim's Progress*, 1880, and was a painter in oils.

Barnard, Frederick Augustus Porter (1809-89), Amer. scientist and educator, b. at Sheffield, Massachusetts; graduated at Yale, 1828. Teacher to the deaf and dumb at Hartford, Connecticut, and later (1832-7) at the New York Institution for the Deaf and Dumb. From 1837 to 1861 he taught in or presided over sev. univs. At the outbreak of the Civil war he retired to Washington. He was president of Columbia College, 1864-89.

Barnard, George Grey (1863-1938), Amer. sculptor, b. Bellefonte, Pennsylvania, educ. at the Art Institute of Chicago and the École Nationale des Beaux Arts. He exhibited in the Salon, 1894, and, in 1900, was awarded the gold medal at the Paris exposition. He was prof. of sculpture at the Art Students' League, New York, 1900-4. His works include 'A Monument to Democracy,' 1920, which comprises 400 figures in plaster; and the 'Great God Pan' (Central Park). His bronze statue of Lincoln, unveiled at Cincinnati, 1917, raised much controversy.

Barnard, Henry (1811-1900), Amer. reformer of education, b. Hartford, Connecticut, educ. Yale; was a member of the Connecticut legislature and reorganised the state schools, 1837-42. In various offices he reformed education in Rhode Is., Wisconsin, and Maryland, and was first U.S. commissioner of education, 1867-70. His pubs. are numerous and he was founder and editor of the *American Journal of Education*, 1855-81.

Barnard Castle, tn. of co. Durham, England, on R. Tees, 15 m. N.W. of Darlington. It contains the ruins of a 13th-cent. castle built by Barnard Balliol, grandfather of John Balliol, King of Scotland. B. C.

School was founded in 1883. The fine Bowes Museum is in Fr. Renaissance style. The chief manuf. is penicillin. Pop. 5000.

Barnard College, for women, New York City, U.S.A., was founded in 1889 and named after President Frederick A. P. Barnard (q.v.) of Columbia College, in honour of his persistent but vain efforts to obtain the Columbia trustees' approval of the admission of women on equal terms with men. B. C. has been affiliated to Columbia Univ. since 1900, and the president of that univ., *ex officio*, is president and a trustee of B. C. The students register in the univ. In 1955 the teaching staff numbered 160; the students 1200.

Barnardiston, Nathaniel Walter, Major-General (1858-1919), Brit. soldier. He was military attaché at Brussels in 1906, and in that year visited Gen. Ducarne, chief of the Belgian General Staff, to discuss the military measures that Great Britain would adopt in the event of a violation of Belgian neutrality by Germany.

Barnardo, Thomas John (1845-1905), Eng. philanthropist, b. in Ireland, and came to study medicine at the London Hospital, where he became interested in the condition of destitute children. In 1867 he opened his first 'home of refuge' in Commercial Road, and in 1873 he founded a 'vil. home' of 52 cottages at Ilford, Essex, for training girls in home conditions (see next article). See J. W. Bready, *Dr Barnardo: Physician, Pioneer, and Prophet*, 1930, and A. E. Williams, *Barnardo of Stepmcy*, 1948.

Barnardo's (Dr) Homes: National Incorporated Association, founded in 1866, with head offices in Stepney Causeway, E.1., having the charter 'No destitute child ever refused admission' and the motto 'For God and Country.' The objects of the homes are to rescue, train, and place out in suitable situations in life destitute, orphan, and forlorn children, irrespective of their age, sex, or creed; physical disability has been no bar to their admission, except in the case of the mentally defective and epileptic. Since its foundation over 150,000 children had passed through its hands up to 1957. The average number in residence is about 7000. The B. H. now have over 110 branches, consisting of separate cottages and households, as well as branches in Australia for immigrants.

Barnato, Barnett Isaacs (1852-97), Eng. financier, son of humble Jewish parents of Aldgate, educ. under Moses Angel at Jews' Free School, Spitalfields. In 1873 he went to S. Africa as conjurer and entertainer; later assumed the name of B., and traded as diamond dealer at Kimberley. In 1880 he estab. the London firm of B. Brothers; in 1881 floated the B. Diamond Mining Co., Kimberley. In 1888 amalgamated with De Beers Co., controlled by Cecil Rhodes. B. was a member of Kimberley divisional council from 1880; member for Kimberley in Cape Assembly, 1888 and 1894. He invested in mining and other property

in the Rand (Transvaal), and was chief manipulator of the 'Kaffir boom,' London, 1895, suffering heavy losses afterwards. B. committed suicide by jumping from a vessel during a voyage from Cape Town. See H. Raymond, *B. I. Barnato: a Memoir*, 1897.

Barnaul, city on the Ob' in S. Siberia, cap. of the Altay Kray (q.v.), and its economic and cultural centre. It has large textile (cotton from Central Asia), engineering, and food industries. The oldest local museum in Siberia is here. Pop. (1956) 255,000 (1861, 12,000; 1926, 74,000; 1939, 148,000). Founded in 1738 as a silver-smelting plant, B. became a town in 1771 and for a cent. was administrative centre of the Altay mining industry; later it became the chief trading centre of the biggest agric. region in Siberia. The construction of the Turksib Railway (q.v.) and the Second World War gave new impetus to its industrial development.

Barnave, Antoine Pierre Joseph Marie (1761-93), Fr. revolutionary, b. Grenoble; he became a lawyer. In 1789 he represented Grenoble in the States-General, where for some time he had much influence as a leader of the popular party. In 1791 he was one of the commissioners who brought Louis XVI back from Varennes to Paris, and his sympathy seems to have been aroused, as after this he advocated more moderate and constitutional measures. In 1792 he was impeached on a charge of royalist sentiments, and guillotined in 1793.

Barnburners, political faction in Amer. hist., so called about 1844 on account of their enthusiastic support of radical reforms, which was compared with the rigour of the Dutchman who burnt down his barn to destroy the rats. They grew dissatisfied with the scanty recognition they received in the Democratic national convention of 1847, and joined the Free Soilers in supporting the presidential candidature of Van Buren. Many of them eventually affiliated with the Republican party.

Barnes, Albert (1798-1870), Amer. theologian, b. Rome in the state of New York. He was educ. at Princeton Theological Seminary. After being in charge of a church in New Jersey, he became the minister of the First Presbyterian Church at Philadelphia in 1830. He was tried for heresy, on account of the tone of some of his *Notes . . . on the Epistle to the Romans*, but was acquitted. He was a gifted preacher, and latterly belonged to the new school of Presbyterians. He resigned, on account of failing eyesight, from Philadelphia in 1867, and d. in that city on 24 Dec. 1870. He is best known for his notes to various books of the O.T. and N.T. which are admirably adapted for Sunday schools and Bible classes.

Barnes, Barnabe (c. 1569-1609), poet and dramatist, b. in Yorks, son of a bishop of Durham. Educ. at Brasenose College, Oxford, he went to France with the Earl of Essex in 1591. His works include *Parthenophile and Parthenophe*,

1593, a collection of sonnets, elegies, odes, and madrigals; *A Divine Century of Spiritual Sonnets*, 1595; and a tragedy, *The Devil's Charter*, printed in 1607 and performed before James I. A friend of Gabriel Harvey, B. had at his best a true poetic vein. He contributed to the revival of the sonnet, and from his style has been regarded as a precursor of the 'metaphysical' poets of the 17th cent.

Barnes, Ernest William (1874-1953), Bishop of Birmingham and F.R.S.; educ. at King Edward School, Birmingham. At Trinity College, Cambridge, he had a distinguished mathematical career, being bracketed second wrangler, 1896. Ordained, 1902; master of the Temple, 1915-19; Canon of Westminster, 1918-1924; Bishop of Birmingham, 1924. His reaffirmation of the Darwinian evolutionary belief, and his prohibition in his diocese of the practice of reservation of the sacrament, brought him into conflict with Anglo-Catholics. On 16 Oct. 1927, when he was about to preach in St Paul's, a London clergyman present called for his excommunication; and in 1930 he refused to defend himself in a civil court action by a recalcitrant presentee whom he had declined to admit. Pubs.: *Papers on Gamma Functions, Integral Functions, Linear Difference Equations*, contributions to the transactions of the Royal Society, the Cambridge Philosophical Society, and the London Mathematical Society; also various sermons: *Should Such a Faith Offend?*, 1927; *Scientific Theory and Religion* (Gifford Lectures), 1933; *The Rise of Christianity*, 1947.

Barnes, George Nicoll (1859-1940), politician, b. Lochie, Scotland. His political life was spent in Labour and trade union politics. B. was general secretary of the Amalgamated Society of Engineers and chairman of the Parliamentary Labour party, which he represented in Lloyd George's War Cabinet. He entered Parliament in 1906 and sat for a Glasgow div. until 1922. Cabinet minister, 1917-20, and member of Peace Conference, 1919. His greatest service was the draft proposals he prepared for the Commission on World Labour, which subsequently developed into the International Labour Office.

Barnes, Harry Elmer (1889-), Amer. educationist, educ. at Syracuse and Columbia Univs., and engaged in research at Harvard. He has taught at Clark Univ., Amherst College, Columbia Univ., and was prof. of the hist. of sociology, Smith College, 1923-30. He was historian to the Pennsylvania Penal Commission, 1918; statistician to the War Dept. 1918. From 1929 to 1940 he was on the editorial staff of the Scripps-Howard newspapers. Pubs.: *Sociology before Comte*, 1917; *History—its Rise and Development*, 1919; *The New History and the Social Studies*, 1925; *Evolution of Penology in Pennsylvania*, 1927; with H. David, *A History of Western Civilization* (2 vols.), 1935; *An Economic History of the Western World*, 1937; with H. Becker, *Social Thought from Lore to Science* (2 vols.), 1938.

Barnes, Joshua (1654-1712), scholar, b. London. He was educ. at Christ's Hospital, and afterwards went to Emmanuel College, Cambridge. He was appointed regius prof. of Greek at Cambridge in 1695. B. is best known for his ed. of Homer, 1711, 2 vols. 4to, and of Euripides, 1694, folio. For his 'injudicious pubs.' and his quarrel with Bentley, see *Jebb's Bentley* in Eng. Men of Letters, 1881, pp. 35-6.

Barnes, Juliana, see BERNERS.

Barnes, Robert (1495-1540), reformer and martyr, educ. at Cambridge. In 1526 he was condemned to abjure or be burnt for preaching a heterodox sermon; he was persuaded to recant, but remained for a time in prison. He was sent to Germany in 1535 to induce the Lutheran divines to approve of the annulment of Henry VIII's marriage with Catherine of Aragon. He attacked Bishop Gardiner in a sermon at St Paul's Cross, and in consequence of this was burnt.

Barnes, Thomas (1785-1841), journalist and editor of *The Times*. He was educ. at Christ's Hospital and Pembroke College, Cambridge, taking his degree in 1808. He took up the profession of journalism in London, and was a member of the literary circle which included Leigh Hunt, Hazlitt, and Charles Lamb. He took over the editorship of *The Times* when Dr Stoddart retired in 1817, and raised it to the position that caused it to be nicknamed 'the Thunderer.'

Barnes, William (1801-86), clergyman, philologist, and poet, b. Rushay, Dorset. In 1823 he went to teach in a school at More, Wilts; in 1835 became master of the grammar school at Dorchester; in 1847 was ordained and became curate of Whitcombe; in 1862 became rector of Winterborne Came, where he spent the rest of his life. His Dorset poems exhibit a deep love of nature and a keen knowledge of his rustic neighbours. They are steeped in Dorset lore and written in the Dorset dialect. The 3 collections appeared under the names of *Poems of Rural Life in the Dorset Dialect*, with a *Dissertation and Glossary*, 1844. *Humely Rhymes*, 1859, and *Poems of Rural Life in Common English*, 1868. The 3 were collected in one vol., pub. in 1879 with the same title as the first. His philological works include *Se Gefylsta, an Anglo-Saxon Dialect*, 1849, *A Philological Grammar*, 1854, *Tr. or. a View of Roots and Items of the English as a Teutonic Tongue*, 1861, and *A Grammar and Glossary of the Dorset Dialect*, 1864. See life by his daughter, Lucy Baxter ('Leader Scott'), 1887.

Barnes, tn and bor. of Surrey, England, situated on the r. b. of the R. Thames, N. of Richmond, and including the pars. of B., Mortlake (q.v.), and E. Sheen. Open spaces include part of Richmond Park, Sheen Common, and B. Common. Pop. 40,567.

Barnet, urb. dist. and mrkt tn of Herts, England, on the N. edge of Greater London (11 m). The ann. Sept. horse fair chartered by Henry II is still held. The second battle of B.

(1471) is commemorated by an obelisk (erected 1740) at Hadley Highstone, where the Earl of Warwick is alleged to have fallen. The urb. dist. comprises 3 main localities: B., Arkley (1 m. W.), and Totteridge ($\frac{1}{2}$ m. S.). Pop. 25,017.

Barnett, Henrietta (1851-1936), social worker, wife of Canon S. A. Barnett (q.v.). She started the Children's Country Holiday movement in 1878 and, soon afterwards, the London Pupil Teachers' Association, of which she was president from 1891 to 1907. Co-operated in the formation of the Whitechapel art gallery, which was opened in 1901, and collaborated with her husband in much of his work. Created D.B.E. in 1924.

Barnett, John Francis (1837-1916), pianist and composer, nephew of the preceding, b. London, studied at Royal Academy of Music, London, and Leipzig Conservatorium; became prof. at the Guildhall School of Music and the Royal College of Music. In 1861 he played at a Gewandhaus concert at Leipzig, and his first noteworthy composition, a Symphony in A minor, was performed in 1864 by the Musical Society of London. His works, mainly cantatas, include *The Ancient Mariner*, 1867, *Paradise and the Peri*, 1870, and *The Lay of the Last Minstrel*, 1873.

Barnett, Samuel Augustus (1844-1913), clergyman, b. Bristol, becoming canon there, 1894. He was educ. at Oxford. Curate of St Mary, Brynston Square, London, 1867-72; vicar of St Jude's, Whitechapel, 1872-94. Here he taught by music and non-biblical readings those who would not attend church; he held art exhibitions and introduced E. London to good pictures, resulting in the building of Whitechapel art gallery. His par. library developed into Whitechapel public library. He had a large share in promoting the Artisans' Dwelling Act, 1875. He was a guardian in Whitechapel for 29 years from 1875 and chairman for 12 years. With his wife Henrietta (q.v.) he founded the Children's Country Holiday Fund, 1877. He was one of the founders of Toynbee Hall (q.v.), and first warden, 1884-96 (president, 1906). Canon of Westminster 1906, president of the Sunday Society. B. pub. *Practicable Socialism* (with his wife), 1888, *The Service of God*, 1897, *Religion and Progress*, 1907, *Towards Social Reform* (with his wife), 1909, and *Religion and Politics*, 1911. See H. O. Barnett, *Canon Barnett: his Life, Work, and Friends*, 1918.

Barneveld, tn in the prov. of Gelderland, Netherlands, 17 m. NW. of Arnhem. It has poultry farms and an important egg market. Pop. 22,000.

Barneveldt, Jan van Olden (1547-1619), Dutch statesman, grand pensionary of Holland. He was b. at Amersfoort in Utrecht. He studied law and divinity at Heidelberg and The Hague, and became an advocate, 1569. He was appointed one of the advocates of the court, and was chosen counsellor and pensionary of Rotterdam in 1576. In his capacity as advocate-general and grand pensionary, B. headed a deputation to England to

make a formal offer of the revolted provs. of the Netherlands to Queen Elizabeth. B. now became leader of the republican party, opposed the war policy of Prince Maurice, and brought about a truce with Spain in 1609, which lasted 12 years. He took the side of the Arminians against the Calvinists, who were supported by Maurice. In 1618 a national synod, known as the Synod of Dort, was summoned to settle the great struggle between the Arminians and the Gomarites. B. and his friends Grotius and Hoogerbeets were arrested and tried. B. was found guilty of treason and was beheaded in the courtyard of The Hague, May 1619. *See* J. L. Motley, *Life of Barnevelt* (2 vols.), 1874.

Barney, Joshua (1759-1818), Amer. naval officer, b. Baltimore, Maryland, U.S.A. He entered the naval service, and at the age of 17 obtained the commission of lieutenant in the Amer. Navy. When on active service on board the *Saratoga* he was placed as prize-master of a captured Brit. ship, which in an almost sinking condition was recaptured by an Eng. 74-gun ship, and B. sent to England. In 1782 he escaped from prison and returned to America, where, as commander of a small ship of war, he captured a brig belonging to the Brit. Navy off Delaware. For this he received the thanks of the legislature of Pennsylvania and was promoted to the rank of commodore. He was afterwards sent with dispatches to Dr Franklin in Paris and returned with the news of the signing of preliminary articles of peace between England and America, 1784. When war broke out in 1812 he joined in a land attack at Bladensburg, and received a wound in the leg. He was appointed naval officer at Baltimore. He d. at Pittsburgh.

Barnfield, Richard (1574-1627), poet, b. Norbury, Shropshire, spent most of his life at Stone, Staffs. He wrote sonnets and pastorals. His works include *The Affectionate Shepherd*, 1594, a pastoral based on Virgil's second eclogue; *Cynthia, with certain Sonnets and the Legend of Cassandra*, 1595; and *The Ecumion of Lady Pecunia*, 1598, which contains 2 of his best songs: 'As it fell upon a day' and 'If music and sweet poetry agree.' These were reprinted in *The Passionate Pilgrim*, 1599, and long attributed to Shakespeare.

Barnoldswick, urb. dist. of Yorks. (W. Riding), England, 9 m. from Skipton, on the Liverpool-Leeds Canal, with cotton-weaving and engineering industries. Pop. 10,300.

Barnsley, co. bor. (since 1912) and parl. constituency of the W. Riding of Yorks, England, on the R. Dearne, 16 m. N. of Sheffield. B. was mentioned in Domesday Book; to-day it has a fine tn hall, a large mining and technical college, a grammar school and a girls' high school, a teachers' training college, libraries, and baths. Large open-air markets are held bi-weekly. The chief parks are Locke Park and Cannon Hall Park. B. is at the centre of the S. Yorks. coal-field, and the chief industries are coal-mining, glass-making, engineering, paper-making,

and metal canister manuf. One member is returned to Parliament. Pop. 75,625.

Barnsleys, The, *see* FURNITURE.

Barnstaple, seaport tn of Devon and oldest bor. in England, 6 m. from the mouth of the R. Taw and 40 m. NW. of Exeter. There is a 14th-cent. par. church, a grammar school endowed in 1649 (occupying part of a ruined monastery) at which the poet John Gay was educ., and sev. old buildings and a castle mound. The riv. is crossed by a 12th-cent. bridge of 16 arches. The tidal harbour and B.'s situation as a centre of N. Devon for agriculture, commerce, administration, and as a tourist centre give the tn importance. Lace, gloves, furniture, light engineering, and pottery (Barum ware) are manuf. Pop. 16,300.

Barnum, Phineas Taylor (1810-91), Amer. showman, b. Bethel, Connecticut; entered a country store in 1823; went into the lottery business in 1828; in 1829 married and went to Danbury, where he ed. *The Herald of Freedom*. In 1834 he removed to New York and made a considerable profit by exhibiting Joyce Keth, supposed to be the nurse of George Washington. In 1841 he bought the Amer. Museum in New York, and made it famous by his collection of real and pretended wonders. In 1847 he acted as manager for Jenny Lind, and in 1871 estab. his 'Greatest Show on Earth,' his circus (q.v.). He pub. an autobiography, 1854 (enlarged in 1888), *Humbugs of the World*, 1865, *Struggles and Triumphs*, 1869, and *Money-getting*, 1883. *See* his life by Benton, 1902, and also M. R. Werner, P. T. Barnum, 1923, and H. W. Root, *The Unknown Barnum*, 1927.

Barocci, or Baroccio, Federigo (1526-1612), It. painter, b. and d. Urbino, son of eminent sculptor. Studied under Battista Franco, and was patronised by Cardinal della Rovere at Rome, whose palace he ornamented with frescoes. After 4 years he returned to Urbino, and painted a picture of St Margaret for the Confraternita of the Holy Sacrament. At the invitation of Pope Pius IV, he assisted in the embellishments of the Belvedere palace, on which Zuccheri was also engaged. Here he executed the Annunciation in fresco on one of the ceilings, and a picture of the 'Holy Virgin with the Infant Saviour, with Saints.' His other works include an altar-piece of the 'Deposition' in the cathedral of S. Lorenzo at Perugia, and a picture of the 'Last Supper' for the church of Minerva. He worked in the manner of Correggio and had many disciples.

Baroque, Pierre Jules (1802-70), Fr. lawyer and politician, b. Paris; in 1847 he entered the Chamber of Deputies as member for Rochefort; in 1848 was elected to the Constituent Assembly; in 1850 became minister of the interior, and in 1851 minister of foreign affairs. Having become a supporter of Louis Napoleon, he was appointed president of the Council of State after the *coup d'état* of 1851, and in 1863 he became minister of justice. At the fall of the second empire in 1870 he fled to Jersey, where he d.

Baroda, tn of India, 248 m. N. of Bombay, formerly cap. of princely state of B. under rulership of the gaekwar, a Mahratta chief. The tn has fine public buildings and wide streets.

Barograph, instrument by which the variations of atmospheric pressure are permanently recorded. The B. commonly used with barometers of the aneroid pattern (q.v.) consists of a system of levers by which the movements of the collapsible chamber are communicated to a pen which records the pressure on a chart wrapped round a rotating cylinder having a period of revolution of one day or one week.

ANEROID BAROGRAPH

Baroja, Pio (1872 -). Sp. novelist, b. San Sebastian, of Basque descent. After 2 years as a country doctor, and 8 years as manager of his brother's bakery, he began to write novels at the age of 30. His books are full of adventure and rapid action, and are written in short, simple paragraphs; notably the *Memorias de un hombre de acción*, dealing with the War of Liberation. His severe attitude to life is best seen in *El árbol de la ciencia*, 1911, based on the story of his youth. His novels cover a vast field; some take place in the Basque provs. (*Las inquietudes de Shanti Andía*), others describe many different countries (*El mundo es así*). His pessimism is relieved by the speed of events, as well as by a lyrical strain in his writings. His *Obras completas* were pub. in 7 vols., 1947-8. Many of his novels have been trans. into English.

Barometer, instrument for measuring the weight or pressure of the atmosphere. The action of a suction pump in raising water was explained prior to 1643 by the principle that 'nature abhors a vacuum.' Galileo had observed that water could not be raised by the ordinary pump more than about 32 ft., and he recommended the study of the matter to his pupil Torricelli, who made the following experiment in 1643: a glass tube, about 3 ft. long, closed at one end, is completely filled with mercury and inverted, the open end placed in a trough of mercury, and the thumb removed. The mercury at once falls into the tube to within about 30 in. of the level of the mercury in the bath, the space above forming what is known as the Torricellian vacuum. As mercury is about 13.57 times as heavy as water (at 14° C.), Torricelli concluded that the force required to support the column of mercury

would support a column of water of the same diameter and about 34 ft. high, and that the action of the pump and the sustaining of the column of mercury both depended on the pressure of the atmosphere. The validity of the conclusion was proved by Pascal, who caused Torricelli's experiment to be performed on the summit of the Puy de Dôme. The column of mercury was found to be 3 in. lower, showing that the pressure supporting the liquid diminishes with ascent to higher levels of the atmosphere. Pascal also performed experiments with water, oil, and wine, and found that columns were supported the heights of which were inversely proportional to the sp. grs. of the liquids; and that in each case a weight of about 15 lb. of liquid was supported upon 1 sq. in. of surface. Any variations in the height of the Torricellian column are accounted for by variations in the pressure of the atmosphere, so that such an instrument acts as a B.

Cistern barometers. The simplest form of cistern B. consists of a glass tube about 33 in. long, containing mercury and dipping into a cistern also containing mercury. It is fastened to a wooden stand, on the upper part of which is a brass scale indicating the height above the average level in the cistern. The instrument is liable to the 'error of capacity'; that is, any diminution in the amount of mercury in the tube raises the level in the cistern, and vice versa, so that the scale does not always indicate the correct height of the column. In *marine B.s* this error is avoided by graduating the scale, not in true in., but in spaces which have been arrived at empirically as representing the correct height. In *Fortin's B.* the bottom of the cistern is made of leather, and can be pushed up by means of a screw until the surface of the mercury in the cistern touches the end of a fixed ivory point, which is the starting-point of the scale. It is necessary that the mercury column should be exactly vertical for the scale to give a correct reading. Another error to which cistern B.s. are liable is due to *capillarity* (q.v.), or the reluctance of the surface of the mercury—a liquid which does not 'wet' the glass—to rise to the height determined by pressure. This error may be diminished by using tubes of more than eight-tenths of an in. in diameter.

Siphon barometers. The simplest form of siphon B. consists of a bent glass tube; one arm is about 36 in. long and is sealed, while the other arm is about 8 in. long and is open. Mercury is poured in and worked to the closed end until the long arm and part of the short arm are full. When placed with the closed end uppermost, the mercury falls until the level in the closed arm is about 30 in. above the level in the open arm. To make an observation, therefore, the height of the mercury in both arms must be taken, the difference giving the true barometric column. Owing to the subtraction, the error of capillarity disappears, and there is no error of capacity. The inconvenient nature of the observations, however, and the

possibility of impurities affecting the mercury at the open end, constitute such disadvantages that the instrument is not in favour for exact work. In the *Hooker* or *wheel B.*, the observations are rendered easier by placing a glass float in contact with the mercury, having attached to it a thread which passes over a pulley. The thread is pressed against the pulley by a small weight which almost balances the

FORTIN
BAROMETER

PRINCIPLE
OF WHEEL
BAROMETER

float. The movement of the pulley is communicated to a pointer which sweeps around a graduated dial, which also bears such inscriptions as 'stormy,' 'set fair,' 'very dry,' etc., giving information of doubtful value.

Corrections. In mercurial B.s for accurate work the scale is engraved on brass. The increase in length of the scale due to a rise in temp. is accurately known and tends to make the reading lower than it should be. On the other hand, the mercury also expands on a rise in temp., its density therefore diminishes, and the height of the column supported by the atmospheric pressure is greater than at

the standard temp., 0° C. or 32° F. The barometrical readings have therefore to be corrected for temp., and with many instruments tables are provided, indicating the corrections necessary to reduce the readings to 0° C. or 32° F. To apply the corrections for errors of capillarity it is necessary to know the internal diameter of the tube and the height of the *meniscus*, or curved surface. Reference to a table with respect to these 2 quantities will indicate the amount required to be added to the observed reading.

Variations in atmospheric pressure may be periodic or non-periodic. The 12-hr oscillation reaches its maxima in the tropics at about 10 hrs and 22 hrs (G.M.T. and its minima about 4 hrs and 16 hrs G.M.T., but in the temperate zones these oscillations are usually masked by the passage of depressions and anticyclones, which occur irregularly. The lunar atmospheric tide can be detected, but its amplitude is very small. For many years the B. has been used to foretell weather, especially by seamen, but unless it is used in conjunction with a synoptic chart (see METEOROLOGY) it cannot be relied upon.

Uses of the barometer. As indicated above, the B. may be used to foretell weather conditions if the general weather situation is known. It is also used as an altimeter, or instrument to measure height above sea level, as the pressure of the atmosphere, unlike the temp., falls fairly regularly with height (see ATMOSPHERE, STANDARD). Standard atmospheric pressure is understood, in physics, to mean the pressure which supports at sea level, and at a temp. of 0° C., a vertical column of mercury 760 mm. high. In engineering the pressure of one atmosphere means a pressure equivalent to 15 lb. on each sq. in. of surface. In meteorology the standard pressure is represented in terms of force as one million dynes per sq. cm., this being equivalent to a barometric height of 29.513 in. or about 750 mm. at Greenwich, the acceleration due to gravity at that place being taken as 981.17 cm. per sec. The pressure of 1,000,000 dynes per sq. cm. is known as a bar, and, by international agreement, all meteorological observations of pressure are now given in millibars (mb.). See also ANEROID and METEOROLOGY. See F. C. Marvin, *Barometers and the Measurements of Atmospheric Pressures*, 1912; Sir R. T. Glazebrook (ed.), *A Dictionary of Applied Physics*, 1922-3; G. W. C. Kaye, *High Vacua*, 1927; London Meteorological Office, *The Observer's Handbook*. See also bibliography to article METEOROLOGY.

Barometz (Russian *barametz*, dimin. of *baran*, ram), prostrate hairy stem of a fern, *Cibotium barometz*, about which an extraordinary superstition arose. It was called Scythian lamb, and its shaggy appearance and crouching attitude gave rise to the fable that it was partly animal, partly vegetable, and devoured all plants in its vicinity.

Baron, Bernhard (1850-1929), Brit. tobacco merchant and philanthropist, b. at Brest-Litovsk, Russia, of poor Jewish parents. His father took him to America

and he began work as a boy in a New York tobacco factory. He invented a cigarette-making machine, unmarketable in America, which he brought to England and sold for £160,000. In 1903 he bought the small tobacco business of Mrs Carreras. He d. worth nearly 5 million sterling in spite of many generous gifts to charity. Benefactions were made from a charitable trust fund after his death and included a gift of £50,000 for rebuilding of St George's Jewish Settlement in the E. End of London; (1928) a trust of £500,000 to be used for hospitals and homes for orphans and crippled children during the succeeding 20 years; also gifts to endow a pathological institute, to the funds of the Brit. Empire Cancer campaign, and to build new research laboratories for the Royal College of Surgeons.

Baron, word of uncertain origin, introduced at the Norman Conquest to denote the 'man,' or vassal, of a lord. Originally the term was of wide application, but in England the process of limitation began early. The word was first restricted to those who held land directly from the king by military tenure, and by the 13th cent. the div. of these into greater and lesser B.s had become common. Magna Carta in 1215 provided that the lesser B.s should be summoned to the Great Council only through the sheriffs, while to the greater B.s, i.e. nobility from earls downward, a special summons should be sent by the king. This summons gradually became the badge of peerage, restricting the privilege to the greater B.s alone. Till this point the position of a B. was that of a holder of the king's land, but the personal note became dominant in 1387, when the creation of B.s by letters patent was inaugurated. In that year Richard II created John de Beauchamp B. of Kidderminster. The practice, however, did not become general until the reign of Henry VI. The creation of B.s by writ, formerly an ordinary proceeding, was almost entirely discontinued. The B.'s coronet (granted by Charles II) is a circlet surmounted by 6 balls known as pearls. B.s of the exchequer was the title long given to the 6 judges in the court of exchequer, and the name B.s of the Cinque Ports shows the retention of the freer use of the word. It designated the chief officials and parl. representatives of the 5 great SE. ports in the House of Commons. On the Continent the title was given a wider application than in Great Britain. In France only those bearing a name of historic note receive status from the title of B., and in Germany the title, which is handed down to all the children, became quite dissociated from all idea of possession of land.

Baron and Femme, or **Feme**, Norman-Fr. words used to denote husband and wife in their mutual relationship. In heraldry the words denote the bearing of the arms of husband and wife per pale, i.e. side by side on the same escutcheon, the husband's always being on the dexter side.

Baron of Beef, large piece of beef consisting of both sides of the back, a double sirloin, sometimes weighing 100 lb. This

huge joint was only served at great public entertainments, notably at civic feasts at Guildhall, London. The origin of the name is unknown, but legend ascribes it, as well as Sir Loin, to a feast of Charles II.

Baronet, title created by James I in 1611 to obtain funds for the defence of Ulster. Each B. was required to supply the funds for keeping 30 soldiers in Ireland (at the rate of 8d. per day) for 3 years. It was promised that the number of B.s created should not exceed 200, and it was also stipulated that the honour could only be conferred on a man who had a clear revenue of £1000 from lands, and whose family had borne arms at least as far back as his grandfather. It conferred the prefix 'Sir' on the B., and 'Lady,' or 'Dame,' on his wife, and gave him precedence over all other knights, but not over the younger sons of barons. B.s are entitled to bear on their arms an inescutcheon or canton charged with the red hand of Ulster. In 1625 Charles I instituted B.s of Nova Scotia in Scotland. This was a scheme for the colonisation of that colony, and grants of land were made to the new B.s, who paid 3000 marks for the honour. The number, not to exceed 150, was never completed. In 1629 they received the right of wearing a badge, suspended by an orange-tawny ribbon, with a saltire azure, thereon an inescutcheon of the arms of Scotland, surmounted by an imperial crown, round the whole a motto, *Fax mentis honestae gloria*. Later, 1707, they were created B.s of the U.K. Since 1800 all new baronetcies are of Great Britain.

Baronius, Caesar (1538-1607). It. eccles. historian. b. Sora in Naples, the son of Camillo Baronio and Porzia Feboria. He studied divinity and law at Naples, and afterwards at Rome, where he became a disciple of St Philip Neri, whom he succeeded as superior of the congregation of the oratory, 1593. In 1596 he was made cardinal, and in 1597 librarian of the Vatican; but failed to become Pope in 1605 owing to the opposition of the Spaniards. His most celebrated work, *Annales Ecclesiastici a Christo Nato ad Annum 1198* (12 vols., 1588-1607), was written in reply to the Protestant work entitled *Magdeburg Centuries*, and its object was to show that the doctrine of the Church of Rome was identical with that of the early Christian Church. Another work of B. worthy of note is *Martyrologium Romanum*, 1586. According to Mazzuchelli (*Scrittori d'Italia*, fol. Brescia, i, pt i, p. 387), there are 19 works of B. in print and MS.

Barons' War, *The*, see MONTFORT, SIMON DE.

Baronscourt, Irish seat of the Duke of Abercorn in co. Tyrone, N. Ireland, 3 m. W. of Newtown Stewart. Also the name of a London dist. between Earl's Court and Hammersmith, on the Dist. Railway.

Baroque, from Portuguese *barroco*, a term originally applied by jewellers to a pearl of irregular form; then to a 17th-cent. revolt in architecture against the rigid conventions of Palladio (see ARCHITECTURE (6)); and lately to sculpture, to

painting, and even to music. See M. S. Briggs, *Baroque Architecture*, 1912, and S. Sitwell, *Southern Baroque Art*, 1924.

Baroscope, type of barometer which indicates only variations of the atmospheric pressure, and does not, as the ordinary barometer does, supply any quantitative data.

Barosma, **Buchu**, or **Bucku**, genus of evergreen S. African shrubs, family Rutaceae; *B. crenulata* and other species provide the Buchu leaves, with medicinal properties, of commerce. *B. pulchella* is a purple-flowering shrub for cool green-houses in Britain.

Barotac, or **Barotag**, Nuevo, tn of Panay Is., Philippine Is., situated in a fertile dist. of Iloilo. Sugar is grown and milled. Pop. 21,860.

Barotseland, former kingdom of central Africa, in the Upper Zambesi. It now forms the dist. of NW. Rhodesia, and is a native reserve and part of the Federation of Rhodesia and Nyasaland (q.v.); Europeans, except for missionaries, traders, and officials who have been approved by the paramount chief, not being permitted to settle. Lewanika (q.v.), who d. in 1916, put B. under Brit. protection. He was succeeded as paramount chief by his son, Yeta III, who was succeeded by Mwanawina III, who supported the idea of federation against his fellow chiefs in N. Rhodesia and Nyasaland. The dist. is well watered and fertile, and supports a large pop., the Barotse being the most capable and adaptable of the N. Rhodesian natives. Many of them are Christians. The migration to the N. and S. Rhodesian and S. African mines of so many of the younger men involves their detribalisation, with consequent hardship to their families through the destruction of their social organisation. Lealui is the cap. and the residence of the chief, but Mongu, 7 m. away, is the chief station and Brit. residency. Other stations are Nakolo and Sheheke. There is a postal service from Lealui to Bulawayo. See D. W. Stirke, *Barotseland*, 1922.

Barousse, valley in the Hautes-Pyrénées, France.

Barozzi, or **Barocchi**, see VIGNOLA.

Barque, or **Bark**, originally any small ship, but later more particularly a 3-, 4-, or 5-masted sailing vessel, with all masts square-rigged, except mizzen-mast rigged fore and aft, i.e. in a line with the run of the ship. Formerly they were small vessels only, later 4-masted steel B.s. ranged between 2300 and 3000 tons. Ocean-going sailing vessels, including B.s., are now virtually obsolete. See SEAMANSHIP.

Barquisimeto, cap. city of state of Lara, Venezuela, on headstream of Cojedes R., 165 m. NW. of Caracas. It is a bishop's see, the third largest city of Venezuela, and contains a college, cathedral, gov. palace, etc. It stands in a fertile agric. and stock-raising dist., and has every type of light manuf. It does a large trade through its port, Tucacas, and has its own airport. Pop. 105,108.

Barr, **Amelia Edith**, née Huddleston

(1831-1919), Amer. novelist, b. Ulverstone, Lancs, England. She went to Texas with her husband in 1853, and after his death in 1869 removed to New York. Among her numerous novels are *Jan Vedder's Wife*, 1885, *The Bow of Orange Ribbon*, 1886, *Remember the Alamo*, 1888, *The Belle of Bouling Green*, 1904, *The House on Cherry Street*, 1909, and *The Paper Cap*, 1918. *All the Days of My Life*, 1913, is an autobiography.

Barr, **Archibald** (1855-1931), Scottish inventor, b. in Renfrewshire. Educ. at Paisley and Glasgow Univ., where he was regius prof. of civil engineering and mechanics, 1889-1913. Invented, with Stroud, naval range-finders, adopted by Brit. Admiralty and foreign govts.; also various range-finders for fortress and field service, electrical fire-control instruments for use between fire-control positions and gun stations of war-vessels (adopted by Brit. Admiralty), and a pump for producing high vacua. Also inventor of height-finders for the anti-aircraft services, torsion dynamometers and power meters, instruments for use in air surveying, and improvements in the optophone.

Barr, **Robert** (1850-1912), novelist, b. Glasgow. Taken to Canada while a child, he was educ. at the Normal School, Toronto. He became a reporter on the *Detroit Free Press*, for which he wrote under the pseudonym Luke Sharp. In 1881 he returned to Britain and collaborated with J. K. Jerome (q.v.) in founding and editing *The Idler*. A facile writer of fiction, he is remembered by *The Triumphs of Eugene Valmont*, 1906, which introduced a comic Fr. detective who in some ways anticipates Agatha Christie's Belgian Hercule Poirot.

Barr, **Fr.** tn in the dept. of Bas-Rhin. It has mineral baths, and manufs. hosiery and leather goods. Pop. 4300.

Barra, is. of Inverness-shire, Scotland, near the S. extremity of the Outer Hebrides. Historically it is famous as the scene of the victory of Robert Bruce, 1308. Pop. 1728.

Barra Mansa, Rio de Janeiro state, Brazil, on the r. b. of the Paraíba do Sul. Industrial centre with metal works and flour and textile mills. It is 5 m. WSW. of the new steel city of Volta Redonda. Pop. 21,340.

Barrackpur, on R. Hugli, is a well-known suburb, 15 m. N. of Calcutta, India. In a fine park bordering the riv. is a house, formerly the country residence of the viceroy and later of the Governor of Bengal. Here too is an up-to-date electric generating station.

Barracks, set of buildings with all conveniences for human habitation and generally used for the accommodation of units of the fighting forces and police. The nature, site, and construction of B. were usually determined by the strategic or other employment of the troops, etc., which had to occupy them. Hence those of the sovereign's bodyguard were built in London and at places near the royal residences; B. near the coast were constructed more in the nature of

forts; whilst the sites of those at depots in the country were chosen more for health reasons. The B. include parade ground and open spaces for drill and manœuvres. B. are generally built in blocks, and are divided into officers' quarters, men's quarters, and quarters for married soldiers and sergeants. The officers' mess usually consists of a dining-room, ante-room, billiard-room, and offices. Each officer has his own private rooms, the number varying according to rank, and special accommodation is made for married officers. The married soldiers usually have separate houses each, with rooms varying in number according to the number of their children. The soldiers are catered for by the regimental institute, which consists of the canteen and the recreation estab. Reading-rooms, coffee bars, gymnasia, billiard-rooms, and other recreation rooms are provided in B. to make the life as comfortable and attractive as possible. There are separate buildings constructed and set apart for hospitals, garages, stores, miniature rifle ranges, guard-rooms, cook-houses, schoolrooms for children, and, in the larger garrisons, garrison schools and libraries.

Formerly accommodation was not provided for soldiers, and it was not till the end of the 18th cent. that permanent buildings for soldiers came to be built. Before this period soldiers were accommodated in scattered billets, which was unsound from a tactical point of view when troops were needed to turn out suddenly against a threatened point or to proceed on special duty where speed was essential. At the H.Q. of every fighting force there is a dept. charged with the duty of looking after B. in all their aspects, including prevention against fire.

Barracuda, Barracouta, or Barracoota, large pike-like fish of the family Sphyracnidae and order Percomorphi. B.s are carnivorous, and some varieties are esteemed as a food, though at times they are poisonous. They are related to the grey mullets (Mugilidae). **Barracouta** is also the Australian and New Zealand name for the snoek (*Thyrsites atun*).

Barratranca, tn in Sicily (q.v.), situated 1470 ft above sea level, 14 m. SSW. of Enna (q.v.). Pop. 10,000.

Barrage: 1. Engineering: an artificial obstruction placed in a water-course to obtain increased depth of water.

2. Artillery: a curtain of shell-fire produced by a number of shells being fired simultaneously by guns on to a definite line. A B. differs from a bombardment (q.v.) in that in the former the fall of the shells takes a linear formation, whereas in the latter they are grouped over an area. B. fire was introduced in the First World War, when, as communications were difficult, it became necessary for B. fire to be prearranged and carried out according to a definite time-table. The procedure was for artillery to 'put down' a 'creeping' B. on a certain line for a certain time during which the infantry moved forward as far as possible under the protection of the falling shells. The B. was usually

put down on an objective which the infantry prepared to assault as soon as the B. 'lifted.' At the time scheduled the B. would come down on the next objective, and the same procedure would be repeated until the B. had 'crept' to its final position, where it 'stood' for a time, and thus became a 'standing' B. Creeping B.s were used to screen troops in retreat as well as in advance, and a 'flank' B. was used to give protection to troops on their flank. A combination of the creeping and flank B. was a 'box B.', which gave all-round protection. See also under ANTI-AIRCRAFT DEFENCE and ARTILLERY.

Barramunda, name applied to the Australian lung-fish, *Neoceratodus forsteri*. Its haunts are the rivers of Queensland.

Barranquilla, city, cap. of Atlántico dept, Colombia, on Magdalena R., near its mouth, and a leading airport and seaport centre. It is the largest commercial centre in Colombia, and handles half her foreign trade, has many manufs., and exports coffee and hides. Pop. (1951) 279,627.

Barrantes, Vicente (1829-98), Sp. poet and publicist, b. Badajoz. He held sev. appointments in Spain and the Philippines, and in 1872 was made a member of the Sp. Academy. His works, for the audacity of which he was sev. times fined, include *Siempre Tarde*, 1851, *Juan de Padilla*, 1855-6, *Narraciones Extramurales*, 1872-3, *Cuentos y Leyendas*, 1875, and *Guerras Piráticas de Filipinas*, 1878.

Barras, Paul Jean François Nicolas, Comte de (1755-1829), Fr. revolutionary, b. Foix-Amphoux in Var, of an old and noble family. In 1775 he entered the army, and served in India. When the revolution commenced he became one of its warmest supporters, and was a member of the Jacobins' Club from its beginning. Representing Var in the National Convention, he voted for the death of Louis XVI. and he also took an active part in the siege of Toulon. He opposed Robespierre, and helped to bring about his downfall. On the 13th Vendémiaire (5 Oct. 1795), the Convention appointed B. General-in-Chief for the second time, and his success on this occasion was chiefly owing to Bonaparte, to whom he had given the command of the artillery. The anarchists were put down and B. was nominated one of the 5 members of the Directory. After the estab. of the Consulate, 1799, B.'s power ended. Implicated in a conspiracy, he was exiled to Rome, but returned to Paris in 1814.

Barratry (from O.F. *baraterie*, fraud) is in Eng. law the offence of habitually moving, exciting, or maintaining suits or quarrels in the courts. A person accused of the offence must have allegedly committed at least 3 breaches of this law and is described as a 'common barrator.' Eng. lawyers guilty of B. are barred from practising. The crime is now rare. The offence in Scotland is not the same, but is the crime of a judge who barter justice for money, i.e. is guilty of corrupt practices. The offence of B. is also known in marine insurance: in that case it is an offence by

the masters or crew of a ship which is to the detriment of the owners or insurers of that ship. It is usually insured against in marine insurance policies.

Barraut, Jean-Louis (1910-), one of the outstanding Fr. actor-managers. He joined the Comédie Française in 1940, where he became outstanding for his clarity of voice and natural methods. In 1946 he left the Comédie Française and has since been an actor-manager. One of his most notable roles is Hamlet in the trans. by André Glide.

Barre, Isaac (1726-1802), Irish soldier and politician. b. Dublin, the son of a Fr. refugee and educ. at Trinity College, Dublin. B. served under Wolfe and was wounded at Quebec in 1759. He entered Parliament in 1761, and consistently defended the rights of the colonies, notably in a famous speech against the Stamp Act in 1765. He was the originator of the term 'Sons of Liberty' applied to the Americans.

Barre, Is of Washington co., Vermont, U.S.A., 6 m. SE. of Montpelier, famous for its granite quarries. Pop. 10,922.

Barre, name given to a group of S. Amer. tribes of Arawakan stock, who occupy the country round the Upper Rio Negro, in N. Brazil. They are an independent, progressive race, their language being spread throughout a wide region.

Barrel, see METROLOGY.

Barrel Organ, portable mechanical musical instrument with a limited number of tunes. Provided with hymn tunes, it was formerly used in some churches, but was ousted by the harmonium; at the end of the 18th cent. it was first used in the street. The organ has a wooden cylinder furnished with pegs or staples which, when revolved, opens a series of valves to admit the air to a set of pipes, and thus produces the sounds.

Barrel-vault, or Tunnel-vault, in architecture, a continuous semicircular arch or tunnel of brick, stone, or concrete; used from very early times, especially in Rom. and Romanesque architecture (see VAULT).

Barrelier, Jacques (1608-73), Fr. botanist, b. Paris. He was educ. for the medical profession, but abandoned it, and in 1635 joined the Dominicans. In 1646 he was appointed assistant to the general of the Order, and traversed S. France, Spain, and Italy. During his travels he collected plants, of which he made drawings, and had them engraved. He returned to Paris, 1672, to complete his work, but d. in 1673. After his death his collections were dispersed, and some were burnt. The copper plates, however, were collected and pub. by Antoine de Jussieu, who supplied descriptions in the place of those which had been destroyed.

Barren, or Blind, Flowers are more commonly known as male flowers. They bear stamens but not pistils.

Barren Island, name given to 4 different is. in various parts of the world. The first is a sandy is. off the S. shore of Long Is., King's co., New York. The second is an is. on the W. coast of Placentia Bay, off Newfoundland. The third is one of the group known as Hunter Is., off the NE.

point of Tasmania. The fourth is a volcanic is. in the Bay of Bengal, situated to the E. of the Andaman Is.

Barrenness, see STERILITY.

Barrenwort (*Epidemum alpinum*), family Berberidaceae, a S. European herb, naturalised in Britain. It is a self-pollinated plant, with nectararies, and the seed has a membranous aril.

Barres, Auguste Maurice (1862-1923), Fr. politician and man of letters, b. Charnes-sur-Moselle. After studying at Nancy he went in 1882 to Paris and became a journalist. He was elected a deputy for Nancy in 1889 and sat in the chamber until 1893. Later he was returned for the Seine div. and elected a member of the Académie Française. He was an individualist and a nationalist, becoming a leader of Fr. aspirations in Alsace-Lorraine. Besides his political works he wrote a great deal of fiction and some dramas. His works include *L'Ennemi des lois*, 1893, *Une Journée parlementaire*, 1894, *L'Ami français et la guerre*, 1915, and *Le Génie du Rhin*, 1921. See studies by J. N. Faure-Biguet, 1924, and A. Blanc-Peridier, 1925.

Barret, George, the Elder (1728?-84), Irish landscape painter, b. Dublin where he learnt to draw, settled in London, 1762. He was one of the original members of the Royal Academy, founded 1768; and towards the close of his life was master painter to Chelsea Hospital. His son, George B. the younger (d. 1842), was also a painter, mainly noted for landscapes in water colour, exhibiting at the Royal Academy and Society of Painters in Water Colours.

Barrett, Eaton Stannard (1786-1820), poet, b. Cork. He studied at the Middle Temple, and in 1810 wrote *Woman and Other Poems*, which he followed with a number of political satires.

Barrett, John (1866-1938), Amer. arbitrator, b. Grafton, Vermont. B. was Amer. minister to Siam in 1894-8, when he settled by arbitration large Amer. claims in that country. He was U.S. delegate in 1901-2 to the second Pan-American Conference, Mexico; and 1907-1920, director of the Pan-American Union, which he developed as the prin. official agency for fostering the growth of Pan-American trade.

Barrett, Lawrence (1831-91), Amer. actor, b. Paterson, New Jersey. He made his first appearance on the boards at Detroit, Michigan, as Murad in *The French Spy* in 1853. In 1857-8 he was associated with the brilliant actor Edwin Booth; subsequently he became the leading member of his company, and worked with him from 1887 till his death. B. was a versatile actor and had a high understanding of his art. His best part was Jussius; he also took the leading parts in many Shakespearean plays. He wrote *Edwin Booth and his Contemporaries*, 1886.

Barrett, Sir William Fletcher (1844-925), physicist, b. Jamaica. Educ. in Manchester. In 1863 he was working as assistant to Prof. J. Tyndall and from 1873 to 1910 was prof. of physics at Dublin

Univ. He did effective research work on alloys and especially on their electric and magnetic purposes. 'Stalloy,' a silicon iron used by electrical engineers, was his discovery. His prin. research work, however, was in the uses of the divining rod. Was lecturer in physics in the Royal School of Naval Architects, also one of the founders of the Society for Psychical Research.

Barrett, Wilson (1846-1904), actor, b. Essex. He first appeared at Halifax in 1864 in *East Lynne*. As manager of the Princess's Theatre he produced *The Lights of London* and *The Silver King*. In 1884 he appeared in *Hamlet*, and later visited America and Australia. In 1895 he produced *The Sign of the Cross*.

Barrethead, burgh of Kenfrewshire, Scotland, 7 m. SW. of Glasgow by rail. Porcelain and sanitary appliances are manuf., and it contains also cotton mills, bleaching and dyeing works, engineering works, and shawl-weaving mills. Pop. 13,000.

Barri, Giraldu de, see GIRALDUS CAMBRENSIS.

Barrias, Louis Ernest (1841-1905), Fr. sculptor, b. Paris. He studied at first under Léon Cogniet, but recognising that sculpture was his true *métier*, he worked under Joffroy. He was awarded the Prix de Rome in 1865, and a medal at the Salon of 1870. His 2 works for the Salon of 1872, one in marble, the other in bronze, were of such excellence that he was awarded a first-class medal. He was awarded a medal of honour and a decoration for his piece at the 1878 Salon, entitled 'The First Funeral,' representing Adam and Eve bearing Abel's body.

Barricade, military term used for any obstruction formed to check the advance of an enemy. B.s may be constructed of palisades and earth or sand-bags, with loop-holes cut for firing, but as they are generally thrown up in haste any material to hand, such as loaded carts, heaps of stones, planking, felled trees, etc., is used. In 1358 B.s were set up in the streets of Paris against the Dauphin Charles, and again in 1588 Henry IV's troops were prevented from entering Paris by the B.s. They were used again in Paris in the insurrections of 1848 and 1871.

Barrie, Sir James Matthew, Baronet, O.M. (1860-1937), novelist and playwright, b. Kirriemuir in Forfarshire (the 'Thrums' of his novels), the son of a weaver. Educ. at Glasgow Academy, Dumfries Academy, and Edinburgh Univ., he planned from boyhood to be a writer. In 1883 he joined the staff of the *Nottingham Journal*, and 2 years later, having estab. a connection with some London papers, he moved there and for 5 or 6 years supported himself with growing confidence and reputation by articles in various periodicals. During this period 'When a Man's Single' appeared in the *British Weekly* under the pseudonym Gavin Ogilvy, and 2 series of sketches, *Auld Licht Idylls*, 1888, and *A Window in Thrums*, 1889, were pub. His first real novel, *The Little Minister*, 1891, was an immediate success. In 1894 he married Mary Ansell, an actress, and settled in Kensington, where he wrote 3

more novels of Scottish life: *Margaret Ogilvy*, 1896, a tribute to his mother's memory; *Sentimental Tommy*, 1896; and its sequel *Tommy and Grizel*, 1900. His first full-length play, *Walker, London*, had appeared in 1892, and in 1898 *The Little Minister* was dramatised, eventually bringing him £80,000. Thenceforward he turned from novels to playwriting, the sentimental comedy of *Quality Street*, 1901, and the social satire of *The Admirable Crichton*, 1902, being followed by what is usually reckoned his greatest work, *Peter Pan*, in 1904. The success of this epic of boyhood, which is a fairy-tale mixed with the essence of all the best adventure stories, with pirates and redskins playing leading parts, was tremendous, and 50 years later it was still one of the most popular plays for children when it was put on every winter. Its immortality is reflected in the statue of Peter Pan which B. had set up in Kensington Gardens, the original home of the 'boy who wouldn't grow up.' No other play of B.'s followed similar lines, the nearest to it being the fantasy *A Kiss for Cinderella*, 1916. His later productions, in the vein of whimsical satire which he made peculiarly his own, include *What Every Woman Knows*, 1908, and *The Twelve-Pound Look*, 1910, both excellent satirical comedies; *Dear Brutus*, 1917, the theme of which is that each man carries his destiny within himself; *Mary Rose*, 1920, an eerie fantasy; and *Shall We Join the Ladies?*, 1921, an uncompleted murder story. His last play, *The Boy David*, 1936, which had a biblical subject, was written especially for Elisabeth Bergner, who appeared in the title role in London and Edinburgh in 1937. In 1909 B. obtained a divorce from his wife and moved to the Adelphi, where he had Bernard Shaw for a neighbour. In 1913 he was made a baronet, and in 1922 he received the Order of Merit and as Lord Rector of St. Andrews Univ. delivered a noteworthy address on 'Courage.' In 1930 he was elected Chancellor of Edinburgh Univ. See J. A. Roy, *J. M. Barrie, an Appreciation*, 1937; P. R. Chalmers, *The Barrie Inspiration*, 1938; W. A. Darlington, *J. M. Barrie*, 1938; D. Mackall, *The Story of J. M. B.*, 1941; G. Blake, *Barrie and the Kailyard School*, 1951; Lady C. Asquith, *Portrait of Barrie*, 1955.

Barrie, cap. tn of Simcoe co., Ontario, Canada, on Kempenfeldt Bay, Lake Simcoe, 64 m. NW. of Toronto. It is a railway centre, and has manufs. of carriages, wool, leather, and machinery. Pop. 16,000.

Barrier (Fr. *barrière*), in fortification, term applied to a chain of military posts protecting the frontiers of a country. It signifies also a wall of strong timbers enclosing an area (stockade), or protecting a passage. In some part of a B. is a gate usually formed of 2 parts, opening in the middle, and frequently proof against small-arms fire, being made of strong timbers in vertical and horizontal positions, with diagonal braces.

Barrier Act, Act passed by the General Assembly of the Church of Scotland in

1697 providing that any proposed change in the Church laws anent 'doctrine or worship, or discipline or government' must be sanctioned by a majority of the Presbyterians. The object of this Act was to guard against hasty legislation in the Church.

Barrier Reef, The Great, see GREAT BARRIER REEF.

Barrier Treaties, name given to 3 treaties which were drawn up during or immediately after the war of the Sp. Succession. It was essential to the Dutch that, in order to resist possible Fr. aggressions, they should have control of the 'barrier' fortresses of the Netherlands. The chief fortresses which the Dutch demanded were Ypres, Tournai, Mons, Charleroi, and Ghent. In return for a recognition of the Protestant and Hanoverian succession, Great Britain signed a treaty in 1709 by which she undertook that the Dutch should be provided with an adequate barrier of fortresses in the Netherlands. The number of fortresses was reduced by the second treaty to practically only those already named (1713). The third of the treaties, signed 1715, was supplemental.

Barring-out, practice formerly common in schools, by which the boys barred the doors of the school against the master. The time chosen was usually a few days before the commencement of the vacations. Addison was the leader of a B. at the Grammar School, Lichfield, 1685 (see Johnson's *Life of Addison*); and at the High School, Edinburgh, in 1595 there was a serious B. in which a magistrate lost his life whilst endeavouring to force an entrance. In the statutes of Witton School, near Northwich, in Cheshire, founded by Sir John Deane, 1558, the observance of the custom by the scholars is directed.

Barrington, Daines (1727-1800), jurist, fourth son of John Shute B. He was called to the Bar in 1749, and made a pulene Welsh Judge in 1757. In 1785 he gave up all public employments except the place of commissary-general of the stores at Gibraltar. Of his writings the most important is *Observations upon the Statutes, chiefly the more ancient, from Magna Carta to the 21 Jac. I. c. 27*, first pub. 1766.

Barrington, George, real name Waldron (1755-1804), convict, b. near Dublin. He became an expert pickpocket at an early age, and in 1780 was sentenced to be transported. Arriving in Sydney in 1791 he ingratiated himself with the authorities, became chief constable of Parramatta and later superintendent of convicts. He d. insane. Sev. books about New S. Wales have been attributed to him, but there is no evidence that he wrote them, nor did he write the famous prologue with the line 'We left our country for our country's good,' which was actually composed by Henry Carter. See R. S. Lambert, *The Prince of Pickpockets*, 1930.

Barrington, John Shute, 1st Viscount (1678-1734), polemical writer and politician, b. Herts and called to the Bar in 1699. B. was one of the commissioners

sent to Scotland to gain the favour of the Presbyterians for the Union; he entered Parliament in 1715. In 1720 he was made baron and viscount in Ireland. He was expelled from Parliament in 1723 for his connection with the Harburg lottery. He wrote a number of works on the rights of Protestant Dissenters.

Barrington, Rutland (1853-1922), actor, b. Penge, son of J. G. Fleet (B. being a stage name), and nephew of Emily Faithfull. Educ. at Merchant Taylors' School, he made his first appearance on the stage at age of 21; thereafter he joined the D'Oyly Carte management and played in all Gilbert and Sullivan operas except *The Yeomen of the Guard*. He also had a distinguished career in musical comedy and straight plays. He wrote humorous articles for *Punch*, also one play.

Barrington, Samuel (1729-1800), Brit. admiral, son of Viscount B. Entered the navy under Lord George Gordon in 1740; became a lieutenant in 1745; commanded the sloop *Weasel* in 1747; and later in that year, in the *Bellona*, captured the Fr. *Duc de Chartres*. He served in the Mediterranean and on the Guinea coast; in 1754-5 accompanied Commodore Keppel to N. America; in 1757 served under Sir Edward Hawke in the Basque Roads expedition; and in 1761 under Koppel at Belle Isle. In 1759, while commanding the *Achilles*, he captured the *Comte de St Florentin*. He was made commander-in-chief in the W. Indies in 1778, where he defeated the French under d'Estaing. He was in the action off Grenada in 1779, and was second in command to Lord Howe at the relief of Gibraltar in 1782. He was made an admiral in 1787.

Barrington, Shute (1734-1826), Eng. churchman, sixth and youngest son of John Shute, Viscount B., b. Becket, Berks. He was educ. at Eton and Merton College, Oxford. He was ordained in 1756, and appointed chaplain-in-ordinary to George III in 1760. He was made canon of Christ Church in 1761, and took his D.C.L. in the following year. He was appointed a canon of St Paul's in 1768, and Bishop of Llandaff in 1769, of Salisbury in 1782, and of Durham in 1791. He was a defender of the Protestant estab., and opposed to the acquisition of political power by the Rom. Catholics, though he showed great hospitality to emigrant Fr. clergy. He left many bequests to charity.

Barrios, Justo Rufino (1835-85), Guatemalan politician, b. San Lorenzo, Guatemala. He took part in the unsuccessful liberal insurrection under Serapio Cruz against Cerna, the president of Guatemala, in 1867-9. He was obliged to flee to Mexico, but in 1871 he returned and defeated Cerna, and assisted in making Granados president. Two years later he overthrew Granados and took his place, being re-elected in 1876 and again in 1880. Seeing that his ideal of a union of Central Amer. states would never be attained by peaceful means, he invaded Salvador in an attempt to bring about his aims by force. He was, however, defeated and killed at Chalchurapa.

Barrister, member of that branch of

the law which has the exclusive right to practise and be heard in the superior courts of law in England and Ireland. For the Scottish equivalent branch see *Advocate*. The right to practise at the Bar is confined to the 4 Eng. Inns of Court (q.v.), viz. Lincoln's Inn, Inner and Middle Temples, and Gray's Inn, and to the King's Inns in Ireland. A student is 'admitted' to an Inn by passing a preliminary examination (excused for those who have passed certain univ. examinations), and paying fees. He then 'keeps' 12 terms by eating dinners in the hall of his Inn, 6 in each legal term (3 for univ. members). On passing the examinations of the Council of Legal Education and paying fees he is 'called to the Bar' by the benchers of his Inn, who may refuse to admit. They also may 'disbar' or expel a B. for misconduct. On his call or before, a B. usually passes a year as pupil in the chambers of a practising B. and if he intends to practise at the common law

criminal cases he may be engaged directly in open court. He drafts 'pleadings' (q.v.), gives opinions on the case, advice on evidence, etc., and it is his especial and peculiar function to conduct the case in court. A B. is not answerable for anything said by him in court so long as it is suggested by his instructions and is relevant to the case. He may not sue for his fees, but is not obliged to return them though he cannot attend the court. He is not liable for negligence. The attorney- and solicitor-generals are leaders of the Bar; queen's counsels (Q.C.s) are appointed by the lord chancellor on application; they are called 'within the Bar' and are said to 'take silk,' their gown of special form being of silk for dress occasions, when they also wear a full-bottomed wig (see *QUEEN'S COUNSEL*). The ordinary B., or junior Bar, wears a 'stuff' gown. Counsel do not wear wig or gown when appearing before justices of the peace.

Barron, Clarence Walker (1855-1928), Amer. financial editor and publisher, b. Boston, Massachusetts; educ. in the English High School in that city, and d. at Battle Creek, Michigan. He began his career by joining, in 1873, the staff of the Boston *Daily News*, in which his article on the debate between Wendell Phillips and Wm Lloyd Garrison attracted much attention. Joining the *Boston Transcript* in 1875, he founded, 12 years later, the Boston News Bureau, an agency publishing financial news in a daily bulletin. After founding a like agency in Philadelphia, he went to New York in 1901. Bought the *Wall Street Journal* in the same year and founded *Barron's National Business and Financial Weekly* in 1921. Wrote among other books *War Finance*, 1919, and *A World Remaking*, 1920.

Barron, James (1768-1851), Amer. commodore, b. Virginia; entered Amer. Navy in 1798; in 1806 surrendered the *Chesapeake* to the Brit. frigate *Leopard*. He was court-martialled and removed from the service for 5 years. In 1820 he

challenged Decatur (an officer whom he suspected to be principally instrumental in keeping him ashore) to a duel, and mortally wounded him; he was wounded himself, but recovered, and in 1851 d. in Norfolk, the senior officer of the Amer. Navy.

Barros, João da (1496-1570), Portuguese historian. In 1522 he was sent as governor to St George del Mina or São Jorge da Mina, on the Guinea coast; in 1525, recalled to Lisbon, he was appointed treasurer to the colonial dept, and afterwards agent-general for the colonies. While he held this office he composed his work, *Asia portuguesa*.

Barros-Arana, Diego, Chilean historian (1824-1907). He was prof. of geography at the univ. of Santiago, and Chilean minister at Buenos Aires. He formed one of the commission which studied the delimitation of the frontier between Chile and the Argentine Rep. His works, which are in Spanish, include *General History of the Independence of Chile*, 1854-1857, *Elements of Physical Geography*, 1881, and *General History of Chile*, 1884.

Barrosa, Sp. vil. in the prov. of Cádiz, 16 m. SE. of Cádiz city. The French were defeated here in 1811 by Gen. Graham (see *LYNEDECH, BARON*) during the Peninsular War.

Barrot, Camille Hyacinthe Odilon (1791-1873), Fr. orator and statesman, b. Villefort. He studied law in Paris, and was called to the Bar there. Though a supporter of monarchy, he was dissatisfied with the restoration gov.; he took a prominent part in the revolution of July 1830, being a member of the municipal commission of the Hôtel de Ville, and one of the 3 commissioners appointed to conduct Charles X out of France. He at first supported Louis Philippe, and was appointed prefect of the Seine dept, but later went into opposition. The revolution of 1848 came as a surprise to him, however, but he acquiesced in the rep., and accepted office, but was soon dismissed. After the *coup d'état* of 1851 he retired into private life. After the fall of the empire, Thiers nominated him president of the Council of State, but he d. a year later.

Barrow, Isaac (1630-77), Eng. divine and mathematician, son of the linen-draper to Charles I; educ. at Charterhouse and Felsted; entered Peterhouse College, Cambridge, 1643, under his uncle, who was a fellow. The Presbyterians having taken possession of Peterhouse, B. removed to Trinity College, Cambridge. He became a fellow in 1647; took his M.A. 1652, and was made D.D. by royal mandate in 1670. He first intended to study physic, but turned to theology; gradually he was led to astronomy and geometry. Meanwhile he studied the classics and was recommended for the chair of Greek at Cambridge; he lost it, being suspected of Arminianism. Then he went abroad (1655-9), travelling through Europe. He was ordained in 1659. In 1660 he was chosen Gk prof. and in 1662 Gresham prof. of geometry, but this he resigned on his appointment to

he Lucasian prof. of mathematics, 1663. This he resigned (1669) in favour of his great pupil Isaac Newton. In 1677 Charles II (whose neglect of him he celebrated in his well-known *Lat. lines*) appointed him master of Trinity College and he exerted himself to form a library. He never married. His 2 mathematical works were *Lectiones Opticae* and *Lectiones Geometricae*, both of which were esteemed by Newton. Among his theological works are *Exposition of the Creed, Decalogue, and Sacraments*, 1669. His treatise on the Pope's supremacy is still admired as a specimen of controversy. An ed. of his theological works was ed. by Napier (9 vols.), 1859.

Barrow, Sir John (1764-1848), diplomat, writer, and patron of Arctic exploration. b. Drayley Beck, Lancs. He became a time-keeper in a Liverpool iron foundry, but managed to educate himself. After a trip to sea in a Greenland whaler he became a teacher of mathematics in Greenwich. Here he was fortunate enough to secure the interest of Sir George Staunton, who obtained for him (1792) the post of secretary to Lord Macartney the first Brit. ambas. to China. He mastered the Chinese language and studied Chinese literature and science. On the appointment of Macartney to the governorship of the Cape of Good Hope, B. took part in the settlement of the affairs of that colony. From 1804 to 1845 he was second secretary of the Admiralty. He was made a baronet in 1835. He was a fellow of the Royal Society, and one of the chief founders of the Royal Geographical Society. His publs. include *History of Voyages into the Arctic Regions*, 1818, an autobiography, 1847, and various books of travel.

Barrow, riv. of Rep. of I., rising on the NE. side of Slove Bloom Mts. Leix, and flowing E. to the border of Kildare, then S. With the Suir, which it joins 29 m. from the sea, and the Nore, which flows into it 2 m. above New Ross, it forms the estuary of Waterford harbour. Navigable for barges up to Athy, where it joins the Grand Canal. Length 119 m.

Barrow, Point, most northerly point of Alaska. There is a U.S. naval base and meteorological station near the point.

Barrow-in-Furness, seaport, manufacturing tn, and municipal co., and par. bor., Lancs, England, 9 m. SW. of Ulverston, 268 m. NNW. of London. Here are situated the famous shipbuilding yards of Vickers-Armstrongs, Ltd, the Bessemer steel works, and other large industries connected with iron and copper, which are found in the vicinity. There are also engineering shops, paper and pulp works, etc. There is an active trade at the port in imports of cattle, general merchandise, timber, flour, grain, coal, etc., and exports, among other things, of steel rails, pig-iron, and iron ore. The rise of B. from a fishing vil. to an active industrial centre dates from the discovery in 1840 of haematite ore at Park, near B. The estab. of mines and smelting works soon followed, and the construction of many m. of railway by the Furness Railway

Co. The docks, 4 in number, cover an area of 280 ac. Noteworthy buildings are the tn hall, erected at a cost of £80,000, and the picturesque ruins of Furness Abbey. B. returns one member to Parliament. The residential areas suffered severely from air attack during the Second World War. Pop. 65,370.

Barrow-on-Humber, residential vil. of Lincs, England, with horticult. chemical works. Barrow Haven, with extensive watercress beds, brick and tile works, and small shipbuilding yard, and New Holland, with a ferry steamer service to Hull, combine to form the par. of B. Pop. 3000.

Barrow Strait, Canada, joins Lancaster Sound and Melville Sound. Average breadth 50 m. Discovered by Parry, and named by him after Sir John Barrow (q.v.).

Barrows (O.E. *beorg*, hill or mound) are the grave-mounds of prehistoric or early historic peoples. They are widely distributed, and in their construction and plan vary much according to the period of their erection and regional geological conditions. B. made entirely of stones are called cairns: other local names are *carn*, *carnead*, *howe*, *lowe*, and *tump*, while the generic name *tumulus* is sometimes reserved to indicate round B. There are between 30,000 and 40,000 B. in England alone. From them the archaeologist derives much material for his study of human development, and the excavation of B., once a mere treasure hunt, has now been developed into a highly scientific proceeding. Long B. are of the Neolithic period, and usually cover inhumed burials; they are higher and wider at one end, and the burial chamber of wood or a turf-covered cavity may cover a communal burial. Certain long B. with tomb chambers of stone are more properly regarded as megaliths (see MEGALITHIC CULTURE). Long B. are especially characteristic of Wessex and Sussex. Round B. belong in the main to the Bronze Age, and include bowl, bell, disk, saucer, ring, and pond types. In the earliest Bronze Age burial is by inhumation, but cremation with the ashes contained in a pottery urn follows in the later stages. The burial is always a single one. Recent excavation has shown that there is often evidence of a complicated funeral ceremony based on seasonal rites and centred round a 'mortuary house' in which the remains were placed. Rom. B. have an unmistakable steep and conical outline, and in SE. Britain usually cover the burials of wealthy merchant traders. They are also found in Belgic Gaul, with which country these traders had commercial relations. The Six Hills at Stevenage and the Bartlow Hills, Ashdon, Essex, are notable Brit. examples; a Rom. barrow excavated at Holborough, Kent, in 1953, contained a folding iron chair. In the Saxon period there are a few large conical B. such as *Taeppla's law* which gives its name to the settlement of Taplow, Bucks, but these B. which covered the remains of important chieftains are less often found than clusters of small grave-mounds, the burial

...e, exemplified in E. Kent. Small round cairns were used locally, as in the Danes Graves, Driffeld, Yorks, during the Early Iron Age, but they are not common elsewhere. A vivid account of the barrow of Hector is given in the *Iliad*, and Herodotus gives a detailed description of the burial mounds of the Scythian chieftains. Among the Vikings it was the custom to place the dead man in his ship over which a barrow was erected; the famous Sutton Hoo ship burial excavated in 1939 was a cenotaph of an E. Anglian king of Saxon times. The end of the O.E. epic poem of *Beowulf* affords a classic literary example of burial rites, including the erection of a barrow over the ashes from the funeral pyre. The bibliography is extremely large, but the standard work for England is L. V. Grinsell's *The Ancient Burial Mounds of England* (1953 ed.), which gives many references to other works.

Barrulet, see under **HERALDRY**, *Ordinaries* (2).

Barry, Sir Charles (1795-1860), architect, b. Westminster. After serving his articles in London, he travelled in Greece, Italy, Egypt, and Palestine. He started practice in London in 1820. His first important work was St Peter's Church at Brighton, 1824-8. Other early work included the City Art Gallery and Athenaeum at Manchester, the Travellers' Club (1829-31) and Reform Club (1837-41) in London, and King Edward VI's Grammar School, Birmingham. In 1836 he won the competition for the new Houses of Parliament, and was knighted for this work in 1852. His later buildings included Dulwich College schools, 1841, Halifax town hall, 1849-52, and sev. very large mansions, notably Trentham Hall, 1838 (demolished 1910); Eynsham Hall, Oxon, 1843; Bridgewater House, Green Park, 1847 (demolished 1941); and Clivedon House, Bucks, 1851. He was elected R.A., 1841. See life by his son, the Rt Rev. A. Barry, 1867.

Barry, Comtesse du, see **DU BARRY**, **MARIE JEANNE BÉOU**.

Barry, David (1580-1629), dramatist, b. London. There is confusion about his name; he was Lord Barry by courtesy, and the abbreviation 'Lo' was oddly expanded into 'Lodowick.' He wrote *Ram-Alley* or *Merrie Trickes*, 1611, a coarse but spirited and humorous play. He is said to have accompanied Raleigh to Guiana in 1617. See C. H. L. Ewen, *Lording Barry, Poet and Pirate*, 1938.

Barry, Elizabeth (1658-1713), actress. She is said to have been the daughter of Edward B., a barrister, and to have been patronised by Lady Davenant. She was introduced to the stage by the Earl of Rochester, making her first appearance in 1673 as Isabella, Queen of Hungary, in the Earl of Orrery's tragedy *Mustapha*. Though she showed no talent whatever on her first appearance, she was later universally considered to be one of the finest actresses of the time, and created over 100 roles. Her life was as immoral as her talent was great.

Barry, James (1741-1806), Irish painter,

b. at Cork, the son of a coasting trader; he showed early promise in art and at 22 went to Dublin. Here he was introduced to Edmund Burke, who brought him to London, and soon sent him to Rome, where he remained 5 years. He returned to England, 1770, where in 1772 he proposed (unsuccessfully) to decorate St Paul's with historical pictures, it being his aim to introduce the 'grand manner' into England. In 1775 he pub., in answer to Du Bos and Winckelmann, an *Inquiry into the Real and Imaginary Obstructions to the Acquisition of the Arts in England*. He painted 6 pictures for the Society of Arts, Adelphi, London. His most famous picture is that of the 'Victors at Olympia.' Canova said that this was sufficient to bring him to England. A.R.A., 1772; R.A., 1773. He was elected prof. of painting at the Royal Academy, but his quarrelsome spirit made him unpopular, and he was expelled (1799).

Barry, Sir John Wolfe Wolfe- (1836-1918), engineer, son of Sir Charles B., b. London; educ. at Trinity College, Glenalmond, and King's College, London. While under Hawkshaw, B. was engaged as resident engineer during construction of bridges over the Thames, and of stations at Charing Cross and Cannon Street. Later he built Blackfriars, Kew, and Tower Bridges; carried out Earl's Court, Ealing, and Fulham extensions of Metropolitan Dist. railway; constructed B. Dock near Cardiff (largest in Great Britain), and other engineering works in various parts. B. visited the Argentine, 1872, and planned a railway from Buenos Aires to Rosario. Consulting engineer on underground railways of Glasgow; 1903-5 royal commissioner of London traffic. Pubs.: *Railway Appliances* (Text-books of Science), 1876; *Lectures on Railways and Locomotives*, 1882; *The Tower Bridge*, 1894. Was consulting engineer to many railway companies. D. 22 Jan. 1918.

Barry, Philip (1896-1949), Amer. playwright, b. Rochester, N.Y., of Irish parentage. Educ. at Yale and Harvard, he started as a dramatist in 1923 with *You and I*, a social comedy. Many of his plays are of the light and witty type, such as *In a Garden*, 1925, *Paris Bound*, 1927, *Holiday*, 1928, *The Animal Kingdom*, 1932, *The Philadelphia Story*, 1939, *Without Love*, 1942, and *Foolish Notion*, 1945. A more serious vein was struck in *John*, 1927, which tells of the life of John the Baptist. Others with a religious or philosophical motif are *Hotel Universe*, 1930, *The Joyous Season*, 1934, *Bright Star*, 1935, and *Here Come the Clowns*, 1938.

Barry, Sir Redmond (1813-80), Australian judge, educ. Trinity College, Dublin; barrister, 1838. In 1839 he went to Sydney, becoming commissioner of court of requests in Melbourne, 1850. On the formation of the colony of Victoria, B. was solicitor-general; judge, 1851; first chancellor of Melbourne Univ., 1855; knighted, 1860. He founded Melbourne Public Library and National Gallery.

Barry, Spranger (1719-77), Irish actor, b. Dublin; son of a silversmith. He mismanaged his father's business so badly that he became bankrupt, and adopted the profession of an actor. His first appearance was made at the Theatre Royal, Dublin, on 15 Feb. 1744. He played for a time under Garrick, but in 1749 left Drury Lane for Covent Garden, and both houses played *Romeo and Juliet* in rivalry of each other simultaneously. B.'s performance of *Romeo* was considered by many to surpass that of Garrick. B. crossed to Ireland after a time, and opened theatres in Dublin and Cork, but returned to work with Garrick in 1767. He again went to Covent Garden, however, in 1774, where he played till his death.

Barry: 1. Is. in Bristol Channel, part of Glamorgan, Wales.

2. Seaport of Glamorganshire, S. Wales, 7 m. SW. of Cardiff, opposite B. Is. It has a tidal basin of 90 ac. between the mainland and the is., and large docks (114 ac.), opened in 1889, which accommodate the largest vessels. Within the bor. are the church of St Cadoc at Cadoc-ton and the remains of B. Castle (15th cent.); at B. Is. are the remains of St Baruch's church. B. Dock is an important coal-exporting port. Pop. 42,000.

3. Par. of Angus co., Scotland, 7½ m. SW. by W. of Arbroath, and including approximately half the tn of Carnoustie (q.v.). The golf-links were acquired by the gov. in 1892 for military manoeuvres. Pop. 6000.

Barry, heraldic term applied to a shield divided by horizontal lines into 6 equal portions of alternate tinctures. If the number of partitions (which must always be an even number) is more than 6, the shield is described as *Barry of eight, ten, etc.* If the lines are undulating, the shield is said to be *Barry wavy*.

Barry Cornwall, see PROCTER.

Barry Railway Viaduct, across Taff R., Glamorganshire, Wales, spans 2 other railway lines and a canal. Length 1420 ft, height 112 ft.

Barrymore, John (1882-1942), Amer. actor, of a distinguished theatrical family, his real name being Blythe. He first appeared in Chicago, in *Magda*, 1903, and 2 years later made an appearance in London in *The Dictator*. He scored a success as Hamlet, in U.S.A., in 1923, and in London in 1925. He also acted for the films, a notable success being his performance in the double role in the film of Stevenson's *Dr Jekyll and Mr Hyde*. In talking films his best parts were in *Arsène Lupin*, *Moby Dick*, *Romeo and Juliet*, and *Svengali*. His autobiography *Confessions of an Actor* was pub. in 1926. See also biography by Alma P. Waters, 1942. His brother and sister, Lionel and Ethel Barrymore, also became leading Amer. actors, his sister, in 1928, opening the Ethel Barrymore Theatre in New York.

Bars Khotan, see BARS KHOTUN.

Barsine: 1. Also called *Statira*, daughter of Darius Codomannus and wife of Alexander the Great. After the death

of Alexander, she was put to death through the instigation of Roxana (q.v.), who feared that B. might give birth to a son, whose claims would clash with those of her own son, Alexander Aegus.

2. Daughter of Artabazus, satrap of Bithynia, and wife of Memnon, a Rhodian. At the fall of Damascus, 335 bc, she fell into the hands of Alexander the Great, and became the mother of his son Heracles. She and her son were afterwards murdered by Polysperchon, at the instigation of Cassandra.

Barstow, Emmuska, see ORCZY.

Bar-sur-Aube, Fr. tn in the dept of Aube, cap. of an arron. A Rom. fortress here was destroyed by the Huns. In the Middle Ages B. had an important trade fair. There are 2 churches partly 12th cent. It has a trade in wine, grain, leather, and wool. Pop. 3900.

Bar-sur-Seine, Fr. tn in the dept of Aube. It was sacked by the Eng. in 1359, and suffered in the 16th-cent. religious wars. Wines and paper are made. Pop. 2100.

Bart, Jean (1650-1702), Fr. naval officer, b. Dunkirk, as a boy served under Adm. de Ruyter. Was in command of a frigate of the Fr. Navy against the Sp. in the Mediterranean Sea. In the war with England he was captured and taken to Plymouth; he escaped, however, and was made a captain by the Fr. king. In 1690 he took command of a 40-gun ship and helped Adm. de Tourville against the combined Eng. and Dutch fleets; he obtained command next year of a squadron that went up the N. Sea and landed on the coast of Scotland, plundering sev. vils.; made an attack on Newcastle after the Fr. defeat at La Hogue. Retired after Peace of Ryswick in 1697.

Bartan-su, or Bartine, River, the anct Parthenius (q.v.).

Bartas, Guillaume de Saluste du, see DU BARTAS.

Barter, system of trading by the exchange of one commodity for another, as distinguished from the sale of commodities for money. It is the common method of exchange amongst primitive peoples, and is a phase in the economic hist. of all races. In civilised countries the custom became practically extinct with the estab. of the money currency. In law, B., or exchange, is a contract for the exchange of 2 commodities.

Bartfeld, see BARDEJOV.

Barth, Heinrich (1821-65), Ger. explorer, b. Hamburg. After studying at the univ. of Berlin, he made his first expedition to Africa, visiting Tunis, Tripoli, and travelling down the valley of the Nile. In 1847 he again travelled in Egypt and the Near E. An account of these journeyings was given in his *Wanderungen durch die Küstenländer des Mittelmeeres*, 1849. From 1849 to 1855 he was engaged with the Brit. expedition of exploration in Central Africa. His experiences during these years he described in his *Reisen und Entdeckungen in Nord- und Zentralafrika*, 1849-58 (Eng. trans., new ed., 1890). In 1863 he became

prof. of geography at the univ. of Berlin. His collection of Central African vocabularies (1862-4) is of great value.

Barth, Karl (1886-), Swiss prof. of theology, a native of Basel. The leader and prophet of the New Reformation thought. B. has changed the whole outlook of Protestant theology on the Continent. After holding professorships at Göttingen, Münster, and Bonn, he was forced to retire from the latter univ. in 1935, and settled in his bp. B. stresses the absolute difference between God and man, man's inherent inability to solve his own problems, and his utter dependence on revelation and grace. His prin. writings are as follows: *The Word of God and the Word of Man* (trans.), 1930; *Credo* (trans.), 1936; *The Knowledge of God and Service of God* (trans.), 1938; *The Holy Ghost and the Christian Life* (trans.), 1938. See J. McConnachie, *The Significance of Karl Barth*, 1931, and C. Van Til, *New Modernism, theology of Barth*, 1946.

Barth, Ger. fishing port in the dist. of Rostock, on an inlet of the Baltic Sea, 32 m. NW. of Rostock (q.v.). Pop. 14,000.

Barthélemy, Auguste Marseille (1796-1867), Fr. poet, b. Marseilles. After completing his education at the Jesuit College of Julliy, he went to Paris in 1822, where he wrote a series of brilliant satires against the Bourbons. In 1826 was pub. his mock-heroic poem, *Le Villéladre*, written in collaboration with his friend Méry. This was an enormous success, as was also his *Napoléon en Égypte*, 1828. The imperialistic sentiments of *Le Fils de l'homme*, 1829, brought about his imprisonment, from which he was released by the 1830 revolution. This event he celebrated, with Méry, in *L'Insurrection*, 1830. From 1832 his popularity declined, owing to his support of gov. measures distasteful to the Liberal party. His changes of front he attempted to justify in his phrase, 'L'homme absurde est celui qui ne change jamais.'

Barthélemy, Jean Jacques (1716-95), Fr. writer and antiquarian, b. Cassis, Provence. He devoted himself to the study of Greek and oriental languages, and antiquities, especially numismatics. In 1745 he became an assistant in the royal cabinet of medals, and in 1753 was appointed its director. He was deprived of office in 1789. Later, Paré, the *pro tempore* minister of the interior, offered him the place of chief librarian of the Royal, now National, Library, which he refused on account of his age. His best-known work is the *Voyage du jeune Anacharsis en Grèce* (4 vols.), 1788, which has been trans. into many languages, the Eng. ed. being ed. by W. Beaumont (5th ed., 6 vols.), 1817.

Barthélemy Saint-Hilaire, Jules (1805-1895), Fr. politician and scholar, friend and literary executor of Thiers, b. Paris. After occupying a minor position in the ministry of finance, he became in 1838 prof. of Gk and Rom. philosophy at the Collège de France. In 1848 he became a

republican deputy, and was imprisoned for a short time after the *coup d'état* of 1851. After his release he resigned his professorship and devoted himself to oriental studies. As a member of the Bordeaux Assembly, to which he was elected in 1871, he supported Thiers, and for some time acted as his secretary. In Ferry's Cabinet of 1880-1 he was foreign minister, being chiefly responsible for the annexation of Tunis by the French. His chief work is his trans. of Aristotle (1839-44). He also made a verse trans. of the *Iliad*.

Barthez, Paul Joseph (1734-1806), Fr. physician, b. Montpellier. Here he studied medicine and obtained his doctor's degree at the early age of 19. In 1756 he was employed as a physician to the army, but soon returned to Paris to edit in part the *Journal des savants* and the *Encyclopédie méthodique*. In 1769 he was appointed prof. at Montpellier, and became chancellor of the univ. in 1785. His chief work, *Nouveaux Éléments de la Science de l'homme*, 1778, expounds his doctrine of vitalism. Amongst his other works are: *Oratio de Principio Vitæ Humanæ*, 1773; *Nova Doctrina de Functionibus Corporis Humani*, 1774; *Nouvelle Mécanique des mouvements de l'homme et des animaux*, 1798; *Traitément des maladies gouteuses*, 1802. Appointed physician to Napoleon, 1802. Died of fever. Pub. posthumously, *Traité du Peau*, 1807, and *Consultations de la médecine*, 1810.

Bartholdi, Frédéric Auguste (1834-1904), sculptor, was b. Colmar, Alsace, his father being of It. descent. His famous work is the Liberty statue ('Liberty enlightening the World') on Bedloe's Is., New York, commissioned by the Fr. Gov. and presented to the Amer. nation to commemorate the centenary of its independence. This huge figure, 220 ft high, was unveiled in 1886. Among B.'s other well-known works are the Lafayette statue, New York, 'The Lion of Belfort,' the monument to Vercingetorix, the Gaulish leader, and 'Grief.'

Bartholin, Thomas (Bartholinus) (1616-1680), Dan. physician, son of Kaspar. He visited the most celebrated schools of Europe. In 1637 he went to Leyden, where he republished his father's *Institutiones Anatomicae*, with additions, in 1641. He also visited Paris, Montpellier, Padua, Malta, and Basel, where he took the degree of doctor of medicine. In 1647 he was appointed prof. of philology in the univ. of Copenhagen, which in 1648 he exchanged for the chair of anatomy, which he held till 1661. In 1670 he was appointed physician to the king, and became librarian for the univ.; afterwards in 1675, the king appointed him a member of the grand council of Denmark. He discovered the thoracic duct, a discovery also claimed by J. Pecquet, and pub. numerous medical works, including a study of diseases mentioned in the Bible (1672) and a dissertation on medical poets (1669).

Bartholin, or Bartholine, Thomas (1659-1690), Dan. jurist, son of Thomas B.

Studied at the univs. of Copenhagen, Leyden, Paris, Leipzig, and Oxford. Appointed prof. of hist. and civil law at Copenhagen, and held the offices of assessor of the consistory, secretary to the king, antiquary and keeper of the royal archives. His chief work is *Antiquitatum Danicarum Libri Tres*, 1689.

Bartholinus, Kaspar (1585-1629), Dan. scholar, b. Malmö, Sweden. He became prof. of rhetoric in the univ. of Copenhagen in 1611, of medicine in 1615, and of theology in 1624. His text-book, *Institutiones Anatomicae*, 1611, was trans. into English, French, and German, and was used throughout Europe during the 17th cent.

Bartholomé, Paul Albert (1848-1928), Fr. painter and sculptor, b. Thiverval, Seine-et-Oise. He studied in Geneva and later entered the studio of Léon Gérôme in Paris; exhibited *genre* pictures at the Salon from 1879 to 1886, his best being 'Souper de vieillards,' 1808, 'Les Derniers Epis,' and 'L'Alcôve coupant du pain pour ses petits enfants.' From 1891 he exhibited sculptures at the Salon. 'Aux morts,' 1899, now placed in the Père Lachaise cemetery, is one of his finest pieces of sculpture. Largely self-taught, B. followed the classical and not the impressionist school. Among his later pieces may be mentioned 'Paris, 1914-18,' and a memorial to J. J. Rousseau in the Panthéon. He designed the Croix de Guerre and was elected president of the Société Nationale des Beaux-arts.

Bartholomew, St., one of the 12 apostles, commonly identified with Nathaniel, was b. Cana in Galilee, and introduced to Jesus by Philip. After the Crucifixion he is stated by various untrustworthy authorities to have preached in India, Armenia, and Asia Minor. According to tradition he was flayed alive and crucified at Albanopolis in Armenia, or Urbanopolis in Cilicia. His feast is on 24 Aug.

Bartholomew, Edward Sheffield (1825-1858), Amer. sculptor. He was b. Connecticut, and became, in succession, a dentist, painter, and sculptor. He was director of the Wadsworth Gallery at Hartford, where there is a large collection of his works. He studied art in New York, and then lived in Italy till his death, at Naples. His best-known statues are 'Youth and Age,' 'Sappho,' 'Ganymede and the Eagle,' and 'Eve Repentant.'

Bartholomew, Massacre of St., name given to the massacre of Huguenots which began in Paris on St B.'s Day, 24 Aug. 1572, and spread through the provs. during the succeeding weeks. The total number of those killed has been estimated at figures varying from 5000 to 70,000 (probably the figure of 25,000 is roughly correct). In Paris alone 1100 d. The outrage almost certainly owed its origin to the tortuous personal designs of Catherine de' Medici, who, as regent for her son Charles IX., after provoking the 8 years' conflict between the Catholics under the Duke of Guise and the Protestants under the Prince of Condé, during which both leaders lost their lives, lured

the Huguenots into a sense of security by marrying her daughter Margaret to the Protestant Henry of Navarre (afterwards Henry IV.). She then so worked upon the king's feelings as to convince him that Coligny (q.v.), the Huguenot leader, of whose influence over her son she and the Guises were acutely jealous, had designs upon his life, and in a fit of passion he gave orders that Coligny should be killed. His death was the signal for an orgy of slaughter which was probably quite contrary to Catherine's original intention. The Pope commemorated the event by striking a special medal, but it is now generally acknowledged by historians that the massacre was fundamentally political in origin and motives, and that the Holy See had no part in its planning. The majority of modern historians deny that the massacre was premeditated.

Bartholomew Anglicus, Eng. Franciscan, author of *De Proprietatibus Rerum*, c. 1250.

Bartholomew Fair was held annually in W. Smithfield, London, from c. 1123 until 1840 on St Bartholomew's Day, 24 Aug., old style. The right to hold the fair was part of the grant by Henry I to Rahere (*see succeeding articles*) for the foundation of a hospital and priory. It was at one time the chief cloth fair in the country, and an important market for cattle, pewter, and leather. A great and very popular feature was the large number of exhibitions, shows, performers of all kinds, quack doctors, etc. Inevitably the fair became boisterous and licentious, and at various times unavailing efforts were made to stop it. After 1840 the exhibitions were held at Islington. It was proclaimed by the lord mayor for the last time in 1850 and abolished as a nuisance in 1855. *See* Henry Morley, *Memoirs of Bartholomew Fair*, 1859.

Bartholomew the Great, St., Smithfield, London, relic of the priory of Augustinian canons founded by Rahere in 1123. He began building the priory soon after the hospital, and at his death (1144) the remarkable Norman apsidal choir was nearly complete. The church was not fully completed until the early 13th cent. At the Dissolution most of the priory buildings were pulled down; the choir was reserved for parish use, and the rest of the buildings were sold. The site of the original nave has for long been the churchyard, and the present entrance to the church, a 13th-cent. doorway over which a timber-framed building was erected c. 1595, was the entrance to the S. aisle. The tower was built in the early 17th cent. Later the church itself was put to entirely secular uses. Since 1863 much restoration has been carried out and surviving buildings recovered from private hands. The tomb of Rahere in the sanctuary has a very old effigy (possibly 13th cent.) surmounted by an early 16th-cent. canopy. Wm. Hogarth was baptised (1697) in the 15th cent. font.

Bartholomew's Hospital, St. ('Bart's'), Smithfield, London, was founded in 1123 by Rahere, a courtier under Wm Rufus and Henry I. Whilst on pilgrimage to

Rome he contracted malaria, and vowed that if he survived he would found a hospital, and through the agency of Richard de Belmeis, Bishop of London, he received a grant of land in Smithfield from Henry I. Rahere himself was the first master of the hospital, but retired in 1137 to devote himself to the priory. Both priory and hospital were dissolved in 1539, but Henry VIII refounded the latter in 1547. It was rebuilt in 1730-1766, and there have been considerable later additions. It became a great voluntary teaching hospital. Among the profs. of the medical school have been Harvey, Richard Owen, and Abernethy. There are at present over 700 beds; attached to the hospital is a convalescent home at Swanley, Kent. The hospital has some paintings by Kneller, Hogarth, Reynolds, Lawrence, and Millais. The church of St B. the Less, within the grounds, was rebuilt in 1789 on the site of the original church, and again rebuilt in 1823. See also BARTHOLOMEW THE GREAT, St.

Barthou, Jean Louis Firmin (1862-1934), Fr. statesman, b. Oloron-Sainte-Marie, Basses-Pyrénées. After practising law, he entered politics in 1889, being appointed deputy for the dept of Basses-Pyrénées. From 1894 he held a succession of ministerial posts until he became premier in Mar. 1913. His gov. lasted until Dec. of the same year, and B. later served as minister without portfolio in Poincaré's gov. during the First World War. After the war he was a protagonist of the policy to maintain vigorously all Fr. claims and guarantees as recognised in the peace treaties. From 1922 to 1926 he was president of the reparations commission, and then became minister of justice in Poincaré's gov. of 1926. He later served under Briand, and was foreign minister in 1934 when, on 9 Oct. he was assassinated at Marseilles with King Alexander I of Yugoslavia, who was also murdered. B. was the author of sev. books, including *L'Action syndicale*, 1904, *Mirabeau*, 1913, and *Lamartine Orateur*, 1919. He became a member of the Academy in 1919.

Bartine, River, see PARTHENIUS.

Bartizan, in architecture, a small, overhanging turret, projecting from the angle at the top of a tower or from a parapet of a building; more commonly seen on castles on the Continent than in the U.K.

Bartlesville, city of Washington co., NE. Oklahoma, U.S.A., trade and distribution centre for an agric. and oil-producing area. It has oil refining and zinc smelting and manufs. seismographs, ventilators, sulphuric acid, metal products, and leather. It is the seat of B. Junior College, and has a U.S. Bureau of Mines experiment station. Near by are the Hulah Dam and a state park. Pop. 19,225.

Bartlett, John (1820-1905), Amer. compiler, b. Plymouth, Massachusetts. In 1849 he became owner of the univ. book store at Cambridge. His knowledge of books was so wide and he was so often

asked for the source of quotations that he began a collection which developed into his well-known *Familiar Quotations*, 1855, now in its centenary ed. In 1894 he followed this with his complete and authoritative *Concordance to Shakespeare*. He was an honorary A.M. of Harvard.

Bartlett, John Russell (1805-86), Amer. author and antiquarian. He was appointed on the commission to determine the boundary line between the U.S. and Mexico (1850-3); and was secretary of state for Rhode Is. from 1855 to 1872. He wrote *The Progress of Ethnology*, 1847, *A Dictionary of Americanisms*, 1848, *Literature of the Rebellion*, 1866, and *Primeval Man*, 1868. His bibliographical works include *An Index to the Acts of the General Assembly of Rhode Island, 1758-1862*, 1863.

Bartlett, Paul Wayland (1865-1925), Amer. sculptor, b. New Haven; educ. there and at Boston. He began sculpture under Frémiet, and at the age of 14 exhibited at the Salon. In 1880 he entered the École des Beaux-arts, and he represented the U.S.A. on the international jury of awards for sculpture at the Paris Exposition of 1900. A chevalier of the Legion of Honour, 1895, he became an officer, 1908, and a commander, 1925. Among his most noted works are statues of Michelangelo, Columbus, and Benjamin Franklin, and one of Lafayette in the square of the Louvre; the pediment over the House wing of the Capitol at Washington; and 6 figures in front of the N.Y. public library.

Bartlett, Vernon (1894-), journalist, b. Westbury, Wilts, educ. Blundell's School, Tiverton. He was successively on the staff of the *Daily Mail*, Reuters, and *The Times*, being foreign correspondent for the latter in Germany, Poland, and Italy, 1919-22. He joined the staff of the *News Chronicle* in 1934, and from 1938-50 was Independent M.P. for Bridgwater. He is a noted commentator and broadcaster on international affairs. Fubs. include *Behind the Scenes of the Peace Conference*, 1919, *Nazi Germany Explained*, 1933, *This is My Life*, 1938, *Struggle for Africa*, 1953, and *Report from Malaya*, 1954.

Bartlett, William Henry (1809-54), artist, b. London. He was apprenticed, as an architect, to John Britton. His sketches were almost entirely topographical. He provided the illustrations to Britton's *Cathedral Antiquities of England*, 1814-35; and illustrated *American Scenery* 1840; and *Canadian Scenery*, 1842, by N. P. Willis, after having travelled extensively in N. America. He wrote sev. works on Palestine and Egypt.

Bartók, Béla (1881-1945), Hungarian composer and pianist, b. Nagyszentmiklós. He first learnt music from his mother, a schoolmistress who became a widow when he was 8. They moved from place to place until 1894, when they settled at Pozsony (Pressburg, now Bratislava), where he studied with L. Erkel. In 1899, by which time he had already played the piano in public, he entered for Budapest Academy of Music

as a pupil of Thomán for piano and Koessler for composition. In 1901 he won the Liszt scholarship. His student works were influenced in turn by Liszt, Brahms, and Wagner, and in 1902 he came under the spell of Richard Strauss for a short time; but later he repudiated all his early works, the first he acknowledged, and labelled Op. 1, being the Rhapsody for piano and orchestra of 1904. About 1905 he began to realise that what had so far passed as Hungarian folk music and been used as such by composers like Liszt, was really Gipsy music, and that the true Magyar peasant music was quite different. He began to collect and publish folk-songs with Kodály (q.v.). In 1907 he became piano prof. at the Academy. His success as a composer was retarded by the often uncompromising harshness of his first mature works; but in 1917 his ballet *The Wooden Prince* and in 1918 his opera *Bluebeard's Castle* were produced. Soon afterwards the political changes in Hungary brought him new difficulties; yet his importance was recognised by 1923, when he was commissioned to write an orchestral work for the 50th anniversary of the union of Buda and Pest, when he produced the *Dance Suite*. In 1927 he toured the U.S.A. and in 1929 Russia. Meanwhile his interest in folk music had extended to Rumanian and Arab music, and in 1934, when he resigned from the Academy, he was engaged by the Hungarian Academy of Arts and Sciences to prepare folk-song collections for official pub. The events of the Second World War made life in Hungary politically intolerable to B. and in 1940 he decided to emigrate to America. But owing to ill-health he found it impossible to obtain profitable employment there, and his pride forbade him to accept money which he did not feel he had earned. He d. in penury in New York on 28 Sept. 1945. His music may be said to fall into 4 periods: a first including the immature early works he discarded; a second in which the influence of earlier composers gradually gives way to that of folk music; a third (including the middle string quartets, the 2nd piano concerto and the *Cantata profana*), where experimentation becomes often ruthless and disconcerting; and a fourth showing a beautiful clarification of style, without any sacrifice of individuality and enterprise, in such works as the 3rd Concerto, the Sonata for 2 pianos and percussion, the *Concerto for Orchestra*, the 6th Quartet and the *Music for Strings, Percussion and Celesta*.

Bartoli, Adolfo (1833-94), It. author, b. at Fivizzano. He was associated in the editorial management of *Archivio storico Italiano*, 1856-9; and prof. of literary hist. in the Instituto di Studi Superiori of Florence, 1874-94. He pub. eds. of old It. texts and catalogues of MSS., as well as a critical hist. of It. literature down to the 14th cent., *Storia della Letteratura Italiana* (8 vols.), 1878-89.

Bartoli, Daniello (1608-85), It. Jesuit, b. Ferrara, and d. at Rome. He entered the order of the Jesuits at the age of 15.

He was commissioned by the father-general to write a hist. of the order, and it is for his *Istoria della Compagnia di Gesù* that B. is chiefly remembered. He was appointed rector of the Gregorian or Rom. College in 1671. A complete ed. of his numerous works, mainly moral, scientific, and linguistic, appeared at Turin in 34 vols. (1823-44).

Bartoli, Pietro Santi (1635-1700), It. painter and engraver, b. Perugia. As an engraver he obtained a great reputation, more, however, from the subjects and the number of his prints than for any particular excellence of execution. He studied painting under P. Le Maire and under Nicolas Poussin (q.v.), whose works he copied closely.

Bartoli, Taddeo, or Taddeo di Bartolo (c. 1363-c. 1436), It. painter, b. Siena. He was one of the greatest of artists in the period which preceded the Renaissance, and his chief care was expended on frescoes. Some of his best work, dating from 1414, is to be found in the municipal palace of Siena, and in the cathedrals of Pisa, Perugia, and Genoa. His favourite subject was the life of the Virgin, and one of his earliest works, 'The Virgin among the Saints,' 1390, is in the Louvre. His nephew, Domenico Bartoli, was his pupil.

Bartolini, Lorenzo (1777-1850), It. sculptor, b. Vorno, near Florence. After acquiring considerable reputation as a modeller in alabaster, he went to Paris in 1797, where he studied painting under Desmarests and sculpture under Lemot. His bas-relief of 'Cleobis and Biton,' 1803, gained the second prize of the Academy. After the fall of Napoleon, who had been his great patron, he retired to Florence, where he d. Amongst his best works are: 'Charity,' 'Pyrrhus hurling Astyanax from the Walls of Troy,' 'Hercules and Lichas,' and 'Faith in God.'

Bartolommeo di Pagnolo del Fattorino, Fra (1475-1517), also known as Baccio della Porta. Florentine painter, b. Savignano, near Florence, by the gate of San Piero Gattolino, hence his name 'della Porta.' He entered the studio of Cosimo Rosselli (q.v.), where he came into contact with Piero di Cosimo and Albertinelli. He became a follower of Savonarola, and on the reformer's death renounced his profession, and in 1500 joined the Dominicans at San Marco. However, he continued to paint in his convent, and about 1504 painted the picture in the Florentine Academy, 'Apparition of the Virgin to Saint Bernard.' In 1506 Raphael on a visit to Florence made the acquaintance of B., and the 2 artists influenced each other's work. B. also learnt much from Leonardo da Vinci, and later from Michelangelo. He was associated with his friend Albertinelli in many of his pictures; the fresco of the 'Last Judgment' (Santa Maria Nuova), 1498, was finished in the lower part by Albertinelli; and the 'Madonna and Saints' in the Pitti and the 'Assumption' in Berlin are among their joint productions. Some of his finest work is at Lucca, including the beautiful 'Madonna della Misericordia.'

1515; of his other well-known pictures, only a few can be mentioned: the 'Marriage of Saint Catherine' (in the Louvre), 'Saint Mark' (Pitti), and 'Saint Sebastian.' B. excelled particularly in draperies and in symmetry of composition. He is said to have been the first to use the lay figure. Consult the biographies of Leader Scott, 1880, and Gruyer (Paris, 1886), and Vasari's *Lives*.

Bartolozzi, Francesco (1725-1815), It. engraver, was a native of Florence. He was originally intended for his father's profession of silversmith, but his artistic bent led to his being instructed in painting. He studied engraving at Venice under Joseph Wagner. For a short time he lived in Rome, where he engraved a fine set of plates from the life of St. Nilus. In 1764 he settled in England under the patronage of George III. He was one of the original members of the Royal Academy, and executed for them, from Cipriani's (q.v.) design, the diploma which is still used. In 1802, at the invitation of the prince regent of Portugal, he became superintendent of an engraving school at Lisbon, where he d. B. was famous as head of the school of stipple-engravers in England. He worked mainly after Cipriani and Angelica Kauffman, Sir Joshua Reynolds also, though 'Clytie' after Annibale Carracci has been considered his best work. The famous actress, Mme Vestris, was his granddaughter, *nee* Lucia Elizabeth Bartolozzi. See Tuer's *Bartolozzi and his Works* (2nd ed.), 1885, and Baily's *Francesco Bartolozzi*, 1907.

Bartolozzi, Lucia Elizabeth, see VESTRIS.
Bartolus (1314-57), It. jurist, b. Sassoferrato. Studied civil law at Bologna and Perugia; he was a doctor of civil law at the former, and a prof. at the latter, univ. He had a rare knowledge of the jurisprudence of the imperial period of anc. Rome and his commentaries on Justinian's *Digest* are authoritative. He also wrote treatises on evidence and procedure.

Barton, Andrew, Scottish naval commander and the hero of a popular ballad, was killed in a fight with 2 Eng. ships in 1511. Many of his operations savoured of piracy.

Barton, Benjamin Smith (1766-1815), Amer. naturalist and doctor, b. at Lancaster, Pennsylvania. He studied medicine and the natural sciences in Philadelphia, Edinburgh, and London from 1782 to 1788, and graduated at Göttingen. On his return to America he practised in Philadelphia, and in 1790 became prof. of natural hist. and botany in the college there; the earliest teacher of natural science in N. America. In 1802 he was elected vice-president of the Amer. Philosophical Society, and in 1809 president of the Philadelphia Medical Society. His works include *Elements of Botany*, 1812-14, *Collections for an Essay toward a Materia Medica of the United States* (3rd ed.), 1810, and *Flora Virginica*, 1812.

Barton, Bernard (1784-1849), commonly known as the Quaker poet, b. Carlisle. For the greater part of his

life he was a bank clerk at Woodbridge in Suffolk. He was the author of sev. vols. of mediocre verse, but is chiefly known for his friendship with Charles Lamb. See his *Poems and Letters*, 1849 (new ed., 1853), with a memoir by his son-in-law Edward Fitzgerald (q.v.).

Barton, Clara (1821-1912), Amer. philanthropist, b. Oxford, Massachusetts. During the Amer. Civil War she did relief work on battlefields and organised at her own expense the search for missing men. In the Franco-Ger. War of 1870 she associated herself with the International Red Cross of Geneva, after which she represented the U.S.A. at many international conferences, and did personal field work in Cuba in 1898 and in the Anglo-Boer War of 1899-1902. She d. at Washington, D.C. Her pubs. include a *History of the Red Cross*, 1882, *The Red Cross in Peace and War*, 1898, *A Story of the Red Cross*, 1904, and *Story of My Childhood*, 1907. See C. Bacon-Foster, *Clara Barton, Humanitarian*, 1918.

Barton, Sir Edmund (1849-1920), Australian statesman. He was b. Glebe, near Sydney, New South Wales; called to the Bar in 1871. He was a leading figure in the legislative council and assembly, and Speaker, 1883-7; attorney-general, 1889-1891. He became leader of the Federation movement on the retirement of Sir Henry Parker in 1891, and founded (July 1893) the Sydney Federation League. A conference of Australian premiers at Hobart in Feb. 1895 resulted. The Federal Convention at Adelaide, 1897, appointed B. leader. In 1900 he was in England to watch the passage of the Commonwealth Bill through the Imperial Parliament; and he was first Commonwealth Prime Minister, 1901-3. In 1903 he retired and became senior puisne judge of the Federal High Court. He d. at Mellow, Blue Mountains, N.S.W., 6 Jan. 1920. See J. Reynolds, *Edmund Barton*, 1948.

Barton, Elizabeth (c. 1506-1534), commonly called the nun, or holy maid, of Kent. She worked at an inn in Aldington. After a severe illness in 1525 she became subject to hysterical ravings and fell into a state of religious mania. Archbishop Warham sent 2 monks to examine her, and one of these, Edward Bocking, was quick to see that she might be used for countering the growing trend in favour of Protestantism and separation from Rome. In 1527 she became a nun at the priory of St Sepulchre at Canterbury. In 1532 she opposed Henry VIII's intention to divorce Catherine and predicted his death within 7 months of his marriage with Anne Boleyn. The non-

ever said was feigned of my own imagination only, to satisfy the minds of those which resorted to me and to obtain worldly praise.' In 1534 she was executed at Tyburn, with Bocking and other accomplices, on a charge of high treason.

Barton, William Eleazar (1861-1930), Amer. theologian and clergyman, b.

Illinois. Associate editor of the *Bibliotheca Sacra*, and, later, of the *Congregationalist*. Lectured on applied practical theology and eccles. law. Among his works are *Life in the Hills of Kentucky*, 1889, *The Old World in the New Century*, 1902, *The History and Religion of the Samaritans*, 1906, *The Law of Congregational Usage*, 1915, *Congregational Creeds and Covenants*, 1917, *Saved and Kept*, 1921, and *My Faith in Immortality*, 1926.

Barton Clay, geological name of a group of Eocene (q.v.) beds exposed in S. England, called after Barton in Hants. The B. C. contains a variety of marine fossils.

Barton-on-Sea, see LYMINGTON.

Barton-upon-Humber, anct mkt tn on the S. Bank of the R. Humber, Lincs, England, and one of the prin. ports of the Humber at the Norman Conquest. The tower of Old St Peter's church and the W. porch are Saxon, to which is joined a 14th- and 15th-cent. building; St Mary's church dates from the 13th cent. There is considerable trade in corn, and bricks, tiles, ropes, cycles, and fertilisers are manuf. Pop. 6300.

Barton-upon-Irwell, dist. of Lances, near Manchester, where the aqueduct constructed by Brindley conducts the Bridgewater Canal over the Irwell.

Bartsch, Johann Adam Bernhard von (1757-1821), b. and d. at Vienna; he received his education in the school of engraving at Vienna under Prof. Schmutzer. In 1781 he was appointed keeper of the prints of the royal collection, which led to the pub. of his work *Le Peintre-Graveur* in 21 vols., 8vo, 1803-21, which is a description of the greater part of the works of the prin. engravers of Europe.

Bartsch, Karl Friedrich Adolph Konrad (1832-88), Ger. philologist, b. Sprottau, Silesia. He was prof. of Germanic and Romance philology at Rostock (1858-71), and at Heidelberg (1871-88). He ed. numerous texts of Middle High Ger. and Provencal poetry, and pub. *Untersuchungen über das Nibelungenlied* in 1865, which he trans. into modern German 2 years later. He wrote *Grundriss der Geschichte der prov. Literatur*, 1862, and *Chrestomathie provençale* (6th ed.), 1904, and trans. the poems of Burns (1865) and Dante's *Commedia* (1876), while in 1874 he pub. a vol. of original lyrics.

Bartsch, Paul (1871-), Amer. naturalist, b. Breslau, Silesia; educ. at the State Univ. of Iowa. He was appointed to the staff of the U.S.A. National Museum, Washington, and was assistant curator and later curator of marine invertebrates there. In 1899 he became prof. of zoology in the George Washington Univ. and then lecturer on medical zoology in the Howard Univ. Was Smithsonian representative in the Philippine expedition, 1907-9, and has represented that institution in many other expeditions. In the First World War he supplied a gas detector in chemical warfare. In 1920 he was Smithsonian delegate to the scientific congress at Honolulu. Author of numerous technical papers on biology.

Bartsia, family Scrophulariaceae, genus

of about 6 species of perennial herbs of Europe and N. Africa, of which *B. alpina*, Alpine B., is found in Britain. Red B. is *Odontites verna*, an ann. weed; and Yellow B. is *Parentucellia viscosa*, an ann. of Britain.

Baru, fluffy substance obtained from the sago palm *Saguerus saccharifer*, used for stuffing cushions and for caulking boats.

Baruch (Heb. 'blessed'), son of Neriah, the son of Maaseiah, to whom Jeremiah dictated his prophecies, and who read the roll before the princes in the reign of Jehoiakim about 600 bc. During the siege of Jerusalem by Nebuchadnezzar, B. and his master were at first imprisoned, but were afterwards released and allowed to choose their place of residence; they afterwards went into exile in Egypt, c. 588 bc. According to the deuterocanonical book of Baruch (cf. Josephus, *Antiquities* x. ix. 7) B. went from Egypt to Babylon, and in 581 bc returned to Jerusalem bringing the authentic parts of that book with him. See Jeremiah xxxii, xxxvi, xliii, xlv, and li.

Baruch, Bernard Mannes (1870-), Amer. economist, son of Dr Simon Baruch (q.v.). Going into finance B. was for many years a member of the New York Stock Exchange, and accumulated a large fortune. When the entry of the U.S.A. into the First World War was imminent, President Wilson made him a member of the advisory commission of the Council of National Defence. He became chairman of the committee on raw materials, minerals, and metals, and also head of the commission in charge of all purchases for the Allies. Wilson in 1918 made B. chairman of the War Industries Board, a body invested with vast power to co-ordinate Amer. industries for war-making purposes. After the armistice he went to Paris with Wilson, who had him nominated a member of the Supreme Economic Council. As such he played a leading part in drafting the economic and reparations sections of the treaty of Versailles. In 1919 he became a member of the Conference for Labour and Capital. During the Second World War he worked from 1943 as personal adviser to James Byrnes, then director of the Office of War Mobilisation. In Mar. 1946 he was nominated by President Truman as the Amer. member of the commission of 12 who formed the U.N. commission on atomic energy. B. is a lifelong friend of Sir Winston Churchill, and the author of *Making of Economic and Reparation Sections of Peace Treaty*, 1920, and pamphlets on agric. and economic subjects.

Baruch, Simon (1840-1921), Amer. physician, b. Posen, educ. at the gymnasium at Posen, and later at the Medical College of Virginia. He practised at Camden, S. Carolina, and later at New York. In 1889 he diagnosed the earliest authenticated case of perforating appendicitis successfully operated on. He was the pioneer of scientific hydrotherapy in U.S.A., and became prof. of that subject at the College of Physicians

and Surgeons, New York. Piloted through the Legislature the bill which secured free public baths to the community, the first, the Rivington Bath, being opened in New York in 1901.

Barwick, John (1612-64), Eng. divine. He graduated at St John's College, Cambridge, in 1635, and became M.A. in 1638. His loyalty to the Royalist cause obliged him to leave Cambridge. In London he worked for the king and communicated the designs of the rebels to Charles I, was charged with high treason and imprisoned in the Tower, 1650-2. At the Restoration, he became dean of Durham, 1660, and dean of St Paul's, 1661.

Barye, Antoine Louis (1796-1875), Fr. sculptor, *b.* Paris. He studied sculpture under Bosio and painting under Gros. He is famous for his marvellous animal studies, which are unique in the hist. of sculpture. Amongst these are the 'Lion Struggling with a Snake,' 'Lion Resting,' 'Theseus and the Minotaur,' 'Lapitha and Centaur,' and 'The Hunt of the Wild Ox.' There are sev. examples of his work in the gardens of the Tuilleries. He was also successful with the human figure, as exhibited in his 4 groups, 'War,' 'Peace,' 'Strength,' 'Order.' His drawings and water-colours of animals are outstanding also. He worked largely in bronze. See Ballu, *L'Œuvre de Barye*, 1890.

Baryta, barium monoxide (BaO), earth occurring in the minerals barytes, or heavy spar, and witherite. The original name was barote, but Lavoisier's alteration to B. has been universally adopted. It was at first thought to be an elementary substance, but prolonged investigation led to its being separated into the metal barium (q.v.), and oxygen. B. is formed when barium burns in air, or by heating barium nitrate until no more red fumes are given off. It may also be prepared by heating witherite mixed with charcoal to a white heat. It is a greyish-white solid, with sp. gr. about 5; it melts at 2000° . When heated with air barium peroxide (BaO_2) is formed. B. water is a solution of barium hydroxide in water. It is used as an absorbent for carbon dioxide.

Barytes, Barite, heavy spar, or barium sulphate, mineral, important as chief source of soluble barium compounds, and as a pigment under the name of permanent white. It derives its name from its high sp. gr. (4.5) as compared with other mineral sulphates or other minerals with the same general appearance. It occurs in rhombic crystals of varied forms, and may be artificially produced by acting upon baryta with fuming sulphuric acid. The natural sulphate is commonly found associated with lead and silver ores, and is prepared for use as a paint by being finely ground, usually along with white lead, treated with sulphuric acid to remove iron salts, washed, and dried.

Baryton, also called *Viola di Bordone*, stringed musical instrument resembling in tone the viola da gamba. It was invented in 1700, and has now fallen into disuse. Haydn composed a large number

of works for this instrument, which was played by his patron, Prince Esterházy.

Bas, William, see **BASSE**.

Bas, or Batz, is. in the Eng. Channel, off the N. coast of the dept of Finistère, France. It is about $2\frac{1}{2}$ m. long and 2 m. broad. The is. has 3 villa., a fine light-house erected on a hill 223 ft above sea level, 2 forts, and a haven, that of Kernoc. The chief occupation is fishing. Pop. 1150.

Basaiti, Marco (active 1496-1530), It. painter, *b.* Friuli, perhaps of Gk origin—his works are mainly signed 'Baxaiti.' He lived chiefly in Venice, where he was the rival of Giovanni Bellini, whom he closely resembles in style. He is noted especially for his colour. There are still sev. of his works in Venice. His masterpiece is the 'Calling of St Peter and St Andrew,' in the Academy of Venice, formerly in the old church of the charterhouse. There is a beautiful 'Descent from the Cross,' by B., in the Gallery of Munich. See J. Crowe and G. Cavalcaselle, *Painting in North Italy*, 1914.

Basal Metabolism, see **METABOLISM**.

Basalt, igneous rock. The Lat. *basaltis* is derived from an African word meaning a stone containing iron, and many varieties of the rock contain iron in the form of magnetite. Igneous rocks are broadly divided into acid rocks containing a large amount of silica, such as granite; and basic rocks, in which silica as quartz is absent, and a comparatively large amount of iron and magnesia is present. The most abundant member of the latter group is B., which consists chiefly of plagioclase feldspar, augite, and olivine and which has a fine-grained texture due to rapid cooling at or near the earth's surface. Most B.s are lavas ejected from fissures or craters. Seen with the naked eye, they are dark rocks in which the crystalline structure is barely apparent, although some large crystals may be scattered through them. Under the microscope the minerals augite and olivine appear embedded in a crystalline ground mass of plagioclase feldspar, augite, and magnetite. In certain rocks the olivine is frequently altered in part to a fibrous green serpentine. B. rocks are of common occurrence in Iceland, Skye, Mull, Antrim, central France, Germany, Italy, Washington, Idaho, the Deccan, Sandwich Is., etc. They represent lava which has exuded from fissures in the ground, and has spread over a considerable surface. The stresses to which the cooled rocks were subjected resulted in a network of cracks or 'joints' of a roughly hexagonal shape, similar to the cracks produced in dry mud under certain circumstances. Hence many of the basaltic rocks of N. Ireland and W. Scotland exhibit a columnar structure, as in the Giant's Causeway and Fingal's Cave. B. was known to the anc. Egyptians and Romans, who used it for building purposes. The basaltic plateau of Auvergne played a part in the controversy between the 'Vulcanists' and 'Neptunists' of the latter part of the 18th cent. The 'Neptunists,' led by Werner,

held that igneous rocks were produced by chemical precipitation from the ocean which covered the surface of the earth at one time. Desmarest, however, by a careful study of the B. rocks of Auvergne, showed that they were true lavas, not necessarily ejected from cone-and-crater volcanoes, but gradually extruded from fissures in the earth's crust and extending themselves in all directions.

Bascinet, Basinet, or Basnet, light helmet (q.v.), so-called from its resemblance to a basin, with or without a visor, the latter often being acutely pointed in front. The B. was worn throughout the 14th and early years of the 15th cent., and was the helmet of Crécy and Poitiers. *See also* ARMOUR.

Base: 1. In architecture, either (i) the lowest member of a column, on which the shaft rests; or (ii) the lowest course of masonry in a building; or (iii) the lowest stage of panelling in a room. *See* DADO.

2. In heraldry, the lower third of a shield, sometimes marked off from the remainder by a horizontal line. Any figure which is placed in this lower part is said to be in B., and if it does not occupy the central portion it must be distinguished as being in the dexter or sinister B. point.

3. In games, such as baseball and prisoner's B., the station to or from which the player proceeds.

4. In the military art, a secure position where the main supplies and reserve forces are kept, which is connected with the attacking forces by defended lines of communication.

5. In chem., a B. is a substance which can combine with an acid to form a salt and water only. In inorganic chem., B.s are oxides and hydroxides of metals and hence a B. is any substance that produces hydroxyl ions, OH^1 , as the only negative ions in aqueous solution. If a B. is soluble in water, it is also known as an alkali. In organic chem., the most common basic substances are amines, which are the alkyl or aryl derivatives of ammonia. They combine with acids to form organic salts.

6. In geometry, the line or surface upon which a figure or solid stands. In the case of a triangle any one of the angular points may be regarded as its *vertex*, and the side opposite it is then called the *base*.

Base Exchange, *see* WATER-SOFTENING.
Base Fee, *see* ESTATE AND MINES AND RECOVERIES.

Base Line, in surveying (q.v.), measured line which forms the side of a triangle, and of which the adjacent angles are also measured, so that the third point of the figure is easily determined. The country to be surveyed being thus mapped out in triangles, the details can be filled in without overlapping. In large surveys many B. L.s are drawn, varying in length from 3 to 10 m. *See* GEODESY.

Base of Operations, term used in warfare for the depot where everything required for the fighting army—munitions, food, transport, tanks, relief troops, etc.—is collected and organised

before being sent to the front, and where the wounded can be attended until recovered or transported to their homes. The development of aircraft, however, has made it possible to transport wounded men immeasurably greater distances than in pre-aircraft days. The B. of O. is usually a seaport on the bank of a riv., but in inland warfare may be a railhead, road junction, or group of landing grounds. The essential is that the base should command a line of communications with the source of supply. An army cut off from its B. of O. and a base cut off from its source of supplies are more or less useless; but in modern warfare the development of paratroops and airborne troops and supplies has made it possible to operate within enemy ter. or enemy-occupied ter. regardless of a B. of O. in the old sense; though the forward landing ground or dropping area may be regarded as a base to be made secure; as, for example, in the case of Wingate's famous Chindits in the campaign in Burma in the Second World War. In the Franco-Prussian war of 1870 the Prussian B. of O., for instance, was the chain of fortresses which line the banks of the Rhine; in the S. African war, 1899-1902, the Brit. base was Cape Town; in the First World War the base of the B.E.F. was Boulogne, and of the Armée de l'Orient, Salonika; and in the Second World War Cairo was the base of the Brit. Eighth or Desert Army. Sydney was MacArthur's (q.v.) base. Rome was the allied base in the later stages of the campaign in Italy. *See also* ARMY.

Baseball, national game of the U.S.A. Research has revealed that a game called 'Base Ball' was played in the U.S.A. and England before 1839. It was founded on the old Eng. game of rounders. However, baseball as Americans know it was first played at the Elysian Fields, Hoboken, New Jersey, in June 1846, between the Knickerbockers and the New York Nine. The Cincinnati Red Stockings were the first all-professional team, and in 1869 they played 64 games without a loss. The standard ball of the same size and weight, still the rule, was adopted in 1872. The first catcher's mask was worn in 1875. The National League was organised in 1876. The first chest protector was donned in 1885. The Amer. League became a major league in 1901. Judge Kenesaw Mountain Landis became Commissioner of B., by action of the two major leagues, in 1921, and, upon his death (1944), Albert B. Chandler was elected to that office in 1945. Chandler was succeeded by Ford Frick (1951), the National League president. To-day B. 'fans' (devotees) number millions of all classes.

The World Series B. contests have been held since 1903; they are played between the champions of the National League and the Amer. League. Besides these there are over sixty minor professional leagues and many more amateur ones. The game is played by nine players on each side. The bat is round, and must not exceed 42 in. in length and 20 in. in diameter at the thickest part.

The average weight of bats used in the major leagues is 36 oz. The ball weighs about 5 oz. and is 9 $\frac{1}{4}$ in. in circumference. The ground is in the form of a diamond, 90 ft square. The first B. diamond was laid out in 1839 by Gen. Abner Doubleday, and his demarcation has not since been altered. The rules were standardised in 1887. Bases are placed on each angle, and are known as home, first, second, and third bases. The ball is delivered with great swiftness by the pitcher, who stands in the centre of

caught by one of the fielders before it hits the ground. He is also out if he fails to reach first base before the ball, or is hit by the ball when running between the bases. An innings is over when three men are out, and then the fielding side takes its turn at bat. Nine innings make up a game, unless the score stands at a tie at the ninth innings, in which case the game is continued till one or other of the teams is ahead at the end of the next innings played. The most important defensive player is the pitcher. Pitching is an art, and great

THE BASEBALL DIAMOND

U, umpire; C, catcher; P, pitcher; 1B, first baseman; 2B, second baseman; 3B, third baseman; SS, short stop; LF, left field; CF, centre field; RF, right field.

the diamond, to the batter, who stands at home plate. The pitcher pitches the ball in any manner he chooses, and it must pass over the home plate between the batter's shoulders and knees. If he fails to do so four times the batter is given a 'walk' to first base. The catcher is behind home plate, while the fielders take up positions as first, second, and third basemen, short stop, centre fielder, right fielder, and left fielder. The batter, if he hits the ball, attempts to make the circuit of the bases at the angles of the diamond. If he succeeds he scores a run. He may stop at any base and try to steal on to the next while another player is at bat, but he must always move on to make room for a following base-runner. A batter may be put out by failing to hit the ball after three fair attempts, in which case he is said to be 'out on strikes,' or if he hits the ball and it is

skill is required for the curves, drops, and speed a pitcher must possess. Besides the pitcher's skill, the speed, accuracy, and throwing ability of the fielders are of the utmost importance. However, as the game is now played, the hard-hitting batter is the most valuable man in the team: the whole game revolves around the man who can hit for extra bases. The most outstanding player of modern times was 'Babe' Ruth (q.v.).

BASEBALL STATISTICS (1936-56). *U.S. Championships—National League*: New York Giants (1936-7, 1951); Chicago Cubs (1938, 1945); Cincinnati Reds (1939-40); Brooklyn Dodgers (1941, 1947, 1949, 1952-3, 1955-6); St. Louis Cardinals (1942-4, 1946); Boston Braves (1948); Philadelphia Phillies (1950); Cleveland Indians (1954). *American League*: New York Yankees (1936-9, 1941-3, 1947, 1949-56); Detroit Tigers (1940, 1945);

St Louis Browns (1944); Boston Red Sox (1946); Cleveland Indians (1948). *World Series*: New York Yankees (1936-1939, 1941, 1943, 1947, 1949-54, 1956); Cincinnati Reds (1940); St Louis Cardinals (1942, 1944, 1946); Detroit Tigers (1945); Cleveland Indians (1948); Brooklyn (1955). See D. E. Jesse, *Baseball*, 1938.

Basedow, Johann Bernhard, originally **Johann Berend Basedau** (1723-90), Ger. educational reformer, b. Hamburg and d. Magdeburg. In 1753 he taught at Sorø, in Denmark, and in 1760 in a school at Altona, which he was obliged to leave in the following year because of his heterodoxy. In 1762 Rousseau's *Emile* gained in him a strong admirer, and increased his desire to instruct youth according to nature in all things. In 1774 he pub. his *Elementarwerk*, infused with the theories of Rousseau; it was an illustrated school-book, pub. by contributions from influential and wealthy people. In the same year he opened his Philanthropin at Dessau to carry his theories into practice, but after 10 years he found himself unable to cope with it, owing to his restless and quarrelsome disposition. He then devoted himself to private tutoring, and the Philanthropin was closed 3 years after his death. He is noteworthy as the forerunner of Froebel and Pestalozzi, and his work as a reformer has had great influence on education throughout Europe.

Basel (Fr. *Bâle*): 1. Canton of Switzerland, divided into two half-cantons in 1833 after civil strife between the peasants of the rural part and the citizens of the tn. The latter were worsted, and their share of the canton was limited to the tn and two cooms. **Basel-Stadt** or **Bâle Ville** (area 14 sq. m., pop. (1955) 209,700), has a constitution dating from 1889. The remainder of the canton comprising **Basel-Land** or **Bâle Campagne** has an area of 165 sq. m., mainly agric. land, and a pop. (1955) of 118,800, with constitution dating from 1892. B. joined the Swiss Confederation in 1501.

2. Cap. of the above canton, second largest tn of Switzerland, with pop. (1955) 194,700, mainly Protestants, lies on both sides of the Rhine, where France, Germany, and Switzerland meet. It is mentioned as a fort in AD 374 (the name means a royal residence, *Basilla*). The middle classes freed themselves from the dominion of the bishops and nobles and Austrian grand dukes, and in 1501 the tn became a member of the Swiss Confederation. It was one of the literary centres of Europe, and so many books were printed at its presses between 1468 and 1500 that there are 324 in the library of the Brit. Museum. The univ. was founded in 1460 and became famous under Erasmus (q.v.). In 1529 B. accepted the Reformation and became one of its chief centres. The picture gallery contains paintings by Holbein (q.v.), who lived at B. in 1515-26. The univ. library contains 433,000 vols. and 267,000 pamphlets. B. is one of the chief industrial and commercial centres in the country, and is the only Swiss tn having an important inland port. There is weaving of silk ribbon

and a flourishing chemical industry. B. is the site of the Bank for International Settlements estab. in 1930.

Basel, Council of, 17th oecumenical council, met in 1431, Eugenius IV being Pope and Sigismund Emperor of the Holy Rom. Empire. The main purpose of the council was to conciliate the Hussites, but the Pope refused to sanction the movement and ordered the council to be dissolved. This order was disregarded, as was also the order that the council should remove to Italy. The council ratified the right of the general council to exercise authority over the Pope. It concluded a peace with the Hussites, known as the treaty of Prague, 1433. The council was oecumenical up to its twenty-fifth session, and the Pope ratified only those of its decrees which dealt with the eradication of heresy and the peace of Christendom, and only those reforms which did not detract from the rights of the Holy See. In 1438 the council continued at Ferrara, having a brief prospect of union with the Gk Church. The Pope failed to appear and the council then issued a decree suspending him from office. He was formally deposed, and in 1439 Duke Amadeus of Savoy was elected in his place. Eugenius held his position, however, and re-assembled the council at Florence (1439). On his death a compromise was effected whereby the council directed the Church to obey the new Pope Nicholas V. See **COUNCILS, CHURCH**.

Basement, in architecture, either (i) the lowest storey of a building, if wholly or partially below ground level; or (ii) the lowest stage or storey of a classical building, beneath the prin. order of columns or pilasters on the façade. In such cases the B. was sometimes 'rusticated' to create the effect of massive strength.

Basevi, George (1794-1845), architect, b. London, pupil of Sir John Soane (q.v.). Travelled in Italy and Greece, 1816-19. Designed the Fitzwilliam Museum, Cambridge, 1836-45; country mansions at Bretton Park, Gatcombe Park, Taplow, etc.; Gothic churches at Stockport, Twickenham, Chelsea, etc.; and laid out part of Belgravia, London, including Belgrave Square and Pelham Crescent. He was killed by falling from a tower at Ely Cathedral while surveying it.

Bassey, tn of the Philippine Is. It is on the San Pedro Bay, Samar Is. Pop. 35,523.

Bashan is called by the Septuagint *Basan*, by Josephus and Ptolemy *Balanaia*. It belonged to Gilead in the widest sense, but in a stricter sense it was distinguished from and situated to the N. thereof. B. bordered in the N. upon the Syrian dists. Geshuri and Maachathi; in the S. it stopped short of the R. Jabbok. Its W. boundary was the Jordan. The E. limits are undefined.

B. was a kingdom under Amoritic sovereigns who resided in Ashtaroth and in Edrei. Og was the last king of the Amoritic dynasty. In the battle of

Edrei, about the year 1452 BC, the Israelites smote Og, with his sons, and all his people, until there was none left alive, and they possessed his land (Num. xxi. 33). Moses gave B. unto the half tribe of Manasseh, 1451 BC. (Num. xxxii. 33). At the commencement of the Christian era B. belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II.

Bashaw, see PASHA.

Bashi Islands, see BATAN ISLANDS.

Bashibazouks, irregular Turkish troops serving under the sultan and receiving their reward chiefly from plunder. They were chiefly responsible for the Bulgarian atrocities of 1876.

Bashkir Autonomous Republic, in Russia, was formed in 1919. It lies in the S. of the Ural Mountains and the adjacent lowland in the W. traversed by the R. Belaya, a trib. of the Kama. It has rich deposits of oil, iron ore, and non-ferrous metals. Area 55,400 sq. m.; pop. 3,323,000, mostly Russians (since 16th cent.), Bashkirs, and Tatars. There are varied industries (engineering, oil, chemical, metallurgical, textile, food), grain growing, market gardening, cattle, sheep, and horse breeding, and bee-keeping. The prin. tns are Ufa (cap.), Sterlitamak, and Oktyabr'skiy. The area was annexed by Muscovy after the conquest of Kazan'. Industrial development dates from the 18th cent. (metallurgy); there has been oil extraction since the 1930's, and engineering since the Second World War.

Bashkirs (own name Bashkort), Turkic-speaking people living in the Bashkir Autonomous Rep. (where they form a quarter of the pop.) and the surrounding areas, and numbering (1939) 843,000. They have been known since the 9th cent., when they were nomads and partly spoke an Ugrian language related to Hungarian. They acknowledged the supremacy of the Volga Bulgarians and the Golden Horde, then of the Kazan', Nogay, and Siberian Khanates, and from 1557 that of Muscovy. Russian colonisation led to sev. Bashkir uprisings in the 17th and 18th cents. A Bashkir nationalist gov. was formed in Orenburg in 1917 but joined the Bolsheviks in 1919 (see R. Pipes, *The Formation of the Soviet Union*, Cambridge, Massachusetts, 1954). Since the 14th cent. they have been Muslims. Now the majority of B. are sedentary collective farm members.

Bashkirtseff, Marie (1860-84), Russian painter and diarist, was b. of wealthy parents at Poltava, Russia. At the age of 13 she instituted a diary which she continued to the time of her death, inscribing in it her joys and sorrows, her enthusiasms and her ambitions, above all her passionate desire for immortal fame. She was endowed with a beautiful voice and considerable literary gifts, but chose painting as her final expression in the arts, and her picture of 'The Meeting,' 1884, was acquired by the Luxembourg. She travelled much, but when only 24 she succumbed to consumption. See Mathilde Blind, *A Study of Marie Bashkirtseff*, 1892; *The Journal of Marie Bashkirtseff*,

trans. by Mathilde Blind (2 vols.), 1890; *The Letters of Marie Bashkirtseff*, trans. by Mary J. Serrano, 1891; Dormer Creston, *Fountains of Youth*, 1936, *Life of Marie Bashkirtseff*, 1943.

Basic English, 'pocket English' with a vocabulary of some 850 words. The first work on 'basic'—or Brit.-Amer.-Scientific-International-Commercial-English—was written by I. A. Richards of Cambridge, and later of Harvard Univ., and the late C. K. Ogden. Its advocates contend that it can give the sense of anything which may be said in English. Actually it was found that 1000 words were needed to put the N.T. into B. E. The use of such a restricted vocabulary naturally demands great ingenuity to express many ideas. In 1943 Mr Winston Churchill persuaded the Cabinet to set up a committee of ministers to report on B. E. and inquire into the possibilities of extending the use of English as an international language—since it is an easier language for foreigners to learn than Esperanto, Volapük, Ido, Novial, and Solresol. A similar idea was under consideration in 1939, when the gov. appointed a committee of the Economic Advisory Committee to examine the methods of teaching simplified English to those who did not speak the language, but the war broke out soon afterwards and the committee never met. B. E. would, no doubt, be of some value in Brit. colonial territories in developing the policy of stimulating educational advance among backward peoples. B. E. has made headway in many countries as a quick method of giving some facility of expression in English. The Local Examinations Syndicate of Cambridge Univ. include texts in B. E. as options in Eng. literature for the Oversea Junior Certificate and they regularly set examination question papers in B. E., on the Basic N.T. In 1947 the Crown purchased the copyright of B. E. for £23,000. See C. K. Ogden, *Basic English and its Uses*, 1943, and *The Basic Dictionary* (for translators), 1932.

Basic Rocks, igneous rocks containing about 45-55 per cent of silica (SiO_2). The basic volcanic rock basalt is one of the most abundant of all igneous rocks. The commonest plutonic basic rock is gabbro. See BASALT; GABBRO; IGNEOUS ROCKS.

Basic Slag, a by-product of steel manuf., consisting chiefly of tetra-calcium phosphate ($Ca_4P_2O_8$), calcium silicate ($CaSiO_3$), calcium oxide (CaO), and ferric oxide (Fe_2O_3), used as a slow-acting phosphatic fertilizer in agriculture and horticulture, especially for legumes and fruits.

Basidiomycetes, large class of fungi, perhaps 13,500 species, which includes mushrooms, toadstools, bracket fungi, smuts, and rusts (q.v.).

Basidu, **Basidom**, or **Bassadore**, port at the NW. extremity of Qishm Is. in the Persian Gulf. It was used as a Brit. naval H.Q. in the suppression of piracy (1822-8), but was soon abandoned because of its intolerable climate. In

1935 the Brit. coaling station in B. was transferred to Bahrain.

Basil, or **Basilius**, St (329-79), sur-named the Great; b. Caesarea, studied at Antioch and Constantinople, where Libanius (q.v.) was his fellow student. B. went to Athens and met Gregory of Nazianzus (q.v.), who became his close friend; returned to Cappadocia in 355, and taught rhetoric; travelled in Syria, Egypt, and Libya, visiting the monasteries, and was so pleased that he determined to found a monastery in Pontus. B. and Gregory of Nyssa (q.v.), his brother, and Gregory of Nazianzus are the 3 great Cappadocian Fathers. His rule still governs E. monasticism (see EASTERN ORTHODOX CHURCH). In 370 he succeeded Eusebius as Bishop of Caesarea, but was persecuted by the Emperor Valens for his opposition to Arianism. See E. Leigh-Bennett, *Handbook of the Early Fathers*, 1920; W. K. L. Clarke, *The Ascetic Works of St Basil*, 1925; R. J. Deferrari (trans.), *Letters of St Basil*, 1926; M. G. Murphy, *St Basil and Monasticism*, 1930; G. L. Probst, *St Basil the Great and Apollinaris*, 1956.

Basil, Monks of St. St B., about the year 358, when he retired to Pontus, founded a monastery for himself and his followers, and drew up its regulations, which were soon adopted in other monasteries. This rule gradually spread to all E. monasteries, so that all Orthodox monks are now Basilians. There are Basilian monasteries in the W. in communion with the Holy See, notably in Italy, Lithuania, Ruthenia, Canada, and the U.S.A.

Basil, name applied to sev. species of Labiatae. The sweet B., *Ocimum basilicum*, grows in India and is cultivated as a pot-herb; *Acinos arvensis* is B.-thyme, and *Clinopodium vulgare* Wild B. The B. famed in romance and art is the *Ocimum basilicum*; it is immortalised in Boccaccio's *Decameron*, in Keats's poem, *The Pot of Basil*, and in Holman Hunt's painting of 'Isabella and the Pot of Basil.'

Basilian Island, largest is. on Sulu Archipelago, separated from Mindanao Is. by the strait of Basilan. It produces coconuts, corn, rice, and rubber. There is also fishing. Pop. c. 50,000.

Basildon, urb. dist. of Essex, England, 12 m. SW. of Chelmsford, including Billericay and Wickford. B. is scheduled for development as a new residential tn. with a target pop. of 90,000. Pop. 32,000; (of urb. dist. 51,000).

Basilica (Gk. *basilikē*, a royal building or palace) may be either (i) a public hall used for administering justice and for the transaction of commercial business in a Rom. city, usually adjoining the forum or market-place; or (ii) an early Christian church, somewhat resembling a secular B. in its general plan and arrangements.

The chief Rom. B.s were built in Rome itself, and provided shelter from rain and freedom from disturbance, essential requirements for the orderly conduct of legal and commercial business. The earliest recorded example, the Porcian B., was built in 184 BC, and may have

been inspired by the Stoa at Athens; it no longer survives. The earliest remaining example is at Pompeii, c. 100 BC. In Rome the B. Aemilia, c. 54-34 BC, was soon followed by the B. Julia, 31 BC-AD 14, and the B. Ulpia, AD 113. The B. Nova, begun by Maxentius, was finished by Constantine after AD 313.

SECTIONAL ELEVATION OF A TYPICAL BASILICAN CHURCH OR CHRISTIAN BASILICA

There were B.s in all the chief Rom. prov. cities, including a large one on the site of Gracechurch Street in London; and smaller examples have been excavated at Cirencester and Silchester. The typical Rom. B. (excluding the latest examples) consisted of a long and wide open space, or nave, flanked on either side by aisles, which were separated from the aisles by a range of columns. Above the aisles were often galleries, with flat roofs, and above these again was a range of windows lighting the main interior. The normal Roman B. did not possess an apse, but there was a throne for the judge at the end opposite the entrance. See also CHURCH.

Basilica, Gk code, begun c. AD 876 by the Emperor Basilus I (q.v.), completed by his son Leo VI the philosopher, and pub. in 60 books in 887. It was revised by the order of Constantine VII, about AD 945.

The B. comprised most of the *Corpus Juris Civilis* (q.v.) of Justinian, and the *Imperial Constitutions* made after his time, in 60 books, which are subdivided into titles. The extracts from the *Digest* are placed first under each title, then the constitutions of the Code, and next the extract from the *Institutes* and the *Novellae*. The B. does not contain all that the *Corpus Juris* contains, but it contains some things which are not in the *Corpus Juris*. An ed. of the larger part of the B., by Fabrot, was pub. at Paris in 1647 in 7 vols.

Basilicata (anct. Lucania, q.v.), region (compartimento) of S. Italy, comprising the provs. of Potenza and Matera (qq.v.). It is bounded N. by Apulia, W. by Campania and the Tyrrhenian Sea, S. by Calabria, and E. by the Gulf of Taranto (qq.v.). The chief tn is Potenza. Area 3855 sq. m.; pop. 647,000.

Basilicon (Gk *basilikos*, royal), name

sometimes applied to sev. resin ointments, consisting of yellow wax with lard and rosin, or of Burgundy pitch, suet, and turpentine. It is usually known as *ceratum resinæ*, or resin ointment.

Basilicon Doron (Gk 'royal gift'), title of a pamphlet written by James VI of Scotland in 1599 for his son, Prince Henry. In it he expounds his theory of the divine right of kings.

Basilides (fl. AD 125), founder of a Gnostic sect, lived in Alexandria under the Emperors Trajan and Hadrian. His doctrines reflected those of Zoroaster, but his tendency towards extremes was discarded by his later followers. He taught the doctrine of emanation, beginning with the emanation of mind from Abraxas, the Supreme Power, down to the creation of 365 worlds by a number of angelic powers. There were 365 emanations, a mystic number constantly occurring in this religion; the name Abraxas itself being a corruption of Abrasax, a Gk word of which the letters are computed to make the number 365.

Basilisk: 1. Name given by the Greeks and Romans to an imaginary creature whose glance could kill, as could its burning, poisonous breath.

2. Genus of tree lizards of the family of Iguanidae, which are perfectly harmless. They are found in central America, where they are considered edible. *Basiliscus mitratus* is the most common species, noted for its scaly helmet.

Basilius I, the Macedonian (c. 812-86), Byzantine emperor; he became a favourite of the Emperor Michael III, who made him his co-ruler. In 867 B. murdered him, and was proclaimed emperor. He ruled wisely, and began to compile the code of laws completed by his son Leo VI (see BASILICA). He fought successful wars against the Saracens, and helped to make the Gk Church more independent of Rome. B. was the founder of the Macedonian dynasty.

Basilius II (c. 958-1025), Byzantine emperor, son of Romanus II, at whose death (963) B. and his brother Constantine became nominal rulers, the actual power being in the hands of Phocas. In 976 the brothers were proclaimed emperors under their guardian Basilius the Eunuch, but from about 986 B. was emperor in fact as well as theory. In 1018 B. inflicted a crushing defeat on the Bulgars. Vladimir, grand duke of the Russians, married B.'s sister and became a Christian in 988. B. was succeeded by his brother Constantine as sole emperor.

Basilosaurus, or Zeuglodon, primitive Eocene Cetacean or whale of giant size. It had an elongated body over 50 ft long.

Basin: 1. Term used in geography to indicate the whole tract of country drained by a certain riv.

2. In geology, term applied to depressions of the strata occasioned by synclinal dips, especially such as are on a large scale. The Tertiary B.s of London, Hants, and Paris rest on Chalk, and the coal basin of S. Wales rests on Old Red Sandstone.

Basing, or Basingstoke, John (d. 1252),

Eng. scholar. He is said to have studied at Oxford, Paris, and Athens; he brought home with him sev. Gk MSS., and was promoted by Grosseteste to be arch-deacon of Leicester.

Basingstoke, mkt tn, parl, and municipal bor. of Hants, England. The remains of the castle destroyed by Cromwell in 1645 may be seen, and traces of Rom. occupation abound. Industries include agric. machinery, motor works, engineering, scientific instruments, clothing, leather, and mineral waters. Pop. 17,000.

Basingwerk, see HOLYWELL.

Baskerville, John (1706-75), Eng. printer, b. Wolverley in Worcs. Having a talent for calligraphy and carving in stone, he kept a writing school in Birmingham. In 1740 he entered the japanning business, making a fortune by improvements in the process. Soon after this he experimented in typesetting, and produced types far superior in distinctness and elegance to those previously employed. He then estab. his own printing-house, publishing a *Virgil* in royal quarto, a *Terence*, *Horace*, etc., all being fine specimens of typography. But as the sale did not justify his hopes, he did not print many works. He was printer to Cambridge Univ. (1758-68). Specimens of the B. press have long been rare.

Basket, vessel of willow rods, rushes, cane, and other like materials, used for the purpose of holding, carrying, and

Rural Industries Bureau

EXAMINING WILLOW CROP PRIOR
TO HARVESTING

protecting articles. B.-work was used in ancient times for huts, boats, horse-drawn vehicles, and military equipment. The etymological derivation of the word is obscure, the connection with the Lat.

bascauda being now discredited. The probable derivation of B. from *bascauda* through O.F. *basche* is supported by Wyld (*Universal English Dictionary*, 1932-6).

Willow is the traditional material for basketry in England; its cultivation is mentioned by Pliny in his *Historia Naturalis*. The growing of willows as a crop is, however, recent, dating only from 1800. The species grown and used for basketry are *Salix triandra*, *S. viminalis*, and *S. purpurea*. There are many

Rural Industries Bureau
COMPLETING THE BORDER ON
A WASHING BASKET

varieties of each species. The most important is *S. triandra*, black maul, which produces high quality rods much favoured by the B.-makers. They are propagated by cuttings and, when estab., a willow bed will produce a crop of rods annually for from 20 to 50 years, depending on local conditions. They require fertile lowland sites and deep, well-drained soil. The willow-growing and B.-making industry reached its peak in the 19th cent., and although now, for many reasons, including foreign competition, considerably reduced in extent, it is enjoying renewed prosperity. The area of Eng. willow beds is now estimated to be 2000 ac., of which over half is situated in an area 7 m. by 9 m. with the centre at Langport, Somerset, the remainder being situated mostly in the Midlands and E. Anglia. B. ware is entirely hand-made. A willow stripping machine was introduced from France in 1937; willow husbandry has been mechanised to some extent in recent years.

The weaving of wicker-work is one of the oldest known crafts, probably

practised by Neolithic man. In England wicker-work fragments were found at the site of the Glastonbury lake vil. of c. 100 B.C. The earliest known B.-maker, Johanne Hoc, was subject to the Suffolk poll tax in 1381. The Basket Makers' Co., estab. in 1569, was granted a royal charter in 1937. Nevertheless it is certain that B.-makers practised their craft in the City of London prior to the estab. of the company; they were included in a crafts list of the Brewers' Co. dated 1422. Documents of churches in the Eastcheap neighbourhood where they lived, dated from 1479, record gifts by B.-makers and their wives.

The industry has suffered from the effects of cheap imported B. ware and latterly from the use of substitute materials. London apprentices complained of imports from Holland in the reign of Henry VIII. In more recent times wooden boxes have largely replaced B.s for horticult. and agric. produce. To-day the Brit. industry, which is carried on in urb. and rural

Farmers' Weekly
OKE BASKET

dist., produces a wide range of B. ware for agric., commercial, and domestic purposes. The chief urb. centre is London, whilst rural B.-makers are to be found in most cos. but are considerably fewer in the N. half of the country, excepting the Furness dist. of Lancs which is the centre of the oak spale B.-making industry. See T. Okey, *An Introduction to the Art of Basketry*, 1932; H. H. Bobart, *Basket-work Through the Ages*, 1936; K. G. Stott, *Cultivation and Uses of Basket Willows*, 1955.

Basket Ball, game played by opposing teams of 5 with an inflated ball, the average dimensions of the court being

85 ft by 46 ft. At each end there is a metal hoop 18 in. in diameter (commonly called the basket) which is fixed to a back-board 6 ft by 4 ft, the hoop being 10 ft from the ground. Each team may use 7 substitutes. The object of the game is to throw the ball through the hoop. Two points are awarded for each field goal and one for a penalty. The ball, which is about 30 in. in circumference and 20 oz. in weight, must be played with the hands and not kicked. It is a no-contact game; personal contact such as kicking, pushing, slapping is a foul and the penalty is one or two free shots for the goal from a free throw line 15 ft from the basket. Playing time is 20 min. each way with a 10-min. half-time interval. The game was invented in 1891 by James Naismith of the Y.M.C.A. at Springfield, Massachusetts, and is now recognised as one of the most popular team games in the world. Fifty-two countries are registered members of the International B. B. Federation. European, World, and S. American championships are regularly organised for both men and women. The 1936 Olympic Games saw 23 countries playing in the B. B. competition, and in 1952 34 national teams competed at Helsinki.

Basket-fish, name given to echinoderms, of the class Ophiuroidea. They resemble star-fish in appearance, having the same number of arms, and obtain their name from their habit of coiling these arms over their mouths.

Basking Shark, or **Sun-fish** (*Cetorhinus maximus*), large shark of the family Lamnidae which is found in the temperate seas of both hemispheres. After the whale-shark it is the largest of living fishes, growing to a length of 35 to 40 ft. Like the whale-shark it feeds on small animals in the plankton, these being strained from the water by the long, bristle-like gill-rakers. The external gill clefts are very large and the large mouth is provided with numerous small conical teeth.

Basle (Switzerland), see **Basel**.

Basnage, celebrated Protestant Fr. family: (1) Nicolas, a religious refugee, who settled in Norwich, where he had a congregation. Afterwards returned to France. (2) Benjamin (1580-1652), his son, pastor of his father's church at Carentan; a zealous defender of the Fr. Reformed Church. (3) Antoine (1610-1691), son of above; after the revocation of the edict of Nantes escaped to Holland. Died at Zutphen, where he had a pastoral charge. (4) Samuel (1638-1721), son of above, b. at Bayeux; preached there at first, but escaped to Holland with his father. Died at Zutphen. He wrote voluminously in French and Latin. (5) Henri (1615-95), youngest son of Benjamin, b. at St Mère Eglise; studied for the Bar, and became one of the most eloquent advocates in the parliament at Rouen. His works were pub. at Rouen, 2 vols. fol., 1776. (6) Jacques (1653-1723), son of above, the most celebrated of his family. Studied at Saumur under Tanaquil le Févre and at Geneva and Sedan. Ordained pastor at Rouen, 1676. In 1685, when

the church was closed, he received permission to retire to Holland; settled at Rotterdam; knew many scholars of all countries, including Bayle; was esteemed by Voltaire. His works were principally theological. (7) Henri (1656-1710), son of Henri above, b. at Rouen, followed the profession of his father. On the revocation of the Edict of Nantes fled to Holland, where he died.

Basochs, or **Bazochs**, corporation of the clerks of the parlement of Paris which existed from about 1302 until the revolution. Philip the Fair is said to have been the founder, and to have granted the members certain privileges. Other B.s included that of the clerks of the Palais de Justice, etc.

Basque Provinces (Sp. *Provincias Vascongadas*), name given to 3 provs. of N. Spain: Alava, Guipúzcoa, and Vizcaya (qq.v.). The considerable autonomy enjoyed by the region was curtailed in 1876 as a result of Basque support of the Carlists (q.v.). During the civil war of 1936-9 (see **SPAIN, History**), the region supported the republicans, and in Oct. 1926 a short-lived autonomous Basque gov. was set up at Guernica (q.v.). Area 2736 sq. m.; pop. 1,100,000. See **BASQUES**.

Basque Roads, Action in the, naval engagement in the B. R., below the ls. of Aix, near Rochefort, where the Fr. fleet of 14 ships was attacked by Lord Cochrane, in command of the fireships, and Lord Gambier, 11-12 April 1809. There was a panic among the Fr. sailors; 12 ships ran aground and 4 were destroyed. Cochrane thought that the victory would have been more complete had he received more active support from his superior Gambier. The latter was accused of negligence at a court martial, but was acquitted, and Cochrane was obliged to retire on half-pay.

Basques (Sp. *Vascongados*), race of people dwelling on the slopes of the Pyrenees, occupying, on the S. in Spain, Navarra (q.v.) and the Basque provs of Alava, Guipúzcoa, Vizcaya (qq.v.); on the N., the Fr. dept of Basses-Pyrénées (q.v.). The word Basques is derived from the Lat. *Vascones*, which word in its Germanic form, *Wascones*, has also given a name to the Gascons, an entirely different people. Perhaps no race has raised so much discussion as to its origin as that which we are now considering, and the question is still unsettled. There is no doubt as to the extreme antiquity of the Basque settlements on the Pyrenees. Moreover place names throughout Spain, Sicily, Sardinia, and Corsica bear a strong resemblance to Basque names, and may sometimes be explained from Basque derivations. It is thought that the Basque race is connected with the anc. Iberian or Celtiberian (see **CELTIBERI**) and was dispersed over the dists. named above. Some, however, deny the connection of the B. with the Iberi of the Romans, and make them an indigenous people who have never extended over larger regions than their present quarters. A third theory connected them with the fair-skinned

African races, and would carry their origin back through some of the Berber tribes, through the anct Libyans to a people represented on the Egyptian monuments. Lastly may be mentioned a theory deriving them from the inhab. of a lost Atlantic continent, represented also by the Guanches (q.v.) of the Canary Is., and by a certain fair-skinned W. African race. The B. themselves are fairer than the peoples of the S., but darker than the N. races. The race is by no means pure, and a large range of types is found. As in complexion, so in stature, they occupy an intermediate place between the N. and S. Europeans. Their skulls are both dolichocephalous and brachycephalous, and have certain peculiar characteristics. Collignon tells us that the Basque type differs from all those he knows of Europe and N. Africa. The B. know themselves by the name *Euskaldunak*, a word formed from the name of their language *Euskara*. The origin of this word is uncertain, but the most probable meaning is 'speaking plainly.' Their tongue stands alone among the languages of Europe, as the only remaining example of a consistent incorporative and agglutinative tongue. Though no close connection is to be traced, it shows affinity with the Finnic and Magyar families, which are simply incorporative, and the N. Amer. incorporative and polysynthetic languages. Morphologically it occupies a position between these 2 groups, constituting a separate class. It is, as has been said, agglutinative, modifications of meaning and grammatical relations not being expressed either by prepositions or by inflections. Instead, there is a system of post-fixing, various additions being made one after the other. Thus, *valdi*, 'horse'; *valdia*, 'the horse'; *valdiak*, 'the horses'; *valdiaren*, 'of the horse', etc. There is a lack of general and abstract terms, though an abundance of particular terms. The personal pronouns, *ni*, 'I'; *hi*, 'thou'; *gu*, 'we'; *zu*, 'you', bear a superficial resemblance to the Hamitic languages. Basque has no genders except in the verb, where a suffix is added to show the sex of the person addressed. Thus *estakinal* means 'I do not know it, woman'; *estakial* (for *estakikal*), 'I do not know it, man.' The verb incorporates with itself not only the pronoun, but also the direct and indirect complements. Thus there are separate forms for 'I give it,' 'I give it to you,' 'I give them to you,' etc., varying according to the sex of the person addressed. The regular verbal conjugations for the transitive and intransitive are now used but rarely, being reserved for the verbs 'to have' and 'to be' respectively. The language has, on the other hand, developed a conjugation by combining auxiliaries with the participles of all the other verbs. Thus instead of saying *dakust*, 'I see it,' the form is *ikusten dut*, 'I have it in seeing.' Originally there were but 2 tenses, the present and the imperfect, but a conditional future has now been formed. There are no clearly defined moods. Syntax is simple,

as in all agglutinative languages, and the phrases are short. Composition is used to such an extent that many phrases originally distinct have now become confounded. The dialects vary considerably, 25 in number, in 8 divs., which can be again reduced to 4 main dialects, those of Guipúzcoa and Vizcaya (Spain) and Labourdin and Souletin (France). The hist. of Basque literature is short as no anct monuments remain. The first printed book in the language was the *Linguae Vascorum Primitiae*, a collection of poems by Bernard d'Echepare. Next to this comes the trans. of the N.T. by Licarrague, acting under the instructions of Jeanne d'Albret (La Rochelle, 1571), which ranks as the great classic of the language. Before the 19th cent. there existed no national literature, but attempts have been now made to form one. The few hundreds of vols. printed in Basque consisted chiefly of trans. from French, Spanish, or Latin. The B. are profoundly religious, and their country has produced 2 great champions of the faith. Ignatius Loyola, founder of the Society of Jesus, and Francis Xavier, the great missionary (qq.v.). Most of their older literature, though no MS. exists older than the 18th cent., is religious. Their legends and *pastorales*, a kind of open-air drama, are mainly derived from the French. The B. have ever shown the ability to retain their independence. Though the Romans conquered them, they did not assimilate them in any way. The Visigoths did the same and no more. At the beginning of the 10th cent. the B. to the S. of the Pyrenees were brought into the kingdom of Navarre, but they still retained their *fueros*, or assemblies, in which they ruled themselves to a great extent. The B. are engaged in agriculture and fishing, and many of them have emigrated to the Newfoundland cod-fisheries. Their great agility was remarked in the 8th cent., and still remains a characteristic. They make excellent soldiers and sailors, and their anct renown as pirates is continued by their success as smugglers. They are extremely conservative in dress, customs, and tradition. The dress of the men is simple, consisting generally of the knickers, girded with a large red belt, open waistcoat, short tight coat, and carelessly tied kerchief round the neck, the whole surmounted by the national beret, a red or blue cap. Pelota (q.v.) is a popular game with the B. The number of B. in Europe is about 700,000 of whom about 125,000 are in France, and the rest in the Sp. provs. Of late years there has been a great deal of emigration, especially to S. America, where it is estimated that there are at present no fewer than 200,000 B. scattered over the Argentine Rep., Mexico, and Cuba. See BASQUE PROVINCES.

Bibliography. LANGUAGE AND LITERATURE: W. Webster, *Basque Legends* (including Basque poetry), 1879; E. H. J. Vinson, *Essai d'une bibliographie de la langue basque*, 1891; H. Gavel, *Éléments de phonétique basque*, 1920; P. Lhanda, *Dictionnaire basque-français et français-basque*, 1926-38; W. J. Entwistle,

Spanish Language (with Basque), 1936. GENERAL: K. W. Fedden, *The Basque Country*, 1921; P. S. Ormond, *The Basques and their Country* (chiefly the Fr. provs.), 1925; R. Gallop, *A Book of the Basques*, 1930; T. C. Smith, *San Sebastian and the Basque Country*, 1935.

Basra, Bassora, or Bussora: 1. Div. and liwa of Iraq and formerly a Turkish vilayet of Mesopotamia. The dist. of B. includes also the liwas Amara and Muntafik, the total area being 53,580 sq. m. and the pop. (1947) 1,029,953 (B., 352,039; Amara, 308,108; Muntafik, 369,806).

2. A port on the Shatt al-Arab about 67 m. from the sea. A tn was in the

B. and Bagdad and a railway connects B. through the cap. with Stamboul and Persia. At some period the tn moved to its present position. It consists of 3 parts: B., Ashshar Creek, and Maqll, the port; the dist. is intersected with ditches and canals and is only 8 ft above sea level. There are no anct monuments. Pop. 37,000.

Bas-relief, or low-relief, term used to denote forms of sculpture which project very little from the background. The It. terms *basso-rilievo*, *mezzo-rilievo*, and *alto-rilievo* (q.v.) were used at the time of the Renaissance according to the degree of projection from the surface forming a

W. F. Mansell

BAS-RELIEF

A group from the Elgin Marbles, British Museum.

vicinity in anct times but the Arab tn was a new foundation (AD 637), originally a permanent camp to serve as a base for further campaigns with the desert behind to secure the retreat of the Bedouin Arabs in case of need. It was some 9 m. SW. of the modern tn. Under the Umayyad caliphs the governor of B. administered Khorasan (N. Persia) by a deputy; this shows its importance. Under the early Abbasid caliphs it was a lively centre of literary life and its position made it the emporium of trade with the far E. In 1534 the Turks occupied it. In the 17th cent. a native made himself an independent ruler and opened the port to European ships, first Portuguese, then Dutch, and then English. The last independent ruler had to take refuge in Persia; then Turks and Persians fought for the tn till 1779 when the Turks won. During the First World War B. was equipped as a modern port to take ocean-going ships; now it has an air-port, seaplane base, wireless station, and the bar at the mouth of the riv. has been dredged to take ships of 22½ ft draught at low tide. Riv. steamers ply between

background. These terms fell out of use, and 'B.' became the general term to signify all 'relief' sculpture, as distinct from sculpture in the round. The anct Egyptians appear to have been the earliest people to practise this art, but the Persians, Assyrians, and Babylonians also represented their exploits and divinities in this way. The figures shown in these early B.s are stiff and regular in outline. After the time of Crassus, the marble sarcophagi at Rome were usually decorated at the ends with B., many well-known legends being thus portrayed. The Elgin Marbles in the Brit. Museum, which provide examples of both high and low relief, constitute the best anct example of this class of art, whilst the B.s of Donatello, Canova, Flaxman, and Thorwaldsen were noted in later ages.

Bas-Rhin, see RHIN, BAS-.

Bass, George (d. 1812), explorer, b. Asworthy, Lincs. He was apprenticed to a surgeon at Boston, Lincs; joined the navy and became surgeon to H.M.S. *Reliance*. In 1795 he sailed to Australia, and explored the coast of New S. Wales and Tasmania with Flinders (q.v.),

1795-1800. B. Strait owes its name to him.

Bass, Michael Thomas (1799-1884), Brit. brewer. He made his family business into the largest of its kind, with a world-wide reputation. He sat in Parliament as a Liberal, 1848-83, where he was a strong advocate of social reform.

Bass (It. *basso*, low), musical term denoting the lower part in the harmony of a composition, the lowest pitched of a class of instruments, or the lowest male singing voice. The B. part contains more frequently than not the fundamental notes of the chords, and the pedal-'point' is formed on the long-sustained sound of a single note of it. The ordinary compass of the B. voice is from F below the stave in the B. clef to about D above it.

Bass, or **Basse**, name applied to certain perch-like fishes of the order Perciformis. The Eng. varieties are marine, while the Amer. comprise sev. fresh-water fish. The common bass of the family Serranidae is known as *Morone labrax*, receiving its specific name from its wolf-like voracity; it is common to the Mediterranean. Two species of black B. afford sport for Amer. anglers; they are the *Micropterus salmoides* and *M. dolomieu* of the sun-fish family, Centrarchidae. Nearly all B. are edible.

Bass, Double, see DOUBLE BASS, also VIOLIN.

Bass, Figured, see THOROUGH-BASS.

Bass, Fundamental, see FUNDAMENTAL BASS.

Bass, Ground-, see GROUND-BASS.

Bass, Thorough-, see THOROUGH-BASS.

Bass Clef, see CLEF.

Bass Rock, conical insular rock at the mouth of the Firth of Forth, Scotland, 3 m. from N. Berwick, about 1 m. in circumference, rising to a height of 350 ft. It has an imposing aspect, with precipitous lofty cliffs; a cavern runs from the NW. to the SE. which is explorable at low tide. It is inaccessible save at one shelving point on the SE. side. Purchased by the Eng. gov. in 1671, the castle was converted into a state prison in which sev. eminent Covenanters (q.v.) were confined. The rock was held for James II by 16 Jacobites against a small army of William III (1691-4). The fort was demolished in 1701. The rock is now private property, being farmed for the sea-birds that breed there.

Bass Strait, broad sea channel, average width c. 140 m., and some 200 m. long, separating Australia from Tasmania. It is studded with is., the chief of which are King Is., and the Furneaux (q.v.) group. Navigation is difficult as a result of the numerous coral reefs. The strait was discovered in 1798, and named after George Bass (q.v.).

Bass Tuba, another name for the bass saxhorn in F or E flat. It is sometimes applied to the euphonium.

Bass Viol, or **Viola da Gamba**, bass instrument of the viol family. It had six strings. The name B. V. was sometimes wrongly given to its successor, the violoncello.

Bassadore, see BASIDU.

Bassandyne, Bassendyne, or Bassinden, Thomas (d. 1577), Scottish printer, book-binder, and bookseller at the Nether Bow, Edinburgh. He printed the earliest trans. of the N.T. produced in Scotland in 1576, and also an ed. of Lindsay's works. See Dobson, *History of the Bassandyne Bible*, 1887.

Bassano, otherwise **Jacopo da Ponte** (1510-92), It. painter, b. Bassano, son and pupil of Francesco da Ponte. He was sent by his father to Venice to study the Venetian school of painting. His work met with success, and Tasso and Ariosto sat to him for their portraits. A painter of considerable influence, he is noted for the rustic and peasant elements in his compositions. His best works are the 'Entombing of Christ' at Padua, and the 'Seizure of Christ.' He had 4 sons who worked in the prolific family studio: (1) Francesco, commonly called the younger B. (1548-91), studied under his father, and achieved considerable reputation, practising at Venice. In a fit of delirium he threw himself out of a window and was killed. (2) Giovanni (1553-1613), known as a copyist of his father's work. (3) Leandro (1558-1623), distinguished himself as a portrait-painter, but painted historical and sacred subjects occasionally. (4) Girolamo (1560-1622), employed by his father in copying, but contributed an original piece of 'St Barbara and the Virgin' at Bassano.

Bassano (del Grappa), It. tn, in Veneto (q.v.), on the Brenta (q.v.), 17 m. NE. of Vicenza. The Austrians were defeated here by Napoleon (q.v.) in Sept. 1796, and at nearby Monte Grappa there was heavy fighting during the First World War. During the Second World War the tn was seriously damaged, but many structures, including the remarkable wooden bridge, have since been repaired. B. has ant. walls, a 10th-cent. cathedral, and a museum which contains, among other masterpieces, works of the famous B. (q.v.) family of painters. Silk, paper, porcelain, and wax are manuf., and there is a trade in wine and olive oil. Pop. (tn) 15,000; (com.) 27,300.

Bassantin, or Basington, James (c. 1504-68), Scottish astronomer, educ. at Glasgow, and settled in Paris where he taught mathematics and astronomy. His best-known work was a *Discours astronomique*, Lyons, 1577, trans. into Latin by de Tournes (Tornesius) under the title of *Astronomia J. Bassantini*, Scott., Geneva, 1559. His planetary system is that of Ptolemy.

Basse, or Bas, William (c. 1583-1653), Brit. poet. He was a retainer of Sir Richard Wenman of Thame Park, Oxon. He wrote on country life and was the author of *Sword and Buckler*, 1602, and *Great Brittaines Sunnes-set*, 1613. He is remembered for his epitaph on Shakespeare, and for a song quoted in Walton's *Compleat Angler*. His works were ed. by R. W. Bond, 1893.

Basse-terre: 1. Seaport and cap. of the W. Indies, on the SW. coast of the is. of St Kitts, Leeward Is., of St Kitts-Nevis residency. *Entrepôt* trade in sugar,

cotton, salt, fruits with nearby is. Cable station and airfield. Pop. 12,200.

2. Is., W. part of Guadeloupe, separated from the E. part by a narrow channel; rocky and mountainous, it contains the volcano *Son Frière* (4858 ft) which erupted in 1956 after being dormant for 120 years.

3. City, cap. of Guadeloupe, on SW. coast of B.-T. is., centre of rich agric. region. Pop. 10,000.

Bassedau, Johann Berend, see BASEDOW.

Bassée, La, Fr. tn in the dept of Nord, on the La B. canal, near Lens. It occupied an important strategical position on the W. front in the First World War; in the first battle of Ypres the allied line ran through La B. (see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN). Pop. 4900.

Bassein: 1. Seaport of Lower Burma, and cap. of the dist. of B., on the riv. of that name. The H.Q. of the Irawadi div., B. is the second port of Burma and can handle ships up to 10,000 tons. Prin. export is rice, and coal, salt, cotton goods, etc., are imported. Pop. 45,700.

2. Tn in the presidency of Bombay, India, 28 m. NE. of Bombay. It was ceded to the Portuguese by the King of Gujarat in 1534, and remained in their possession until taken by the Mahrattas in 1739. It was taken over by the British in 1818. It contains notable remains of the Portuguese fort and of many fine buildings of the 16th and 17th cents. Pop. 13,969.

Bassenthwaite, lake (4 m. long and $\frac{1}{2}$ m. wide), Cumberland, England, lying on the R. Derwent some 5 m. above Derwent Water (q.v.).

Basses-Alpes, see ALPES, BASSES.

Basses-Pyrénées, see PYRÉNÉES, BASSES.

Basset, Fr. breed of medium-sized hound with a long body, short crooked legs, and heavy head, which was introduced into England for the first time in the early 17th cent. It was formerly used in the baiting of badgers, but is now employed in deer-hunting and in hare-hunting, in which it shows its persevering but slow nature. There are both smooth and rough-haired varieties, but the colouring is usually tan on the head and black and white on the body.

Basset Horn (It. *corno bassetto*, wrongly *corno di bassetto*), wind musical instrument invented in Germany in 1770. It is similar to a clarinet in fingering, but transposing down a fifth. It contains additional low notes. The scale as written embraces nearly 4 octaves, from C, the second space in the bass clef to G in altissimo, including every semitone; but its real notes, in relation to its use in the orchestra, are from F below the bass stave, to C, the second ledger line above the treble. 'Corno di Bassetto' was an early pseudonym of George Bernard Shaw as music critic.

Bassett, John Spencer (1867-1928), Amer. historian, b. Tarboro, N. Carolina. Educ. in N. Carolina. Specialising in hist., he became prof. of Amer. hist. at

Smith College, Massachusetts, from 1906 to 1914, when he became head of the hist. dept at the same institution, holding this post until 1928. He wrote many books dealing with the hist. of his native state, and, in addition, the following: *The Life of Andrew Jackson*, 1911; *A Short History of the United States*, 1913; *The Lost Fruits of Waterloo*, 1918; *Our War with Germany*, 1919; *The League of Nations, a chapter in World Politics*, 1928.

Bassia, see MADHUGA.

Bassières, Jean Baptiste, Duke of Istria (1768-1813), Fr. marshal. In the Constitutional Guard of Louis XVI he took part in the Sp. war. He won honour in the E. Pyrenees and the Moselle. In 1796 he served under Napoleon as captain during the It. campaign. A distinguished career saw his return with Napoleon from Acro and Aboukir, when he was second-in-command of the Consular Guard. He was made marshal of France in 1804, and was created Duke of Istria 5 years later.

Bassigny, dist. in the former prov. of Champagne, France, now forms parts of the depts of Haute-Marne, Meuse, and Aube. Its chief tns were Langres, Chaumont, and Bourbon-les-Bains.

Bassinden, Thomas, see BASSANDYNE.

Bassington, James, see BASSANTIN, JAMES.

Basso Continuo, It. for thorough-bass (q.v.).

Basso-rilievo, see BAS-RELIEF.

Bassompierre, François de (1579-1646), marshal of France and captain-general of the Swiss Guard, b. Lorraine of a noble and military family; became a favourite of Henry IV; took part in the religious wars, appointed captain-general of the Swiss Guard; under Louis XIII ambas. to Spain; 1626, sent to England by Richelieu to enforce the marriage treaty between Henrietta Maria and Charles I in so far as it related to toleration of Rom. Catholic worship. Supported Marie de' Medici against Richelieu, at whose instance he was arrested and sent to the Bastille for 12 years; released at Richelieu's death; d. of apoplexy 3 years afterwards. See *Mémoires du Maréchal de Bassompierre*, 1723, and *Bassompierre's Embassy to England*, 1819.

Bassoon (Fr. *basson*, Ger. *Fagott*, It. *fagotto*), wood-wind instrument with a double-reed mouthpiece, forming the bass of the oboe family. Its direct ancestor was the bass pommer, which was straight and 6 ft in length; the tubes of which the B. is formed resemble a bundle (fagot), hence the Ger. and It. names for the instrument. It consists of 5 pieces, joined together into a wooden tube 93 in. long, which has a conical bore tapering from a diameter of $1\frac{1}{4}$ in. at the bell to $\frac{1}{4}$ in. at the reed. The pieces are known as the bell, the long joint, the wing, the butt, and the crook, to the last of which the mouthpiece is attached. The performer holds the instrument in a diagonal position, passing its strap around his neck; the notes are produced by 7 holes, and 16, 17, or 19 keys. The mechanism and fingering are intricate. From an acoustic point of view the B. is badly constructed,

but in practice it affords the artist a scope surpassed only by the stringed instruments. Its compass comprehends 3 octaves, rising from B flat below the bass staff. It has been a favourite instrument with all the masters after Bach and Handel, and Mozart wrote a concerto for the B., with orchestra. The range of the double B. is roughly an octave below that of the B. It is much employed in the modern orchestra to add the lowest bass to the woodwind section.

Aristaenetus. B.'s literary labours were devoted to verbal criticism.

Bast, in its 2 forms, soft and hard, constitutes what is known in botany as phloem. The soft B. consists of sieve tubes, companion cells, and parenchyma cells, and the sieve tubes are employed in carrying food material from the leaves to the rest of the plant; the hard B. is composed of long, narrow B. fibres, resembling wood fibres, and parenchyma cells. In commerce the B. fibres of flax,

A. Modern French.

B. Modern German.

Bassora, see **BASRA**.

Bassora Gum, name given to a gum derived from plum and almond trees, and often used to adulterate gum tragacanth; came originally from Bassora or Basra.

Bassus, **Caesius**, Rom. lyric poet of Nero's reign. He was a friend of Persius (q.v.), whose works he ed. and whose sixth satire is addressed to him. B. is said to have perished in the eruption of Vesuvius (AD 79). Quintilian praises him (Instit. x, I. 96). Fragments of his works survive, and he is generally identified with the author of a partially extant treatise *De Metris* (ed. Kell, 1885).

Bassus, genus of hymenopterous insects of the family Braconidae. They are closely allied to the ichneumon flies, have 4 wings, long and narrow bodies, and frequent the flowers of umbelliferous plants.

Bast, **Friedrich Jakob** (b. c. 1772), Ger. scholar, b. in the state of Hesse-Darmstadt. He afterwards studied in the univ. of Jena, under Profs. Griesbach and Schütz. His first literary essay was a commentary upon Plato's *Symposium*, which was followed in 1796 by a specimen of an intended new ed. of the letters of

hemp, and jute are sold for various purposes. See **VASCULAR SYSTEM**.

Basta, **Georg**, **Baron von Sult** (1550-1607), Austrian general, b. at Rocca, S. Italy. He served under Alexander Farnese in the Low Countries, 1589-90, and occupied Transylvania in 1598. In 1603 and 1604 he suppressed risings which were largely due to his cruel administration.

Bastan, see **BAZTÂN**.

Bastard (O.F. *filz de bast*), person b. out of lawful wedlock and not subsequently legitimated. By the Eng. law a child b. during the marriage of his parents is legitimate, even if the child is begotten out of matrimony. The fact of birth during marriage or within a certain time after the husband's death raises a strong presumption of legitimacy, rebuttable only by proof of non-access on the part of the husband. By the Scottish law and most continental systems, which are based on the canon and civil laws, a B. may be legitimised either by the subsequent marriage of his parents, or by special dispensation not affecting the rights of third parties. In 1926 the Eng. law was assimilated to the Scots law by the Legitimacy Act of that year, under

which an illegitimate child can become legitimate on the subsequent marriage of the parents, provided at the time of birth both were free to marry. The father of a legitimated child must, at the time of the legitimating marriage, be domiciled in England or in Wales. The rights of succession to property acquired by legitimation are, however, confined to dispositions made after legitimation took place. Civilly the B. is *filius nullius* for most purposes, and is therefore heir to none of his reputed ancestors and entitled to no share of the personal property of his reputed parents if they die intestate. Nor has he a surname until he acquires one by reputation. But Eng. law admits a B. to be the son of his putative father and his natural mother for purposes of maintenance. A B. takes as his primary settlement for public assistance purposes the place where he was b., but a legitimate child takes his father's bp. The Eng. law relating to the maintenance of B.s is to be found in a number of statutes, the nature of the changes in the law indicating that no settled principle has regulated Eng. legislation on this subject. By the Bastardy Laws Amendment Act, 1872, the mother of a B. may summon the putative father before the petty sessions within 12 months after the birth of the child, or at any later time if he is shown to have contributed to the child's support within 12 months, and the justices, on the mother's evidence being corroborated, may adjudge the man to be the putative father and order him to pay a weekly sum for its maintenance. Such order becomes invalid after the child attains 16. An appeal lies to quarter sessions. The mother only may apply for such an order, though in case of her death or incapacity or omission to apply before the child becomes chargeable to National Assistance, the public authority concerned may proceed against the putative father. The custody of a B. belongs to its mother in preference to the putative father.

Bastard Bar is a name sometimes employed erroneously in speaking of the baton sinister (see BATON).

Bastard Palm, see MELITTIS.

Bastardy, Declarator of, suit which holds in Scots law for the disposal of the effects of a deceased person who was illegitimate. The recipient of the estates must receive a deed of gift from the Crown to state that he is entitled to them, and the defender is represented by any person or persons who could pretend to heirship if the owner had been b. in wedlock.

Bastl, see BAZA.

Bastia (*bastiglia*, a fortress), most important city and port of Corsica (q.v.), 65 m. N.E. of Ajaccio (q.v.). It is on the E. coast, and is overlooked by a 16th-17th-cent. fortress which has replaced the original *bastiglia* built by the Genoese in 1380. There are sev. fine churches. Much destruction was caused during the Second World War. The chief industries are fishing, and the manuf. of foodstuffs and pipes. Pop. 52,300.

Bastian, Adolf (1826-1905), Ger. traveller and ethnographer, b. Bremen. He

was educ. as a physician, but in 1851 he started on the first of his many voyages. This first voyage lasted for 8 years, and he travelled round the world. Between 1864 and 1866 he visited the Indian Archipelago and Japan, the desert of Gobi, the Ural and Caucasus Mts, and the Caspian and the Black Seas. He was created prof. of ethnology and administrator of the ethnological museum at Berlin, and later was president of the Berlin Anthropological Society. He organised the station of Chinchoxo on the coast of Loango, and completed the ethnographical collections of the Royal Museum at Berlin. Between 1875 and 1891 he undertook journeys to Oceania, central and S. America, and from central Asia to America. He wrote numerous standard books on ethnology and anthropology, his chief work, *The Peoples of Eastern Asia*, being pub. in 1866-71.

Bastian, Henry Charlton (1837-1915), biologist and physician, b. Truro. He was educ. at Falmouth and at Univ. College, London. He was assistant curator in the univ. museum 1860-3, and 1864-6 head officer in Broadmoor Criminal Lunatic Asylum. In the latter year he was appointed lecturer on pathology and assistant physician at St Mary's Hospital, in 1875 prof. of pathological anatomy at Univ. College, and 1887-95 prof. of medicine and clinical medicine. He supported the theory of spontaneous generation. He was one of the founders of Brit. neurology; his best work in this field was on aphasia and other speech defects. His more important works include *Modes of Origin of Lowest Organisms*, 1871, *Evolution and Origin of Life*, 1874, *Brain as an Organ of Mind*, 1880, and *Treatise on Aphasia and other Speech Defects*, 1898.

Bastiat, Claude Frédéric (1801-50), Fr. economist, b. Bayonne. Educ. Saint-Sever and Sorèze colleges, and in 1818 entered the counting-house of his uncle. In 1825 he retired to a property at Mugron, of which he became the owner on the death of his grandfather. Here he passed his time in farming and study until the revolution of 1830, which he welcomed. He became a *juge de paix* for his canton in 1830, and in 1832 a member of the General Council for the Landes. He followed the progress of Cobden's Anti-Corn-Law League, and formed a parallel association in France. After the revolution of 1848 he was elected to the constituent and legislative assemblies. He d. at Rome, 24 Dec., of a lingering disease. His pamphlets against Socialism and Protection are considered to be masterly; his great economic work was cut short by death.

Bastien-Lepage, Jules (1848-84), Fr. painter, b. in the vil. of Damvillers, in the dept of Meuse. In 1867 he went to Paris to the Ecole des Beaux Arts, where he studied under Cabanel, and in 1874 his 'Song of Spring,' a study of rural life, attracted attention at the Salon. 'The Hayfield,' which he first exhibited at the Salon of 1877, and which went to the Luxembourg, is a typical example of his truthful and simple style which had some

influence in England. He gained the cross of the Legion of Honour in 1879 by his portrait of Mme Sarah Bernhardt and exhibited in the Royal Academy of 1880. See study by G. Clausen, with memoir by A. Theuriot, 1892.

Bastille, Fr. name for any castle with towers, but as a proper name it signifies the old state prison and citadel of Paris. This was built about 1369 by Charles V. but came to be used as the place of confinement for persons of rank or political importance. It was popularly detested as an emblem of tyranny. The capture of the B. on 14 July 1789 marked the beginning of the Fr. Revolution. De-launay, the governor, was lynched as he was being taken to the *Hôtel de ville*, and the B. was completely destroyed by the mob. A column in the Place de la Bastille now marks its site. See F. Kirchelsen, *The Grim Bastille*, 1930.

Bastinado (Sp. *bastón*, cudgel), European name for an oriental form of punishment which consists in inflicting blows with a stick upon the victim, generally on the soles of his feet, sometimes on his back.

Bastion (Fr., from It. *bastione*), in fortifications, is a mass of earth which stands out from the rampart of which it forms the main portion. Bs are faced with turf or stone, and consist of 2 flanks, which serve to protect the neighbouring Bs, and 2 faces, which meet in an angle towards the enemy, and command the outworks and the ground in front. The fifth side, which is open to the interior, is known as the gorge.

Bastogne, small tn in the prov. of Luxembourg, Belgium, the scene of the Rundstedt (q.v.) offensive in Dec. 1944. See WESTERN FRONT IN SECOND WORLD WAR.

Bastwick, John (1593-1654), physician and Puritan, b. Writtle, Essex, and educ. at Emmanuel College, Cambridge. He pub. a number of pamphlets attacking ceremonial in the Church of England, for which he was fined, pilloried, had his ears cut off, and was imprisoned. The proceedings were reversed by Parliament in 1640.

Basutoland, one of the 3 High Commission Terr. in S. Africa, administered under general control by the Commonwealth Relations Office in London. Local control is by the High Commissioner for the U.K. in the Union of S. Africa who is represented in B. by a resident commissioner. B. is a member of the S. African Customs Union. It is bounded on the N. and W. by the Orange Free State, on the S. by Cape Province, and on the E. and NE. by Natal. The surface is mountainous, and the average height above the sea is 6000 ft. The Maluti Mts and the Molappo Mts, which are parallel to the Quathlamba Range, divide the country into 3 almost equal dists.; the headwaters of the Orange R., the Tugela R., the Kornet Spruit, the Caledon R., and the Senka R. lie in B. The Maletsunyane Falls (660 ft) are the twelfth highest waterfalls in the world. The climate is healthy and invigorating,

but cold in winter, and the average rainfall is about 32 in. per annum, most of it falling in the summer. B. is the best grain-producing country in S. Africa, and maize, Kafir corn, and wheat are grown over an area of some 730,000 ac. The ponies of B. are hardy and sure-footed, whilst sheep and cattle are also reared in large numbers. Mule-breeding has been introduced. Diamonds were discovered in 1856, but whether or not in payable quantities is uncertain. B. has a great hydro-electric potential, and if the waters were harnessed power could be sold profitably to the new Orange Free State gold-field. Surveys have been carried out and reports are being examined (1957). Considering the mountainous nature of the country the roads are good, but there are no railways, except for a line that crosses the W. border to connect Maseru with Bloemfontein. Wool, mohair, cattle, and hides are the chief exports, also wheat and Kafir corn. There are few forests, and much of the country is uninhabitable. Whites are not allowed to settle without special permission. The natives are intelligent, industrious, and brave. Ritual and medicine murders are still prevalent. Dr G. I. Jones prepared a valuable report on this subject in 1950 for the Colonial Office. The area of B. is 11,716 sq. m., and pop. (1946), natives, 561,289; whites, 1689; Asiatics and others, 876.

History. The Basuto of B. are commonly believed to have been the remnant of a number of tribes which were dispersed by the wars waged by Mosilikatze, King of the Matabele, in the early part of the 19th cent. Their earliest ruler was Moshesh or Moshoshe, who welded his dispersed tribesmen into a political unity. Moshesh is the Basuto national hero, and Thaba Bosiu or Bosigo was the scene of his triumph against the Zulus and others. No other spot in B. carries so much of the hist. of the nation as this small mt where Moshesh first took his stand against his foes, and where all the paramount chiefs of the past lie buried. In 1852 war broke out between Moshesh and the British, and the Basuto were defeated by Sir G. Cathcart at the battle of the Berca Mt. Between 1856 and 1866 there were border disputes with the Boer Orange Free State Rep.; the Basutos sought Brit. protection in vain, and in 1866 Moshesh ceded part of his ter. to the Boers, and acknowledged himself to be a subject of the Orange Free State. War again occurred and the Basuto again appealed to be taken under the authority of the Brit. Crown. In 1868 Sir Philip Wodehouse was authorised to recognise Moshesh and his people as Brit. subjects and to incorporate their ter. as a Brit. possession. A proclamation to that effect was issued on 12 Mar. 1868, which day is commemorated as a public holiday, 'Moshoshe's Day.' In 1871 B. was annexed to Cape Colony by an Act of the Cape Legislature, but was not made subject to the general law of the colony. The Basutoland Disannexation Law of 1883 brought the ter. under the immediate

authority of the Crown, and so it has remained. B. is economically dependent on the Union of S. Africa, by which ter. it is surrounded. Suggestions made from time to time by S. African politicians that the Basuto should throw in their lot with the Union have so far fallen on unrecipiente ears, although a clause in the S. Africa Act, 1909, makes provision for the possible future inclusion of all High Commission Terr., and the inclusion of the 3 High Commission Terr. was in fact envisaged at the time of Union. In the First World War the Basuto offered to raise fighting regiments, an offer that was, however, declined. They raised £50,000 for presentation to King George V. In the Second World War, besides raising a fund for the purchase of a Spitfire squadron, Basuto to the number of 10,000 formed part of the African Auxiliary Corps, which served in the Middle E. and Italy.

See the standard hist. by Sir G. Lagden, *The Basutos* (2 vols.), 1909; also D. F. Ellenberger, *History of the Basuto*, 1912; E. A. T. Dutton, *The Basuto of Basutoland*, 1923; Sir Alan Plm, *Report on the Financial and Economic Position of Basutoland* (H.M.S.O.), 1935.

Basyl, or **Basyle** (Gk *basis*, base; *kulf*, matter), name formerly in use to indicate a metal or group of metals which acts as a base (q.v.).

Bat, or (popularly) **Flittermouse**, or **Reremouse**, mammal of the order *Chiroptera*, nearly related to the Insectivora (hedgehogs, shrews, etc.), but differing from them in having the power of bird-like flight. The fore-limbs are greatly developed, and between each of the 4 fingers is a skin expansion which extends to the side and the hind legs; another expansion spreads from the tail to the hind legs. The thumb does not share in the flight

L, tragus; TH, thumb; MC, metacarpal; IFM, interfemoral membrane; T, tail.

modifications, and is clawed, its uses being those of attachment and occasional efforts to walk. The shoulder girdle and breast-bone are large, the latter extended to a keel, while the pelvic girdle is small. The bones of the limbs have large medullary cavities, but other bones are slight, and the ribs are flattened. The females have either 1 or 2 pairs of thoracic mammae, and give birth usually to a single offspring, which they carry with them during flight and which are born blind. The eyes of adult bats are functional but

small. However, the poorly developed visual sense is no handicap to a B., the experiments of Abbé Spallanzani in 1775 proving that B.s deprived of sight are yet able, in a room across which have been stretched a number of strings, to fly without coming into contact with one of them. Many have curiously shaped fleshy appendages called nose-leaves round the nose and mouth, and these 'leaves' direct the sounds emitted by B.s. The ears of all B.s are large, prominent, and mobile. B.s inhabit all parts of the globe except

LONG-EARED BAT

the coldest regions, but abound in the tropics. In habit they are nocturnal, sleeping during the day head downwards, holding to some object with their curved claws. They hibernate in belfries, caverns, and forests, and in some cold climates, such as that of Canada, they migrate to warmer places for the winter season. At twilight they search for food, which in most species consists of insects, in others of fruit, and in a minority of the blood of mammals. They are classified according to the food they eat into *Megachiroptera*, or frugivorous forms, and *Microchiroptera*, or insectivorous forms. To the first class belong the *Pteropus edulis*, or flying fox, the largest known species, which sometimes measures 5 ft across the wing; *Epomophorus* of Ethiopia; *Cynonycteris* of the Egyptian pyramids. To the second class belong the genera *Rhinolophus*, or horse-shoe B.; *Nycteris*, or leaf-nosed B.; *Megaderma*, of which *M. lyra*, the lyre-B., attacks other B.s, frogs, and small mammals, and sucks their blood; *Vespertilio*, the common naked-faced B. of most countries; *Vesperugo*, of which *V. pipistrellus*, the pipistrelle, is well known; *Synotis*, of which *S. barbastellus* is the barbastelle. There are in all nearly 100 genera of B.s and among others should be mentioned the true vampires, or blood-suckers; these belong to the *Desmodus* and *Diphylla*, and will attack even men and horses; the genus *Vampyrus*, to which the repulsive *V. spectrum* is attached, consists strangely enough of frugivorous and

insectivorous animals. In Britain there are a dozen species of B.s. contained in 7 genera. The power of B.s. to detect and avoid obstacles when flying in the dark has recently been reinvestigated. It is now known that the ears form an essential part of the mechanism. Squeaks pitched so high as to be inaudible to the human ear are emitted through the B.'s mouth or nose. Each squeak, which is of very short duration (2/1000 sec. or less), produces an echo when it is reflected from an obstacle. The echo is received by the ears, and the interval from the time of emission of the squeak indicates the distance of the obstacle: the longer the interval the greater the distance. The process has been termed echo location, and resembles the echo-sounding device used on ships to determine the depth of the sea. It is paralleled by the use of electro-magnetic ('wireless') waves in radar. Some blind humans appear to have similar power of echo location. See Barrett-Hamilton's *History of British Mammals*, vol. i, 1910; *Catalogue of the Mammals in the British Museum*, 1912; also the vol. on *Mammalia* by P. E. Beldard in the *Cambridge Natural History*, 1902. For echo location see *Nature*, civl. 490 (1945), and civlil. 46 (1946), and P. Bourlès, *The Natural History of Mammals* (1955).

Bataan, prov. of Luzon, Philippine Is., on the W. of the Bay of Manila; pop. 22,901. The defence of B. Peninsula by U.S. forces under Gen. MacArthur against the Jap. armies from Jan. to April 1942 will go down in hist. as a great military exploit. It shed undying lustre on Amer. and Filipino arms, and gained valuable time for the Allies. Gen. MacArthur was assisted by 2 Amer. senior officers, Maj.-Gen. Jonathan Wainwright and Brig.-Gen. Albert M. Jones, the former taking command after Gen. MacArthur had flown to the defence of Australia. The defence of B. Peninsula against the immense preponderance in men and equipment which the Japanese enjoyed there, besides shattering illusions about the invincibility of the Jap. Army and Air Force, held up at a most critical juncture in the war other very large Jap. naval, military, and air forces which could otherwise have been used much earlier against Sumatra, Java, or other important positions held in the allied cause. It gave time for recovery of Amer. naval strength after the disaster of Pearl Harbour, and for the re-grouping of Brit. naval and air forces; and it was a serious setback to the Jap. strategical plan of rapid action and shock tactics. Off the S. point of the peninsula and in the entrance channel to Manila Bay lies the small rocky is. of Corregidor. This is., which was well fortified with 16-in. guns, was the last Amer.-Filipino position to fall. See also PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

Batao, or **Batag**, tn of Luzon, Philippine Is., in the prov. of Ilocos Norte, near Laoag. It is situated in a fertile dist. and grows rice. Pop. 22,587.

Bataille, Henri (1872-1922), Fr. dramatist, b. Nîmes. He studied painting at the

École des Beaux Arts, Paris, but was so successful with his first vol. of poems, *Le Beau Voyage*, 1905, that he gave up painting for literature. Turning to drama he produced a successful play, *La Léprouse*, in 1896, and enhanced his international reputation with *Maman Colibri*, 1904, *Le Scandale*, 1909, and, later, with *La Vierge folle*, 1910, *Les Flambeaux*, 1913. His *Théâtre complet* was pub. in 12 vols. (1922-9). See J. B. Besançon, *Essai sur le théâtre de Bataille*, 1929.

Bataks, see **BATTAS**.

Batalha, tn of Portugal, in Leiria dist., 8 m. S. of Leiria (q.v.). It received its name from the battle of 1385 fought at Aljubarrota (q.v.) near by, and has a famous Dominican monastery, containing the tomb of Henry the Navigator (q.v.). Pop. 1000.

Batalpashinsk, see **CHEKRESSK**.

Batalyoz, see **BADAJOS**.

Batan, seaport of Panay Is. in the Philippines, a shipping centre for copra, hemp, and rice. Pop. 14,714.

Batan Islands, formerly **Bashi Islands**, group of is. situated between the is. of Luzon and Formosa, producing rice, corn, and coal. Pop. 10,700.

Batang, or **Battam**, is. opposite Singapore, in the Malay Archipelago.

Batangas, tn of Luzon, Philippine Is., cap. of the Batangas prov., and 58 m. S. of Manila. A well-built tn, it was founded in 1581, and contains a palace, the residence of the alcade. It has a considerable trade in native produce with Manila. There is fishing. The prov. itself is mountainous in character. The pop. of the prov. is about 510,224; of the tn, 59,582.

Batara, name given by D'Azara to the bush shrikes which form the genus *Thamnophilus*. They come from S. and central America, and belong to the family Formicariidae. The males are usually black above, whitish-brown beneath, and in length do not exceed 13 in. *T. naevius* has a rounded and comparatively short tail; *T. viginosus* has a large reddish crest, blackish at the apex.

Batatas, see **IPOMOEA**.

Batavi, race of Germans, mentioned by Tacitus as a branch of the Chatti, a Ger. tribe. They inhabited the land between the Rhine, Waal, and the Maas, called the Insula Batavorum.

Batavia: 1. See **JAKARTA**.

2. Cap. of Genesee co., New York, U.S.A., situated on Tonawanda Creek, about 30 m. WSW. of Rochester. It manufs. farm implements, shoes, paper, and metal products. The state institute for the blind is situated here. Pop. 17,800.

Batavian Republic, name by which the Netherlands were known from May 1795 till June 1806, i.e. from the conquest of the country by the French till the appointment of Louis Bonaparte as King of Holland.

Batchian, **Bathian**, or **Bachan**, is. of Indonesia; one of the Ternate group of the Molucca Archipelago, SW. of Halmahera Is.; chief port, Labuha. Area 900 sq. m. It is mountainous and fertile, but is only inhabited on the coast.

Bateman, John Frederic La Trobe- (1810-89), civil engineer, b. near Halifax. His life work was the construction of reservoirs and waterworks. It was his suggestion that Manchester should obtain its water supply from Lake Thirlmere, and Glasgow from Loch Katrine. He also superintended the construction of the waterworks of many other large towns, and was responsible for the water schemes of Buenos Aires, Naples, and Constantinople.

Bateman, Kate Josephine (1842-1917), Amer. actress, b. Baltimore, daughter of Hezekiah B. (see BATEMAN, SIDNEY). Her first appearance on the stage was at the age of 4, in *The Babes in the Wood*; later she played chiefly in Shakespearean and classical drama, with her father as her manager. She acted at the St James's Theatre, London, in *Richard III* in 1851, and in other leading parts until 1909. From 1892 she conducted a school of acting. She d. in London.

Bateman, Sidney Frances (1823-81), actress and dramatist, *née* Cowell, brought up in Ohio, where her family had settled. She became the wife of Hezekiah B. (1812-75), Amer. theatrical manager, and coming to London in 1870 assisted her husband in managing the Lyceum Theatre until 1875; later she managed the Sadler's Wells Theatre. Her 2 most popular plays were *Self*, a comedy, and a tragedy, *Geraldine*.

Bateman, William (c. 1298-1355), Bishop of Norwich, founder of Trinity Hall, Cambridge. Pope Benedict XII appointed him Dean of Lincoln, 1340. During the wars in France he undertook diplomatic negotiations between Edward III and the Fr. king, 1348-54. In 1344 he succeeded Antony Bek as Bishop of Norwich, and was consecrated by the Pope at Avignon.

Bates, Harry (1850-99), sculptor, b. Stevenage, Herts. Having won the travelling scholarship of £200 at the Academy Schools, he went to Paris in 1883 to study under Rodin. In 1892 he was elected A.R.A. 'Love and Life' is considered his masterpiece.

Bates, Henry Walter (1825-92), naturalist and explorer, b. Leicester. His father was a manufacturing hosier, and his son entered the business, but in 1844 he met Alfred Russel Wallace, and in 1848 they sailed together in a trading vessel to Pará. They had practically no money, but hoped to sell their collections when made. B. was 11 years in the country, made his way up the Amazon for 1400 m., and discovered 8000 new species of insects. In a paper which he read to the Linnean Society on the insect fauna of the Amazon valley, he stated and solved the problem of mimicry. His best-known work is *The Naturalist on the Amazons*, 1863.

Bates, Herbert Ernest (1905-), novelist, b. Rushden, Northants. Educ. at Kettering Grammar School, he began life as a journalist, and pub. his first novel, *The Two Sisters*, at the age of 20. Since then have followed a number of novels, in which various aspects of country life are depicted with a sensitive touch. They include *Catherine Foster*, 1929, *Charlotte's*

Row, 1931, *The Fallow Land*, 1932, *The Poacher*, 1935, *A House of Women*, 1936, *Fair Slood the Wind for France*, 1944, *The Purple Plain*, 1947, *The Jacaranda Tree*, 1949, *The Feast of July*, 1954, and *The Sleepless Moon*, 1956. He is particularly successful as a writer of short stories, collections of which include *Day's End*, 1928, *Seven Tales and Alexander*, 1929, *The Woman Who Had Imagination*, 1934, *Cut and Come Again*, 1935, *The Flying Goat*, 1939, *My Uncle Silas*, 1940, and *The Bride Comes to Evensford*, 1949. *The Day of Glory*, 1945, is a play, and *The Country Heart*, 1949, a travel book. He served in the R.A.F. in the Second World War, and his experience was the source of his poignant stories of service life, originally pub. under the pseudonym 'Flying-Officer X.'

Bates, Joshua (1788-1864), Amer. financier, b. Weymouth, Massachusetts. Sent to London in 1816 to take charge of business for Gray & Son; met the Baringes, and formed a partnership with John Baring; B. eventually became senior partner of Baring Bros. & Co. During the Civil War he used his influence against the Confederate States.

Bates, Katherine Lee (1859-1929), Amer. scholar and poetess, b. Falmouth, Massachusetts. She was educ. at Wellesley College where, after a period of study at Oxford, she was prof. of Eng. literature from 1891 to 1925. She is best known for her poem 'America the Beautiful,' which has been suggested for adoption as the U.S. national anthem. Her *Selected Poems* appeared in 1930.

Bateson, Mary (1865-1906), historian, b. Robin Hood's Bay; daughter of a fellow of St John's College, Cambridge. Educ. at Newnham, of which she became a fellow. Her main interest was the study of the hist. of the Middle Ages, especially that of the constitutional and legal problems offered by the hist. of municipalities and bor. customs. Among her contributions of most importance were 'Laws of Breteuil' in the *English Historical Review*, 1900, and *Bale's Index Britanniae Scriptorum*, 1902 (in collaboration with W. B. L. Poole).

Bateson, William (1861-1926), biologist, b. Whitby. Educ. at Rugby School and St John's College, Cambridge, he was early attracted to biological studies. He became Silliman lecturer at Yale in 1907; prof. of biology at Cambridge, 1908-9; director of John Innes Horticult. Institution at Merton Park, Surrey, 1910; Fullerian prof. of physiology, Royal Institution, 1912-14; president of the Brit. Association for Advancement of Science, Australia, 1914; trustee of Brit. Museum, 1922. In addition to his various papers on biological subjects, he pub. books entitled *Materials for the Study of Variation*, 1894; *Mendel's Principles of Heredity*, 1902; *Problems of Genetics*, 1913.

Bates's Case (or *the Case of Impositions*), famous case in Eng. constitutional hist., which came before the court of exchequer in 1606. In that year James I directed the collectors of customs to demand a duty of 5s. per cwt on imported currants, in

addition to the 2s. 6d. granted by the Statute of Tonnage and Poundage. John Bates, a merchant of the Levant Co., refused to pay the additional duty, on the ground that it had not been granted by Parliament; but a unanimous decision of the 4 barons of the court of exchequer, under Chief Baron Fleming, was soon given for the Crown on process against him by information. The decision, which created a dangerous precedent, was entirely subversive of liberty, but, apart from the fact that in those days judges could be dismissed at the royal pleasure, Eng. constitutional law had not reached that stage of development which later, under Coke and Hale, estab. for all time what is known as the 'rule of law.' See 2 State Trials, 371; S. R. Gardiner, *History of England* (i. 449), 1883-94; *State Papers, Domestic*, xviii. 109, 116, xlix. 10; and i. 1.

Bath: 1. City, municipal co., and par. bor. of Somerset, England, situated in the valley of the Avon, 107 m. W. of London. B. is built in a natural amphitheatre, and as the character of its buildings and streets corresponds with the beauty of its situation, it has an appearance equalled by no other Eng. city. These advantages, and especially the therapeutic efficiency of its medicinal spring, have long made B. the resort of fashion. The houses of B. are all built of the white freestone known as B. stone (q.v.). The numerous and handsome public buildings of B. include the assembly rooms, the pump-room, the city markets, and the guild hall. The abbey church is one of the finest specimens of Perpendicular Gothic architecture. The present building was begun in the reign of Henry VII, the original foundation dating back to 775. The Rom. Catholic priory church is a handsome building with a spire 200 ft high. B. has many parks and numerous open spaces, many educational estab., a museum, theatre, hotels, etc. The radioactive springs are beneficial in gout, rheumatism, cutaneous diseases, etc. Half a million gallons flow every day from the hot springs of B., the only natural hot springs in Britain and the richest in radium emanation. Their temp. ranges from 117° to 120° F. The great Rom. bath occupied a hall 110 ft by 68. The Royal Baths were opened by the Earl of Ypres in 1916, the B. St wing in 1919, the Old Royal Baths, entirely reconstructed, in 1927. All the baths belong to the corporation, and full details will be found in *The Book of Bath*, issued by it. B. is of great antiquity; it was called *Aquae Sulis* by the Romans. Magnificent remains of the Rom. baths exist. Richard I granted the tn its earliest existing charter, confirmed by Henry III and extended by George III. B. was most famous in the days of 'Beau' Nash, M.C. from 1704 to 1761. The follies and vices of the city have frequently been commemorated by Fielding, Smollett, Anstey, etc. B. is, with Wells, the seat of a diocese, returned two members to Parliament from 1295 to 1918 and now returns one. The city suffered severely from air-raids during the Second World War,

particularly in the so-called 'Baedeker raids' in April 1942. Over 200 buildings of architectural or historic value were either destroyed or seriously damaged, including the assembly rooms. The ancient windows of the abbey were also smashed. Pop. 80,000. See F. Harrison, *The City of Bath*, 1924; C. M. Spender and E. M. Thompson, *Bath*, 1922; G. Home and E. A. Foord, *Bristol, Bath, and Malmesbury*, 1925; E. Sitwell, *Bath*, 1932; R. Little, *The Building of Bath*, 47-1947; 1948; Walter Ison, *The Georgian Buildings of Bath*, 1948.

P.A.—Reuter

THE WEST FRONT OF BATH ABBEY
On the right is the pump-room.

2. Co. seat of Sagadahoc co., Maine, U.S.A., on the W. bank of the Kennebec R., 36 m. N.E. of Portland. It has a good harbour, and shipbuilding is the prin. industry. Other manufs. are iron, brass, and lumber, and there is a trade in ice, coal, and iron and steel. Pop. 10,644. **Bath**, in its original sense, is the plunging of the body into water, fresh or salt, hot or cold, but the meaning is now extended to the application of some unusual substance to the body or the alteration of the enveloping atmosphere. The institution of bathing is of E. origin, and among many oriental peoples was a religious rite. It was practised among Jews, Buddhists, and Muslims, and prevailed among the Greeks at an early period, and was subsequently valued by the Romans. The spread of the custom came through the Romans, who never formed any colony throughout the Old World without building B.s. These were often magnificent structures and closely resembled in number of chambers and uses the modern Turkish B.; they were

used as lounges by the Romans, who resorted to them daily for rest and recreation. In England to-day the Turkish B. is popular on account of its stimulating influence on the system, but many other forms of bathing are common. In the Turkish B. the bather passes from one warm-air room to another until he perspires from every pore, then undergoes a shampoo, ending with being sprayed with warm water, steadily decreasing in heat until it runs cold. Hot-air B.s may also be impregnated with such substances as sulphur or eucalyptus; brine B.s are common in some places; electric B.s are water B.s into which currents of electricity are introduced; mineral B.s are common in spas all over Europe. See BALNEOLOGY.

Bath, Knights of the, Brit. order of knighthood, whose origin is uncertain, though it is traditionally attributed to Henry IV, who bestowed the order on 46 knights on the day of his coronation. It was allowed to lapse from the time of Charles II until the reign of George I, when it was revived, and the number limited to the king and 37 knight-companions. It was formally instituted in 1815, and in 1847 it was extended to civilians. The order now consists of 3 classes: the members of the first class are knights of grand cross (G.C.B.); those of the second class knights commanders (K.C.B.); and those of the third class companions (C.B.). Each of the classes is subdivided into military, civil, and honorary members. The dean of Westminster is dean of the order. The ribbon of the order is crimson, and the badge a gold-white cross (military), gold oval (civil); the motto is 'Tria juncta in uno.' The 2 first classes also wear a star.

Bath-brick, name given to the cakes of siliceous sand used for scouring vessels, cleaning knives, etc. These cakes are made from the sand of the Il. Parrett, and manuf. at Bridgwater, in Somerset.

Bath Stone, name of a species of oolitic limestone, so called because it is found near Bath. It is used for building. When quarried it is soft, but though it becomes hard on exposure to the air, it is not very durable.

Bathgate, burgh and mkt tn of W. Lothian, Scotland, 6 m. S. of Linlithgow. Coal and shale are found in the neighbourhood, and there are iron and steel foundries, and spade and shovel manufs. Pop. 11,300.

Bathometer, or **Bathymeter**, name applied to an instrument used in deep-sea sounding.

Báthori, or **Battori**, name of a famous Hungarian family, members of which ruled Transylvania and Hungary.

Stephen B. (1532-86) was a distinguished soldier. He was elected to the sovereignty of Transylvania in 1571, on the death of John Sigismund Zápolya, nephew of the King of Poland. In 1575 he was elected to succeed Henry of Valois on the Polish throne, was crowned at Cracow in 1576, and conducted a successful war against the Tsar of Muscovy. Stephen's nephew, **Sigismund B.** (d. 1613),

became prince of Transylvania in 1581. He freed the land from Turkish rule, but subsequently resigned his dominions to the Emperor Rudolf II. He later changed his mind, but failed to recover his position. **Elisabeth B.** (d. 1614), niece of Stephen, and wife of Count Nadassy of Hungary, is notorious as a type of inhuman cruelty. The rumours current that she used to murder young girls to bathe in their blood were shown to have some foundation in 1610, when it was discovered she had killed over 600 girls. She was shut up in Csaf fortress in 1610, where she d. For the connection of this case with the 'werewolf' tales, see the *Book of Were-Wolves* by S. Baring-Gould, 1865.

Bathos, see ANTICLIMAX.

Baths, Science of, see BALNEOLOGY and BALNEOTHERAPEUTICS.

Bathsheba, wife of Uriah and mother of Solomon. King David, seeing her one day bathing in a court, made her his mistress and, to conceal his guilt, sent Uriah, with a letter commanding his destruction, to Joab, who was besieging Rabbath Ammon. He then wedded B., but God punished him by the death of his child (2 Sam. xi-xii).

Bathurst, Allen, Earl of (1684-1775), politician, b. Westminster, and educ. Trinity College, Oxford. He entered Parliament in 1705. He was a Tory, and an opponent of Walpole, and was created Earl B. in 1772. B. was a friend of Pope, Swift, and Addison. **Henry**, his son (1714-94), was made Lord Chancellor, 1771, with the title of Baron Apsley; he resigned in 1778.

Bathurst: 1. Prin. tn of the central tableland dist. of N. S. Wales, Australia, on the S. bank of the Macquarie R., 150 m. W. of Sydney. It is the centre of a mixed agric. and pastoral dist. Pop. 16,390.

2. Cap. of the Brit. colony and protectorate of Gambia, W. Africa, on a marshy is. at the mouth of the Gambia R. Pop. (1957) 19,602.

3. Tn in New Brunswick, Canada, at the end of Nepesiguit Bay. The chief industry at present (1956) is pulp and paper, but important mineral discoveries have been made in the vicinity, making B. a boom town. Pop. 4453.

Bathurst Island, one of the Parry Is. of N. Australia, 120 m. W. of Port Essington. It lies between Cornwallis Is. on the E. and Melville Is. on the W. Discovered by Capt. Parry in 1819. Length about 30 m. It is partly covered with forests and partly unproductive. It is an aboriginal reserve and has the largest mission station in the ter. This was founded by Father (later Bishop) Gsell of the Sacred Heart Order in 1911.

Bathyal Deposits, sediments laid down on the sea bed on the continental slope and around certain oceanic is. B. D. form at depths of from 500 to 12,000 ft and consist typically of green, black, and blue muds. See OCEANOGRAPHY.

Bathybius (Gk *bathus*, deep; *bios*, life), name applied to a slimy mass discovered in great depths of the ocean and first

described by Huxley in 1868. *B. haeckelii* was supposed then to be a new organic mass. *Proto-bathytus* was the name given by Dr Beesels in an Arctic expedition of 1876 to a similar substance found in Smith's Sound. The *Challenger* expedition of 1872-6 disproved the theories of Huxley and Haeckel, showing *B.* to be caused by the addition of alcohol to the sulphate of lime in the sea-water.

Bathycles, anct Gk sculptor, of Magnesia on the Maeander in Lydia. He is thought to have lived in the 6th cent. B.C. *B.* was the artist who made the throne of the Amyclaeon Apollo at Amyclae, near Sparta.

Bathymeter, see BATHOMETER.

Batignolles, Les, dist. in the NW. of Paris, a former tn joined to the city in 1860.

Batik (Malay *bátik*), process for colouring fabrics, originating among the Dutch E-Indian natives, and subsequently used in Europe for velvet, velours, and similar fabrics. The design is covered with melted wax, and the uncovered portions dyed, the wax then being dissolved in boiling water.

Batista, y Zaldivar Fulencio (b. 1901), Cuban president since 1933. As an army sergeant he led in that year a successful rising against the former President Machado.

Batiste, material made of fine linen or cotton lawn; in France the term is applied to cambric. The inventor of the material was a certain Baptiste of Cambrai.

Batley, municipal bor. (since 1868) of Leeds (W. Riding), England, 8 in. SSW. of Leeds, the H.Q. of the heavy woollen trade with manufs. of pilot cloths, worsteds, druggets, shoddy, etc. At Birstall (included in the bor. in 1937) is Oakwell Hall (15th to 19th cents.), the original 'Fieldhead' of Charlotte Brontë's novel *Shirley*, preserved as a typical Yorks manor house. Pop. 40,200.

Batman, John (1800-40), reputed founder of Victoria, was a settler in Van Diemen's Land. He formed a company to colonise Port Phillip, and proceeded thither in 1835. He obtained from the aborigines a tract of 600,000 ac., including the present site of Melbourne, but on returning home his title to the land was declared invalid.

Batman (Fr. *bât*, pack-saddle), term used in the Brit. Army for the soldier-groom or servant of an officer, originally the man who was in charge of a bat-horse, or baggage animal.

Batna, fort. tn in Algeria, on the Biskra railway, 65 m. SSW. of Constantine. It is near the splendid cedar forests of Mt Tugurt. Altitude 3471 ft. Pop. 17,000.

Batn-el-Hajar (womb of rocks), dist. of the Nile valley of Nubia. It stretches for a distance of about 95 m., and has many lofty granite hills.

Baton (Fr. *bâton*, a stick), short staff or club. The name is applied to sev. articles. The short staff presented to every Brit. field marshal by the sovereign, as the symbol of authority, is known as a *B.* The long staff which is carried by the

drum-major of an infantry regiment is also so called, as is the truncheon of a policeman. As a musical term, the *B.* is the thin stick which is used by the conductor of an orchestra or choir to conduct the performance. *B.* (boston, baton, or batun) sinister is a term used in heraldry to indicate illegitimacy. It is a dimin. of the bend sinister, being one-fourth of its width, and does not extend right across the shield. It came into use in England in the 15th cent. to mark the illegitimate descendants of the royal family.

Baton Rouge, cap. of Louisiana, U.S.A., on the l. b. of the Mississippi. It is situated on a high bluff, and has the state univ., an arsenal, and a penitentiary. On 5 Aug. 1862 the Confederate forces under Gen. Breckenridge suffered a heavy defeat here. Pop. 125,600.

Batoni, Pompeo Girolamo (1708-87), It. painter, b. Lucca. His father was a goldsmith. He estab. himself in Rome, where he studied Raphael and the antique. In a few years he became a figure in Rome, painting miniatures, copies, and doing some work for Rom. churches, and lived there until his death, for 40 years, without a rival, with the exception of Mengs (q.v.). *B.* was extremely popular, from c. 1760, with visitors to Rome as a portrait-painter.

Batou Khan (d. 1254), Mongol emperor, grandson of Genghis Khan, ruled over Russia and Bulgaria. He laid waste Hungary, and in 1252 acquired Moscow.

Batrachia (Gk *batracheios*, frog-like), term that is frequently used synonymously with the class Amphibia, i.e. frogs, toads, newts, salamanders, etc., and sometimes with the order Anura, which consists of frogs and toads alone.

Batrachomyomachia (Gk *Batrachos*, frog; *mys*, mouse; *mache*, battle), Gk poem consisting of 294 hexameter verses. It is a parody on the *Iliad* of quite uncertain date, though it has been attributed by Plutarch and Suidas to Pigras of Halicarnassus.

Batsford, Bradley Thomas (1821-1904), publisher, b. Hertford. At the age of 16 he was apprenticed to his cousin Henry Bickers, bookseller of Leicester Square, London. In 1843 he opened his own bookshop in High Holborn, dealing first in general and medical books, and later specialising in architecture and engineering. He began publishing in 1874 and, joined by his 3 sons, Bradley, Henry, and Herbert, built up a reputation for well-produced books on architecture, topography, and social life; a tradition which has been maintained by his grandson and great-grandson to the present day.

Batshian, see BATHCHAN.

Batta (Kanarose *bhatta*, rice in the husk), extra money added to the pay of a Brit. officer in India. It varied according to place and circumstances.

Battalion, tactical and administrative unit of command in a military force. In the Brit. army only infantry and parachute troops are now organised in *B.s.* The strength of an infantry *B.* is about 1000 officers and men and consists of a

B.H.Q., and H.Q. company, 4 rifle companies, and a support company. The parachute B. is organised on a similar basis. In general the term is also used to signify the unit commanded by a major, but in the Brit. Army a B. is commanded by a lieutenant-colonel.

Battam, see **BATANG**.

Battambang, prov. of Cambodia ceded to Fr. Indo-China by Thailand in 1907. It was returned to Thailand by Japan in Dec. 1941, and again ceded to Fr. Indo-China after the Second World War. B. produces large quantities of high-grade rice.

Battas, **Batacks**, or **Batahs**, race of people which inhabits the central highlands of Sumatra, Indonesia, as far as Achi. Their national centre is Lake Toba. The B. are akin to the Malay race; they till the soil, and grow rice and maize; they also keep cattle, horses, goats, and pigs. Their prin. occupation consists in the manuf. of ironwork, earthenware, and cloth. The people are distinguished by their unwillingness to give up old customs. They are of middle height and light brown in colour, with long black hair. Some are pagan; others were converted to Christianity by Protestant missionaries. Slavery, cannibalism, and other barbarous customs and the endless civil wars among the B. were largely suppressed by the Dutch Gov., which from 1910 until the attainment of Indonesian independence ruled the whole of the tribes. Peaceful as a rule, the B. have no lack of courage on occasion. They have also a written language and literature. See D. Réal, *The Batiks of Java*, 1924.

Batten, commercial term for a piece of square-sawn softwood timber 2 in. to 4 in. thick and 5 in. to 8 in. wide, inclusive. The term is also applied to narrow wooden strips used in shipbuilding.

Battenberg, name of family of Ger. descent, now known as **Mountbatten** (q.v.). The seat of the family was near B., a small place in the Prussian prov. of Hesse-Nassau. In 1851 Alexander, the younger son of Louis II of Hesse, marriedmorganatically the Polish Countess Julia Theresa von Hauke, who was then created Countess of B. In 1858 she was given the rank of princess, and her children were permitted to call themselves Princes and Princesses of B. The eldest son of the marriage, Louis Alexander, was b. in 1854. In 1884 he married Princess Victoria, daughter of Louis IV of Hesse and of Princess Alice, daughter of Queen Victoria (see **MILFORD HAVEN**, **MARQUESS OF**). He d. in 1921, leaving 2 sons, George Louis Mountbatten (1892-1938), Earl of Medina and (second Marquess of Milford Haven, and Louis, first Earl Mountbatten (q.v.). The second son of Julia, Countess of B., was Alexander Joseph, who was prince of Bulgaria, 1879-86, and d. in 1893. The third son, Henry Maurice (1858-96), married Beatrice, youngest daughter of Queen Victoria, in 1885. He had 3 sons and a daughter, Victoria Eugénie, who married

King Alfonso XIII of Spain in 1906. The fourth son of the Countess of B., Francis Joseph, was b. in 1861, and married the daughter of Nicolas I of Montenegro in 1897. The only daughter of the Countess of B. was Marie Caroline, who was b. in 1852 and married Gustavus Ernest, Prince of Erbach-Schönberg, in 1871. The children of Princess Louis and Henry adopted the surname of Mountbatten in 1917.

Batter, in architecture: the inward tilt or inclination of a wall from the base upwards. The purpose is either to increase the strength at the base, as in retaining walls, or to add to the defensive strength of the wall of a fortress; or, occasionally, as an optical refinement, as in the Cenotaph in London. The B. of walls and pylons (q.v.) in Egyptian temples is probably a superfluous trans. into stone of building methods in mud, when walls were battered to increase stability.

Battering-ram, military engine employed in ancient times to cause a breach in the walls of a besieged place. Two kinds of B.s were used, one kind being suspended in a frame, the other movable on wheels or rollers. The ram consisted of a large beam, or spar, with a massive metal head; it was usually set in motion by means of cords passing over pulleys. A roof or screen generally protected those employing it. B.s were often made of great weight and size.

Battersea, Cyril Flower, 1st Baron (1843-1907), politician, b. at Streatham and educ. at Harrow and Trinity College, Cambridge. He entered Parliament in 1880, representing first Brecknock, 1880-1885, and afterwards S. Beds, 1885-92. He was junior lord of the Treasury under Gladstone, in 1892, and was created a peer in the same year.

Battersea (the name means 'Beadurio's island'), parl. and metropolitan bor. of London, on the S. bank of the Thames, facing Chelsea and the S. of Westminster. The manor of B. once belonged to Westminster Abbey. It was originally a marshy area, later given to market gardening, and industrialisation followed the development of railways. Huguenot silk weavers settled there after the revocation of the Edict of Nantes (1685). B. Park (185 ac.) was opened in 1853; the Festival Gardens were opened there in 1951. B. Polytechnic occupies part of the site of the former Albert Palace (1885-8). Many factories, foundries, and engineering works are in the bor., and also the B. Power Station, one of the largest in Europe. Old B. House, built in 1699, contains a collection of De Morgan pictures, pottery and period furniture. The bor. includes parts of Clapham and Wandsworth commons; it returns 2 members to Parliament. Area 2163 ac.; pop. 114,300.

Battery, see **ARMY AND ARTILLERY**.

Battery, see **ASSAULT**.

Battery, Electric, see **ACCUMULATOR**.

Baththyányi, name of a Hungarian family, which traces its descent to the 9th cent. It numbered among its

members some of the most illustrious men of Hungary. In 1526 Francis B. distinguished himself in the battle of Mohács, and Balthazar B. in the Turkish wars of the same cent. Count Casimir B. (1806-54) was minister of foreign affairs in Hungary during the insurrection of 1848-9. After the disaster of Vilagos he fled with Kossuth into Turkish ter., and afterwards went to Paris. Count Louis B. (1809-49), b. Pressburg, entered the army but subsequently adopted a diplomatic career. He was a moderate Nationalist, distrusting Kossuth's extremism, and was Prime Minister of Hungary Mar.-July 1848. Despite his moderation, he was arrested by the Austrians in Jan. 1849, condemned to be hanged but eventually shot.

Battidae, Cyrenaean dynasty of 8 kings. They were: Battus I, who led a colony from Thera (c. 631 BC) to Africa by command of the Delphic oracle, and founded Cyrene; Arcesilaus I (590-574); Battus II (574-c. 560); Arcesilaus II (c. 560-550); Battus III (550-530); Arcesilaus III (530-510); Battus IV (of whom nothing is known); and Arcesilaus IV (d. about 450 BC). The last-named is the subject of 2 of Pindar's odes. The hist. of the dynasty may be found chiefly in Herodotus.

Battistini, Mattia (Barone di Poggio Casolino) (1858-1928), lt. singer known by the title 'La Gloria d'Italia.' His debut in 1878 at the Teatro Argentina in Rome brought him an engagement immediately for the lt. opera in Buenos Aires. Thereafter he toured in all the prin. tns of S. America and Europe and attained fame as one of the greatest dramatic baritones in the world. B. created many important roles, and his friend Massenet rewrote for him the tenor part in *Werther*.

Battle, mrrkt tn and par. of Sussex, England, 7 m. NW. of Hastings. The great abbey, St Martin's, was founded by William I to commemorate his victory in 1066. It stood on a bare ridge above the hamlet of Santlache (Senlac). The impressive gateway and other substantial parts of the abbey remain, and also the Abbot's House, enlarged after the Reformation, in which Elizabeth I lived in Mary's reign. This is now a girls' boarding-school. Industries include jam-making and metal working; B. is the agric. and administrative centre of a large rural dist. Pop. 4250.

Battle, fight between armed forces, whether large or small, on land, sea, or in the air. A B. is termed general when both armies are brought fully into action; if only a considerable portion of each it is partial. A commander may choose to act on the offensive or defensive, or to combine both, according to circumstances; judgment in decision, skill in preparing the plan of B., and promptness in varying it as required are the marks of a great leader. See articles on individual B.s and FIRST and SECOND WORLD WARS.

Battle, Wager of, see TRIAL BY COMBAT. **Battle-axe**, weapon which has been in use from primitive times. The head was

originally made of stone, then of bronze, and finally of iron or steel; some varieties could be held with one hand, while others required two. The pole-axe, or halberd, is merely a B. with a long handle.

Battle Creek, city in Michigan, U.S.A., on the Kalamazoo R., 45 m. SW. of Lansing. A health resort and farm trade centre, it has a well-known sanatorium and manufs. cereal and health foods, steam pumps, printing presses, and farm equipment. The Kellogg Bird Sanctuary is near. Pop. 48,700.

THE BATLEMENTED TOWER OF SWANSEA CASTLE

Battle Honours, devices or distinctions employed to memorialise outstanding episodes in the hist. of an army or a regiment. These devices take various forms, the commonest being the emblazoning of the names of battles or campaigns on regimental colours. Other forms are the granting of special badges, mottoes, and titles (such as 'Royal'), distinctive items of uniform (such as the bearskin of the Scots Greys, and the back-bage of the Gloucestershire Regiment). The custom is derived from the grant of 'augmentations of honour' to a knight's coat-of-arms in the Middle Ages. In the Brit. Army all B. H. are granted by the sovereign, and are pub. in Army Orders, and recorded in the Army List, at the head of each regimental list. In the U.S.A. names of battles are not placed upon the colours, but are emblazoned upon streamers attached to the colour-pike, just below the head. In the Brit. Army, Royal Artillery units commemorate some particular episode in their subtitles, e.g. '25th Medium Battery (Battle Axe Company)', whose forerunners were a company of artillery which served with distinction at the capture of Martinique in 1809, and was presented with a battle-axe, which it still possesses. The 1st Foot Guards were granted the title of Grenadier Guards to commemorate their service at Waterloo. The 3rd Hussars

were allowed an extra drum-horse to carry some drums captured from the French at Dettingen; the 2nd Gurkhas (Brit. Army) carry a 'truncheon' to commemorate their service at the siege of Delhi during the Indian mutiny. It is a practice in most armies to decorate the regimental colours with medals, etc., but this is not permitted in the Brit. Army. B. H. are also painted upon regimental drums.

Battle of Britain, see BRITAIN, BATTLE OF.

Battledore and Shuttlecock, game played 2000 years ago in China, and still popular. It consists in battling the shuttlecock, a cork base surrounded by feathers, with parchment rackets, the game being to keep the shuttlecock in the air as long as possible.

Battleford, tn at the confluence of the Battle and N. Saskatchewan R.s, Canada. From 1876 to 1883 it was the seat of gov. for the NW. Terr., and the first newspaper in the terr., the *Saskatchewan Herald*, was estab. here in 1878. It was the scene of an Indian uprising during the rebellion of 1885. Fort B. National Historic Park, a renovated N.-W. Mounted Police post and museum, was opened in 1948. Pop. 1320.

Battlement (O.F. *bataillement*), wall erected round the top of a fortified building consisting of rising parts known as crenels or merlons, and intervening spaces called crenelles. The soldiers fired from the embrasure while taking refuge behind the merlon. In architecture B.s are still erected for artistic effect.

Battleships, the heaviest class of warship, and the most heavily armoured, now generally considered obsolescent, although they or ships of a similar type may have a future as firing platforms for guided missiles. Armour plate was first used by the French in 1859 after their experience of the power of shore batteries in the Crimean war; but these ironclads, as they were called, were none the less built of wood, covered with 4-in. wrought-iron plates—a tribute to the increasing power of shell-fire. The *Warrior*, of 9000 tons displacement and 4½-in. plates, launched in 1860, was England's earliest ironclad. Three years later the ironclad was superseded by the ship with revolving turrets, the *Royal Sovereign* being the first of this type, and its armament was the standard main armament of a battleship for many years. Guns were soon invented, however, which could pierce the armour carried by such vessels as the *Devastation* and others, of which the plate varied from 8 to 12 in., with turrets protected by 14-in. plating; whence later ships had a still greater thickness of armour, and still more powerful guns. The next development was a ship capable of firing in all directions from central batteries and, therefore, not dependent upon broadsides. Most subsequent developments have been due to increase in gun power, and vessels of larger displacements have had to be built to carry the heavy armament. The *Dreadnought*, completed in 1906, is generally held to be the type

from which the modern battleship has been evolved. She was 490 ft in length, of 17,900 tons displacement, had 10 12-in. guns in 5 turrets, was plated with improved resisting substitutes for wrought iron, and was capable of a speed of 21 knots. The Washington Treaty of 1922 limited the size of B. to 35,000 tons and the calibre of their guns to 16-in. The London Treaty of 1936 continued this limitation of size and tried to reduce the maximum calibre to 14-in. Japan did not sign this treaty, with the result that, firstly, the maximum calibre of guns reverted to 16-in. and, secondly, a protocol of June 1938 increased the maximum permitted tonnage to 45,000.

At the outbreak of the Second World War the Brit. Navy had 12 B. and 3 battle-cruisers (capital ships faster and more lightly armoured than B.)—the latter comprising the *Hood*, then the largest battle-cruiser in the world (see HOOD, TMS), having a displacement of 42,000 tons; the *Repulse* (32,000 tons and armed with 15-in. guns), which was sunk by the Japanese in 1942; and the *Renown* of similar tonnage and main armament. Five more B. were then being built, all of 35,000 tons and armed with 14-in. guns. At the end of the war there were 15 B., the additions being *King George V* (1940), *Howe* (1941), *Anson* (1941), *Duke of York* (1941), all 35,000 tons displacement, and armed with 10 14-in. and 16 5.25-in. guns.

The U.S. Navy, as at Jan. 1939, had 15 B., Japan had 10, France 5 B. and 1 battle-cruiser, Italy 4, and Germany 2 B. and 2 battle-cruisers. The U.S. Gov. had then made provision for 6 new B.—2 for completion by 1942, and 4 by 1943; and it was also then decided to build ships of 45,000 tons in future. But this programme was revised during the war and by 1944 America had 23 B. and 2 battle-cruisers. No details were available concerning Japan's intentions at that time. France was a party to the protocol which provided for the limitation of the size of B. to 45,000 tons, but the Fr. Gov. subsequently announced that they would not build ships over 35,000 tons unless other continental powers exceeded that tonnage. The *Richelieu* and *Jean Bart*, both laid down before this decision, are of 35,000 tons, as was the *Clemenceau*, sunk uncompleted in Brest. Italy had 4 B. under construction, all of 35,000 tons and armed with 15-in. guns. Three Ger. B.—*Bismarck*, *Tirpitz*, and another—were building, all of 45,000 tons with 15-in. guns. In 1939 the largest Ger. warships actually in commission were the 26,000-ton *Gneisenau* and the sister ship *Scharnhorst* (q.v.), completed in 1938, officially classified as battle-cruisers. Next to these in size were the 3 so-called pocket B. of the *Deutschland* class, of 10,000 tons displacement, and so lightly armoured that they were really no more than armoured cruisers. (See ADMIRAL GRAF SPEE.)

The *Vanquard*, the most recently built Brit. battleship, was launched on 30 Nov. 1944, and commissioned in Aug. 1946. It

is a 42,500-ton ship, somewhat shorter and broader than the *Hood* (q.v.), with a superstructure rising like a fortress more than 80 ft above the water-line. It has a main armament of 8 15-in. guns, and a secondary armament of 16 5.25-in. guns, besides numerous 6-barrelled and single-barrelled Bofors. It has the latest radar equipment and embraces results of exhaustive research in every other sphere of ship armament and design. Thus the ship incorporates many lessons of the recent war in machinery damage control. A distinctive feature also is the streamlining of the funnels, the result of tests to evolve a design which would prevent the funnel gases from interfering with gunfire. The main power for propulsion and the many intricate services originates in boilers that incorporate a new system of high-efficiency oil-burning. There are on board information rooms where men can study; a cinema, with tiered seating for 200; and even soda fountains. Laundry, cooking, bakery galleys, and the air-conditioning plant are all powered by electricity. The *Vanguard* is now in the Reserve Fleet, as one of the 4 B. of the *King George Class*. The U.S.A. has 13 B., France 2, and the U.S.S.R. 3, but more are included in the operational fleets. See also CRUISER and NAVY AND NAVIES.

Battori, see BATHORI.

Battue (from Fr. *battre*, to beat), method of killing game, such as hares, pheasants, etc., by having them driven out of cover by beaters towards the spots where sportsmen are stationed to fire. In war or civil strife the term has often been applied to the slaughter of helpless crowds.

Batu (Russian often *Batuy*), Mongol-Tatar khán, grandson of Genghis Khan (q.v.). He conquered Russia 1236-40; he defeated the Hungarians and Poles but was repulsed by the Czechs and Austrians. He founded the Golden Horde (q.v.).

Batum, see BATUMI.

Batumi (ancient *Bathys*), port on E. shore of Black Sea, cap., economic and cultural centre of Adjara (q.v.) Autonomous Rep. It has exports of Baku oil products, citrus fruits, and tea. There is a famous botanical garden (founded 1911). Pop. (1939) 71,000.

Baturin (Ukrainian *Baturyn*), vil., former tn. in Chernigov Oblast of the Ukraine, 63 m. E. of Chernigov, founded in 1575 by Stephen Batory (see BATHORI). In 1669-1708 and 1750-64 it was the residence of the Ukrainian hetmans (q.v.).

Batz, tn in dept of Loire-Inférieure, France, situated on the coast 50 m. NW. of Nantes. B. and the neighbouring vills. are inhabited by a community with own dialect and customs, said to be of Saxon or Scandinavian descent. Pop. 2000.

Batz, is., see BAS.

Bauan, or **Baun**, tn in Batangas prov., Luzon, Philippine Is., at the head of Batangas Bay, 50 m. S. of Manila. It grows coco-nuts, corn, rice, and sugar. There is also fishing. Pop. 40,168.

Baucant, see BEAU SÉANT.

Bauchi, hilly dist. of N. Nigeria, notable for its tin mines which are situated chiefly

on the plateaux. Bauchi is the cap., and other tns are Bukuru, the S. terminus of the railway from Kano, Naraguta, and Leri.

Baucis, see PHILEMON AND BAUCIS.

Baudelaire, Charles Pierre (1821-67), Fr. poet, b. Paris, son of a civil servant under the First Empire. After his father's death his mother married Col. Aupick. B.'s childhood was unhappy, and there was constant friction between B. and his stepfather. He was educ. at Lyons and Paris, and at the age of 20 was sent on a voyage to India, which was interrupted at Mauritius. Back in Paris he lived on a small patrimony, his difficult circumstances being increased by his relationship with Jeanne Duval, a half-caste who had become his mistress; she was, however, the direct inspiration for some of his greatest poems. He began writing poetry as early as 1841; he pub. art criticism on the Exhibitions of 1845 and 1846 in the *salons*; and he trans. the works of Edgar Allan Poe. His masterpiece, *Les Fleurs du Mal*, was pub. in 1857. It is a unique work in the hist. of 19th-cent. poetry—classical in form, realistic in outlook, and romantic in its fire and rich imagery. Much of the colour and oriental images were probably due to his voyage in the E. After the pub. both B. and the publisher were prosecuted on account of the impropriety of certain poems. But it is clear that B.'s bitter cynicism and painting of debauchery are due to a need for purging himself by self-expression; and thus implicitly there is a spiritual note inherent in the *Fleurs du Mal*. In spite of his prosecution, the work was praised by a number of critics, and since then his fame has steadily grown. His influence on the younger poets, such as Mallarmé and Rimbaud, was immense, and he is now recognised as the greatest of the poets of the later phase of the Fr. Romantic movement. His later works include *Les Paradis artificiels*, 1860, and *Petits poèmes en prose*, 1869. From 1864-6 he lived in Brussels where he fell seriously ill; he was taken back to Paris, and d. there soon after.

Théophile Gautier's life of B. was trans. into English in 1915; also B.'s *Intimate Journals* (trans. by C. Isherwood, 1930); and the *Letters of Charles Baudelaire to his Mother*, 1833-66 (trans. by A. Symons, 1928). See also J. Rivière, *Études*, 1911; G. T. Mines, *The Influence of Baudelaire in France and England*, 1913; R. Vivier, *L'Originalité de Baudelaire*, 1926; P. Quennel, *Baudelaire and the Symbolists*, 1930; E. Starkie, *Baudelaire*, 1933; J. P. Sartre, *Baudelaire* (trans.), 1949; H. Peyre, *Connaissance de Baudelaire*, 1951.

Baudin, Charles (1784-1854), Fr. adm., fought in the Napoleonic wars. In 1838 he distinguished himself by the capture of San Juan de Ulloa (or Uluá).

Baudissin, Wolf Heinrich von (1789-1878), Ger. writer, was for some time secretary to the embassy in Vienna, and later in Paris. Afterwards, however, he gave all his time to the study of literature. He took an active part in the Shakespeare trans. of Tieck and Schlegel, and trans.

also other Elizabethan dramatists, as well as Molière and Goldoni.

Baudouin I (1930-), King of the Belgians, elder son of Leopold III (q.v.) and his first wife, Queen Astrid. During the controversy over his father's conduct during the Second World War B. remained with Leopold in Switzerland. He succeeded to the throne on 17 July 1951, Leopold having abdicated the day before. He is unmarried, the heir-presumptive being his brother, Prince Albert (1934-).

Baudouin, Manuel Achille (1846-1917), Fr. lawyer, b. Tours, advocate general at Lyons, 1880; procurator general at Limoges, 1885; advocate general at the court of cassation in 1880, and president of the civil tribunal of that court 3 years later. Prominent as procurator general in the revision of the Dreyfus trial. In 1913 he became general president of the court of cassation.

Baudrillard, Henri Joseph Léon (1821-1892), Fr. economist, son of Jacques Joseph B. (1774-1832), a writer on forestry. As a member of the Academy of Moral and Political Science he was entrusted with an inquiry, the results of which were pub. in his *Agricultural Population of France*, 1885. He was prof. of political economy at the Ecole des Ponts et Chaussées.

Baudry, Paul Jacques Aimé (1828-86), Fr. painter, b. in Vendée. He won the Prix de Rome in 1850. His subjects were mythological or decorative, but he painted one historical picture ('Charlotte Corday after the death of Marat'). His best work was his mural decorations in the Paris opera house, the château de Chantilly, and the Cour de Cassation. His works are marked by graceful design and rich colouring rather than by strength or originality.

Bauer, Bruno (1809-82), Ger. theologian and editor, b. Eisenberg, Germany, and edncr. at Berlin, where he became a licentiate of theology in 1834. In 1839 he moved to Bonn, but within the next 2 years pub. such unorthodox works on the Gospels that his licence to teach was withdrawn, and he retired to Rixdorf to spend the rest of his life in study and authorship. His theories on the origins of the Gospels are, briefly, that Mark was written in the time of Hadrian, and that from this the others were forged a century later by Gentile converts, who passed them off as genuine apostolic documents. B. also wrote hist. of the 18th cent. and the Fr. Revolution.

Bauer, Caroline (1807-77), Ger. actress, b. Heidelberg. She made her début in 1822. In 1829 she was married morganatically to Prince Leopold of Coburg, then widower of the Princess Charlotte and afterwards King of the Belgians. Their union was unhappy, and came to an end in 1830. Returning to the stage for some years, she finally left it in 1844 to marry a Polish count. She wrote 2 vols. of theatrical reminiscences and memoirs.

Bauer, Georg, see AGRICOLA, GEORGIUS.

Bauer, Otto (1881-1938), Austrian Socialist politician. In Nov. 1918 he became foreign minister. In this capacity

he saw the inauguration of the rep.; he resigned, July 1919, and subsequently led the Socialist opposition. Dollfuss's campaign against the social democrats forced him to seek refuge in Czechoslovakia, 1934. He later went to Paris, where he d.

Bauernfeld, Eduard von (1802-90), Austrian dramatist, b. Vienna. His irrepressible humour, and his sense of the ridiculous both in circumstances and character, make him the Molière of the Viennese stage. *Leichtsinns aus Liebe*, 1831, *Bürgerlich und Romantisch*, 1835, *Der kategorische Imperatif*, 1851, and *Moderne Jugend*, 1868, are the best known of his comedies. See W. Zentner, *Studien zur Dramaturgie Bauernfelds*, 1922.

Baugé, tn, cap. of a canton, dept Maine-et-Loire, France, on R. Couanon, 23 m. N.E. of Angers. The French defeated the British under the Duke of Clarence here in 1421. Pop. 3500.

Bauhin, Gaspard (Kaspar Bauhinus) (1550-1624), Swiss botanist, b. Basel. He is said to have held the offices of prof. of Greek, of anatomy and botany, and of the practice of medicine, dean of the faculty of medicine, chief physician to the tn, and rector of the univ. His chief works were *Phytopinae*, Basel, 4to, 1596, and *Prodromus Teatri Botanici*, Frankfurt, 1620. He also made collections of the synonyms of the botanical writers who had preceded him. The latter appeared in his *Pinax Teatri Botanici* in 1623 (2nd ed., 1671), forming a complete key to the botanical knowledge of the day.

Bauhin, Jean (1541-1613), Swiss botanist and physician, b. Basel, brother of Gaspard B. His father (an Amer. Protestant and refugee) placed him with Leonhard Fuchs (q.v.), the famous botanist, and afterwards with Conrad Gosner (q.v.), the great naturalist, whom he accompanied on excursions through Switzerland. He visited sev. other parts of Europe with a view to collecting materials for his *Historia Plantarum*, afterwards pub. In 1566 he settled at Basel, where he was elected prof. of rhetoric.

Bauhinia, genus of tropical Leguminosae named by Linnaeus after the 2 botanists, Bauhin. The leaves are generally divided into twin lobes, but the genus is chiefly remarkable for its twining stems which twist in and out in an intricate manner. *B. variegata* is the ebony wood of India; *B. purpurea* and *B. galpinii* showy shrubs for a cool greenhouse.

Baumann, Oskar (1864-99), Austrian traveller, b. Vienna; in 1885 journeyed with Leng up the Congo R. to Stanley Falls; the following year he explored Fernando Po, and 2 years later ascended the mt of Kilimanjaro. During 1892-3 he led an expedition to Lake Victoria and explored the surrounding dist.; in 1896 he was made consul at Zanzibar. He pub. sev. works on his explorations.

Baumannshöhle, stalactitic cavern in the Harz Mts (q.v.), on the R. Rode, 5 m. S.E. of Blankenburg (q.v.). It contains numerous fossil remains.

Baumbach, Rudolf (1840-1905), Ger. poet and novelist, b. Kranichfeld. Among his best works are the epic, *Zlatorog*, 1877; his book of lyrics, *Lieder eines fahrenden Gesellen*, 1878; and fairy tales, as *Es war einmal*, 1889.

Baume (-les-Messieurs), Ger. vil. in the dept of Jura. There are grottos with stalactites. Pop. 260.

Baume-les-Dames, Fr. tn in the dept of Doubs, on the Doubs. It had a convent for nuns of noble birth. It manufs. pipes and cloth. Pop. 2900.

Baumgarten, Alexander Gottlieb (1714-1762), Ger. aesthetician, b. Berlin. He studied at Halle, and became a warm admirer of Wolff's philosophy. B. applied himself to logic, on which he afterwards gave lectures at the orphan institution of Halle. He invented the word aesthetics, which he applied to the theory of taste, or the science of the beautiful. He divided the science of aesthetics into theoretical and practical; he developed his ideas first in his treatise *Disputationes de nominibus ad poema pertinentibus*, 1735, and in his *Aesthetica*, 1750. The other works of B. are *Metaphysica*, 1739, *Ethica Philosophica*, 1740, and *Initia Philosophiae Practicae*, 1760. In 1740 B. was appointed prof. of philosophy at Frankfurt-on-the-Oder, where he d.

Baumgarten-Crusius, Ludwig Friedrich Otto (1788-1842), Ger. theologian, b. Merseburg; studied at Leipzig Univ. From 1812 to 1842 he was prof. of theology at Jena. He was an authority on the hist. of Christian dogma, and his books include *Grundzüge der Biblischen Theologie*, 1828, and *Kompendium der Dogmengeschichte*, pub. 1846.

Baumgärtner, Andreas, Baron von (1793-1865), Austrian scientist and politician, b. Friedberg, Bohemia, and studied at the univ. of Vienna, where he became prof. of physics. He was later minister of commerce and of finance, 1851. He pub. *Die mechanische Theorie der Wärme*, 1864, *Naturlehre*, 1823, and other works.

Baun, see BAUAN.

Baur, Ferdinand Christian (1792-1860), Ger. theologian, b. near Stuttgart. In 1825, while prof. in the theological seminary at Blaubeuren, he pub. his *Symbolik und Mythologie oder die Naturreligion des Altertums*. Next year he became prof. of theology at Tübingen, where he wrote mainly on mythology and allied subjects. *Das manichäische Religionssystem* appeared in 1831; *Apollonius von Tyana* in 1832. Meanwhile he was coming under the influence of Hegel, whose philosophy of hist. he adopted. Between 1835 and 1847 he estab. the Tübingen school, whose teachings were so opposed to orthodox tradition that they aroused antagonism. B. contended that the only genuine epistles of St Paul are Galatians, Corinthians, and Romans, and that these prove him an opponent of Peter. B. also argued in his book on the Gospels (1847) that these were 1st and 2nd cent. adaptations from an earlier gospel, and show a desire to reconcile the opposing factions. His main argument is that Peter tried to establish a

Jewish Christianity, while Paul worked on broader lines, and that their differences influenced Christian literature for 2 cents.

Bautain, Louis Eugène Marie (1796-1867), Fr. theologian, b. Paris, educ. at the Ecole Normale. He became prof. of philosophy and later also of literature at Strasburg. In 1828 he resigned to take orders, but remained in Strasburg until 1849, when he was transferred to Paris as vicar of the diocese, and remained there until his death. He was strongly opposed to rationalism.

Bautzen (anc. Budissin), Ger. tn in the dist. of Dresden, on the Spree (q.v.), 30 m. E. by N. of Dresden (q.v.). Napoleon defeated Blücher (qq.v.) near by in 1813. There is a 16th-cent. cathedral. Textiles, engines, and chemicals are manuf. Pop. 42,000.

Bauxite, earthy compound of aluminium oxide, iron oxide, titanic acid, and water, in varying proportions; found in the S. of France (taking its name from Les Baux, near Arles), in Brit. Guiana (the chief Brit. source of supply), in Ireland (Antrim), and in the U. S. United States. Its colour varies according to the proportion of oxide. B. is valuable for the production of aluminium and its salts, of which it is the chief commercial source. As it resists heat well it is used for making crucibles and fire-bricks. See C. S. Fox, *Bauxite*, 1927, and N. V. S. Knibbs, *The Industrial Uses of Bauxite*, 1928.

Baval, Fr. tn in the dept of Nord, 13 m. SE. of Valenciennes, the anc. Bagacum, cap. of the Nervii. It has ironworks and marble quarries. Pop. 2600.

Bavaria (Ger. *Bayern*), *Land* of SE. Germany, in the Federal Rep., bordered on the N. by the dists. of Suhl, Gera, and Karl-Marx-Stadt (in the Ger. Democratic Rep.); on the E. by Czechoslovakia and Austria; on the S. by Austria; and on the W. by the *Länder* of Baden-Württemberg and Hesse (qq.v.). Until 1918 B. was a kingdom of the Ger. empire, and from 1918 until 1945 was a state of the Ger. Reich; its ter. (total area 29,498 sq. m.) then included also the Rhenish Palatinate (see PALATINATE) on the W. bank of the Rhine, now part of the *Land* of Rhineland-Palatinate (q.v.). The present *Land* of B. is divided into 7 areas, 191 urban and rural dists., and 7127 coms. There are 3 univs. (Munich, Erlangen, and Würzburg, qq.v.), and there is also a technical univ. at Munich. The pop. is (1950) 71.87 per cent Rom. Catholic, 26.5 per cent Protestant, and 0.1 per cent Jewish. Cap. Munich (q.v.). Area 27,000 sq. m.; pop. 9,161,300.

The country is in general a plateau, with minor ranges of mts and wide plains. It is enclosed on the S. by the Alps, on the N. by the Frankenwald, and on the NE. by the Forest of Bohemia (qq.v.). It belongs principally to the basins of the Danube and the Main (qq.v.), and water communications on these rvs. and their tribs. are well developed.

B. is predominantly agric.: the main products are wheat, rye, barley, oats, potatoes, and sugar beet. One-third of

the area of the country is forested (pine, fir), and one-sixth is pasture land on which cattle, horses, sheep, and goats are raised. In industry the prin. occupation is the manuf. of textiles; the brewing industry of B. is famous, and there are also machine-construction, saw-milling and wood-working, engineering, chemical, and motor-car building industries. The chief minerals found in the country are coal, lignite, iron ore, pyrites, salt, and bauxite. Three-quarters of the electricity produced is from hydro-electric installations. B. has 2 artistic festivals which are world famous: the Wagner festival at Bayreuth (q.v.) and the Passion play at Oberammergau (q.v.).

History. The original inhabs. of B. were probably Celtic. Shortly before the Christian era they were conquered by the Romans and included in a Rom. province. After the decline of Rom. power they suffered from the inroads of the Barbarians, and were ultimately conquered by the Franks (q.v.); eventually B. was incorporated in the empire of the Carolingians (q.v.). During the cents. which followed B. was the cause of many disputes between rival princes, until towards the end of the 11th cent. it passed into the hands of the family of Welf (see GUELPHS). The first Welf retained it with difficulty, and passed it on to his sons, but his grandson, holding both B. and Saxony (q.v.), was deprived of B., which passed back into the hands of the imperial family. In 1156, however, it was recovered by Henry the Lion (q.v.). But Henry did not hold the duchy for long; in 1180 he was placed under the imperial ban, and his lands were given to a duke of the Wittelsbach family. Under the early Wittelsbachs B. increased in prosperity, but its means of territorial expansion were declining owing to the growth of neighbouring states. During the 13th and 14th cents. the possibility of B. becoming one of the great Ger. powers was stopped by the div. of the duchy into 2, and again, after a short union, into 6. For some time the hist. of B. is simply the record of the quarrels which were the outcome of these divs. In 1504 the duchy was reunited under Albert the Wise. After his death again a partial div. took place between his sons, William IV and Louis; after Louis's death, in 1545, William IV again ruled over a united B. William IV keenly supported the Catholic Church, and was able to a very great extent to repress the progress of the Reformers. His son followed his policy, and was succeeded by William the Pious, who had been trained by the Jesuits. His son, Maximilian I, placed B. on a strong basis, reformed it internally, took an active part in the Thirty Years War (q.v.) and regained for his country the addition of the Upper Palatinate. He d. in 1651, leaving B. strong and able to take her place in the councils of Europe, a thing which internal strife had forbidden during the past 4 cents. The next reign was taken up in a judicious attempt to allow the duchy to recover from its exhaustion after the

Thirty Years War. Under Maximilian's son this work was carried out, but Maximilian Emmanuel unfortunately sided with France during the Sp. Succession War and shared in the defeat at Blenheim (q.v.) in 1704. His dominions, lost for the time, were only restored in 1714 in a ravaged and exhausted condition. On the death of the Emperor Charles VI, untainted by the experience of 1702-14, Charles Albert devoted all his strength and power to an attempt to win from Maria Theresa the crown of Austria. Semi-successful at first, he d. in the midst

E.N.A.

BAVARIAN PEASANT

of failure (1745), and his successor got back the ancestral possessions only by giving unconditional acknowledgment of the Pragmatic Sanction (q.v.). For a short while B. was again allowed to attempt to recover. And in 1777, on the extinction of the Bavarian line of the Wittelsbachs, the succession passed to the elector palatine (Charles Theodore), and the Palatine and the duchies of Julich and Berg were united to B. This directly led to the war of the Bavarian Succession. The revolutionary wars found B. a prey to the alternate attacks of France and Austria. In 1805, however, B. was made into a kingdom by Napoleon, the title being vested in the ducal elector. B. now remained a firm ally of Napoleon until 1813, when, by a change of sides, it was confirmed by the victorious allies in all the benefits and advantages given it previously by Napoleon. In 1818 Maximilian I presented his people with a constitution, attempting to reconcile the demand for

political freedom with his newly acquired kingly rights. He started political and religious reforms and was a much-loved monarch. He d. in 1825 and was succeeded by his son, Ludwig I (see LOUIS). He made Munich a centre of culture and art, but Parliament opposed the expenditure on art, and this opposition of the Catholic party, the Ultramontanes, was inflamed by the king's love for Lola Montez, a dancer. This led to Ludwig's abdication in 1848 in favour of his son, Maximilian II. For the religious hist. of this period see DÖLLINGER, IGNAZ VON. During the Austrian-Prussian war

the bourgeois Majority Socialists on the other, Eisner was forced to call a general election for a Bavarian constituent assembly. On 21 Feb. 1919, while on his way to the assembly, Eisner was assassinated. Chaos ensued, and out of it arose a coalition gov. with Hoffmann, a Majority Socialist, as minister-president. Owing to Communist agitation Hoffmann was forced into retirement, and a Communist Soviet Republic was proclaimed in Munich by Ernst Toller, Landauer, Levine. Hoffmann, however, was supported by Prussian troops. Munich was starved into surrender and on 1 May

13. helped Austria, and had to pay indemnity to Prussia and concede a small amount of ter. In 1870 it placed its army under the command of the Prussians, and by the treaty of Versailles (1871) became an integral part of the Ger. Empire with certain privileges. Ludwig II, who had succeeded to the throne in 1864, was through his madness forced to abdicate and committed suicide in 1886. His brother Otto, also insane, became king, but Ludwig's uncle, Luitpold, reigned as regent until 1912. This regency marks a period of prosperity until the First World War. Ludwig III had succeeded his father as regent, and on 5 Nov. 1913 was crowned king. On the same day 5 years later a Socialist meeting was held in Munich to protest against the continuance of the war. This was the beginning of the Nov. revolution, and on 8 Nov. 1918 a Soviet Gov. was set up under Kurt Eisner (q.v.). Ludwig III fled the throne and on 13 Nov. abdicated. With the communistic Spartacists on one side and

capitulated. After a week of bloodshed the Hoffmann gov. was restored. Landauer was murdered, Levine court-martialled and shot, and Toller imprisoned. B. now became the centre of conservative reaction, and many of the counter-revolutionaries of the unsuccessful Kapp (q.v.) revolt in Berlin (1920) sought refuge in Munich. Hoffmann was succeeded as minister-president by the bourgeois von Kahr, who, however, resigned in 1921 as a result of a conflict with the allied commission over the disbanding of the citizen guard. Count Lerchenfeld took office, but in 1922 was succeeded by von Knilling. Von Kahr, a man of strong monarchist sympathies, was made general commissioner in 1923, and he planned with Gen. von Lossow, military dictator appointed by the Reich, and with Col. Seisser, chief of police, to establish Bavarian nationalism. This triumvirate broke negotiations with the Reich, but were embarrassed by a movement having similar aims, only without

any monarchist intentions, led by Hitler and Ludendorff (qq.v.). Both parties planned a march on Berlin, and Hitler forced Kahr and Lossow to join him. They went back upon their word, but when the Hitler group collapsed from its own indecision Kahr's hopes of a dictatorship were also doomed. Gen. von Seeckt was appointed by the Reich to restore order in B., and he came to an agreement, called the Peace of Homburg, with the Bavarian minister-president, von Knilling. Later von Knilling resigned, and a coalition gov. was formed, of which Dr Held took the lead. His policy was a vigorous assertion of Bavarian rights, while remaining, however, within the Ger. Federation. After Hitler's accession to power the fortunes of B. were merged with those of Germany as a whole. During the Second World War Augsburg, Munich, and other towns were heavily bombed by the R.A.F., and eventually B. was conquered by the Amer. Third Army under Gen. Patton (q.v.), which entered Regensburg in Mar. 1945. After the war B. was administered as part of the Amer. and Fr. zones of occupation. See WESTERN FRONT IN SECOND WORLD WAR.

Bavarian Forest, see BOHEMIA, FOREST OF.

Bawean, or **Bawan**, Indonesian is. situated in the Java Sea between Borneo and Java; hilly, with fertile valleys and hot springs. Pop. 30,000.

Bawtry, tn and par. of Yorks (W. Riding), England, 9 m. SE. of Doncaster on the extreme S. boundary of the co. The first house coming in from London and the S. is known as 'Number One, Yorkshre.' Pop. 1500.

Bax, Sir Arnold Edward Trevor- (1883-1953), composer, b. London. He studied composition and pianoforte at the Royal Academy of Music. He never held any official teaching appointment, but in 1941 was appointed Master of the King's Music. His work, influenced slightly by the Russian school at first and owing much to Ireland and the Celtic revival, has been described as neo-romantic. He wrote a great deal in almost every musical form, including film music for *Oliver Twist*, the carol *Mater ora Filium* for double choir, 7 symphonies, the symphonic poems *The Garden of Fand*, *Tintagel*, and *November Woods*, various solo works with orchestra, much chamber music, and numerous piano works and songs. Oxford Univ. awarded him the degree of D.Mus. in 1934 and Durham Univ. in 1935. He was knighted in 1937. His vol. of memoirs, *Farewell, My Youth*, was pub. in 1943.

Bax, Clifford (1886-), dramatist and poet, b. London. He studied painting at the Slade, and lived abroad for some years until, abandoning painting, he turned to literature and drama. His first play to be produced was *The Poetasters of Ispahan*, 1912. Among subsequent productions were *Polly*, 1923, *Midsummer Madness*, 1924, *Mr Pepys*, 1926, *The Venetian* and *The Immortal Lady*, 1931, *The Rose without a Thorn*, 1932, and *The House of Borgia*, 1935. His numerous pubs. include, in addition to plays, *Inland Far* (memoirs), 1925, a monograph on Leonardo da Vinci, 1932, his collected poems, *My Muse*, 1932, *Evenings in Albany*, 1942, a novel, *Time with a Gift of Tears*, 1943, and *Some I Knew Well* (reminiences), 1951.

Bax, Ernest Belfort (1854-1926), journalist and philosopher, b. Leamington. He studied philosophy in Germany, where he acted as a foreign correspondent during 1880 and 1881. In 1885 he was the co-founder with Wm Morris of the Socialist League, and for a time assisted in the editing of the *Commonweal*. He later joined the Social Democratic Federation, and became the editor of its organ, *Justice*. His works on historical and socialistic subjects include *Ethics of Socialism*, 1889. His vol. of *Reminiscences and Reflections* appeared in 1918.

Baxar, see BUXAR.

Baxter, Richard (1615-91), clergyman, b. Rowton in Shropshire. Educ. at Ludlow by Richard Wickstead, he studied for the ministry at Wroster, and was ordained in 1638. After a period as headmaster of Dudley Grammar School and a curacy at Bridgnorth he went as preacher to Kidderminster, the scene of his famous ministry. While siding with the Parliamentarians in the Civil war (he accepted a chaplaincy to the Parl. army), he was a supporter of the constitutional principle of 'King-in-Parliament', and opposed the execution of the king. He held a middle course between the Episcopalians and Presbyterians and was an advocate of 'moderate Episcopacy.' On the restoration of the monarchy he was appointed one of the king's chaplains and was twice offered a bishopric. He presented to the conference at the Savoy a reformed liturgy. On the passing of the Act of Uniformity of 1662, he was the first to give the lead to the 'ejected 2000,' and was later the first to suffer imprisonment. His brutal treatment and trial by Judge Jefferies have been immortalised by Macaulay. He retired to Acton, but after the indulgence of 1672 he returned to London. He wrote *The Saints' Everlasting Rest*, 1650, and sev. other religious works, and left an autobiography, *Reliquiae Baxterianae*—a favourite work with Johnson and Coleridge. This has been abridged and ed. by J. M. Lloyd Thomas as *The Autobiography of Richard Baxter*, 1925. Orme prefixed a life to his ed. of B.'s works in 23 vols., 1830; lives by Dean Boyle, 1883, and F. J. Powicke (2 vols.), 1924 and 1927. See I. Morgan, *Nonconformity of Richard Baxter*, 1946.

Baxter, William (1650-1723), Eng. philologist, nephew of Richard B., b. Shropshire. Pub. an ed. of Horace and a *Glossarium Antiquitatum Britannicarum*.

Bay (Fr. *bayer*, to gape), name given to an inlet of the sea that is wider towards the open sea and narrower as it advances into the mainland. The term is often used where gulf would be more appropriate, a gulf being deeper and less variable in width than a B. In theory the character of B.s or gulfs as territorial or free is a matter of measurement, the material point being the width at the mouth; but by another usage certain B.s or gulfs, such as Conception in Newfoundland, Chesapeake, Delaware, and Cape Cod B.s (Amer.), and Cancale (Fr.), have a national character, though far wider than 6 m. at their entrance (6 m. being the conventional limit, as laid down in 1894 by the Institute of International Law for territorial waters generally). Various views have been expressed by jurists, e.g. defensibility from the shore, the range of one cannon shot from shore to shore (or 3 m.), a cannon shot from each shore (or 6 m.), an arbitrary distance of 10 m., and so on, so that obviously there is no agreement and could be none on a question which has become increasingly baffling with the development of aircraft and submarines.

Bay, name chiefly given to *Laurus nobilis*, the Sweet B., an evergreen tree, native to S. Europe, and the victor's laurel of olden times. The aromatic leaves are dried for culinary use, and the berries for veterinary purposes. B.-berry is a name given to *Myrica pensylvanica*, *M. californica*, and *Pimenta acris*, while the Loblolly B. is *Gordonia lasianthus*. The Red B. is *Persea borbontia*.

Bay, in architecture, either (i) a compartment or section in the length of a building, between each pair of roof-trusses and their supporting buttresses, if any; or (ii) a similar div. of a long vaulted building, between the main

transverse arches and buttresses; or (iii) a compartment of the floor of any large modern framed building, between the girders.

Bay City, port, city, and summer resort, cap. of Bay co., Michigan, U.S.A., on the Saginaw R. near Saginaw Bay. It has sugar and oil refineries, a fishing fleet, and manufs. heavy machinery, metal products, chemicals, and cement. Pop. 52,500.

Bay Islands, group of is. off Honduras, discovered by Columbus in 1502. The largest is., Roatan, is 30 m. long by 9 m. broad; others are Guanaja (Bonacca), Utila, etc. They were occupied by Brit. settlers in the 17th cent., but not formally annexed until 1852. In 1859 they were ceded to Honduras. English is still largely used there. Their prin. produce consists of coconuts, bananas, and other fruit, which are exported to the U.S.A. Area 144 sq. m.; pop. 8860.

Bay of Islands, co. of New Zealand on the E. coast of N. Island, named from a bay of irregular coastline on the E. side, containing numerous is., but forming a spacious and safe harbour. Russell is the site of the first missionary settlements and the first centre of gov.

Bay Psalm-Book, first book pub. in the Amer. colonies. It appeared in 1640, under the guidance of Richard Mather, Thomas Wolde, and John Eliot, and was a rendering into verse of the Psalms.

Bay Rum, aromatic liquid, obtained by mixing oils of bay with alcohol, water, and oils of pimento and orange peel. It is of value as a perfume and cosmetic.

Bay State, name applied to the state of Massachusetts, U.S.A., which was estab. in 1626-30 as the Massachusetts Bay Colony.

Bay Window, window projecting from the face of a building at ground-level, and either rectangular or polygonal on plan. The name seems to have been given originally to the large window adjoining the dais (q.v.) in a bay (q.v.) of a medieval great-hall. It may be of one or more storeys; but if projecting from an upper floor only and supported on brackets or corbels, it is called an 'oriel'; and if semicircular on plan it is a 'bow window'.

Baya (*Ploceus baya*), bird of the family Ploceidae or weaver birds (q.v.); common to India and Ceylon.

Bayadère (Portuguese *bailadeira*, female dancer), name given to the trained dancing-girls of India, the nautch girls. Some of the pantomimic dancers are attached to the Hindu temples.

Bayamo, or **San Salvador**, city in Oriente prov., SE. Cuba, on the Bayamo R., founded by Diego Velásquez in 1513 as San Salvador de B. It is a rail junction, and has an airport; a stockraising centre and H.Q. of Cuban dairying. Pop. 16,160.

Bayamón, tn of Puerto Rico, situated in an agric. area inland about 5 m. SSW. of San Juan. It was the cap. of the is. in the 16th cent. It raises sugar, fruit, tobacco, and vegetables, and manufs. leather goods, rayon, and alcohol. Pop. 20,171.

Bayana, tn of Uttar Pradesh, India, a fort and formerly a famous city, the scene of fierce battles between Muslims and Hindus. There are fine ruins of Muslim origin.

Bayan-Khara-ula Mountains, Mongol name of an extensive range in E. Asia. The dist. is unexplored by Europeans, and the existence of these mts was long only known from Chinese geographers, according to whom they lie in the centre of the E. Asian table-land, W. of Lake Koko Nor, between 35° and 38° N. lat. and 96° and 100° E. long. According to the Oxford Atlas they lie due S. of the Koko Nor. The mts rise to 20,000 ft.

Bayard, Pierre du Terrail, Seigneur de, known as 'le bon chevalier, sans peur et sans reproche' (the good knight without fear and without reproach) (c. 1475-1524), Fr. soldier, b. at the château de B. in Dauphiné. He was a page in the household of the Duke of Savoy; in 1494 he accompanied Charles VIII to Italy and distinguished himself at the battle of Fornovo, after which he was knighted; later he served in the It. wars of Louis XII; and was present at the battle of the Spurs, where he was taken prisoner. Francis I was knighted by B. on the field of battle at Marignano, 1515; but B. was mortally wounded when defending Bonivet against an army of Charles V. Besides being a brilliant soldier, B.'s chivalry was acknowledged by both his friends and enemies. See S. Shellabarger, *The Chevalier Bayard*, New York and London, 1928.

Bayard, Thomas Francis (1828-98), Amer. statesman, b. Wilmington, Delaware. In 1848 he began to study law, and was called to the Bar in 1851; he was a senator, 1869-85, and became secretary of state, 1885-9. He was the leader of the Democratic party in the Senate, and was many times proposed as President. He was U.S. ambas. to Great Britain, 1893-7. See Edward Spencer, *Public Life and Services of Thomas F. Bayard*, 1880.

Bayard, horse of the 4 sons of Aymon; he appears in Tasso's *Rinaldo*, Ariosto's *Orlando Furioso*, and Bolardo's *Orlando Innamorato*; the name is also given to a horse in Scott's *Lady of the Lake*, and is frequently applied to any spirited horse.

Bayazid I and II, see BAJAZET.

Baybay, tn on the W. coast of Leyte, Philippine Is., 40 m. direct SW. from Tacloban, the cap. of the prov.; pop. 50,725.

Bayberry, name given to N. Amer. species of *Myrica*, family Myricaceae; including *M. cerifera*, the evergreen shrub whose fruits are covered with a wax used for fragrant candles; *M. californica*, the Californian B., also evergreen; and *M. pensylvanica*, a deciduous shrub. *Pimenta acris*, family Myrtaceae, is the aromatic B. Black Cinnamon or Wild Clove of the tropics.

Bayer, Gottlieb (Theophil) Siegfried (1894-1738), Ger. Orientalist and historian, b. Königsberg; studied Syriac, Coptic, Chinese, Mongolian, and Tibetan. Member of the newly founded Academy

in St Petersburg and Prof. of Classical Antiquities in 1726. In Petersburg he pub. his main works: *Museum sinicum*, 1730; *Historia Oshroëna et Edepena*, 1734; *Historia regni Graecorum Bactriani*, 1738.

Bayer, Johann (1572-1625), Ger. astronomer, b. Rhain in Bavaria, followed the profession of a lawyer at Augsburg. In 1603 he pub. a chart of the stars, *Uranometria*, in which he included 12 new constellations of the S. hemisphere, and employed letters of the Gk alphabet in star nomenclature. His S. constellations are said to have been derived from the observations of a Dutch navigator.

Bayern, see BAVARIA.

Bayessa, see BAEZA.

Bayeux, Fr. tn in the dept of Calvados, on the Aure, 17 m. NW. of Caen. It is on the site of the Rom. *Augustodurum*, and has a bishopric dating from the 4th cent. It was taken by Rollo (see under NORMEN) in 890, was pillaged by Henry I of England in 1106, and was under siege many times in the Hundred Years War and the religious wars of the 16th cent. The splendid cathedral is mainly 12th-13th cent. The famous tapestry is preserved in the museum (see BAYEUX TAPESTRY). B. was the first tn liberated by the Allies in 1944 (see under WESTERN FRONT in SECOND WORLD WAR, INVASION OF NORMANDY), and has a large Brit. war cemetery, in which a memorial (dedicated in 1955) to those whose graves are unknown, bears, in Latin, the inscription: 'We whom he conquered have set free the land of William the Conqueror.' Charter (q.v.) was b. in B. There is an agric. market, and lace and pottery are made. Pop. 10,300.

FLOWER

BAYBERRY

Bayeux Tapestry, roll of linen 20 in. wide and 231 ft long, preserved in the ant. bishop's palace of Bayeux, Normandy, upon which are worked in coloured woollen thread the events connected with the invasion and conquest of England. It is not, strictly speaking, tapestry, as it is worked in sampler fashion. The work is divided into 72 compartments,

with descriptions in Latin, and the crude colours still retain their freshness. Various conjectures as to its origin have been made, tradition assigning it to Matilda, wife of William the Conqueror; it was more probably worked for his half-brother, Odo, Bishop of Bayeux, a view which gains support from the fact that 3 of Odo's followers mentioned in Domesday Book (q.v.) are among the very few named figures in the tapestry. It was first mentioned in the 14th cent., when an inventory was made of the goods in Bayeux Cathedral, which it adorned. In 1724 a drawing of a portion of it was presented to M. Lancelot, a member of the Académie des Inscriptions, and this led

Holy Sea'), freshwater lake in S. Siberia stretching from SW. to NE. in a mountainous region (1513 ft above sea level). Length 390 m.; breadth 20-50 m.; area 12,500 sq. m. It is the deepest lake in the world, its greatest depth being 5660 ft. Lake B. has many rivs. flowing into it, the main one being the Selenga, and only one outlet, the Angara; it is rich in fish and there are also seals.

Baykalean Mountains, sev. ranges enclosing Lake Baykal in SE. Siberia. They stretch in a NE. direction. The highest peak (Shebetuy in the Barguzin range) is 8380 ft. There are gold, tin, mica, and coal deposits. *See also* TRANSBAYKALIA; YABLONOVYY.

BAYEUX TAPESTRY
Panel showing the death of Harold.

to public knowledge of the work. In 1803 it was sent to Paris by order of Napoleon for a short inspection, but was shortly after returned, and in 1816 Charles Stothard was sent by the Eng. Society of Antiquaries to make an accurate copy of it. His drawings of it were pub. in the sixth vol. of *Vetusta Monumenta* in 1819. During the Second World War the tapestry was placed in safe keeping, first in Bayeux and later in a château near Le Mans. After the allied invasion of Normandy the tapestry was taken to Paris by the Germans and placed in a basement in the Louvre, from which it was recovered intact in Aug. 1944. *See* Jules Comte's *Tapisserie de Bayeux*, 1878; Rev. J. C. Bruce's *Bayeux Tapestry Elucidated*, 1855; F. R. Fowkes's *Bayeux Tapestry*, 1898; E. MacLagan, *The Bayeux Tapestry*, 1943; F. Stanton (ed.), *The Bayeux Tapestry*, 1957.

Bayf, Jean Antoine de, *see* Balf, JEAN ANTOINE DE.

Bayida, or Bahinda, Steppe, desert of Nubia, the Sudan, in the bend of the Nile, N. of Khartoum, which contains sev. rocky mts and sparse vegetation.

Baykal (Mongolian Dalai-nor, 'The

Bayle, Gaspard Laurent (1774-1816), Fr. physician, b. Vernet, Provence. He studied at the École de Médecine, Paris, and was M.D. in 1801. His reputation rests on his intensive study of pulmonary tuberculosis, summarised in his book *Recherches sur la Phthisie Pulmonaire*, 1810 (Eng. trans. 1815). He himself d. of the disease, a victim of his own zeal for work.

Bayle, Pierre (1647-1706), Fr. critic and philosophical writer, b. Carlat-la-Comte. He was the son of a Calvinist minister, and was brought up in this faith, but while at the Jesuit College of Toulouse, he made a profession of the Rom. Catholic faith, which he revoked less than 2 years later. For this reason he withdrew, in 1670, to Geneva to study, and 5 years later he was appointed to the chair of philosophy at the Protestant univ. of Sedan. When this univ. was suppressed by Louis XIV in 1681, he became prof. of philosophy at Rotterdam. He lost his professorship in 1693 as a result of controversy, and devoted himself to the compilation of his great dictionary, the first vol. of which under the title *Dictionnaire historique et critique* appeared in 1695, completed in

1697. The uniqueness of this work, its grace of style, the erudition and learned scepticism which it displayed, enhanced his reputation, already considerable, and a second ed. appeared in 1702. There have been many subsequent eds., notably that by P. des Maizeaux, Amsterdam, 1740, to which a life of B. was added. Among B.'s earlier works were controversial writings on theology, his *Pensées sur la comète*, 1682, and particularly the *Nouvelles de la république des lettres*, 1684-7, a species of periodical which he pub. over a number of years, devoted to literary criticism. Voltaire called him 'le premier des dialecticiens et des philosophes sceptiques.' See H. E. Smith, *The Literary Criticism of Pierre Bayle*, 1912; H. Robinson, *Bayle the Sceptic*, 1931.

Baylén, see BAILÉN.

Baylis, Lillian Mary (1874-1937), theatrical manager. She was associated with the introduction in 1914 of Shakespeare's plays as a permanent programme at the Old Vic Theatre, London, of which she was lessee and manager from 1898. She also leased the Sadler's Wells Theatre when it was rebuilt and reopened in 1931. Her productions here of opera in English alternated with those of Shakespeare at the Old Vic. She began her career as a child violinist, and as such played both in Great Britain and in S. Africa. C.II., Hon. LL.D.

Bayliss, Sir William Maddock (1866-1924), physiologist, b. Wolverhampton. Early studied medicine, but did not complete his studies, preferring research work, which he did under Ray Lankester and Burdon Sanderson at Univ. College, London, from 1881. Resumed medical work, studying physiology under Sanderson and later under Schäfer. It was the scientific rather than the clinical side that appealed to him, and he resolved to abandon medical qualification and confine himself to physiology. Took natural science and physiology at Oxford, and after obtaining his degree resumed work under Schäfer at Univ. College, and applied himself to research with John Rose Bradford, notably in the electrical phenomena accompanying secretion. Soon after this he began research work at Guy's Hospital in the electrical phenomena of the heart and the action of the nerves on the heart and, later, carried out important research work on the vasomotor nerves (also with Bradford). As prof. of general physiology at Univ. College (1912-24) he took part in the teaching there. Collaborated with E. H. Starling (q.v.) in the study of internal secretions. Wrote numerous papers dealing with physico-chemical problems of physiological importance, and also on the action of enzymes. His *Principles of General Physiology* (1915) is a work of outstanding significance, and reveals a catholicity of study besides a profound knowledge of its prin. topic. In 1911 he was awarded the royal medal of the Royal Society and in 1922 the Copley medal; he was knighted in 1922.

Baylis, Sir Wyke (1835-1906), painter, b. Madeley; studied at the Royal Academy. He became president of the Royal

Society of Brit. Art, 1888, and was knighted in 1897. He specialised in interior views of cathedrals and churches.

Baylor University, founded by Baptists of Texas in 1845, has been at Waco since 1887. In addition to the college of arts and sciences it has colleges of dentistry (Dallas) and medicine (Houston), and schools of law, education, music, nursing, and business. Its libraries had a total of 208,000 vols. in 1956, including a famous Robert Browning collection of 13,000 items. In 1955 there was a teaching staff of 235, with 5800 students.

Bayly, Ada Ellen, see LYALL, EDNA.

Bayly, Thomas Haynes (1797-1839), song-writer and dramatist, b. Bath. He was educ. at Winchester and Oxford and was best known for his sentimental songs, such as 'I'd be a Butterfly,' 'Oh! no! we never mention her,' 'The Pilot,' and 'Gaily the Troubadour.' His most successful play was *Perfection*, and he also pub. 5 novels.

Bayne, Alexander (d. 1737), jurist, first prof. of law in Scotland. Became an advocate at the Scottish Bar, 1714; in 1722, prof. of Scots law at Edinburgh; ed. and wrote sev. works on Scots law.

Bayne, Peter (1830-96), Scottish author. He graduated at Marischal College, Aberdeen, and studied theology for the ministry at Edinburgh. He became editor of the *Edinburgh Witness*, 1856; the *Dial*, 1860-2; and of the organ of the Eng. Presbyterian Church, the *Weekly Review*. He wrote the *Testimony of Christ to Christianity*, 1862; and a *Life of Luther*, 1887.

Baynes, Thomas Spencer (1823-87), writer and editor, b. Wellington, Somerset, son of a Baptist minister. He was sent to Edinburgh Univ., where he was a pupil, and afterwards assistant, of Sir Wm Hamilton. In 1850 he became editor of the *Edinburgh Guardian*, and in 1858 was appointed assistant editor of the *Daily News*. Six years later he became prof. of logic, metaphysics, and Eng. literature at St Andrews Univ., a post which he held till his death. From 1873 to 1881 he was sole editor of the ninth ed. of the *Encyc. Brit.* His *Shakespeare Studies* were pub. with a memoir in 1894.

Bayonet, name of a short spear-like weapon of varying lengths. When not in use it is carried in a scabbard; when in use it is fixed to the muzzle of the rifle, and forms the thrusting weapon of the infantry in close combat. The original weapon is thought to have been invented at Bayonne in the 17th cent.; it was triangular in section, and had a tapering point. See C. Boulkes, *Sword, Lance and Bayonet*, 1938.

Bayonne: 1. Fr. tn, the anct Lapurdum, cap. of an arron., in the dept of Basses-Pyrénées, at the confluence of the Adour and the Nive, 3 m. from the sea. An anct fort. tn, it is the chief port of the Basque country. The city has Rom. walls, a citadel by Vauban (q.v.), good quays and promenades, and a cathedral which is partly 13th cent. It is the seat of a bishopric. Once renowned for swords and knives (see BAYONET), it to-day has

distilling, ham-curing, and leather industries, and is a tourist centre. Pop. 32,600.

2. City of Hudson co., New Jersey, U.S.A., on 3-m. peninsula S. of Jersey City between Newark and New York bays. A 1675-ft bridge connects with Staten Is. across the Kill Van Kull. B. has large oil refineries connected by pipeline to the oil-fields of the SW. U.S.A.; it has sev. m. of waterfront with docks and U.S. Navy dry-dock and supply depots. It manufs. chemicals, paints, clothing, machinery, textiles, food products, cottonseed oil, cork, radiators, motors, generators, etc. It has a junior college. Pop. 77,200.

Pop. 59,000. See A. Bahr-Mildenburg, *Bayreuth and the Wagner Theatre*, 1913.

Bays, Queen's, see DRAGOON; GUARDS REGIMENT.

Bayse, see BALSE.

Bayswater, dist. of London N. of Hyde Park and Kensington Gardens, in the bor. of Paddington. It derives its name from 'the watering place of Baynard'; a Robert Baynard was knight of the shire here in 1327. The part of B. nearest Marble Arch is sometimes called Tyburnia because of its proximity originally to the Tyburn gallows.

Baytown, see ROBIN HOOD'S BAY.

Baza (anc. Basti), Sp. tn in the prov. of

Breitkopf & Härtel

THE THEATRE, BAYREUTH

The stage is set for the Grail scene in *Parsifal*.

Bayou (Fr. *bayau*, channel), term originally applied in some of the S. states of N. America to a branch of a riv. or lake, but now sometimes loosely applied to streams of various descriptions.

Bayreuth, Ger. city in the *Land* of Bavaria (q.v.), on the Red Main (q.v.), 122 m. N. of Munich (q.v.). It is famous for its connection with Wagner (q.v.), and a yearly festival of Wagnerian opera is held in the theatre, the *Festspielhaus*, which the composer himself designed. There is also another, baroque, opera-house (1748), and there are fine old churches and a notable 18th-cent. castle, now a museum. The *Eremitage*, a rococo castle, was often visited by Frederick the Great (q.v.), whose sister was margravine of B. Wagner is buried in the garden of his former villa, and in the tn cemetery are buried Liszt, Johann Paul Richter, and Houston Stewart Chamberlain (qq.v.). There are textile and other manufs., and there is a trade in agric. produce and fruit.

Granada, with a Moorish fortress, and a fine Gothic church, which was formerly a cathedral. There are troglodytic dwellings near by. Lead, iron, and cinnabar are mined. Pop. 21,500.

Bazaar (Persian *bazar*, market), oriental name for a covered market, where various objects are exposed for sale. In the W. the term has been extended to shops which sell fancy goods, and to sales of fancy articles which are contributed gratuitously for charitable or religious purposes.

Bazaine, François Achille (1811-88), marshal of France, entered the army as a private soldier in 1831, served in Algeria, and in 4 years became lieutenant, with the cross of the Legion of Honour. In 1839 he was a captain, and a few years later brigadier-general. He distinguished himself in the Crimean War and was made governor of Sebastopol on its capture. Gaining fresh laurels in Italy (1859) he was appointed to a command

in the Mexican expedition. Here, however, he was accused of mixing up political and personal aims with his generalship, and on returning to France in 1867 was coolly received by Napoleon III. In 1870, at the outbreak of the Franco-Ger. war, he was appointed to command the 3rd Corps, and afterwards the whole army of the Rhine. He has been blamed for the defeat of Spieheren, when he allowed Gen. Frossard to be beaten unsupported. B. retreated with his army to Metz, where the Prussians hemmed him in. MacMahon's attempt to relieve Metz ended at Sedan. Then came a series of obscure negotiations by B., which have never been fully explained, but which ended in his surrendering with 140,000 men; setting his besiegers free just in time to crush the great effort then made to relieve Paris. In 1873, after B.'s return from captivity in Prussia, he was court-martialled for dereliction of duty, and condemned to degradation and death, but the sentence was commuted to 20 years' seclusion. Being imprisoned in the Ile Sainte-Marguerite, he escaped thence in 1874. Fourteen years later he d. in exile at Madrid. See R. Peyron, *Le Cas de Bazaine*, Paris, 1905; P. Guedalla, *The Two Marshals*, 1943; R. Christophe, *La Vie tragique du Maréchal Bazaine*, 1948.

Bazalgette, Sir Joseph William (1819-1891), civil engineer, b. Enfield, Middlesex. He became chief engineer to the London Metropolitan Board of Works (1855-89); he superintended the construction of the London drainage system, 1858-75; and the Thames embankment, 1862-74. He was knighted in 1874.

Bazard, Amand (1791-1832), Fr. socialist, b. Paris. He became a civil servant. About 1820 he organised a secret society modelled on the Ft. Carbonari, but a premature outbreak upset their plans and sent its leaders into hiding. Subsequently, B. adopted the ideas of Saint-Simon which he and Enfantin propagated in various forms, and in the *Doctrines Saint-Simoniennes* (1829-30). Later they quarrelled, and B. d. a few months later after an apopleptic seizure.

Bazargic, see **TOLBUKHIN**.

Bazarjic, see **TOLBUKHIN**.

Bazas, Fr. tn in the dept of Gironde, on the Beuve. It is the seat of a bishopric. There is a trade in wine and market-garden produce. Pop. 4300.

Bazeilles, Fr. vil. in the dept of Ardennes, near Sedan. It was destroyed during the Franco-Ger. war (q.v.). The house where the last cartridge of the war was fired is preserved as a museum. Pop. 1000.

Bazin, René François Nicolas Marie (1853-1932), Fr. writer, b. Angers; he studied law at the univ. of Paris, and was appointed to the professorship of law at Angers in 1878; he was elected to the Fr. Academy in 1904. His novels deal with provincial life, and he also pub. books of criticism and travel. The following may be noted: *Stéphane* (his first novel), 1884; *Une Tache d'encre*, 1888; *Sicile*, 1892; *Humble Amour*, 1894; *Terre d'Espagne*, 1896; *La Terre qui meurt*,

1899; *Les Oberlé*, 1901; *Le Blé qui lève*, 1907.

Bazooche, see **BASOCHE**.

Baztán, or **Bastan**, valley in the Pyrenees to the N. of Pamplona in Spain. It produces Indian corn, wheat, pulse, and flax, has meadows and forests, and is drained by the R. Bidassoa (q.v.).

'**B.C.O.N.**,' see **ARMY NEWS SERVICES**.

Bdellium, gum-resin obtained from some species of *Commiphora*. B. is similar to myrrh and is sometimes found adulterating it.

Beach, Sir M. Hicks, see **ST ALDWYN**.

Beach, Rex Ellingwood (1877-1949), Amer. novelist, b. Atwood, Michigan. He studied law at Chicago, but then turned to mining and finally to writing red-blooded novels of adventure. Among his best are *Pardners*, 1905, *The Spoilers*, 1906, *The Barrier*, 1907, *The Silver Horde*, 1909, *The Iron Trail*, 1913, *The Mating Call*, 1927, and *Money Mad*, 1931. In *Personal Experiences*, 1941, he tells the story of his life.

Beach, Thomas Miller (1841-94), known as Maj. le Caron, spy, b. Colchester. In 1861, at the outbreak of the Amer. Civil War, he went to New York and enlisted with the Federalists. He served till 1865, and then joined the Fenian organisation, supplying the Brit. Gov. with information and remaining in America until 1888. See his *Twenty-Five Years in the Secret Service*, 1892.

Beaches, Raised, terraces near the sea coast which were formerly beaches, but were later raised to constitute dry land. They consist of gravelly, sandy, and shelly deposits. Such B.s are to be found in England and Ireland, but more often in Scotland, many of the coast tns, e.g. Nairn and Cromarty, being built upon them. In S. America they occur in some places at as great a height as 1200 ft above the present sea level.

Beachy Head, cape in England, on the Sussex coast, between Eastbourne and Seaford. Its altitude is about 575 ft, and it forms the termination of the S. Downs. The Bell Tout lighthouse, 285 ft above sea level, erected in 1831, was replaced in 1902 by a lighthouse at the base of the cliff, 125 ft high. The battle of B. II. was fought on 30 June 1890, and won by the Fr. fleet, commanded by the Comte de Tourville, over the allied Eng. and Dutch fleets, under the Earl of Torrington and Count Evertsen. The view from the head in clear weather extends to the Isle of Wight and France.

Beacon (O.E. *bēacon*, a sign), originally a fire lighted on a high hill, or tower, for the purpose of sending signals over some long distance, or an alarm or warning. The name has been given to lofty hills, such as Dunkery B., the highest point of Exmoor, and B. Hill, a height N. of Boston Common. Upon these heights the B. fires were formerly lighted, and the towers and cressets are still to be seen. The term B. is now given to any structure used for the warning or guidance of shipping in rivers, estuaries, or the open sea, and may or may not have a light on it, although in terms of the Merchant Shipping Act

(1894) a B. with a light is a lighthouse. One type of Eng. B. is constructed of iron plates, closely fitted together and surmounted by an iron mast, which bears a daymark consisting of a triangle or ball, etc. The B. for a sandbank is an iron tube sunk in the sand, and fitted with a mast to carry the daymark. In some few cases B.s are lighted by gas, a pipe being laid under water and carried up to the lantern, or the gas may be supplied from a tank or cylinders which hold compressed gas for some months. The Monkstone B. in the Bristol Channel is an example of the latter type of lighted B. It is a stone tower ascended by an iron ladder and railed round at the top.

The name is also given to inland lights for aerial navigation and to radio and radar installations for giving direction-finding bearings to ships or landing instructions to aircraft.

Beaconsfield, Benjamin Disraeli, Earl of (1804–81), statesman and man of letters, b. London. He was the son of Isaac D'Israeli, the descendant of a family of Levantine Jews. He was baptised into the Christian Church in 1817, and was educ. privately. At the age of 17 he was articled to a firm of solicitors, and later entered at Lincoln's Inn in 1824, where he kept 9 terms. In 1826 he pub. the first part of *Vivian Grey*, a second part of which appeared in the following year. He left England in 1828 and spent 3 years in the E. During the decade 1830–40 he wrote a number of novels, and pub. sev. political pamphlets. In 1837, on the death of William IV, a general election took place, and he was invited to contest Maidstone, and was returned with Wyndham Lewis as his colleague. In Dec. of the same year he made his first speech in Parliament, and it was on this occasion there occurred the scene when, howled down by the House, he warned the mockers that the day would come when they *would* hear him. In 1839 he married the widow of his late colleague, Wyndham Lewis. In her he found the sympathy and courage which were to be so necessary an asset in his life. With her fortune he was able to buy an estate at Hughenden.

From the time of his first failure in Parliament he awaited his opportunity, prominent in the House only for the bitterness with which he attacked the Whigs. By 1842 he was known as the leader of the Young England (q.v.) party. But in 1846, by his onslaught against Sir Robert Peel in the Corn Law debates, he became the virtual leader of the Conservative party, though nominally it remained under the leadership of Lord George Bentinck, who, with Disraeli, did much to reorganise and reinvigorate the party machine in the years immediately following 1846. In 1844 had appeared *Coningsby*, in 1845 *Sybil*, and in 1847 *Tancred*, 3 political novels which were intended to explain the origin and the positions and duties of the great political parties. In 1852 he was Chancellor of the Exchequer for a short time; in 1858 he again returned to office, but the 'fancy franchises' drove him and his party out of office for 7 years, during

which he added to his reputation as a debater and a politician. In 1867 he came back into office in the third Derby administration, and then came one of the most striking political incidents, the 'leap in the dark', which 'dished the Whigs.' In that year he introduced a parl. reform Bill more democratic and sweeping than anything which the Liberals had introduced. In the next year he succeeded Lord Derby as the head of the administration, but at the end of the year, not having a majority, he resigned. In 1870 he pub. *Lothair*. In 1874 he began his second administration, an administration notable for its many measures of social reform, as well as for its foreign and imperial policy;

BENJAMIN DISRAELI
EARL OF BEAconsFIELD

in 1875 he acquired the half rights in the Suez Canal; in the following year he proclaimed Queen Victoria empress of India, and in the same year retired to the House of Lords as Earl of B. In 1878 followed the Congress of Berlin, which raised him to the greatest height of his power, and gave England 'peace with honour.' The wars in Afghanistan and Zululand, together with the commercial depression, gave the opposition their opportunity, and the 'imperial' policy was condemned at the general election of 1880. A large Liberal majority was returned and the Gov. resigned. In the same year appeared the novel *Endymion*, really a book of personal memories. The following year Disraeli d., and was buried at Hughenden, as he had wished.

It is primarily as a statesman that his fame lives, his role as novelist being by way of understudy to the greater part. It is doubtful whether the novels, which are in many ways autobiographical, faithfully reflecting the mystical cynicism of his politics, would survive on their own

merits, though in manipulation of plot and in vividness of characterisation, he showed considerable skill. But the purpose of his novels was always political; his most characteristic novels were *Coningsby* and *Sybil*, and they were powerful because they were ancillary to his political convictions. As a member of the Young England party, he wanted to attack the gov. policy generally as being a break with classic Tory tradition. The lesson he tried to convey was that the Tory govs. from the revolution to the time of the Reform Bill, 1832, were oligarchies which had whittled away the royal prerogatives. *Coningsby*, like *Sybil*, is notable for his championship of the rights of the peasantry, which Disraeli held to have been encroached on by the Poor Law; but *Sybil* went further, and embodied his horror of the misery and squalor of the lives of the working classes in the industrial N., and there is no doubt it was effective propaganda for the cause of factory reform. The 2 novels were a definite expression of the new Tory gospel of the Young England party, which was the assertion of the royal prerogative and the freedom of the Church, and also of the co-equality of the rights of labour and property—which latter doctrine was so eloquently voiced in his famous Chartist speech, alluded to in one of the novels. Finally, *Coningsby* is also a moving plea for the Jewish race. As a writer Disraeli is always informative and interesting, and his style, if mannered and turgid, contains brilliant phrases and shrewd maxims. See lives by J. R. Thurnsfield, 1898, A. Manrois, 1927, and T. Lever, 1942. See also *Letters of Disraeli to Lady Bradford and Lady Chesterfield, 1873-1881*, ed. Marquess of Zetland (2 vols.), 1929, and D. C. Somervell, *Disraeli and Gladstone*, 1925.

Beaconsfield: 1. Residential tn in Bucks, England. It is 10 m. from Windsor and 23 from London. It is noted as the home of Edmund Waller, the poet, and of Edmund Burke; both are buried here. The Earl of B. took his title from the tn. Pop. 8000.

2. Tn of Tasmania, in an area of apple orchards, with some dairying and general mixed farming, formerly a gold-mining centre.

Bead, in architecture, a small convex moulding.

Bead-tree, *Melia azedarach*, tropical plant cultivated for its flowers, which resemble the lilac.

Beadle (also **Bede**) (A.-S. *byddell*, a summoning officer), official whose function has had many variations. Originally, in Saxon times, he called householders to the moot. After the Conquest he was an officer both of the manor and of the church, but gradually developed into a par. constable. The Univ. bedels, once important functionaries, now figure in official processions. At Oxford Univ. there are 4 bedels, the junior being the vice-chancellor's attendant and macebearer. At Cambridge Univ. there are 2 bedels, called esquire bedels, who bear maces before the vice-chancellor. In the Scottish Church the B. attends on the

minister when divine service is being held. See LOCAL GOVERNMENT.

Beads, ornaments which have been used for decoration and barter from remote times, beautiful examples being found in early Egyptian tombs. At the present time they are still the medium of exchange with barbaric tribes. They are made of gold, gems, coral, glass, etc. The manuf. of glass B. in Britain is carried on chiefly at Birmingham; on the Continent Venice is noted for the enormous variety and quantity of B. made there. In the process of manufacturing glass B., the glass is blown into a bulb and drawn out into long tubes. The B. are then pinched or cut off, and heated in cylinders which rotate. To prevent the sticking together of the B. sand and ashes are put into the cylinders. See J. B. Littlejohn, *Beadcraft*, 1930.

Beagle, variety of Eng. hound, used in hare-hunting, there being a good number of packs in Great Britain and Ireland. It has a keen scent, powers of endurance, and intelligence. It is 10-16 in. in height, has long, thin, pendulous ears, a deep chest, and strong widely set shoulders. The coat is thick and flat and of the usual variety of colours of the hound.

'**Beagle**,' H.M.S., name of a brig of 235 tons which, in 1831, was sent by the Brit. Gov. on an expedition, under the command of Capt. Fitzroy, to survey the S. extremity of America. Charles Darwin, as a young man of 22, accompanied the expedition as honorary naturalist on the staff. The voyage lasted from 27 Dec. 1831 to 2 Oct. 1836, and an account of it was pub. by Darwin in 1839 under the title *A Naturalist's Voyage round the World; or, A Journal of Researches into the Natural History and Geology of the Countries visited during the Voyage of H.M.S. 'Beagle.'* Darwin also contributed to the official narrative of the voyage.

Beak, see BILL.

Beak-head Moulding, in Norman architecture, a grotesque ornament, resembling an animal's head with a bird's beak; used in rows around the doorways of churches.

Beaked, heraldic term, followed by a metal or colour, to denote that a bird has a beak of a different tincture from that which it would have according to the normal rules of heraldry.

Beaker (Gk *bikos*, wine-jar), cylindrical or conical vessel made of annealed glass used in chemical operations for making solutions, in analyses, and for various other purposes.

Beaker Folk, widely spread group of peoples with distinctive round-headed skulls who, about 1800 bc, brought the knowledge of metal-working to Europe, and by way of Holland and the Rhineland to Britain. They are so named from a characteristic pot buried with their dead. The B. F. were not themselves metal-workers, and their culture is therefore to be regarded rather as a bridge between those of the Neolithic and the true Bronze Ages; indeed in the E. parts of Britain where the mining and manuf. of flint had long been practised, bronze daggers were

imitated in flint. There are chronological differences between the 2 main varieties of beaker which assist in the definition of 2 separate phases in the settlement of the B. P., but the subject is one of complexity and cannot be considered here. The B. F. were also responsible for the building of simple stone circles with opposed entrances, as at Avebury, Wilts, and Stanton Drew, Somerset, and for other earthwork enclosures some of which contained settings of timber uprights as at Woodhenge (see STONEHENGE). Such circular sanctuaries seem to imply belief in a sun- or sky-god. See J. G. D. Clark, 'The Dual Nature of the Beaker Invasion,' in *Antiquity*, V, 1931, and the same author's *Prehistoric England* (4th ed.), 1952; also Brit. Museum, *Later Antiquities of the British Isles*, 1953. See also ARCHAEOLOGY; BRONZE AGE; PREHISTORY; STONE AGE.

Beal, Samuel (1825-89), scholar, b. Devonport; educ. there and at Cambridge; ordained 1852, and became a naval chaplain on board H.M.S. *Sybilie*, which went to the China station. B. spent his spare time in acquiring the language; acted as naval interpreter during the war of 1856-8, and continued his studies after settling in England. His works include *The Travels of Fah-hian and Sung-yun*, 1869; *A Catena of Buddhist Scriptures*, 1871; *The Legend of Sakya Buddha*, 1875; *Texts from the Buddhist Canon*, 1878.

Beale, Dorothea (1831-1906), educationist, daughter of a London doctor. In 1857 she was appointed head of a school for clergymen's daughters, in Westmorland, and in 1858 took charge of the Ladies' College at Cheltenham. She quickly raised the school to very high rank by increasing the number of pupils, reorganising finances, and putting up new buildings. In the report of a commission (1868) before which B. gave evidence, the low average standard of girls' education was exposed. B. felt the absence of trained teachers was perhaps the greatest obstacle to progress. A residential training college for women (the first of its kind in the country) was opened as St Hilda's College, Cheltenham, in 1885. B. subsequently (1893) estab. at Oxford the St Hilda's Hall of Residence for women. Associated with the movement for women's suffrage, she was deeply religious and did much to improve women's education.

Beale, Mary (1632-97), Eng. portrait-painter, *née* Cradock, daughter of a clergyman. She imitated the style of Sir Peter Lely (q.v.), whose pupil she may have been, and painted Charles II, the Duke of Monmouth, Cowley, and Milton. Her son, Charles B. (d. 1689), was also a portrait-painter.

Beale, Robert (1541-1601), Eng. diplomatist and antiquary. He was a Protestant of Puritan inclinations, and became Walsingham's secretary in 1570. He entered Parliament in 1572, and it was he who read Mary Queen of Scots her death warrant. His works include *Discourse after the Massacre of St Bartholomew's*, of which he was an eye-witness;

A Book respecting Ceremonies, the Habits, the Book of Common Prayer, and the Power of Ecclesiastical Courts; and The Order and Manner of the Execution of Mary Queen of Scots.

Beam (from O.E. *beam*, a tree; cf. horn-beam and whitebeam), piece of timber, as a house-B., a weaver's B., etc. The cross-timbers of a ship are her B.s, so that when she heels over she is 'on her B.-ends'; hence the phrase signifying distress or difficulty.

Beam-tree, or White Beam (*Sorbus aria*), species of Rosaceae which grows to a height of 20 to 40 ft in Europe and Asia. The leaves are ovate, with serrated edges, and are white and downy underneath; the flowers grow in terminal corymbs, and the small red fruit resembles a haw. It is acid and astringent, and is sometimes called sorb or service-berry. The wood is used in turning, and beer is made by fermentation of the fruit.

Beam Wireless. For a reliable point-to-point telephone service between 2 widely spaced countries it is necessary to concentrate the energy into a narrow 'beam' of waves. In 1900 Hertz used a parabolical metal reflector. The physical dimensions of the reflecting system must be very large compared with the wave-lengths involved. Unfortunately such small wave-lengths are not suitable for long-distance communication, and the longer wave-lengths involved (10 to 100 metres) would require parabolas of hundreds of ft diameter.

FIG. 1A. PARABOLIC REFLECTOR FOR ULTRA-SHORT WAVE

L, Aerial length equalling half of wave-length.
D, Diameter of parabola opening.

Another method of obtaining directive properties is to use a number of aeriels grouped in an 'array.' The 'dipole aerial,' the physical length of which is half the wave-length being radiated, gives a radiation pattern in the form of 2 main 'lobes,' one on either side of the wire (Fig. 1b). By placing sev. dipoles side by side and 'feeding' all of them in phase, the radiations add up in a line at right angles to the line of dipoles, and subtract at the angles towards the sides. Fig. 1c shows this for 4 dipoles, the main lobes of radiation being about 36 in. wide. This

aerial system is known as a 'broadside' array. It is also possible to feed the dipoles in such a phase as to radiate the maximum energy in line with the aeriels; this is known as an 'end-fire' array. By using more dipole elements the beam can be concentrated still further; for example, 16 dipoles suitably arranged would be used to achieve a beam width of about 8 in. This only concentrates the beam in the horizontal plane. To concentrate the

FIG. 1B. RADIATION DIAGRAM OF A DIPOLE
L, Aerial length

beam in the vertical plane, a suitable number of dipoles are stacked one above the other. Since the spacing between dipoles must also be half a wave-length, the number of dipoles that can be stacked in this way is limited. For wave-lengths of about 25 metres 8 dipoles could be accommodated vertically on 500-ft masts, giving a beam width in the vertical plane of approximately 20°. A 24-dipole broadside array is shown in Fig. 1D. It is usual to employ a 'reflector,' consisting of an exactly similar array placed a quarter of a wave-length behind the main aerial. This prevents radiation from one side and increases it on the useful side. About 30 per cent reflection can be achieved in this way. The actual direction of radiation depends on the disposition of the masts supporting the array, and for a comprehensive transmitting service the number of aeriels employed is formidable. An attempt to provide movable masts was made by the Philips Radio Co. at

FIG. 1C. CONCENTRATION OF ENERGY BY THE USE OF FOUR DIPOLES

Eindhoven, Holland, where the supporting framework was carried on a circular rail track. Even so, with the multiplicity of wave-lengths that must be used, together with the large number of countries to be served, this device would not give much alleviation in the number of aerial arrays required.

All forms of intelligence may be carried by beam wireless—telegraphic, telephonic, and photographic. In the U.K.

all 3 services are handled by Cable and Wireless Ltd, with the exception of 2-way telephone conversations, which are handled by the G.P.O. Each station comprises 2 units—one for transmitting and one for receiving—usually spaced widely apart in order to obtain the best site conditions. Both sending and receiving stations are connected by land line to the central office of Cable and Wireless Ltd (Electra House, London), which handles all the traffic, both outgoing and incoming. The 2 main transmitting stations are situated at Ongar and Dorchester, with the complementary receiving stations at Brentwood and Somerton respectively. Each station has many transmitters, and a worldwide

FIG. 1D. 24 DIPOLE BROADSIDE ARRAY

service is maintained at all hours of the day. At some periods it is not possible, through ionospheric conditions, to cover a particular link in 1 direct beam. Therefore automatic wireless relay stations have been installed where the original signal is picked up and re-radiated on a more suitable wave-length and course. An example of this is the London-Montreal service, which can be routed via the relay station installed on Ascension Is. The 2-way telephone service maintained by the G.P.O. employs an exactly similar set-up, the 2 separate conversations being combined at the central office (Faraday House, London), and thence connected in the usual way to any telephone subscriber. See also WIRELESS TELEGRAPHY.

Beaminster, anct mrkt tn and par. of Dorset, 6 m. from Bridport, situated on the Brit. It is mentioned in Domesday Book. Pop. 1800 (approx.); rural dist. 8000.

Bean, name given to the seeds of various plants, chiefly to those of the order Leguminosae. The common or broad B. is *Vicia faba*, and has many varieties. The Fr. or kidney B. is *Phaseolus vulgaris*, and the scarlet runner *P. multiflorus*; both of these plants are grown in England, and the pods are eaten as vegetables. The latter is also used as an ornamental climber. *P. lunatus*, the Lima B., is a native of S. America, with broad flat pods and short flat seeds. *P. mungo*, the mungo B. or green gram, and *P. radiatus*, the black gram, are B.s which are given to horses. *Dolichos biflorus* is

also called the horse gram in India, and is excellent food for cattle, while the pods of *D. lablab*, the lablab B., are cooked for human consumption after the manner of kidney beans. *Glycine soja* yields soya B.s (q.v.). *Ceratonia siliqua* is the Mediterranean species known as the locust or carob B.; *Pigna sinensis* is the cherry B. or cow-pea of tropical Asia; *Mucuna utilis* the tropical velvet B.; *Canavalia ensiformis* the Jack, sword, or sabre B. of India; *Physostigma venenosum* the ordeal B. of Calabar.

Of a few plants which are not leguminous, but whose seeds are known as B.s, may be mentioned *Nelumbo nucifera*, the Egyptian or sacred B. eaten in Cashmere; *Strychnos ignatii*, St Ignatius's B., with poisonous properties; *Menyanthes trifoliata*, the bog or buck B. of Europe, Asia, and N. America. The B. caper is an E. plant, *Zygophyllum fabago*, whose flower buds are eaten as capers.

B.s have value as food on account of the nitrogenous or proteid matter they contain. As forage for horses, cows, sheep, and pigs they have fattening and heat-giving properties. The enemies to which they are subject are 2, fungi and insects. When attacked by fungus the B.s can still be used as rich manure, and if by the B. aphid, or black dolphin, they can often be saved by having their tops cut off. They grow best in warm, light, well-manured soil, and enrich the ground themselves for future use.

Bean-feast, name derived from an old custom prevalent in W. Europe in connection with Twelfth Night festivities. A bean was hidden in a cake, and the person who got the slice containing it was 'king' of the revels. Though the festival was a religious one (the feast of the Epiphany), it was an adaptation from paganism. Originally the king may have reigned for the 12 days from Christmas to Twelfth Night, his chief function being to perform the propitiatory rites to ensure good weather. During the Rom. Saturnalia, said to have been estab. by Tullius Hostilius (c. 650 BC), but probably older, children drew lots with beans to decide who should be king. This was a winter festival, and with alteration of date was christianised into the feast of the Three Kings. See Brand's *Popular Antiquities of Great Britain* (Hazlitt's ed., 1905), under 'Twelfth Night.'

Bean Goose (*Anser fabalis*), species of European wild goose with a short black and red beak, which obtains its name from the resemblance of the upper nail of its bill to a horse bean, or else from the fact that it eats the beans sown in the spring. It is of a grey colour, and breeds largely in the Hebrides.

Bean-king's Festival, see BEAN-FEAST.

Bean-tree, species of 2 genera of Leguminosae which occur in the tropics. *Castanospermum australe*, also known as the Australian chestnut, has edible seeds which resemble chestnuts in flavour when roasted. *Ceratonia siliqua*, the carob- or locust-tree of S. Europe, is the other species.

Bear, widely distributed carnivorous

(often omnivorous) mammals of the family Ursidae and div. Arctoidea. They are large, ungainly animals, with short tails, shaggy fur, plantigrade feet, curved claws which are non-retractile, and broad elongated heads ending in a snout. Their usual method of progression is on all fours, but they are capable of walking upright with a clumsy, shuffling gait, and most of them are climbers. They do not attack man unless provoked, but when roused they are ferocious. Though they sometimes eat flesh, they prefer fruit and honey, and some species are fond of termites, or white ants. Most B.s eat largely during the summer months, and then hibernate, coming out again in the spring in a weak but fierce state. During the

BEAR CUB

Barnaby's

winter months the cubs are born and unless carefully guarded by their watchful mothers they fall a prey to the greed of their fathers. The young are blind at birth and are very small.

The various species have many dissimilar points. The brown B. (*Ursus arctos*) is spread through all the mt. dists. of Europe, from the Arctic circle to the Alps and Pyrenees, and is also found in Asia. It is about 6 ft long and 3 ft high at the shoulders, yet it can easily climb rocks and trees; it can attain the age of 50 years. The fur of this animal is of a yellowish colour in youth. The Amer. black B. (*U. americanus*) is a smaller species than the brown B., of which it is thought to be a variety. It is an object of veneration among the Indians. The grizzly B. (*U. horribilis*) is a native of N. America; it is large, strong, and fierce, has powers of endurance, and is a great hunter. The polar B. (*Thalarchos maritimus*), found in the Arctic regions, is the largest species, attaining a height of 9 ft, and lives on seals and fish. The spectacled B. (*Tremarctos ornatus*) is a smaller species with ringed eyes, found in the Andes; and the sloth B. (*Melursus ursinus*) dwells in mountainous parts of India and lives chiefly on fruits, honey, and termites.

Bear, The Great and Little, see *UNSA MAJOR* and *UNSA MINOR*.

Bear Animalcules, see *TARDIGRADA*.

Bear-baiting, sport consisting of teasing a tethered bear by setting dogs to bite it or by beating it with sticks. The bear was often blinded beforehand. It was in favour with the ancients Romans, and was popular in England from Norman times down to the 18th cent. Private bear-gardens, or baiting-places, were kept by nobles and gentry, besides those provided by caterers for popular amusement, such as the famous 'Bankside,' where the charges were 'a penny for admission, a penny at the entry of the scaffold (i.e. stage), and a penny for quiet standing.' Mary Tudor and Elizabeth were both fond of witnessing this sport. The Privy Council in 1591 ordered all theatres to be closed every Thursday, because baitings generally took place on that day, and actors could not be allowed to prejudice such entertainments by their competition. Another favourite day was Sunday, which was a further reason for the Puritan interdiction of such sports. B. and bull-baiting were finally banned by Act of Parliament in 1835.

Bear-cat, see *PANDA*.

Bear Lake, Great, freshwater lake in the NW. of Canada. Its shape is irregular, and it has an area of over 11,000 sq. m. The water is transparent and abounds with fish, especially the so-called herring salmon. It has an outlet in the Great Bear R., which flows into the Mackenzie.

Bear-leader was a term used jestingly of a person who was in charge of a young man of wealth when making a tour of the world, or of one who acted as guide to a celebrity. It arose from the custom of leading about a tame bear, muzzled and on a chain, for entertainment.

Bear River: 1. Rises in N. Placer co., E. central California, and flows about 75 m. SW. and W. to Feather R.

2. In W. Maine, rises in W. Oxford co., flows 12 m. SE. to Androscoggin R.

3. Stream in Utah, Wyoming, and Idaho about 350 m. long, rising in the Uinta Mts and flowing, after a circuitous course through Utah and Idaho, into Great Salt Lake. It is used to irrigate about 50,000 ac. in Utah and Idaho.

Bearberry, Bear's Whortleberry, see *ARCTOSTAPHYLOS*.

Beard, Charles Austin (1874-1948), Amer. historian, b. Knightstown, Indiana. Educ. at various Amer. univs. and at Oxford Univ. Was prof. of politics at Columbia Univ., 1915-17; adviser to the Institute of Municipal Research, Tokyo, Japan, 1922; adviser to Viscount Goto, Jap. minister of the interior, after the great earthquake of 1923. Among his prin. works are *Introduction to the English Historians*, 1906, *American Government and Politics*, 1910, *Economic Interpretation of the Constitution*, 1913, *Contemporary American History*, 1914, *History of the American People* (with W. C. Bagley), 1918, *History of the United States* (with his wife), 1921, *The Rise of American Civilization* (with his wife), 1927, *America in Midpassage* (with his wife), 1939, *The*

Republic, 1943, *A Basic History of the U.S.*, 1944, and *American Foreign Policy in the Making, 1932-41*, 1946.

Beard, John (c. 1717-91), tenor singer, the finest of his generation in England, both on the stage and in oratorio. Loss of hearing caused his career to come to an end in 1767. Some of Handel's finest tenor parts were composed for B.

Beard, Thomas (d. 1632), divine, educ. at Cambridge. Soon after the acceptance of the rectory of Hengrave, Suffolk, B. became headmaster of Huntingdon hospital and grammar school, where he was Oliver Cromwell's schoolmaster. He wrote *The Theatre of God's Judgements*, which contains an account of Marlowe's death.

Beard, name given to a growth of hair on a man's cheeks and chin. The fashion of the B. varied considerably in various times and countries. Egyptian men were always clean-shaven, and so were young Greeks. Pliny says the Romans did not begin to shave until a.u.c. 454, yet in later times the first day of shaving was considered the entrance to manhood and was kept with festivities. Caesar says that the ancient Britons left the hair long only on the upper lip (see *MOUSTACHE*). The Saxons wore B.s, but the Normans shaved the whole of the face. The sepulchral monuments of kings and nobles show that for many cents. the B. was in fashion, but since the 17th cent. the practice of shaving has become more and more general in Europe and America. The hardships of the Crimean War, when shaving was impossible, resulted in a fashion for long beards which lasted for the rest of the 19th cent. After largely disappearing from the fashion in the early 20th cent., they came back into favour, to some extent, in Europe during and after the Second World War, but are not popular in America. Beards are permitted in the Brit. Navy, but only moustaches in the army.

Beards in south-west Arabia. In SW. Arabia clean-shaven faces that could grow B.s are considered effeminate, and are frowned upon by the tribesmen. According to the Ulema the B. may not be shaved but can be trimmed. Moustache only is rare and considered not unmanly, but to be in imitation of Christians and, as such, indicates a townsman of Lahel or Aden and a bad Muslim. Some seyyids in the Hadhramaut shave the B. This is not approved of by the tribesmen, but the seyyids look upon shaving as a sign of civilisation. To seize a man's B., or even to flick it, is considered a deadly insult. 'God burn his beard' is a frequent exclamation of dislike. The B. is touched or held when swearing by God or as a mark of silent reproof. Trimmings from the B. are carefully concealed, as it is considered that their possession by an enemy, who might burn them, is a grave danger. To kiss the tip of the fingers and then to touch another's B. with them is a mark of supplication and respect. An Arab will describe his B. as his *sherraf* or personal honour. The B. is regarded as a mark of distinction and masculinity.

'Abu Dagan' (father of a chin tuft) is a nickname of respect applied to men with particularly well-grown B.s. The oath 'by the beard of the Prophet' is a powerful one. Frequently, before pronouncing judgment, the B. will be touched, held, or stroked in a contemplatory gesture. An Arab will seize his B. between thumb and forefinger to emphasise his remarks in a quarrel. Beardless youths often imitate the gestures of their bearded seniors, holding invisible B.s, nor is the gesture considered comic.

Beard Grass, species of *Polypogon*, family Gramineae, mostly natives of warmer temperate regions, but the ann. B. G., *P. monspeliensis*, is found in S. England.

Beard Moss (Fr. *barbe de vicillard*) belongs to the genus *Usnea* of lichens. It creeps over stems and branches of trees, hanging down in thick trails, whence its name.

A DECORATION FROM BEARDSLEY'S
'LE MORTE D'ARTHUR'

Beardsley, Aubrey Vincent (1872-98), black-and-white artist, b. Brighton, d. of consumption at Mentone. He worked for various illustrated papers at the age of 20; the following year he illustrated the *Morte d'Arthur*, which at once assured his fame. He was art editor of the *Yellow Book*, but was elbowed out of that position: he joined with Arthur Symons in 1895 to edit the *Savoy*, a rival to the *Yellow Book*. He illustrated *The Rape of the Lock*, Oscar Wilde's *Salomé*, *Mademoiselle de Maupin*, and Ernest Dowson's *Pierrot*

of the Minute. He was at work on initial letters for *Volpone* 3 weeks before he d. His line drawings were delicate and exact, and showed that fastidious elegance that appears even in the most grotesque of his drawings. He worked almost entirely in black and white. See Arthur Symons, *Aubrey Beardsley*, 1898, and *Beardsley Miscellany: Drawings and Designs*, ed. R. A. Walker, 1949.

Beare, Bere, or Beer, common name for the 4-rowed variety of barley (q.v.).

Bearer Securities, in commerce or banking practice, any draft, cheque, bill, note, etc., the presentation for payment of which by the bearer entitles him to receive a certain sum of money. Most B. S. have become negotiable by custom; but to be so negotiable in Great Britain an instrument must be customarily transferable in this country, like cash, by mere delivery. Debenture bonds payable to bearer have by modern usage become negotiable instruments.

Bearing, direction of a line drawn from one point to another, is a term usually employed for the points of the compass: e.g. if the point B is due NW. of A it is said to *bear* NW. of A and its B. is said to be NW. To take B.s is to ascertain the points of the compass on which points lie.

Bearings, see BALL BEARINGS.

Béarn, anc. prov. of France, now included in the dept of Basses-Pyrénées. Its cap. was Pau.

Bear's Breech, name given to the genus of *Acanthus* (q.v.).

Bear's Foot (*Helleborus foetidus*), evergreen Hellebore, family Ranunculaceae, native to Britain and Europe, related to the Christmas rose.

Bear's Whortleberry, see ARCTOSTAPHYLOS.

Beardsen, tn of Dunbartonshire, Scotland, a residential suburb of Glasgow (q.v.).

Beardsted, Marcus Samuel, 1st Viscount (1853-1927), oil magnate. Began in a modest way of business as a representative in Japan for the shipment of oil from Baku to the E. In 1897 he secured capital from the Rothschilds for the purpose of grouping a number of concerns under the style of the Shell Transport and Trading Co., which later became amalgamated with the Royal Dutch Petroleum Co. Was Lord Mayor of London in 1902.

Beas, or Bias, riv. of the E. Punjab, India. It rises in the Himalayas and flows into the Sutlej. The B. and lower Sutlej (in Pakistan) formed the Hyphasis, which marked the farthest progress of Alexander the Great.

Beast, Number of the, see APOCALYPTIC NUMBER.

Beastings, see COLOSTRUM.

Beatenberg, summer health resort situated on the wooded heights to the E. end of the lake of Thun, in the canton of Bern, Switzerland.

Beath, par. of Fifeshire, Scotland, 6 m. NE. of Dunfermline. Coal-mining is carried on. Pop. 22,600.

Beatification, act by which the Pope

permits the limited *cultus* of a 'venerabilis servus Dei,' as of one entitled to be called 'blessed' (*beatus*). B. is generally only preliminary to canonisation (q.v.).

Beating the Bounds, see BOUNDS.

Beaton, or Bethune, Cardinal David (c.1494-1546), prelate, son of John B., or Bethune, of Balfour in Fife. He went to France to study civil and canon law, and in 1519 was appointed resident for Scotland at the Fr. court. In 1533 B., now prothonotary apostolic (a high office in the church), was sent as an ambas. to France to treat for a league with the Fr. king and a marriage between James V and the Fr. princess. In 1537 he procured the papal bull for the erection of St Mary's College at St Andrews; in 1538 became a cardinal, and 1539 primate of St Andrews. Even after the death of James V, 1542, B. still had great influence, and with the help of the nobles forced the regent to abjure the doctrine of the Reformation. B.'s main interests were political: he worked for a Franco-Scottish alliance, which involved him in enmity with the pro-Eng. Protestants. The following year Mary Queen of Scots was crowned, and B. became chancellor. In 1546 he tried and condemned George Wishart to be burnt, and shortly afterwards a group of Wishart's friends murdered him at St Andrews in revenge.

Beaton, or Bethune, James (d. 1539), Scottish prelate, uncle of Cardinal David B., was lord treasurer of Scotland, 1505; Archbishop of Glasgow, 1509; chancellor, 1513; and Archbishop of St Andrews and primate, 1522. As one of the regents during James V's minority, he was a chief mover in the Fr. alliance. Patrick Hamilton and other reformers were burned during his primacy. Another James B. (1517-1603) was a nephew of the cardinal. He was in the confidence of Mary of Guise when regent, and was the last pre-Reformation Rom. Catholic Archbishop of Glasgow, 1552 to 1560, when he fled to France.

Beatrice, see DANTE ALIGHIERI.

Beatrice, Princess (1857-1944), youngest daughter of Queen Victoria. In 1885 she married Henry Maurice, Prince of Battenberg (see BATTENBERG). She had 3 sons, the eldest of whom was made Marquess of Carlsbrooke, and her daughter, Victoria Eugénie, married King Alfonso XIII of Spain in 1906. Her sons, in 1917, took the name of Mountbatten. On her husband's death, in 1896, she succeeded him as Governor of the Isle of Wight.

Beattie, James (1735-1803), poet and philosopher, b. Laurencekirk, Kincardine. He was educ. at Marischal College, Aberdeen, where in 1760 he became prof. of moral philosophy and logic. In 1770 he won temporary fame with his *Essay on Truth*, written to confute Hume. Johnson, always zealous for Christianity, praised it at the expense of Hume, who estimated the ephemeral effusion at its true worth, and refrained from answering it, beyond saying that he 'had not been used like a gentleman.' George III received B. with great warmth

and his fortune was made. Sir Joshua Reynolds introduced B. in a metaphorical painting as the Defender of Truth, with Hume and Gibbon skulking low with diabolical faces. In 1771-4 B. pub. *The Minstrel*, a poem for which alone he is remembered; it contains some beautiful descriptive passages. In 1773 he was awarded a pension of £200. He d. of palsy. His *London Diary* was ed. by R. S. Walker in 1946. See life by Sir Wm Forbes, 1807.

Beattook, vill. of Dumfriesshire, Scotland, 2 m. SW. of Moffat, in upper Annandale. Auchen Castle (1 m. NNW.), late 13th cent., is now an hotel.

Beatty, David, 1st Earl (1871-1936), admiral, second son of David Longfield B., of Borodale, co. Wexford; educ. at the Royal Naval Academy, Gosport, and entered the navy as a cadet in 1884. He became lieutenant, 1892, and served in Egypt and the Sudan with the naval brigade—being in the expedition to Dongola in 1896 (received D.S.O.), and being present (1897-8) at the battles of Atbara and Khartoum. Became commander, 1898. In the expedition to China in 1900, on account of the Boxer rebellion, he was wounded, and promoted captain. He was made rear-admiral by special order in council in 1910, and in 1912 became naval secretary to the First Lord of the Admiralty (Churchill). In 1913 he took command of the battle-cruiser squadron, and, when the First World War broke out, he conducted the first move at sea against Germany—the raid into Heligoland Bight, 28 Aug. 1914. On 24 Jan. 1915 at the Dogger Bank he intercepted von Hipper, coming to bombard the E. coast. The same year he was made vice-admiral. He again encountered von Hipper at the battle of Jutland, 31 May 1916, whose fleet he successfully enticed into the range of the Brit. Grand Fleet. The indecisive battle which followed led to some div. of opinion in the fleet as to the merits of Jellicoe and B., and the controversy spread to the press. Even the pub. of Sir Julian Corbett's last vol. of the *Official History of the Great War Naval Operations*, 1920, did not satisfy public opinion. In his *The Jutland Scandal* Adm. Sir Reginald Bacon (q.v.) accused B. of incompetence and inexperience. Two other books, *The Truth about Jutland* by Adm. Harper, who was entrusted with the task of producing a report on the battle, and *The Riddle of Jutland* by Adm. Harper and Langhorne Gibson, expressed the view that the conduct of the battle by Jellicoe was wise and well judged, while B. was criticised for neglecting the training of his command in gunnery and signalling, and for the rashness of his handling of it in action. Rear-Adm. W. S. Chalmers in his book *Life and Letters of David Beatty*, and many other critics, however, take the opposite view. (See also JUTLAND, BATTLE OF.) On Jellicoe becoming First Sea Lord, Dec. 1916, B. was made Commander-in-Chief of the Grand Fleet, a position he held till the end of the war. On board his flagship, the *Queen Elizabeth*,

at Scapa Flow in the Orkneys, 16 Nov. 1918, he received from Rear-Adm. Hugo von Meurer the surrender of the Ger. Grand Fleet, which von Reuter soon afterwards sank. In 1919 he was made admiral and admiral of the fleet; he also became First Sea Lord of the Admiralty. Between then and 1927 he conducted the reduction of the navy to a peace footing; and he was Brit. delegate to the Washington Conference on the Limitation of Armaments, 1921. He was awarded the G.C.B. and O.M., and held many foreign decorations. His peerage was conferred on 27 Sept. 1919, when he took the title of Earl Beatty, Viscount Borodale, and Baron Beatty of the North Sea and of Brooksby.

Beau Nash, see NASH, RICHARD.

Beau Séant, or **Baucant**, banner belonging to the knights templars in the 13th cent. It was an oblong flag party argent and sable.

Beaucaire, Fr. tn in the dept of Gard, on the Rhône, at the head of the Rhône-Sète canal. There are Rom. remains, and a ruined 13th-cent. château. B. was once famous for its fair, and has cloth and leather manufs., and stone quarries. Pop. 9300.

Beauce, La, dist. of central France, the prin. tn of which is Chartres. It includes parts of the depts of Eure-et-Loir, Loir-et-Cher, and Loire (qq.v.), and is very fertile. It is called 'the granary of Paris' from the amount of wheat produced. Area c. 2800 sq. m.

Beauchamp, name of an anct and noble family of England. The founder, Walter de B., obtained large estates in Wores by his marriage with the daughter of one of the Conqueror's barons; from him descended Wm of Elmley, whose marriage with the heiress to the earldom of Warwick in 1268 brought Warwick Castle and the earldom to his son. Of the B. earls of Warwick commemorated in the famous B. Chapel in St Mary's Church, Warwick, the prin. was Guy, the 'black cur of Arden,' the enemy and executor of Piers Gaveston, and one of the lords ordainers in the opposition to Edward II. The last B. earl of Warwick d. in 1445, and his sister Anne brought the earldom to the Nevilles on her marriage with Richard, the king-maker. The present earls B. are descended from Wm Lygon, who claimed descent through the female line from a cadet branch of the anct family, the B.s of Powycke, and who was created Baron B. in 1806 and Earl B. in 1815. The viscounty of B. of Hache, granted to Edward Seymour, Lord Protector Somerset, belonged to a distinguished family in Somerset. The title remains with the Marquess of Hertford, and the name in the family of the B. Seymours.

Beauchamp, **Alphonse de** (1767-1832), Fr. historian, b. Monaco; joined the Sardinian army, and was imprisoned for refusing to serve against the Fr. Rep. He came to Paris and obtained a gov. post at the ministry of police at the head of the press bureau. In 1806 he pub. his best-known historical work, *Histoire*

de la Vendée et des Chouans, which led to his retirement to Rheims. He returned to his post in 1811, but resigned at the Restoration.

Beauchamp, **Kathleen Mansfield**, see MANSFIELD, KATHERINE.

Beauchief, dist. of the city of Sheffield (q.v.), Yorks, but still independent of eccles. jurisdiction. It was once an extraparochial liberty, as the estate of B. Abbey (founded 1175, dissolved 1536). The tower of the abbey remains as part of the church of St Thomas a Becket, built in the 17th cent. of stones from the rest of the abbey.

Beauclerk, **Topham** (1739-80), bibliophile, grandson of the 1st Duke of St Albans. He amassed a library of 30,000 vols., but is chiefly remembered as the friend of Dr Johnson, and a member of the famous Club. His wit, personal charm, taste in literature, and knowledge as a man of the world endeared him to Johnson, and he figures largely in Boswell's pages. See also J. Forster, *Life and Adventures of Oliver Goldsmith*, 1848.

Beaufort, name of a noble Eng. family, members of which were earls and dukes of Somerset and earls and marquesses of Dorset; also the title of a dukedom, borne by members of the family of Somerset, descended from the B.s. The name of B. was borne by the children of John of Gaunt by Catherine Swynford, who were legitimated after their parents' marriage in 1396. Of these, John (d. 1410), Earl of Somerset and Marquess of Dorset, was a supporter of Richard II against the lords appellant; Thomas (d. 1427), Duke of Exeter, was one of Henry V's generals; Henry (d. 1447) was Bishop of Winchester and cardinal (see BEAUFORT, HENRY). Margaret was daughter of John, 3rd Earl of Somerset (1403-44) (see BEAUFORT, MARGARET). Three successive B.s, earls and dukes of Somerset, were killed or beheaded during the Wars of the Roses, supporting the house of Lancaster. Charles, the illegitimate son of one of these—Henry, 3rd Duke of Somerset, beheaded after Hexham, 1464—was a favourite of Henry VII and Henry VIII, and made Earl of Worcester; his descendant, Henry, 5th earl, was a loyal supporter of Charles I, and was made a marquess in 1642; in 1682 the 3rd marquess was made Duke of B., the title now held by the 10th duke.

Beaufort, **Henry** (c. 1377-1447), Eng. cardinal and bishop, was the son of John of Gaunt and Catherine Swynford (see BEAUFORT, family). He entered the Church and was made Bishop of Lincoln in 1398, and on his half-brother Henry IV attaining the throne he became chancellor, 1403, and Bishop of Winchester, 1404. He was also chancellor in 1413, and in 1424. During the reign of Henry V and the minority of Henry VI he was the leader of the party opposed to Humphrey, Duke of Gloucester, especially in the matter of making peace with France. In 1426 he was made a cardinal by Martin V, for whom he had voted in 1417 at the Council of Constance, and was sent as papal legate to conduct a crusade against

the Hussites in Hungary and Bohemia. He crowned Henry VI as King of France in 1431. Charges were made against him by Gloucester, and attempts to deprive him of his see failed. He refounded and endowed the hospital of St Cross near Winchester, which still exists, and on several occasions advanced large sums of money to the crown. See L. B. Radford, *Henry Beaufort*, 1908.

Beaufort, Louis de (d. 1795), Fr. historian. Little is known of his life. He was one of the first writers who questioned the trustworthiness of the classical historians in the early hist. of Rome. His works include *Dissertation sur l'incertitude des cinq premiers siècles de l'histoire romaine*, 1738 (second ed., 1750), *Histoire de César Germanicus*, 1761, and *La République romaine*, 1766.

Beaufort, Margaret, Countess of Richmond and Derby (1443-1509), daughter of John, Duke of Somerset (see BEAUFORT, family). She married, 1455, Edmund Tudor, Earl of Richmond, by whom she was mother of Henry, Earl of Richmond, afterwards Henry VII. After her first husband's death she married Henry, son of the Duke of Buckingham, and thirdly, Thomas Stanley, Earl of Derby. During the Wars of the Roses she lived at Pembroke Castle; later she took part in arranging the marriage of her son and Elizabeth of York. She founded the Lady Margaret professorships of divinity at Oxford and Cambridge, and founded by will St John's and Christ's Colleges, Cambridge. See life by E. M. Routh, 1921.

Beaufort, cap. tn of Beaufort co., S. Carolina, U.S.A., situated on Port Royal Is., on the Beaufort R., 16 m. from the sea. It has a harbour. Its climate has made it a popular winter resort. It is a canning, processing, and shipping point for a truck and sea-food area. The tn was first permanently settled in 1710, and was named in honour of Henry Somerset, Duke of Beaufort. Pop. 5080.

Beaufort-en-Vallée, tn in the dept of Maine-et-Loire, France, with a trade in corn, fruit, and linen. Pop. 3300.

Beaufort Scale, scale of numbers for recording wind velocity at sea, invented in 1805 by Adm. Sir Francis Beaufort. See WIND.

Beaufort Testimonial, result of a subscription raised in 1860 to commemorate the services of Sir Francis Beaufort (1774-1857), rear-admiral, to the Brit. Navy. It took the form of an ann. prize awarded to the cadet of the Royal Naval College who, as a candidate for the rank of lieutenant, passed most successfully his examination in navigation and kindred subjects.

Beaufort West, tn, cap. of B. W. div., Cape prov., S. Africa, 339 m. N.E. of Cape Town on the line to Kimberley. It lies 2792 ft high, on the S. slopes of the Nieuwveld Mts, and is the largest tn in this part of the Great Karroo. The dist. is excellent for sheep farming, and there is a rapidly growing karakul industry. Pop.: Whites, 6556; Coloureds, 5174; Bantu, 2188.

Beaugency, Fr. tn in the dept of Loiret, on the Loire, which is spanned by a bridge of 26 arches. It has many anc. buildings, including 'Caesar's Tower,' an 11th-cent. dungeon. Joan of Arc defeated the English here in 1429. Wines, woollens, and leather goods are manuf. Pop. 3600.

Beauharnais, Alexandre, Viscomte de (1760-94), Fr. general, b. Martinique, was descended from an anc. noble family in Orléannois. In 1779 he married Joséphine Tascher de la Pagerie, afterwards the first wife of Napoleon, by whom he had Eugène de B. (q.v.), and Hortense, wife of Louis Bonaparte, King of Holland, and mother of Napoleon III. B. served in the Amer. War of Independence, came to France and joined the revolutionary party. He was secretary to the assembly, and commanded the army of the Rhine, 1793; his failure to relieve the siege of Mainz, and the suspicion attached to his noble birth, brought on him the enmity of the Committee of Public Safety, and he was tried and guillotined.

Beauharnais, Eugène de (1781-1824), Fr. soldier, son of Viscount Alexandre B., b. Paris; after his father's death his mother, Joséphine, married Napoleon Bonaparte. Eugène accompanied Bonaparte to Italy and Egypt, was made a prince of the empire, and appointed viceroy of the (so-called) kingdom of Italy; he married, in 1806, the daughter of the King of Bavaria. He fought with distinction against the Austrians and the Russians. After Napoleon's final defeat, B. was compensated for the loss of his lt. lands, and bought the duchy of Leuchtenberg, in Bavaria, where he lived until his death.

Beauharnois, Charles, Marquis de (d. 1749), Fr. Governor-General of Canada (1726-47). His task was to maintain the then Fr. colony of New France, as it was called, against Eng. designs, and to do all in his power to encourage Fr. immigration. Fr. tradition, however, seemed to look upon New France mainly from the strategic standpoint, and but little attention was paid to its political or social development. B. tried to promote the movement of Canadian expansion towards the W. of the country, and to that end he commissioned the valiant Pierre de la Véronrière, an explorer and native of Three Rivers, then commanding officer at Lake Nipigon, to organise an expedition, in 1731. The result of this expedition was the estab. of a number of trading posts between Lake Superior and the Saskatchewan R. The rivalry between the Fr. and Brit. colonists in commerce, however, led to a renewal of war, and B. set to work to strengthen the Fr. position by building new forts, among which was Fort Ticonderoga on Lake Champlain. He returned to France in 1746. His name has been given to a large hydro-electric station on the St Lawrence, above Montreal.

Beaujeu, Fr. tn in the dept of Rhône, 27 m. from Lyon. It has a wine industry. Pop. 2000.

Beaujolsais, anc. dist. of France, formerly part of the prov. of Lyonnais (q.v.),

now forming parts of the depts of Rhône and Loire. It is famous for its wine, the centre of the trade being Villefranche (q.v.). It produces from the *gamay* grape beverage wines secondary to those of the Côte d'Or. Moulin-a-Vent is its best-known red wine and Pouilly-Fuissé its best-known white wine.

Beaujoyeux, Balthasar de, see BALTAZARINI.

Beaulieu, Walter Edward Douglas Scott Montagu, Baron Montagu of (1866-1929), motoring pioneer, son of Lord Henry Scott Montagu and grandson of the 5th Duke of Buccleuch. Educ. at Eton and Oxford, and trained in engineering in railway workshops. In 1915 was adviser on mechanical transport to the Indian gov. Later took up aviation.

Beaulieu, par. of Hants, England, on the estuary of the B. riv., about 5 m. from Southampton. The ruined Cistercian abbey was founded (1204) by King John and sheltered Margaret of Anjou after the battle of Barnet (1471). The Early Eng. refectory is now the par. church; the former gatehouse is a private residence. Pop. 1000.

Beaulieu (pronounced Bewley), tn, Inverness-shire, Scotland, 10 m. W. of Inverness. Here are the remains of the Cistercian monastery of St John, 1230, and the site of Lovat Castle. Pop. 800.

Beaumarchais, Pierre Augustin Caron de (1732-99), Fr. dramatist, b. Paris, son of a watchmaker. He was brought up as a watchmaker, and also showed great skill in music, playing the harp and guitar. He led an adventurous and sometimes unscrupulous life, now as a business man, now as a political agent in England, Germany, and Austria. He had numerous lawsuits, and was imprisoned more than once. Most of his attempts at drama were unsuccessful, as also his opera *Tartare*, 1787. His fame rests on his two plays *Le Barbier de Séville*, 1775; and *Le Mariage de Figaro*, 1784. Both comedies of intrigue, they are traditional in theme, but at the same time sparkling with wit, gaiety, and movement. An additional interest in his own day were the thrusts at the aristocracy, especially in the *Mariage de Figaro*. The characters are drawn with great artistry, and many of them have become immortal. The plays have been made into operas by Paisiello, Rossini, and Mozart. B. holds a high place as a satirist, and is undoubtedly the best of the Fr. dramatists of the 18th cent. See L. Latzarus, *Beaumarchais*, 1930; P. Frischauer, *Beaumarchais*, 1935; G. Gaiiffe, *Le Mariage de Figaro*, 1938.

Beaumaris, port and mkt tn, also the cap. of Anglesey, Wales. It is situated on Beaumaris Bay, to the N. of Menai Strait. The harbour is safe and roomy. The tn is frequented by summer visitors, who are attracted by the golf-links and the sea bathing. There are slate quarries in the neighbourhood. The castle was founded by Edward I in 1295. Pop. 1700.

Beaumes, Fr. vil. in the dept of Vaucluse, with a trade in wine. Pop. 1300.

Beaumont, Eon de, see EON DE BEAUMONT.

Beaumont, Francis (1584-1616), poet and dramatist, b. Grace-Dieu, Leice, son of a judge of the Court of Common Pleas. He matriculated at Broadgates Hall (now Pembroke College), Oxford, in 1597, and in 1600 was entered at the Inner Temple, for which he wrote a masque in 1613. In 1602 he pub. *Salmacis* and *Hermaphroditus*, a poem based on a tale of Ovid's. He became a close friend of Drayton and Ben Jonson, for some of whose plays he wrote commendatory verses, and from an early period was closely associated with John Fletcher (q.v.). They shared lodgings and servant, and collaborated in writing plays from 1606 onwards, B. excelling in

FRANCIS BEAUMONT

plot-construction and sense of theatre. The partnership came to an end not long after B.'s marriage in 1613 to Ursula Isley, an heiress. He d. soon after and was buried in Westminster Abbey. Some 50 plays were attributed to the 2 playwrights in a collected ed. pub. after their deaths, but this is obviously far too many for their period of collaboration, and was presumably a publicity device of the publishers. Much time has been spent in unravelling the puzzle of the joint authorship; it is maintained by recent authorities that B. was solely responsible for two plays: *The Woman Hater*, 1607, and *The Knight of the Burning Pestle*, 1609; and that he and Fletcher together wrote some dozen plays, including *Four Plays in One*, 1608, *Philaster*, *The Maid's Tragedy*, *A King and No King*, *Cupid's Revenge*, and *The Coxcomb*, dated about 1611 or 1612; and *The Scornful Lady*, and *Thierry and Theodoret*, pub. 1616. A further vol. of B.'s *Poems* appeared in 1640. The standard ed. of B. and Fletcher is that of A. Glover and A. R. Waller (10 vols.), 1905-12; variorum ed. by A. H. Bullen, unfinished, 1904-12. See also G. C. Macanlay, *Francis Beaumont, a Critical Study*, 1883; O. M.

Gayley, *Francis Beaumont, Dramatist*, 1914; U. M. Ellis-Fermor, *The Jacobean Drama*, 1936; L. B. Wallis, *Fletcher, Beaumont and Co.*, 1947.

Beaumont, Sir George Howland (1753-1827), baronet, seventh of the anot family of the B.s of Stoughton Grange, Leics, educ. at Eton. He was a distinguished amateur of the arts and friend of artists, Constable among them. He had some skill as a landscape painter, and gave a number of pictures to the National Gallery (q.v.) at its foundation.

Beaumont, Jean Baptiste Elie de (1798-1874), Fr. geologist, b. Canon. He went to England with a view to preparing a geological map of France after the pub. of Greenough's map, 1820. The result was later seen in the map pub. by him and Dufrenoy, 1840, his greatest service to geology. He was engineer in chief, 1833, and inspector-general of mines, 1847. He was perpetual secretary of the Academy of Sciences, 1853, in succession to Arago. His theory of the origin of n. ranges, *Notice sur le système des montagnes*, 1853, is not now accepted, but it was of great value from the detailed researches he made in its preparation.

Beaumont, Sir John (1582-1627), poet, b. Leics, an elder brother of Francis B., and educ. at Oxford, which he entered in 1597. He was knighted in 1603, and made a baronet in 1626. In religion he was a Puritan. His best-known poem is *Bosworth Field*, first pub. by his son, 1629. Among his friends, not the least intimate was Michael Drayton. He was buried in Westminster Abbey. His works were ed. by A. B. Grosart, 1869.

Beaumont, Joseph (1616-99), poet, b. Hadleigh, Suffolk. He was educ. at Peterhouse, Cambridge, of which he was Master from 1663. In 1674 he was appointed Prof. of Divinity. He wrote *Psyche, or Love's Mysterie*, 1648, an allegory of the progress of the soul. His works were ed. by A. B. Grosart, 1877-80, and his minor poems by E. Robinson, 1914.

Beaumont, William (1785-1853), Amer. physician, b. Lebanon, Connecticut. After an elementary educ. B. worked on the land and then became a schoolmaster. Wishing to study medicine, he became apprenticed to Dr Benjamin Chandler at St Albans, Vermont, and received his licence to practise in 1812. In the same year he joined the Amer. army and served as a surgeon's mate during the war with England. In 1815 he left the army and entered into partnership at Plattsburgh, New York. In 1822 he was called to attend a patient, Alexis St Martin, a young French-Canadian, who had received a gunshot wound in the upper abdomen. B. found a large opening into the stomach which persisted after St Martin had recovered. By suspending articles of food into the stomach and by other means B. was able to study human digestion and stomach movements for the first time in a living person. He took St Martin into his own home and made observations on him over a period of 8

years and although his subject absconded he followed him to various parts of the country. His classical experiments are described in his *Experiments and Observations on the Gastric Juice*, 1833 (facsimile reprint, 1939). See *Life and Letters*, by J. S. Myer, 1912.

Beaumont: 1. Co. seat of Jefferson co., Texas, U.S.A. Incorporated in 1881, it has a pop. of 94,000. Chief industries are oil, steel, lumber, shipping, and agriculture.

2. Small tn in the prov. of Hainaut, Belgium, 15 m. SW. of Charleroi. There are marble quarries and iron works in the dist. Pop. 1700.

Beaumont College, public school for boys, situated in Old Windsor, Berks, England, founded in 1861 by the Society of Jesus, and run by members of the society. Warren Hastings once owned the property.

Beaumont-Hamel, vil. of France in the dept of the Somme. The vil. and its immediate neighbourhood were the scene of heavy fighting in the battles of the Somme and Ancre in 1916. The position was a difficult one to attack. In the Somme battle, on 1 July the 8th Army Corps, under Gen. Sir Hunter Weston, was detailed to make the assault on this part of the line, but the attack failed, with severe losses all round, and the assault had to be abandoned. At the battle of the Ancre in the following Nov., however, the Brit. forces gained a considerable victory by capturing the vil. (see ANCRE, BATTLE OF THE).

Beaumont-sur-Oise, Fr. tn in the dept of Seine-et-Oise. Cement and lace are manuf., and there is agric. trade. Pop. 5400.

Beaumont-sur-Sarthe, tn in the dept of Sarthe, France, on the riv. of the same name, and about 15 m. S. of Alençon. Pop. 1800.

Beaune, Florimond de (1601-52), Fr. geometer and friend of Descartes (q.v.), b. at Blois. He commented on Descartes's geometry, is noted for his problem on curves, and invented sev. astronomical instruments. His discussion on the superior and inferior limits to the roots of an equation was not pub. till 1659.

Beaune, tn in the dept Côte-d'Or, France. It is the centre of the burgundy wine trade (q.v.) and it manufs. casks, oil, mustard, white metal. It has two 12th-cent. churches, and a hospital founded in 1443. In the 18th cent. there were nine religious houses in the tn. B. appears as a fortified place as early as the 17th cent., and for some time was the cap. of a separate duchy. United to Burgundy in 1227 it became the first seat of the Burgundian Parliament. Pop. 11,000.

Beaune-la-Rolande, Fr. tn in the dept of Loiret. It is of great antiquity, was devastated by the English in the Middle Ages, and its church was rebuilt by Charles VII. The French were defeated here by the Germans in 1870 (see FRANCO-GER. WAR). Pop. 1800.

Beaupréau, tn in the dept Maine-et-Loire, France, situated on the Evre, about 28 m. from Nantes. It has a

market for live-stock and a trade in cloth. Pop. 4200.

Beauregard, Pierre Gustave Toutant (1818-93), Amor. general, b. New Orleans. Appointed general, Aug. 1861, he commanded the Confederate Army at Shiloh, 1862, after A. S. Johnston's death in the battle and withdrew to Corinth, which position he defended against Halleck for a month. From Sept. 1862 till May 1864 he defended Charleston, and then defeated Butler at Drury's Bluff. He surrendered with J. E. Johnston after the campaign against Sherman in 1865. See A. Roman, *Military Operations of General Beauregard*, 1883, and T. H. Williams, *P. G. T. Beauregard; Napoleon in Gray*, 1955.

Beaurepaire, Fr. vil. in the dept of Isere, 18 m. SE. of Vienne (q.v.). Pop. 2700.

Beausobre, Isaac (1659-1738). Fr. Protestant, studied at Saumur. After the revocation of the Edict of Nantes he fled to Holland and Germany. He was a favourite with Frederick William I and lived at Berlin 46 years. He wrote critical and historical work on the N.T.

Beausset, Le, Fr. vil. in the dept of Var, with a trade in oil and wine. Pop. 1900.

Beauty, that quality in visible objects in consequence of which their colours and forms are agreeable to the human mind. Though at first applied to objects perceptible by the sight, an easy transition extended the meaning of the word to include the other senses. By a further extension, beautiful has become merely a term of praise synonymous with admirable, e.g. beautiful language. See AESTHETICS.

Beauvais (anct. Bellovacum or Cacsaromagus), Fr. tn, cap. of the dept of Oise, at the confluence of the Thérain and the Avellon. In 1472 occurred the famous siege when Jeanne Hachette (q.v.) defended the tn against Charles the Bold, an event commemorated ann. by a procession in which the women precede the men. B. is the seat of a bishop. The magnificent cathedral, begun in 1227 and never finished, contains the highest of Gothic arches; it was damaged in the Second World War. The earlier cathedral, dating back to 997, called the Bassed'œuvre, still exists. In Oct. 1930 the Brit. airship *R 101* (see AIRSHIP) came down in flames at B. Villiers de l'Isle-Adam was a native of the tn. Carpets, woollens, and brushes are manuf. The Gobelin tapestry (q.v.) factory was destroyed in the Second World War. Pop. 23,200.

Beauvoisais, or **Beauvaisis**, dist. of France, formerly comprised in the gov. of Picardy, then of the Ile-de-France; now part of the arron. of Beauvais in the dept of Oise.

Beaux-Arts Institute of Design, Amer. school of fine arts situated in New York, and modelled after the analogous society in Paris. It was founded in 1916 by the Society of Beaux-Arts Architects to teach the fine arts, at the lowest practicable cost, with the aim of carrying the student

beyond the academic stage to that of practical application; and, further, to bring about co-operation among the different art schools of the U.S.A.

Beaver, Sir Philip (1766-1813), naval captain. At the age of 11 he accompanied Capt. Joshua Rowley in the *Monarch*. He joined a scheme of colonisation in Bulama Is., near Sierra Leone, but the venture proved disastrous.

Beaver (*Castor*), name applied to a genus of rodents of the family Castoridae. There are only 2 species, *C. fiber* and *C. canadensis*: the former is a native of Europe, and the latter of N. America. They are related to squirrels and prairie dogs, and are noted for their intelligence,

their skill in building houses and dams, their glossy fur, and glands which secrete castoreum, used in medicine. In length they are about 1 to 2 ft, while the broad, flat tail is about another foot long; their feet are webbed. Their food consists of the bark of trees and occasionally they eat fruit. They live in large communities in burrows or lodges near the banks of a stream, for in habit they are aquatic. To obtain wood, both for building and for food, they gnaw round the bases of trees until they fall, when they float them down stream to their houses. When the wood near home is exhausted they construct canals and dams so that they may bring into their power the wood beyond their reach at the time, and in this way whole tracts of land are deprived of timber and covered with water. The European B.s construct dams only in certain parts of its range, particularly in Russia and Scandinavia, but *C. canadensis* by its construction does much damage. Their houses, or *lodges*, are built on the banks of streams or on small is., and are made of twigs, moss, and grass plastered together with mud, and the entrance passage is often protected by piles of sticks. The B. is hunted on account of its fur, the fatty castoreum, and its flesh

—especially that of the tail—and is in danger of total extermination. See E. R. Warren, *The Beaver*, with full bibliography (London and Baltimore, 1927).

Beaver Falls, tn, Beaver co., Pennsylvania, U.S.A.; it lies 28 m. NW. of Pittsburgh on a plateau above the Beaver R. It has a large manuf. of iron and steel goods of all descriptions; also chinaware, cork products, paint, lumber, bricks, textiles. Other products are bituminous coal and clay, and agriculture is practised. The Presbyterian Geneva College is now at Colloge Hill close by. Pop. 17,335.

Beaver Rat, name given in Australia to the native water-rat of the genus *Hydromys*, family Muridae, and order Rodentia. These small mammals are related to voles, hamsters, and lemmings. Also a name given to the coypu (q.v.).

Beaver-tree, sweet bay, or swamp laurel, the *Magnolia virginiana*, growing in swampy ground from Massachusetts to Florida. It has evergreen leaves and round fragrant white flowers.

Beaverbrook, William Maxwell Aitken, 1st Baron, of Beaverbrook, New Brunswick, Canada, and of Cherkley, Surrey (1879–), politician and newspaper proprietor, b. Maple, Ontario, son of the Rev. Wm Aitken, minister of Newcastle, New Brunswick. W. M. Aitken went into business at Halifax, Nova Scotia. In 1907 he became a stockbroker in Montreal, where in 1910 he began what ended in the amalgamation of all the Canadian cement-mills—making a fortune on the deal. Then he came to England, and as Conservative parl. candidate won Ashton-under-Lyme, 1910. He became private secretary to Bonar Law (q.v.) and was knighted in 1911. Early in the First World War Aitken was at the front, in the capacity of the Canadian Gov.'s 'eye-witness'; he was made a baronet and a peer in 1917 after Lloyd George had become premier. He was chancellor of the Duchy of Lancaster and minister of information, 1918–19. Afterwards he turned his attention to the management of newspapers. Having already a considerable share in the London *Daily Express*, he now took sole charge of it; he then estab. the *Sunday Express*, and bought the *Evening Standard* from the Hulton group. On the defeat of the Conservative party at the polls, May 1929, he launched his 'Empire Free Trade' policy. During the Second World War he was appointed minister for aircraft production in the Churchill gov. in May 1940. He at once put in hand a programme for a greatly increased output of essential types of machine, particularly Spitfires, Hurricanes, and Whitley bombers. In Aug. 1940 he was made a member of the War Cabinet; minister of state, 1941; minister of supply, 1941–2; and lord privy seal, 1943–5; he was made honorary chancellor of the univ. of New Brunswick, 1947. Pubs.: *Canada in Flanders* (2 vols.), 1916–17; *Success*, 1921; *Politicians and the Press*, 1925; *Politicians and the War* (2 vols.), 1928–1932; *The Resources of the British Empire*, 1934; *Don't Trust to Luck*, 1954; *Three*

Keys to Success, 1955; *Men and Power*, 1956. See lives by F. A. Mackenzie, 1931; Edgar Middleton, 1935; W. J. Brittain, 1941; Tom Driberg, 1956.

Bebel, Ferdinand August (1840–1913), Ger. Socialist and leader of the Social-Democratic party, b. at Cologne. He worked as a turner at Leipzig, joined the Working Men's Association, 1863, and became a Socialist, 1865. In 1867 he was elected to the N. Ger. Reichstag and to the united Ger. Reichstag in 1871, of which he remained a member until his death. He opposed the war of 1870, and in 1871, as the only Socialist member, the annexation of Alsace. In 1872 he was imprisoned for high treason. With Liebknecht he organised the Social-Democratic party and joined the staff of *Vorwärts*, 1890. His oratorical powers gave him a commanding position in his party, which survived the attacks of the more violent 'young' Socialists on one hand and the 'Revisionists' on the other. He became leader of the parl. Socialists and was a confirmed adherent to Marxian principles. His pubs. include an autobiography, *Aus meinem Leben*, 1910–14.

Bebington, municipal bor. of Cheshire, England, on the Mersey estuary immediately S. of Birkenhead. B. is residential and industrial, and includes Bromborough, Eastham, a model vil., and the soap and detergent works of Port Sunlight (q.v.). Pop. 47,742.

Bec, Abbey of, Benedictine abbey, near Bernay, Normandy. It was founded by Herlwin or Herlewin in 1034. Under Lanfranc as prior and Anselm, prior and abbot, it became the centre of learning in Europe. The old abbey buildings are now in ruins, but there is a Benedictine community of B.

Beccafumi, Domenico (1486–1551), It. painter, b. Siena, son of a peasant, Giacomo di Pace, who was employed on the estate of Domenico's subsequent patron, Lorenzo Beccafumi. Domenico was at one time known as Il Mecherino, from the name of an artist with whom he worked; but, later, he was known by the name of his patron. He painted in distemper and in oil; better in the former style, and his small figures are superior to his larger ones. He is remembered chiefly for the work he did for the famous marble pavement of the Duomo of Siena. His best works are in Siena.

Beccaria, Cesare Bonesana, Marquis of (1735–93), It. writer on moral and political philosophy, b. Milan and educ. at Parma. He wrote primarily on economic matters, but his best-known work is *Concerning Crimes and Punishments*, a legal work considerably in advance of his time. In 1768 the Austrian gov. founded a chair of political philosophy for him at Milan. See CAPITAL PUNISHMENT.

Beccaria, Giovanni Battista (1716–81), It. physicist, b. Mondovì; studied theology at Rome, and was prof. of natural philosophy at Palermo. In 1748 the King of Sardinia appointed him to the chair of natural philosophy at Turin. He pub. various works on electricity; elected a fellow of the Royal Society,

London, 1755, and contributed a number of papers to the *Philosophical Transactions*, the prin. one of which was *Dell' Eletticismo Naturale ed Artificiale*, 1753, English trans. 1776.

Beccles, municipal bor. and mkt tn of Suffolk, England, on the R. Waveney, 6 m. W. of Bungay, in the area of the Norfolk broads, and a favoured holiday yachting resort. An ann. regatta is held in Aug. Printing is the main industry, and there are also ironworks, flour mills, and maltings. Pop. 6900.

Becej (Bece), tn in Serbia, Yugoslavia, on the Marshal Tito canal. It has mineral springs, and is a commercial and agric. centre. Pop. 23,400.

Bee-an, Fr. name for various warblers of the family Turdidae. It includes such thin-billed birds as the stone-chat and hedge-sparrow.

Beche, Sir Henry Thomas de la (1796-1855), geologist, b. London. He carried out a geological survey of SW. England which he induced the gov. to support, and thus started the first Geological Survey in the world (1832). He directed Geological Survey from its official foundation in 1835 to his death, and was largely instrumental in founding the Museum of Practical Geology and the Royal School of Mines. A pioneer in applied science. Knighted, 1848. President, Geological Society, 1847-9.

Beche de Mer, often known by the Malay name *trepan*, or as sea-slug or sea-cucumber, species of holothurian *echinoderma*, about 5-12 in. long, with either smooth or warty skins. They are found chiefly off the coasts of the E. Archipelago and New Guinea and Queensland. First boiled and then dried in the sun and smoked, they are used in gelatinous soups in Chinese cookery, and are considered a great delicacy.

Becher, Johann Joachim (1635-82), Ger. chemist and physician, b. Spire. became prof. of medicine at Mainz; his *Physica Subterranea*, 1669, contains his experiments on various substances; Stahl's *Doctrine of Phlogiston* is indebted to him (ed. 1703). He d. in London.

Bechstein, Karl (1826-1900). Ger. pianoforte-maker, b. Götting. He was the founder of the Berlin firm which still bears his name, and whose instruments are famous for depth of tone.

Bechuanaland, Brit. protectorate in Africa, occupying part of the central plateau of S. Africa, bounded by the Orange R. on the S., the Zambesi R. and Rhodesia on the N., the Transvaal on the E., and SW. Africa on the W. Politically it is divided into Brit. B., incorporated, 1895, with Cape Colony, area 51,424 sq. m., pop. over 90,000, of which about 20 per cent are white; and the B. Protectorate, area estimated at 275,000 sq. m., pop. (census 1951) 294,883, of which 2325 are white. The pop. of Ngamiland (1936 census) is 42,000. The protectorate is governed as a Brit. crown colony by the high commissioner represented by a resident commissioner responsible to the Commonwealth Relations Office. The chief European

centres in the protectorate are Lobatsi, Gaberones, Francistown, and Serowe.

Mafeking, in Brit. B., is the H.Q. of the protectorate administration. Until 1915 the excess of expenditure over revenue, derived principally from a hut-tax of £1 per annum, was covered by an imperial grant, but from that year revenue has exceeded expenditure (up to 1944). In 1899 the boundaries of 4 native reserves were estab.; the Bamangwato (102,000), the chief Khama's people, occupying the main portion of the NE. of the protectorate, chief in Serowe, removed from Palapye, 1903; the Bangwaketsi (24,000); the Batawana (42,000); and the Bakgatla (14,000). In 1909 the Bamaletse Reserve (6000) was also fixed. A portion of Matabeleland, the Tati concession, is attached to the protectorate. In 1922 part of SW. Africa, Caprivi-ziptel, was also incorporated, but was transferred back to SW. Africa in 1929. The W. portion of the protectorate is occupied principally by the Kalahari Desert, where big game abounds; the E. is veld, affording pasture for cattle, the chief wealth of the native peoples. The country is more pastoral than agric., crops depending entirely on the rainfall. Kaffir corn, mealies (the chief native food crop), beans, melons, and pumpkins are sown, and, ordinarily, suffice for the people's needs. The winter climate (May to Aug.) is good except in the marshy districts, round Lake Ngami in the Okavango basin, N.W., and in the Makarikari salt marshes, NE.; the rainfall ranges from 10 in. W. to 26 in. E.; the soil is fertile but needs irrigation.

Minerals. Gold and silver are found in the Tati concession, where there is mining on a small scale. Gold and silver to the total value of £15,474 were mined in 1951.

Trade. Imports: blankets, ploughs, ironware, and groceries. Exports: cattle, hides, skins, dairy produce, and wood. Rhodesia is the best customer for sheep and goats from B. and the Union for pigs. Cattle number over 900,000 head, mostly owned by natives. European settlers trade in dairy produce.

Education. There exist at present 9 European, 5 coloured, and 144 native schools. The cost of education in 1953 was, European, £22,703, African, £77,118, Coloureds, £1,037. Under the director of education the schools are controlled, in most of the reserves, by school committees, on which the missionary bodies, together with Africans, are represented. The Bamangwato have for many years past entirely met the cost of the Khama Memorial School.

Development and welfare. As in other African dependencies, schemes are under way in B. for effecting improvements in agriculture, medical services, education, and communications, also for combating soil erosion, improving water supplies, irrigation dams, and tribal granaries.

Communications. The railway from Kimberley to Vryburg and Mafeking traverses the B. Protectorate en route to Rhodesia. A telegraph line from Cape Province runs from Mafeking through

Gaberones and Francistown to Bulawayo and Salisbury in Rhodesia.

History. Exploration began at the end of 18th cent.; in 1818 the London Missionary Society settled at Kuruman, Robert Moffat's H.Q. from 1821. Livingstone's systematic explorations commenced in 1841. After the Sand R. convention, 1852, the Boers began to encroach from the E. The appeals from the native chiefs, notably the Christian and enlightened Khama, during the seventies led to a temporary Brit. occupation. After the first Transvaal war, the Boers set up the reps. of Stellaland (at Vryburg)

Co. obtained the sole right, for 20 years, to prospect for precious stones, minerals, and metals throughout the Bamangwato country. In 1920 an advisory council, both native and European, was estab. for the benefit of the resident commissioner. The Gov. of the Union of S. Africa have from time to time made efforts to induce the Brit. Gov. to transfer the B. Protectorate, and also the other two high commission territories, to the Union, and indeed the S. Africa Act makes provision for the possibility of such incorporation. But hitherto the people of these territories have manifested no wish

E.N.A.

THE NATIVE HOSPITAL AT SEROWE, BECHUANALAND PROTECTORATE

and Goshen in the N., which they retained contrary to the London convention, 1884. Sir Charles Warren's expedition, 1884, finally brought B. under Brit. rule. The present administrative div. dates from 1895. In that year arrangements had been made to transfer the protectorate, with the exception of the native reserves, to the Brit. S. Africa Co., but as a result of the Jameson raid the Imperial Gov. again took over the administration. The same year portions of native ter. were made over to the Brit. S. Africa Co., Ltd. and are known as the Tuli, Gaberones, and Lobatsi farms. In 1896 the B. Railway Co. constructed the railway which connects the Union of S. Africa with Rhodesia. In 1910 the protectorate, excluding the Tati dist., was vested by Order in Council in H.M. High Commissioner for S. Africa, and in 1911 the Tati Concessions, Ltd were confirmed in their possession of the Tati dist. By an agreement concluded in 1932 with Tshekedi Khama, acting chief of the Bamangwato tribe the Brit. S. Africa

to change their political status, particularly in view of the fundamental difference between Brit. and S. African native policy. There are always approximately 10,000 Bechuanaland natives employed in the Rand mines. See G. B. Clark, *Transvaal and Bechuanaland*, 1883; J. T. Brown, *Among the Bantu Nomads*, 1926; J. Mockford, *Khama: King of the Bamangwato*, 1931; L. A. Mackenzie, *Report on the Kalahari Expedition*, 1945.

Beck, Sir Adam (1857-1925), Canadian engineer, b. Baden, Ontario, of Ger. parents. Educ. at Galt, Ontario, and then joined his father's business at London, Ontario. He was the creator of the hydro-electric system of power-supply which led to the development of Canadian secondary industries. He was a member of the Ontario Legislative Assembly and chairman of the Hydro-Electric Power Commission.

Beck, Josef (1894-1944), Polish soldier and politician, b. Warsaw. He served with Pilsudski's Polish Legion in 1914, and also in the Polish war with U.S.S.R.,

1919-20. When Pilsudski came to power in Poland, B. became foreign minister in 1932. He was instrumental in concluding a pact of non-aggression with Hitler's Third Reich on 26 Jan. 1934, but later signed a military alliance with Britain on 25 Aug. 1939. After the fall of Poland B. fled to Rumania, where he was interned until his death.

Beck, Richard (1897-), Icelandic poet and scholar, prof. of Scandinavian languages in the Univ. of N. Dakota, editor of *Icelandic Lyrics*, an anthology, 1930, and author of a *History of Icelandic Poets, 1800-1940*; prolific contributor to learned and literary periodicals in various languages.

Beck Case, legal case of mistaken identity. In April 1904 a man named Adolf Beck was identified by sev. women and an ex-policeman as a certain man named Smith, who had previously been imprisoned for fraud. He was tried and convicted of attempting to defraud these women again. While undergoing penal servitude he discovered that Smith was a Jew, and by personal marks he was at length able to prove his innocence. He was pardoned and offered a sum of money as compensation for his imprisonment. Smith was arrested, and Beck d. in poverty in 1909. This case was largely instrumental in bringing about the estab. in England of the court of criminal appeal. See *Trial of Adolf Beck*, ed. by E. H. Watson, 1924.

Becke, George Lewis (1855-1913), Australian novelist, b. Port Macquarie, New S. Wales, where his father was clerk of petty sessions. Educ. at a school in Sydney, he went to sea at an early age in vessels trading in the Pacific. He started writing in 1892, his first book, *By Reef and Palm*, 1894, a collection of short stories, being followed by *The Ebbing of the Tide*, 1896, *Wild Life in Southern Seas*, 1897, *Roamers the Boat-steerer*, 1899, *Tom Wallis*, 1900, *Helen Adair*, 1903. *Notes from my South Sea Log*, 1905, and others.

Beckenham, municipal bor. of Kent, England, 9 m. SE. of London, a residential area. At Monk's Orchard is the Bethlem hospital, opened in 1930. Pop. 75,160.

Becker, George Ferdinand (1847-1919), Amer. geologist, b. New York; graduated at Harvard and Heidelberg. U.S. geologist, 1879-92; afterwards on staff of U.S. Geological Survey. Reported on goldfields in S. Africa and Alaska, and on the geology of the Philippine Is.

Becker, Karl Ferdinand (1775-1849), Ger. physician and grammarian, b. Lieser on the Mosel, estab. a school at Offenbach, 1823; propounded the theory that logic is the basis of grammar. His prin. work, *Ausführliche deutsche Grammatik*, 1836-8.

Becker, Wilhelm Adolf (1796-1846), Ger. archaeologist, b. Dresden; studied under Beck and Hermann at Leipzig Univ., and became prof. of archaeology there in 1842. His greatest work is the *Handbuch der römischen Alterthümer*, 1843, finished (1868) by Marquardt and Mommsen; but his most popular books are the scenes of Rom. and Gk life in the form

of romances, *Gallus*, 1838 (new ed. 1880), and *Charicles*, 1840 (new ed. 1877); both have been trans. into English. He d. at Meissen.

Beckerath, Hermann von (1801-70), Prussian statesman, b. Krefeld; gained great wealth from the bank which he founded, 1838; was a member of the Frankfurt Parliament, 1848, and made finance minister.

Becket, Thomas (c. 1118-70), saint, chancellor, and Archbishop of Canterbury. He was of Norman stock, b. according to tradition, in Cheapside, where his father was a merchant. He was educ. at Merton Priory and later went to Paris to study theology. He was attached to the court of Theobald, Archbishop of Canterbury, c. 1142-53. When Henry II came to the throne the talented young archdeacon soon became his friend. In 1155 Henry, continuing his policy of gathering around him a group of able, trustworthy servants to carry out his programme of centralisation, made B. chancellor. During his period of office, it was said that B. was more regal in his manner than the king himself. But he was competent and loyal, and Henry was more than satisfied. B. led an embassy to the Fr. court, suggested a means of acquiring the Norman Vexin, and took an active part in the Toulouse campaign. In 1162 he seemed the obvious choice for Archbishop of Canterbury, though he was only, as yet, in minor orders. As chancellor-archbishop, and Henry's friend, Henry no doubt hoped that B. would continue to act as his instrument in both state and church affairs.

B. apparently accepted the archbishopric with reluctance. He was ordained priest on 2 June 1162, and consecrated the next day. Then he resigned the chancellorship. It was clear that he was not going to play the role that Henry had visualised for him. His way of life became that of an ascetic and he began at once to champion the rights of the Church against the king's alleged encroachments.

The dispute raged round the subject of benefit of clergy, and was embittered by the former friendship, and the uncompromising nature of both B. and the king. At first it seemed that B. would agree to Henry's demands; but when these were put down in writing as the Constitutions of Clarendon, he refused to sign them, declaring that they ran counter to canon law. In 1165 B. fled abroad. His property was seized and the revenues of his see impounded. Though he had received little support from his fellow-bishops in England, B. received support from the Pope. In 1170 a reconciliation took place between Henry and B., and B. returned to England and was enthusiastically received by the common people.

B. brought with him papal letters of suspension for the bishops who had taken part in his absence in the coronation of Henry's son; and proceeded to excommunicate all those in possession of his estates. Henry is said to have reacted with a burst of fury that carried with it

the implication that he wanted to be rid of B. permanently; though it is unlikely that he seriously wanted B. murdered if only because any such murder would be—and, indeed, was—politically inexpedient. But on 29 Dec. 1170, the archbishop was murdered by 4 knights in Canterbury Cathedral. He was immediately hailed as a martyr and canonised in 1173. Henry did public penance at his tomb (1174). B.'s shrine became famous throughout Christendom but was totally destroyed at the Reformation (1538). B.'s character remains something of an enigma to the historian; there is an interesting interpretation in T. S. Eliot's drama, *Murder in the Cathedral*, 1935. See also lives by W. H. Hutton, 1889, and R. Speaight, 1938.

Beckford, William (1759–1844), author, son of Wm Beckford (1709–70), lord mayor of London and supporter of Wilkes, was b. at Fonthill, Wilts. He inherited a fortune on his father's death. In 1783 he married Lady Margaret Gordon, daughter of the 4th Earl of Aboyne. After his wife's death in 1786 he went to Portugal. He was M.P. for Wells 1784–90, and subsequently for Hindon. In 1801 he sold the contents of Fonthill, and began the building of a new house at a cost of nearly £300,000. His eccentric habits of seclusion here gave rise to various stories. In 1822 he sold Fonthill to John Farquhar, who sold his collection of pictures and art treasures; 3 years later the tower (260 ft high) collapsed and destroyed part of the house. B. built another tower near Bath, where he lived till his death. The oriental romance for which he is chiefly remembered, *The History of the Caliph Vathek*, was originally written in French and, according to his own account, in a single sitting of three days and two nights, but there is reason to believe that this was a flight of fancy. A pirated Eng. trans. was pub. in 1786, and next year B. pub. the original French. His *Letters from Portugal* were pub. in 1834, and in the same year a reissue of his satirical *Biographical Memoirs of Extraordinary Painters*, originally written in 1780. His *Travel Diaries* were ed. by G. Chapman, 1928. See C. Redding's *Memoirs*, 1859; R. Garnett's ed. of *Vathek*, 1893; L. Melville, *Life and Letters*, 1910; J. W. Oliver, *The Life of William Beckford*, 1932; G. Chapinan, *Beckford*, 1937.

Beckmann, Johann (1739–1811), Ger. scholar and writer, b. Hoya in Hanover, educ. Göttingen Univ. where, in 1766, he was made prof. of natural science. His prin. work was *Beiträge zur Geschichte der Erfindungen* (5 vols.), 1780–1805. He also wrote *Grundsätze der deutschen Landwirtschaft*, 1769, and *Anleitung zur Technologie*, 1777. It was B. who created the term 'Technology.'

Beckton, part of the co. bor. of E. Ham, Essex, England, near the l. b. of the Thames, 9 m. from London. There are extensive gas-works, and the N. outfall of the metropolitan drainage system crosses here to the bor. of Barking. Pop. 300.

Beckum, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 64 m. NE. of

Düsseldorf (q.v.). It is an important centre of the cement and limestone industries. Pop. 20,000.

Beckwith, John Charles (1789–1862), general and missionary, b. Nova Scotia, nephew of Gen. Sir Thomas B. (q.v.), served in the Light Div. in the Peninsular war, and lost a leg at Waterloo. In 1827 sympathy for the Waldensians in Piedmont made him a missionary. He settled at La Torre, founded 120 schools, and built a church.

Beckwith, Sir Thomas Sydney (1772–1831), Eng. soldier, son of Maj.-Gen. John B., who led a regiment of foot at Minden. He won a great reputation as a leader of light troops, and was practically the creator of one of the finest units, the 95th, in Moore's celebrated Light Div. It was in India under Baird that B., as a subaltern, learned military organisation, and when, on his return to England, a rifle corps or regiment of light troops was about to be formed, B. obtained a captaincy in the new unit, which later was known as Manningham's Rifles or the 95th of the Line (later the Rifle Brigade). B. became the lieutenant-colonel of this regiment in 1803, and the part that he and his brigade took in closing Moore's retreat from Portugal is graphically described by Napier. Subsequently he again distinguished himself in the Peninsular war, notably at Busaco and at Sabugal. In 1829 he was appointed Commander-in-Chief at Bombay, India.

Beckx, Pierre Jean (1795–1887), general of the Jesuits, b. Siehem in Brabant, and d. at Rome. He became confessor to the Duke of Anhalt-Köthen, and procurator for the prov. of Austria in 1847. Six years later he was made general of his order, and as such influenced Pope Pius IX. He took a prominent part in the discussions concerning the Immaculate Conception and papal infallibility.

Becon, Thomas (1512–67), Eng. divine, chaplain to Archbishop Craumer. He graduated as B.A. at the age of 16 at St John's College, Cambridge. His religious opinions caused his summons to London, there to recant them and further to burn the books wherein they had been proclaimed. During the reign of Edward VI he prospered, but was sent to the Tower on the death of the king. On being released he went to Strasburg. On Elizabeth's accession he returned, and was restored to his benefice of St Stephen, Walbrook.

Becontree, dist. of Essex, England, situated in the bors. of Ilford, Barking, and Dagenham, 11 m. from London. Here the L.C.C. has built dwellings to accommodate nearly 100,000 persons.

Becoque, Henri François (1837–99), Fr. dramatist, b. Paris. His realistic, often bitter plays, as *Michel Pauper*, 1870, *L'Enlèvement*, 1871, *Les Corbeaux*, 1882, and *La Parisienne*, 1885, are now greatly esteemed, although B. had little success in his lifetime. See E. Dawson, *Henri Becoque*, 1920.

Bécquer, Gustavo Adolfo (1836–70), Sp. poet and man of letters, b. Seville, son of a painter. In 1854 he went to Madrid,

and earned a scanty living on trans. and miscellaneous journalistic work. He wrote 3 vols. of poems and prose legends. In the former he was imbued with the romantic spirit that influenced Byron and Heine; his theme is the hopelessness of love and the suffering in life. His diction is prosaic but expressive of deep feeling. His prose, *Leucidas*, are weird and morbid. B. d. of consumption at the age of 34. His works were pub. posthumously (2 vols). 1871. See B. Jarnés, G. A. Bécquer, 1936.

Becquerel, Antoine César (1788-1878), Fr. physicist, b. Châtillon-sur-Loing; served in the Fr. army as an engineer in Spain, 1810; he was appointed to the École Polytechnique and served in France in 1814. He then left the army to study with Ampère and Biot (q.v.) magnetism, electro-conductivity, and more particularly electro-chem. In 1837 he became prof. of physics at the Musée d'Histoire Naturelle. The value of his researches in electrical science was recognised by the Royal Society with the Copley medal, 1837, and he may be regarded as one of the pioneers in the study of electro-chem. Of his numerous scientific pubs. the chief are *Traité d'électricité et du magnétisme*, 1840, *Éléments de l'électro-chimie*, 1843, *Traité complet du magnétisme*, 1845, and *Éléments de physique terrestre et de météorologie*, 1847.

Becquerel, Antoine Henri (1852-1908), Fr. physicist, b. Paris, grandson of Antoine César Becquerel (q.v.). Studied at the École Polytechnique and the École des Ponts-et-Chaussées. Followed his father as prof. at the Conservatoire des Arts et Métiers. He is famous for his discovery of radioactivity (q.v.) during researches on fluorescence, in 1896. His other work included studies of the magnetic rotation of the plane of polarisation of light. He shared the Nobel prize in 1903 with Pierre and Marie Curie for his work on radioactivity.

Becquerel Rays, invisible rays given off by uranium. The property of radioactivity of uranium was first discovered in 1896 by Antoine Henri Becquerel. See RADIOACTIVITY.

Becse, see BECSÉ.

Bective Abbey, ancient Cistercian monastery (1146) on the R. Boyne, 5 m. S. of An Uaimh, Rep. of Ireland.

Bed, term generally for the sleeping place for human beings or animals; specifically a piece of furniture used for sleeping. Primitive man made his B. upon the floor of a cave or hut, of skins, leaves, ferns, dried grass, or straw. E. nations pile sleeping-mats and rugs on the floor for night, and remove them in the day. The B. of the O.T. and N.T. can be seen to-day in the E. In India the string B. stretched on a low framework of wood, the *charpoy*, marks a transition towards the bedstead. The material of the bedding, straw, wool, or feathers, has not varied much since early times; hair was used in the Middle Ages. Pillows and bolsters were used in anc. Greece and Rome. The curved head-rest of wood or more costly material is found in anc.

Egypt, and to-day in Japan, in Africa, and the Pacific. In modern times flock, wool, horsehair are used for the stuffing of bedding; feathers, still used for pillows, have ceased to be a luxury for the B.; the spring mattress has given place to the coiled wire-woven net, fixed in the framework, a development of the crossed plate of iron or webbing descending from the hide thongs of anc. times which supported the bedding. Interior springing and the use of rubber latex foam for mattresses and pillows are comparatively new. The bedstead proper in anc. Egypt was a low framework of wood, on which was stretched a webbing of rushwork or fibre; more lofty B.s. with steps, were used for persons of rank. The early Gk B. had a head-board, and laced thongs of hide supporting a pile of skins or other coverings. Oriental influence brought carving and inlay of metal and ivory, which the Romans copied. At Pompeii have been found the carved bronze posts and head-rests of B.s. which once supported a narrow frame of wood; such were probably placed in an alcove and sheltered by curtains. In the early Middle Ages the bedstead, where used, appears to have been a box-like construction, but there are illustrations in MSS. of B.s. with carved and decorated head- and foot-boards; others are mere couches or benches placed against the wall with curtains hung from a side cornice. A feature of 12th- and 13th-cent. B.s. is their slope from head to foot. In the 14th cent. is found the tester, with canopy and side curtains usually hung from a wall projection at the head. It must be remembered that bedsteads were luxuries for the well-to-do, and that the common folk slept, as did their ancestors, on rushes, skins, or straw upon the floor. Till the end of the 15th and beginning of the 16th cent. most of the decoration seems to have been lavished on the H-trappings, which a great personage carried with him, to furnish the light frameworks of the permanent bedsteads. With the 16th cent. comes the great 4-post B., with its opportunity for the craft of the wood carver. Many fine examples of Elizabethan and Jacobean B.s. of this type still exist. A historic example is the great B. of Ware, once at the Saracen's Head, now in the Victoria and Albert Museum, London. The 17th cent. ended, a return was made to the tester, but the canopy and side curtains rest on the head-posts of the B., and the foot-board, carved and curved, remains or is dispensed with. France was before England in the change, and the 18th cent. in France produced ornate and beautiful examples. Chippendale and Sheraton designed fine mahogany bedsteads, and the present day has seen a revival of the taste for wooden bedsteads in preference to the iron and brass bedsteads which had come into use since the middle of the 18th cent., and the wide popularity of the divan head-board which is sometimes padded or covered with material matching the other B. coverings. See also FURNITURE.

Bed, in geology, term used to indicate

sedimentary layers of rocks, usually called strata. See GEOLOGY.

Bed of Justice, see LIT DE JUSTICE.

Bedale, markt tn and rural dist. of Yorks (N. Riding), England, 8 m. SW. of Northallerton. The B. hunt is named after the tn. Pop. 1050.

Bédarieux, Fr. tn, in the dept of Hérault. Bauxite is found, and there are textile manufs. Pop. 7000.

Bedda, or **Beda**, Nuts, product of *Terminalia bellerica*, family Combretaceae. These tropical seeds are used in medicines, and also in dyeing and tanning. In common with the seeds of sev. other plants they are called myrobalans.

Beddgelert, i.e. the grave of Gelert, vil., Caernarvonshire, N. Wales, 13 m. SE. of Caernarvon. It is close to the pass of Aberglaslyn, in which is the rock called the chair of Rhys Goch, the bard (d. 1420). From the vil., lying at the foot of Snowdon, the ascent can be made. Pop. 1100. The traditional grave of Llewellyn's hound, Gelert, is marked by a stone, recalling the legend of the hound who saved his master's child from a wolf and was killed in mistake by the father. Pop. 913.

Beddington, dist. of Surrey, England, part of the bor. of B. and Wallington, on the Wandle, 2 m. from Croydon. It has a public park, and, adjoining it, a school which was formerly the seat of the Carew family. Pop. 19,338.

Beddoe, John (1826-1911), anthropologist and physician, b. Bowdley, Worcs. He was educ. at Univ. College, London, and Edinburgh. He served during the Crimean War as a doctor on the civil staff, and from 1857 had a medical practice in Clifton, Bristol. His anthropological works include *The Races of Britain*, 1855, *Stature of Man in British Isles*, 1870, and *The Anthropological History of Europe*, 1910.

Beddoes, Thomas (1760-1808), physician, b. Shifnal, Shropshire. Educ. at Pembroke College, Oxford, he studied languages, chemistry, and geology, then came to London, 1781, and studied medicine under Sheldon. He took his M.D. at Oxford, 1786, and visited France in the following year. At the outbreak of the Fr. Revolution, he supported the rebels, and in consequence had to leave Oxford. He returned to Shropshire, and wrote the *History of Isaac Jenkins*, intended to check drunkenness. In 1794 he married Anna Edgeworth, sister of Maria Edgeworth (q.v.). He was the inventor of a 'pneumatic' system of therapeutics by inhalation of medicated gases, and set up an institution, which is notable as having provided Humphry Davy with opportunities for his researches. See life in F. F. Cartwright, *The English Pioneers of Anaesthesia*, 1952.

Beddoes, Thomas Lovell (1803-49), poet, b. Clifton, the son of Thomas B. (q.v.). He was educ. at Charterhouse and Pembroke College, Oxford. His poetic drama, *The Bride's Tragedy*, 1822, is modelled on Webster and Tourneur, and his verse re-echoes that of the Jacobean dramatists. His fantastic and

amorphous drama in verse, *Death's Jest-book*, or *The Fool's Tragedy*, was pub. posthumously, 1850, by his friend, T. F. Kelsall, who was his literary executor, and in 1850-1 pub. a memoir of B. and collected eds. of his poems. Many of B.'s lyrical poems, such as 'If there were dreams to sell,' are exquisite. From 1824 till his death B. lived a wandering life abroad, chiefly in Germany and Switzerland, but his revolutionary views prevented his remaining long in one place. He committed suicide under peculiar circumstances in 1849 at Basel. See E. Gosse, *Poetical Works of T. L. Beddoes*, 1890, 1928, with the first full account of his life, and *Letters*, 1894; R. H. Snow, *Thomas Lovell Beddoes, Eccentric and Poet*, 1928; H. W. Donner, *Thomas Lovell Beddoes: the Making of a Poet*, 1935.

Bede, **Beda**, or **Baeda**, surnamed **The Venerable** (c. 673-735), historian, b. in the ter. of the monastery of St Peter at Wearmouth. When 7 years old he was admitted to this monastery, and studied under Benedict Biscop (q.v.) and his successor, Ceolfrid. In 682 Biscop founded the neighbouring monastery of Jarrow, and it is here that B. generally resided. In his nineteenth year he was admitted to the diaconate by St John of Beverley, then Bishop of Hexham, and 11 years later the same bishop ordained him priest. At the end of his *Ecclesiastical History* B. gives us these particulars of himself, and goes on to mention how the observance of the monastic discipline, the daily charge of singing in the church, and the delights of learning, teaching, and writing had made up his tranquil life. B. was fortunate in his environment; he was able to draw on the vast library collected by Biscop, and there is no evidence that he himself ever travelled beyond York and Lindisfarne. Yet the scope of his writing is enormous. His learning was great, covering, though probably not so fully as has sometimes been supposed, almost all the subjects then known: Latin, Greek, astronomy, medicine, and possibly some Hebrew. His *Ecclesiastical History* is a chief source of knowledge of the early hist. of England. Its facts are derived partly from the Rom. writers, but also from local sources and traditions. King Alfred trans. it into Anglo-Saxon. B. also wrote scientific works, including a treatise on the calendar, and other historical essays, such as the *History of the Abbots* of his own monasteries. Another large div. of his work consisted of theological treatises and biblical commentaries. B. possessed the gift of co-ordinating the facts at his disposal into a vivid historical pattern, and this gift, combined with his real critical faculty, has helped his historical writing to stand the test of time. Though never canonised, the title *Venerable* was added to his name in the 9th cent. Leo XIII pronounced B. a doctor of the Church in 1899.

Bede, Cuthbert, see BRADLEY, EDWARD.
Bedeau, Marie Alphonse (1804-63), Fr. general, b. and d. Vertou, near Nantes. He was sent to Algeria in 1836, and in

1847 became its governor-general for some time. During the revolution in 1848 he was appointed, by Marshal Bugeaud, commander of one of the 5 columns for its suppression, but proved of little service. He was arrested with Cavaignac and La Moricière in 1851 and banished, but in 1859 returned to his native land.

Bedeaux System, also known as B. point plan, a wage incentive system based on a form of job standardisation covering direct and indirect production work. The employee receives a basic hourly wage until his efficiency exceeds a standard fixed in advance by time study. Production in excess of standard is rewarded by an increasing hourly rate strictly related to production, until for high production it becomes almost a pure piece rate. Thus, if production is 150 per cent of standard, the daily wage earned is 140 per cent of the basic daily wage. The system is similar in principle to other incentive systems involving the 'sharing' of savings resulting from super-standard production between employer and employee. The application is usually accompanied by the fixing of high standards and the exercise of rigid control, but is not concerned with production methods, and has therefore led to industrial disputes and considerable controversy.

Bedegar, or **Bedeguar** (Persian 'wind-brought'), or Robin's Pincushion, gall consisting of moss-like filaments, greenish but later reddish, enclosing a cluster of cells containing grubs of the Gall-wasp, *Rhodites rosae*, responsible for it; found chiefly on wild roses. See GALLS.

Bedel, see BEADLE and LOCAL GOVERNMENT.

Bedell, William (1571-1642), Eng. prelate, b. Black Notley in Essex. Took holy orders and was chosen fellow of his college, Emmanuel, Cambridge; was chaplain to Sir Henry Wotton at Venice. On his return to England he trans. into Latin various works concerning the hist. of the Church. In 1627 he became provost of Trinity College, Dublin, and in 1629 was elected Bishop of Kilmore and Ardagh. He also aided in the trans. of the Prayer Book and Bible into Erse, and saw that the trans. was read in his diocese. In the rebellion of 1641 he was at first unmolested, but afterwards imprisoned, in consequence of which he d.

Bedesman, or **Beadsman**, almsman, who offered *bedes* or prayers for his benefactor's soul. Our word head is derived from *bede*, a prayer counted upon the beads of a Rosary. Bedesmen were attached to the churches. In Scotland the king's bedesmen were licensed mendicants, who received maintenance in kind on the king's birthday. Later the word came to mean a pensioner, or the inmate of a hospital. See also BIDDING PRAYER.

Bedford, Dukes of, see RUSSELL FAMILY.

Bedford: 1. Co. tn of Beds, England, and a municipal and Assize and Quarter Sessions bor. It is situated on the R. Ouse, amid fertile pasture lands and cornfields, about 50 m. from London. The

riv. banks are tastefully laid out as promenades, and there are 3 large parks. There is considerable trade in market garden and agric. produce. Engines and agric. machines are manuf. Sir W. Harpur (d. 1573), lord mayor of London in 1561, is buried in St Paul's Church. He did much to benefit B., his native place, and endowed an Edward VI grammar school, and the 'Harpur Trust' supports B. School and other schools for boys and girls. The name of John Bunyan is associated with the tn. He was imprisoned in the jail; his chair is preserved at the Bunyan meeting house on the site of the chapel in which he preached. Pop. 53,000.

2. City, co. seat of Lawrence co., Indiana, 22 m. S. of Bloomington. It is a shipping port for the B. oolitic limestone, the best building stone in the U.S.A., of which many important buildings have been constructed. Manufs. include stone-working machinery. Pop. 12,600.

Bedford College, school of London Univ. (q.v.), founded in 1849 by Mrs Reid to provide a liberal education for women. The original buildings were in Bedford Square; a move followed to York Place, Baker Street, and in 1913 new buildings in Regent's Park were opened by Queen Mary. There are some 700 undergraduate and 100 postgraduate students.

Bedford Level, dist. in England of about 400,000 ac., situated in the cos. of Suffolk, Norfolk, Lincs, Cambs, Northants, and Hants. It was once fenland, and was first drained in the 17th cent. by the Dutch engineer Cornelius Vermuyden for a group of speculators headed by the Earl of Bedford. A large portion is under cultivation, and coleseed and flax are grown. Wildfowl live in the more marshy dists. in vast numbers.

Bedford Park, residential dist. in the bor. of Acton, Middx, the first London suburb (began 1875) to be planned. See also HAMSTEAD GARDEN SUBURB.

Bedfordshire, S. midland co. of England, bounded by Northants on the NW., Bucks on the W., Herts and Cambs on the E., and Hants on the NE. The surface is generally level, but a branch of the Chiltern Hills crosses the NE. and S. of the co. The prin. rivs. are the Great Ouse, flowing through the centre of the co. to the E. (navigable to Little Bartford), and its trib. the Ivel. The valley of B. is fertile, and the Ouse valley is noted for its pastures. Wheat and barley are grown, and the E. of the co. is largely given up to market gardening. Chief industries are engineering and motor works at Luton and Dunstable, printing at Dunstable, and extensive cement manufs. on the chalk. The world's largest brickworks are at Stewartby. The co. comprises 3 bors., and 5 urb. and 4 rural dists., and returns 3 members to Parliament. Area 302,942 ac.; pop. 312,000. See pubs. of the B. Historical Record Society (1912-); the B. Magazine (1947-); Victoria Co. Hist. of B., 1912-1914; C. G. Chambers, *Bedfordshire*, 1917; A. Mee, *Bedford and Huntingdon*, 1938.

Bedfordshire and Hertfordshire Regiment, The (formerly 16th Foot), regiment of the Brit. Army, raised in 1888 and sent to Holland in 1689, serving in all campaigns down to peace of Ryswyck, 1697. After a few years in Ireland it returned to Holland under Marlborough and fought at Blenheim, Ramillies, Oudenarde, and Malplaquet. In 1782 it received the title the Buckinghamshire, which it exchanged in 1809 for the Bedfordshire. During the 19th cent. it served in the W. Indies, Ceylon, Bengal, and N. America. Under Sir R. Low it served in the Chitral campaign in 1895. During the First World War it raised 18 battalions for service in France, Flanders, Italy, Gallipoli, and Palestine. In 1919 the title was changed to the Beds and Herts Regiment. Units of the B. and H. R. fought in NW. Europe in the Second World War. Other units also fought on the It. front, and in Burma.

Bédier, Joseph (1864-1938), Fr. writer, b. Paris; one of the foremost authorities on Fr. medieval literature, having a gift for moulding legend and tradition into literary forms of grace and distinction. He was prof. of Fr. literature at Fribourg (1889-91), at Caen (1891-3), and at the Collège de France (1893-1925), being administrator of the last-named from 1925 until his death. Pubs.: *Le Roman de Tristan et Yseult*, 1900-20; *Les Chansons de croisade*, 1909; *La Chanson de Roland*, 1921-6; *La Formation des légendes épiques*, 1908-17. He was elected to the Académie Française in 1920 in recognition of his *Histoire de la littérature française*, 1923.

Bedivere, last knight of King Arthur's Round Table. His adventures are recounted in the *Morte d'Arthur* of Malory. It was Sir B. who bore Arthur's body to the barge and hurled his sword *Excalibur* into the lake.

Bedlam (properly **Bethlem Hospital**), London co. mental hospital, originally founded in 1247 by Simon Fitzmary as a priory at Bishopsgate under St Mary's of Bethlehem. Later converted into a 'madhouse,' and transferred in 1676 to Moorfields, then in 1815 to Lambeth. At one time the inmates were treated in a cruel manner, being exhibited as though they were wild beasts. Hogarth's picture refers to this. 'Bedlam beggars' or 'Tom-o'-Bedlams' were names given to such patients as, being partially cured, were allowed to go at large. In 1931 the hospital was moved to Beckenham, Kent, and the grounds on which it stood were given by Lord Rothermere as a playground for S. London children, while the building in Lambeth now houses the Imperial War Museum. See E. G. O'Donoghue, *The Story of Bethlehem Hospital*, 1914.

Bedlington Terrier, so named after the tn of Bedlington in Northumberland. It was first bred there at the beginning of last cent., and was for some time only known to the miners of the dist., with whom it was, as now, a favourite sporting dog. It stands about 13 in. and weighs from 18 to 24 pounds; colour blue-black,

with black nose, or liver, tan, or sandy with light-coloured nose; the coat is short, crisp, and inclined to harshness; the head is narrow, the muzzle long and powerful; ears set low, and falling close to the head; tail tapering and not carried high; the legs are long and flanks cut up. The B. T. is a splendid ratter, and full of courage and fight, with remarkable speed.

T. Fall

BEDLINGTON TERRIERS

Bedlingtonshire, urb. dist. of Northumberland, England. It is situated 4 m. above the mouth of the Blyth. It has collieries, brickworks, and light industries. Pop. 28,270.

Bedloe's Island, in New York harbour, U.S.A., lying, together with Governor's and Ellis Is., in the bay S. of Manhattan Is. In it stands the famous statue of Liberty, presented to the nation by France, which dominates New York harbour.

Bedmar, Alfonso della Cueva, Marqués de (1572-1655). Sp. diplomat. He was appointed to Venice in 1607 to break up a Franco-Swiss-Dutch-Venetian league against Spain. The plot that he was supposed to have planned, in 1618, with the Viceroy of Naples, the Duke of Ossuna, to capture the city during the Ascension Day ceremony of the doge's marriage with the Adriatic, is the basis of Otway's tragedy, *Venice Preserved*. He left Venice on its discovery and went to the Netherlands as president of the council. He became a cardinal in 1622, and Bishop of Oviedo, where he died.

Bednvy, Dem'yan (real name **Pridvorov, Yefim Alekseyevich**) (1883-1945), Russian Communist poet. His simple verses were very popular during the civil war and in the 1920's, when he was held up as the prin. proletarian poet.

Bédos de Celles, Dom François (1709-1779), Benedictine monk of Saint-Maur,

b. Canx. He was a master in the knowledge of organ-building, and pub. *L'Art du facteur d'orgues* in 1786 to 1778.

Bedouins, i.e. the people of the open land or desert, Arab. *Ahl-bedw*, *Badawin*, or, as they also call themselves, *Ahl-el-beit*, the people of the tent. According to Arab traditional ethnology, the B. are Mustarabs, naturalised Arabs, the descendants of Ishmael, as distinguished from the pure Arabs descended from Shem; thus the latter are the agric. settled Arabs, the B. the nomad pastoral people. The earliest home of the B. was N. Arabia, Hejaz, and Nejd, from whence they spread in early times to Syria and Mesopotamia, and much later to Egypt and Tunisia. The name has lost much of its true racial significance, for it is often applied to many Hamitic nomad tribes, such as the Bisharin and Hadendoo in Lower Egypt and the Sudan, while true B. have settled in vils. and become agric. Physically the B. of N. Arabia are slight and wiry rather than strong, and below the middle height; in colour brown, deepening in shade in the S. The features are good, with aquiline nose. Their organisation is tribal, their leader the sheikh, chosen for his qualities, whether of wealth, birth, or courage. Living in tents and moving from well to well and pasture to pasture, the B. are loosely organised; intertribal feuds are common, with constant cattle raidings. They were notorious plunderers of caravans and travellers, and a regular toll was paid by the Turkish gov. to those tribes through whose ter. passed the pilgrimages to Medina and Mecca. The building of the Hejaz railway caused much disturbance in consequence among the tribes. Regarding all travellers as trespassors, they nevertheless respected a safe conduct or passport which could be obtained from a sheikh by payment. The proverbial Arab hospitality was then freely extended. Though professing Mohammedanism, they are by no means strict observers, except under pressure from the Wahabis, as in Nejd. Polygamy is rare, but the marriage tie is loose. The dress of the men consists of a long shirt and a black camel's-hair cloak, with a black or striped headcloth; the women wear white trousers and shirt, with a large blue cloak which they draw over the face before strangers. The chief authorities are J. L. Burckhardt, *Notes on the Bedouins and Wahabis*, 1831, C. M. Doughty, *Arabia Deserta*, 1882, W. S. Blunt, *Bedouin Tribes*, 1879, Lady Anne Blunt, *Pilgrimage to Nejd*, 1881, Hill Gray, *With the Bedouins*, 1890, S. M. Zwemer, *Arabia, the Cradle of Islam*, 1900, and A. Kennett, *Bedouin Justice*, 1925. See also bibliography under ARABIA.

Bedruthan Steps, remarkable natural granite formations on the N. Cornish coast, England, 5 m. from Newquay.

Bedsore, sore or type of ulceration which may afflict a patient who is confined to bed through illness, accident, or old age, especially if unable to move freely and often. Constant pressure on one surface causes a loss of vitality to the surrounding tissues through stoppage of the

circulation, and results, if neglected, in a discoloration of the skin, then a slough, and finally a deep ulcer. The parts most liable are the base of the spine, the hips, shoulders, heels, and elbows, and the back of the head. The tendency to rapid formation of B. varies with the weight of the patient, his capacity to move, etc., but want of cleanliness, the wetting of bedclothes and bedding from perspiration and excretions, rucked or untidy sheets are the chief exciting causes. A patient should, therefore, be kept scrupulously clean, and washed with soap and water daily, all damp clothing at once changed, the sheets kept smooth, and the parts liable rubbed briskly; the skin on these parts should also be rubbed with methy-lated spirits, and dusted with boracic acid or prepared starch powder. A water-bed or an air-cushion for the exposed parts is a good protection and of the utmost use if a bed sore has formed. Should a slough form, continued fomentations will bring it away, when the sore can be dressed with boracic ointment, or if persistent in not healing, friar's balsam, red lotion, or zinc ointment may be applied; an ointment containing gentian violet is now often used for B. and other skin troubles.

Bedstead, though applied originally to the place in which a bed was located, is a term now employed to indicate the framework of the bed. See BED.

HEDGE BEDSTRAW

Bedstraw, name of the genus of Rubiaceae known as *Galium*, related to wood-ruff and madder. *G. aparine* is often called goose-grass or cleavers; *G. verum* (yellow or lady's bedstraw), *G. mollugo* (great hedge bedstraw), and *G. cruciatum* (crosswort) are common in Britain.

Bedwellty, par. of W. Monmouthshire, Wales. It is situated 7 m. W. of Pontypool, and has coal-mines and iron foundries. Pop. 28,560.

Bedworth, tn of Warwickshire, England, 5 m. from Coventry, on the Nuneaton-Coventry branch of the railway. The Coventry Canal serves it for the carriage of its coal and ironstone mined there, and there are brickfields, a colliery,

and light industrial concerns. Pop. 25,000.

Bedzin (Ger. *Bendzin*; *Bendsburg*), tn of Poland, in Stalinogród prov., 7 m. N.E. of Stalinogród (q.v.). It is in an important coal-field, and has metallurgical and chemical industries. Pop. 29,000.

Bee. The B.s form a group of six-legged, four-winged insects of the order Hymenoptera. There are about two hundred and fifty varieties of B.s in Britain, most of them 'solitary' insects. Honey B.s, *Apis mellifica* (as distinct from the bumble (*bombus*) B.), are of great antiquity, and many mythological and biblical references to them exist. The honey B.s, which are 'social' insects, weigh about 4000 to the pound (lb.). They have a head with compound eyes, antennae, a mouth with mandibles for chewing, and a tongue adapted for sucking nectar. The head is joined to the thorax by a short neck. The abdomen is attached to the thorax by a narrow waist (see Plate, E, F, G (twice normal sizes)). The antennae, or feelers, are the sensory organs, being concerned with smell and touch. B.s have an ovipositor, which is used as such by the queen, but is adapted as a sting in the workers: drones do not sting.

A 'colony' consists of 40,000-50,000 B.s; of this total there is one queen (female) and about 300 drones (males), and the remainder are workers (undeveloped females). The colonies usually live in wooden hives provided by the beekeeper, but are sometimes found in hollow trees, wall cavities, belfries, and similar places.

A queen B. lives for sev. years, reaching her prime, usually, in the second or third egg-laying season. She reaches a peak output of more than 2000 eggs per day in the season mid Jan. to mid June; after this there is a steady fall, until laying eventually ceases in mid Sept.

Eggs which are laid before 'mating' are fertile, but are not impregnated with male sperms; after mating, the impregnated eggs, from which workers are hatched, are laid in worker cells, and the unimpregnated eggs, which eventually hatch into drones, are placed in slightly larger cells. The cells are hexagonal in shape and are built horizontally at each side of vertical midribs of wax, which hang parallel to one another (see Plate, C, D). The impregnated eggs will produce queens only when they are placed in acorn-shaped cells, hanging from a comb, and when the larvae are fed with a special richer food called by beekeepers 'royal jelly.'

The eggs hatch in three days. The larvae are fed for five days; then, after five sheddings of skin, they begin to spin cocoons. The cells are then sealed with porous cappings. Inside, the larvae develop into pupae: each pupa then becomes an imago; and finally the complete insect emerges, after biting away the capping. The whole process, from the actual laying of the egg, takes 15 days in the case of a queen; for a worker 21 days, and for a drone 24 days. It is usual for sev. queen cells to be built at the same time. The first queen to emerge inserts her

sting (which is only used against other queens) into the other queen cells, thus killing the occupants. When the young (virgin) queen meets the old queen, she will fight and kill her; but there have been rare cases of two queens in one hive. The young growing B.s perform numerous duties: they clean their cells, feed the larvae, and fly on about the seventh day. They receive, and store in the cells, the nectar, pollen, and propolis brought to the hive by the foragers; and on about the twentieth day they become foragers themselves. In this way the worker B.s are gathering nectar and pollen six weeks after the laying of the egg. The drones develop but do no foraging; they feed, help to regulate the temp. of the hive, and may 'mate' with the queen. In the autumn, when they are no longer needed, the drones are killed by the workers; only the workers and the queen 'winter.'

When about six days old the queen leaves the hive on the mating flight. Her 'scent' is picked up by the drones, and one drone mates with the queen in flight, usually a few yards from the hive. In the mating act the drone's genital organs are torn out by the queen, who then returns to the hive, where she is cleaned by attendant worker bees. Normally she does not emerge from the hive again except with the 'swarm,' although some observers think that there may be further matings. The ruptured drone dies. The mated queen, her spermatheca filled with drone semen, which develops the spermatozoa with which the worker eggs are impregnated, is influenced in her egg output by an urge from within the colony. Instrumental insemination of queen B.s is now successfully practised.

The worker B.s suck the nectar from the flowers of plants and trees, and store this in their sacs. When they return to the hive they pass the nectar, by regurgitation, to other workers, who store it in cells. Pollen and propolis (to seal unwanted openings in the hive) are carried in *corbiculac* (pollen baskets), which are found on the third pair of the B.'s three pairs of legs. Nurse B.s eat pollen and honey; this enables them to produce, from glands in the neck, a creamy larval food, and with this they feed the larvae. Honey is consumed by the wax-makers. High temps. are achieved by the B.s hanging in clusters; and wax scales, which extrude from eight pockets under the abdomen, are manipulated in the mandibles (see Plate, A), and used by the comb builders to make cells. B.s in their natural state increase by swarming (see BEEKEEPING). Von Frisch's theory, that B.s dance on combs to indicate the direction and source of nectar, is now well estab.

Worker B.s, when frightened, use the sting at the end of the abdomen in self-defence. B. venom is momentarily painful and is followed by irritation and swelling: it is seldom serious, though the shock caused by stinging may be very dangerous. Contrary to general belief, B.s need not die after stinging, although they generally do so. This is because the sting barbs hold

A

B

E

G

THE HONEY-BEE

A, mouth parts; B, the sting; C, waxen cells in section; and D, in elevation; E, female (queen); F, male (drone); G, unfertile female (worker).

fast when the B. tears itself away or is flicked off. If given time, the B. will turn round to roll up the barbs, withdraw the sting, and fly away.

The life of a worker B. in the foraging season is seldom more than six weeks, but B.s born in Sept. 'winter' ready to begin the build-up of the colony in spring. Queen B.s, if not naturally superseded, are usually replaced by the beekeeper in the third year of life.

Diseases can be controlled by good management. *Foul brood* is the disease

which is most feared by apiarists. The larvae become discoloured, and can be drawn out from sunken-capped cells as a putrefied substance by inserting and twisting a matchstick. Foul brood is a notifiable disease, and if a colony is infected B.s, combs, and frames are burnt, and the hive woodwork is scorched, to destroy spores of the disease. Normal larvae are pearly-white. Recent experiments with drug treatments, particularly with sulphonamides, suggest that it may soon be possible to avoid the destruction

of the B.s. Other variants of this disease include *chilled* and *sac brood*. *Acarine* (Isle of Wight) is a disease which almost destroyed B. life in Britain some years ago. B.s breathe through spiracles into tracheae and a mite (*Acarapis woodi*) sometimes enters the tracheae and breeds there, thus destroying the B. The cure for acarine is 'frowing' with nitro-benzene fumes. A preventive—methyl salicylate fumes—can be introduced into hives on saturated pads. Paralysis and dysentery sometimes attack B.s. *Braula coeca*, the B. louse, is a pest about the size of a pin-head which fastens itself to the thorax of the B. and sucks up the body juices. Wax moths in hives are also seriously destructive.

In order to obtain the maximum honey production, strain of B. is all important. The Brit. black (dark brown) B. is now rare. Most B.s in Britain are hybrids from Carniolan, Caucasian, Dutch, Fr., and It. B.s. Among the 'solitary' B.s are: *Bombus* (see HUMBLE BEE), which nests among stones or in the ground; *Prosopis*, a small, black, hairless B. that gorges itself with nectar and pollen and regurgitates it into its cells in stems or wall cavities; *Andrena*, most of whose 60 species are partial to dandelion flowers and burrow in sandy soil; *Osmia*, which is like the hive B. and often called the 'mason B.' These B.s fasten together tiny pebbles and other materials with saliva in order to form nests; *Anthophora*, a long-tongued B. like a small bumble B. which nests in walls and ground banks; *Megachile*, a leaf-cutting B., which nips pieces from rose leaves and petals to line its nests; *Anthidium*, the carder B., which shaves the fine hairs from down-covered stems and leaves to line its burrow; *Xylocopa*, the carpenter B., a large B. which bores into wood, sometimes tunnelling 12 in., and then dividing the tunnel into cells in which to lay eggs and store honey and pollen. Among foreign B.s are *Apis dorsata*, which has combs 5 ft in length; the Asian *A. indica*; *A. florea* in the W. Indies; and the *A. adansonii* of W. Africa. See also BEEKEEPING and HUMBLE BEE. See W. E. Kelsey, *The Spell of the Honey Bee*, 1945; G. A. Carter, *Bees and Honey*, 1945; A. D. Imms, *Insect Natural History*, 1947; J. G. Digges, *The Practical Bee Guide*, 1949; H. G. Mace, *Bees, Flowers, and Fruit*, 1949; C. R. Ribbands, *The Behaviour and Social Life of Honeybees*, 1953; C. G. Butler, *The World of the Honeybee*, 1954.

Bee-eater, typical genus *Merops* of the family Meropidae, which has an extensive range over Africa, India, and Australasia. They are slender birds, with long bill and pointed wings, with a flight like a swallow, which in shape they resemble. They are brightly coloured, green predominating. They feed on bees, wasps, and other insects. The European B. is *Merops apiaster*, which migrates from Africa, where it breeds, to S. and central Europe; it nests in colonies in holes dug out by its long bill in sandy riv. banks. It is rarely seen in Great Britain.

Beebe, Charles William (1877-), Amer. ornithologist, b. Brooklyn, New York. Educ. Columbia Univ. Appointed, 1899, curator of ornithology, New York Zoological Society. Organised the collection of birds, New York Zoological Park. Has headed many expeditions in both hemispheres. Among his numerous pubs. are *Two Bird-lovers in Mexico*, 1905, *The Bird: its Form and Function*, 1907, *Tropical Wild Life in British Guiana*, 1917, etc., *Monograph of the Pheasants*, 1918-22, *Galapagos, World's End*, 1924, *The Arcturus Adventure*, 1926, *Beneath Tropic Seas*, 1928, and *Half Mile Down*, 1935.

Beech, *Fagus sylvatica*, is widely distributed throughout Europe and is native to Britain. It is also found in Asia Minor and Japan. It is a very tall tree, often attaining a height of 100 ft or more and frequently has a trunk clear of branches for 50 ft to 60 ft, when grown under forest conditions. The timber is usually straight grained and shows little or no difference between the heartwood and the sapwood. It is characterised by small spindle-shaped markings on plain-sawn boards which are caused by the rather prominent rays. It weighs about 46 lb. per cu. ft. when seasoned. B. is one of the strongest of Brit. timbers, being 20 per cent stronger than oak in most strength properties. It is not resistant to decay, but is one of the easiest timbers to impregnate with preservatives. It is one of the best timbers for turnery and for this reason is used widely for chair legs, cheap tool handles, kitchen utensils, brush backs, and other small household articles. It is also the commonest wood for ladies' shoe heels. The timber bonds readily on steaming which makes it valuable for such purposes as bentwood furniture. The prin. uses for beech are furniture, flooring, turned articles, motor-body framing, textile bobbins, toys, and cabinet making. Although the trees may grow to a height of 100 ft they are often grown in a stunted form, and clipped to make hedges. The flowers appear only

every few years, the male flowers forming pendulous catkins, while the females grow in pairs with a mass of scales, which later develop into a cupule enclosing 2 nuts. The copper and purple B. are well-known varieties of *F. sylvatica*. See FORESTRY-TIMBER; TREE.

Beecham, Sir Thomas, 2nd Baronet (1879-), Eng. musical conductor, son of Sir Joseph B., 1st Baronet, and grandson of Thomas Beecham, who founded Beecham's Pill business, St. Helen's, Lancs. B. was educ. at Rossall School, Fleetwood, where he was taught harmony by Edward Thomas Sweeting; and at Oxford (Wadham College), where he had lessons from J. V. Roberts. He conducted an amateur orchestra, collected by himself, at Huxton, 1899; and in 1905 he became known as a conductor in London, where he founded the New Symphony Orchestra, the B. Symphony Orchestra, 1908, and the London Philharmonic Orchestra, 1932. In 1910 he became lessee of Covent Garden theatre, and entered upon production of opera. It was he who first produced Russian ballet in England, 1911, and who introduced many important works and fine artists to the Brit. public. He was knighted in 1915 and succeeded to the baronetcy the following year. He continued to give opera throughout the First World War, at heavy loss to himself. He made great efforts to establish opera permanently in England, and it was from his company that the Brit. National Opera Co. was formed in 1922. He continued to conduct with brilliant success, not only in Britain, but as a star guest in many European countries and America. He pub. *A Mingled Chime* in 1944. See COVENT GARDEN THEATRE.

Beechdrops, or Cancer-root (*Epiphegus virginiana*), parasitic herb of the order Orobanchaceae; found in the roots of beech-trees in N. America.

Beecher, Charles (1815-1900), Amer. Congregational minister, the fourth son of Lyman B., and brother of Harriet Beecher Stowe. He officiated as pastor of the Second Presbyterian Church, Fort Wayne, Indiana, 1844-51; First Congregational Church, Newark, New Jersey, 1851-4; First Congregational Church, Georgetown, Massachusetts, 1857-81. He d. at Haverhill, Massachusetts. He ed. his father's letters and autobiography (2 vols.), 1864-5. Author of *Pen Pictures of the Bible*, 1855; *Spiritual Manifestations*, 1879; *The Eden Tableau*, 1880.

Beecher, Henry Ward (1813-87), Amer. Congregational minister, son of Lyman B. and brother of Harriet Beecher Stowe, b. in Connecticut, 24 June. He graduated in 1834 at Amherst College, Massachusetts, and later read theology under his father at the Lane Theological Seminary, Cincinnati. In 1847 he became pastor of Plymouth Congregational Church, Brooklyn, New York. He was one of the founders of the *Independent*, which he ed. in 1861-3. He favoured the Republican candidates in the presidential contests of 1856 and 1860, and, on the outbreak of civil war, his church raised a volunteer

corps for active service. From 1870 to 1881 he ed. the *Christian Union*. The chief of his pub. writings are *Star Papers*, 1855, *New Star Papers*, 1858, *Lectures to Young Men*, 1844 (revised ed. 1850), *Aids to Prayer*, 1864, *Norwood, or Village Life in New England*, 1867, *Yale Lectures on Preaching* (3 vols.), 1872-4, *The Life of Jesus the Christ* (2 vols.), 1871 and 1891, and *Evolution and Religion*, 1885. See his life by Joseph Howard jun., 1887; and a biography by W. C. Beecher, Rev. S. Scoville, and Mrs Beecher, 1888; also his *Autobiographical Reminiscences*, ed. by Ellinwood, 1898.

Beecher, Lyman (1775-1863), Amer. Presbyterian minister, father of Harriet Beecher Stowe. He was among the foremost preachers of his time. In 1832 he was appointed president of Lane Theological Seminary, near Cincinnati, a position which he held till 1850. He was arraigned for heresy, but was acquitted and became the recognised leader of the new school of the Presbyterian Church. His autobiography and letters were ed. by his son, Charles B. (1864-5).

Beecher Stowe, Harriet, see STOWE.

Beechey, Frederick William (1796-1856), Eng. admiral and geographer, was the son of Sir Wm B., the painter. He was with Franklin in the N. Polar expedition of 1818, and with Parry in 1819, and co-operated with them in 1825. Beechey Is., in Barrow Strait, is named after him. He was on the Mediterranean N. African survey, 1821; S. Amer. survey, 1835; and Irish coast survey, 1837-47; and was president of the Marine Dept at the Board of Trade, 1850. Promoted rear-admiral, 1854. President of the Royal Geographical Society. Wrote *Narrative of a voyage to the Pacific and Beechey's Strait . . . 1825-28, 1831, and A voyage of discovery towards the North Pole. . . 1818, 1843*.

Beechey, Sir William (1753-1839), portrait-painter, b. Burford. He attended the Royal Academy as a pupil in 1772. In 1793 he became an associate of the Academy, and in that year also he was chosen to be portrait-painter to Queen Charlotte. He was rewarded with a knighthood and the title of R.A. in 1798 for his picture of a review of cavalry, in which he portrayed George III, the Prince of Wales, and the Duke of York.

Beechey Island, in the Canadian Arctic Archipelago, lying off Devon Is. in Barrow Strait, lat. 74° N., long. 92° W. On it have been erected various memorials to Arctic explorers, including one to Franklin, who wintered on the is. in 1845, and one to Lt. Bellot, who d. with a Brit. expedition in 1853. Mean temp. about 3.5° F.

Beeching, Henry Charles (1859-1919), author and divine. He became canon of Westminster Abbey, 1902-11, and dean of Norwich, 1911. He was select preacher at Oxford Univ., 1896-7, and 1912-13, and at Cambridge, 1903, 1909, 1912; prof. of pastoral theology, King's College, London, 1900-3, and chaplain of Lincoln's Inn, 1900-3. His numerous pubs. include *Love in Idleness*, 1883, and

Love's Looking-Glass, 1891 (in collaboration with 2 others), *In a Garden, and other Poems*, 1895, *Religio Laici*, 1902, *The Grace of Episcopacy*, 1906, *Francis Atterbury*, 1909, and *Revision of the Prayer Book*, 1910.

Beeching, James (1788-1885), inventor, b. Bexhill, near Hastings, England. He went to Flushing, where he built the famous *Big Jane*, a smuggling craft. He won £1000 as a prize for his invention of a self-righting lifeboat.

● **Beechworth**, tn and mt holiday resort in Bogong co., Victoria, Australia. It is the centre of the Ovens gold area. Pop. 2600.

Beeding, Francis, see SAUNDERS, HILARY AIDAN ST GEORGE.

Beef, term applied to the flesh of an ox, bull, or cow when killed. Prepared in different ways, it serves as food in many countries. See COOKERY.

Beef-tea, extract of beef, used as a valuable stimulant and restorative in cases of illness. It consists of the blood and juices of the meat, but little of the albumen and gelatinous constituents, such as are contained in various commercial meat extracts.

Beef-wood, very hard and durable wood that makes excellent timber. It is so called because it resembles raw beef in colour. The name is applied to trees of 2 different genera—the *Swartzia*, belonging to the family Leguminosae, in Guiana, and the *Casuarina*, in Australia.

Beekeeper, see YROMAN OF THE GUARD.

Bee steak Clubs, certain London clubs, formed for social purposes, where the refreshment was limited to steaks, with beer or wine. The earliest of these was founded in 1709, and included the wits and chief men of the day, with Richard Estcourt, the actor, as provost. The 'Sublime Society of Steaks,' founded in 1735 by John Rich, the manager of the Covent Garden Theatre, and Lord Peterborough, is the most famous of these clubs. It numbered among its members Garrick, Hogarth, Wilkes, John Kemble, and in 1785 the Prince of Wales joined the club. When the Covent Garden was burnt down in 1808, the club moved to the old Lyceum; afterwards it had rooms in the Bedford Coffee House, and finally in 1838 the 'Steaks' moved to the new Lyceum and there dissolved in 1867. *Consult Arnold's Life and Death of the Sublime Society of Steaks*, 1871. A B. Club was founded in 1749 by Thomas Sheridan (the actor and father of Richard Brinsley Sheridan), in connection with the Theatre Royal, Dublin, and Peg Woffington was elected president. The present B. Club in London was founded c. 1875 by A. J. Stuart-Wortley with rooms in Toole's Theatre. Its premises are now at 9 Irving Street, London.

Bee steak Fungus, see FISTULINA.

Beehive Houses, primitive buildings made of unheven stones and without mortar, specimens of which are to be found in Ireland and W. Scotland. They consist of long stones laid down in a circle, each course being overlapped by the one resting immediately above it, so that with the

circular roof they resemble a bee-hive in shape. From the 7th to the 12th cent. churches, priests' houses, and other buildings were formed after this fashion.

Beekeeping is the keeping of honey bees (*Apis mellifica*) for honey and for the pollination of fruit, cereals, and flowers. Bees were formerly kept in straw skeps, but these have been superseded by 'National' (single-wall) and 'W.B.C.' (double-wall) wood hives; and there are now also observation hives of glass and transparent plastic materials, e.g. perspex. Vertical frames hanging side by side in the brood box hold the wax foundation, stamped with cell bases; the bees draw out horizontal, hexagonal cells from each side. Hives must be dry inside.

The bees draw out the combs, fill the cells with nectar, convert it to honey, and seal each with wax capping. Worker bees forage for nectar from blossoms from May to July and from heather on the moors from Aug. to Sept. Bees are kept in groups of hives in gardens (apiaries), or in fields, orchards, or on moors (out-apiaries). Colony yields of over 300 lb. of honey in a season have been recorded, but the average ann. yield is 60 to 80 lb. The amount of nectar collected in a wet, cold summer is negligible, and in such years the bees must be fed with sugar syrup or they will die. Surplus honey is removed, about 30 lb. being left for the bees' winter and spring food. The combs of honey in the cells are uncapped with a heated knife, and whirled round in an 'extractor'; centrifugal force throws the honey on the side of the cylinder. It runs to the bottom, where it is drawn off through a tap, and bottled through a strainer. The combs are then replaced in the hives for the bees to refill. The more viscous heather honey is extracted by squeezing the combs, and pressed wax is later processed into a fresh foundation. 'Sections' and 'chunk' honey (a divided comb, bottled and filled up with liquid honey) are eaten as produced.

Beekeepers subdue bees with smoke puffs, carbolic cloth, or chloroform. Head-nets and gloves are sometimes worn. Efforts are made to control swarming, as this reduces the honey yield. The normal stock in the hive numbers 40,000 to 50,000 bees. The swarm, of about 20,000 bees, with the queen, leaves the hive and clusters on a tree, bush, or similar place; unless the beekeeper can secure it by shaking it into a container and putting it in a hive the bees will depart to live in a colony as wild bees. See also BEE.

See E. B. Wedmore, *A Manual of Beekeeping* (revised 1945); W. Hamilton, *The Art of Beekeeping*, 1945; H. J. Wadely, *The Bee Craftsman*, 1945; A. L. Gregg, *The Philosophy and Practice of Beekeeping*, 1949; H.M.S.O., *Beekeeping*, 1951.

Beelzebub (god of flies, from Heb. *baal*, lord; *zebub*, fly), Philistine god, whose temple was at Ekron. It is also thought that the word developed from Baal-Zebul, i.e. lord of the high house. B. or Baalzebub appears in the N.T. as the prince of demons.

Beemster, polder in the prov. of N. Holland, Netherlands, reclaimed in the 17th cent. from the Zuider Zee. It is situated 13 m. N. of Amsterdam, and has a pop. of 6200.

Beer, Thomas (1889-1940), Amer. novelist and critic. b. Council Bluffs, Iowa. His forbears were lawyers for 5 generations back, and he himself practised for 4 years after studying at Yale and Columbia. In the First World War he served as a lieutenant in the Field Artillery, and after it turned to writing novels, among which are *The Fair Rewards*, 1922, *Sandoval*, 1924, and *The Road to Heaven*, 1928. *Mrs Egg and Other Barbarians*, 1933, is a collection of short stories. His critical works include a study of *Stephen Crane*, 1923, and *The Mauve Decade*, 1926, which was a name he coined for the 1890's. Although he wrote comparatively little, his reputation stands high.

Beer, see **BARLEY** and **BREWING**.

Beer Acts. The sale of beer in England is under magisterial control, though in the early part of the 19th cent. licences could be obtained without application to magistrates. In 1869 the Wine and Beerhouse Act was passed, regulating the sale of beer. By this Act a licence was estimated at a third of the ann. value of the beerhouse premises, and a minimum value was fixed, based on the pop. of the neighbourhood. For the first hundred barrels the brewers paid a tax of £1, and on every additional fifty 12s. Since those days beer has been subject to almost continuous taxation. The granting of licences, however, remains with the magistracy sitting in what are called Brewster Sessions. See **LICENCES** and **LICENSING LAWS** for later legislation.

Beer-money was an allowance of one penny a day to soldiers of the Brit. Army in lieu of a supply of beer, instituted in 1800 and abolished 73 years later. It was also given to servants by householders instead of providing them with beer.

Beerbohm, Sir Max (1872-1956), writer and caricaturist, b. London, youngest son of Julius E. Beerbohm and Eliza Draper, and half-brother of Sir Herbert Beerbohm Tree. He was educ. at the Charterhouse and at Morton College, Oxford, and first became known as a writer through the *Yellow Book* quarterly, 1894-7. He was dramatic critic to the *Saturday Review* for 12 years from the retirement of Bernard Shaw in 1898. His book, *Around Theatres* (1924), contains articles contributed to that journal over a period of 12 years. His first pub. vol. of drawings, *Caricatures of Twenty-five Gentlemen*, appeared in 1896, the same year in which he issued a vol. of essays entitled *The Works of Max Beerbohm*. His later caricatures are in the vols. *The Poets' Corner* (in colour), 1904, *A Book of Caricatures*, 1907, *The Second Childhood of John Bull* (in colour), 1911, *Fifty Caricatures*, 1913, *A Survey*, 1921, *Rossetti and his Circle* (in colour), 1922, *Things New and Old*, 1923, and *Observations*, 1925. His other books are *The Happy Hypocrite*, 1897, *More*, 1899, *Zuleika Dobson*

(his one novel), 1911, *A Christmas Garland* (prose and verse parodies), 1912, *Seven Men*, 1919, *And Even Now*, 1920, *Yet Again*, 1923, and *The Dreadful Dragon of Hay Hill*, 1928. From 1910 until Italy entered the Second World War in 1940, he lived at Rapallo, from which retreat he surveyed the world with humour and detachment. He was knighted in 1939. From time to time successful exhibitions of his original drawings have been held in London. After his return to England during the war he gave 2 memorabl. broadcasts, and in 1943 he delivered the Rode Lecture, choosing Lytton Strachey's works as his subject. He returned to Rapallo in 1947. Both as a writer and as an artist he had a fastidious and carefully finished style, aiming at nothing short of perfection. Wit, elegance, humour, power of satire, and yet a human sympathy are his characteristics. See Bohun Lytch, *Max Beerbohm in Perspective*, 1921; and life by Lord David Cecil.

Beeroth, O.T. name for the modern Bira, a vil. in Palestine, 9 m. N. of Jerusalem.

Beers, Ethel Lynn (1827-79), Amer. poetess, b. Goshen, New York. Ethelinda Eliot was her maiden name and in 1846 she married W. H. Beers. Her poem on an unknown soldier, 'The Picket Guard,' with its famous first line, 'All quiet along the Potomac,' appeared in *Harper's Magazine* in 1861. In 1876 her *Collected Poems* were pub.

Beersheba (well of the oath, or possibly 7 wells), tn in the extreme S. of Palestine, 50 m. from Jerusalem. The expression 'from Dan to B.' shows its southerly position. The covenant of Abraham and Abimelech, King of the Philistines, was made there. Its Arabian name is Bir-es-Seba, meaning well of the lions. According to Eusebius, it was in his time a prosperous mkt tn and possessed a Rom. garrison. In early Christian times bishops of B. are occasionally mentioned, but by the 14th cent. the tn had lost all importance. The wells played a prominent part in the hist. of the patriarchs: B. being the scene of Hagar's trial and Ishmael's miraculous preservation; of Abraham's covenant with Abimelech, and of Jacob's setting forth on his journey to Haran (Gen. xxi, xxvi, xxviii). Two of the wells still hold water and 5 others have been discovered. It is now a small tn of about 6500 inhab. There is a Brit. military cemetery. During the First World War B. was captured from the Turks on 31 Oct. 1917 by Gen. Allenby's troops, and it was from B. that the advance was made which resulted in the capture of Gaza.

Beestings, see **COLOSTRUM**.

Beeston, urban dist. (constituted in 1935), with Stapleford, of Notts, England, 3 m. SW. of Nottingham. B. is mentioned in Domesday Book, and in the Middle Ages was an agric. community. Industries to-day include telephone works, manufacturing chemists, lace and hosiery manuf., pencils, upholstery, railway and boiler works, light engineering, foundries and iron works. The area comprises B.,

Stapleford, Chilwell, Bramoote, and Toton. Pop. (of B.) 22,551; of urban dist. 49,849.

Beeswax, substance produced by bees and used by them in the construction of the honeycomb. The wax is secreted by special glands in the abdomen of the bee, is pressed out between the segments of the body, and moulded into roughly circular cells for the reception of the eggs and honey. It may be collected by draining off the honey and heating the residue in water, when it rises to the surface and solidifies on cooling. B. is used for making candles, for modelling or casting ornaments or effigies, for polishing floors and furniture, and in medicine as a basis for ointments and plasters, on account of its non-irritant quality. It is sometimes taken internally, when it acts as a protective to the gastric and intestinal surfaces.

Beeswing, very light sediment, mainly mucilaginous, which floats in vintage port, not settling as a crust on the bottle. Its presence in the decanter is welcomed as a sign of age.

Beet, name applied to sev. species of *Beta* of the family Chenopodiaceae. The roots of many species are valued as a food, and *Beta vulgaris*, the common B., is used in the manuf. of sugar. *B. maritima*, sea or wild B., is eaten as a vegetable as well as *B. rubra*, the red beetroot. *B. cicla*, white beetroot, is cultivated for its leaves, which are eaten like spinach. From *B. vulgaris* is derived the sugar B., and also the mangel-wurzel. The production of B. sugar on a large scale has been promoted for some years in the U.S.A., and in Germany and other European countries, while efforts have been made to stimulate its production in Great Britain, at some expense, it is true, to cane sugar production in the Brit. W. Indies. A gov. subsidy was granted after the First World War and has been reviewed recently. At present growers are protected against violent fluctuations in price by the operation of a guaranteed minimum price scheme which is revised annually. Half the world's supply of sugar is now derived from the beetroot. The estimated average ann. world production (all countries) of sugar B., 1953-4, was 100,000,000 tons.

Beet-fly (*Anthomyia betae*), insect, so called because the maggots feed on beet leaves. As soon as the maggots are hatched they begin to feed on the leaf round them and continue feeding for one month, when they turn to chestnut-brown pupae. The flies come out a fortnight later and are grey in colour with black hairs.

Beethoven, Ludwig van (1770-1827), Ger. musical composer, was of Flem. descent. His grandfather, Louis, left Antwerp in 1732 and settled in Bonn, where he became one of the archbishop-electors' musicians. His son (father of Ludwig) was a tenor singer at the court, but through drink and thriftlessness was always poor. The grandfather d. when Ludwig was only 4 years old, but the latter, to whom he had been kind, always cherished his memory. Ludwig's father

taught him to play the violin and clavier; he displayed such precocity that at 9 he had to be placed under more accomplished teaching. At 12 years of age he occasionally acted as deputy for the court organist, and at 13 pub. his first composition. In 1784 he was appointed assistant organist to the court, and played the viola in the orchestra at the opera. Three years later, during a short visit to Vienna, he played before Mozart, who was amazed at his talent in improvisation. For the next few years his life at Bonn was a trying round of hard work and responsibility; his mother d., and his father's habits became so disorderly that his salary had to be paid to Ludwig, who

BUST OF BEETHOVEN BY C. SEFFNER IN THE GEWANDHAUS, LEIPZIG

thus, at about 19, became head of the family. In 1792 the archbishop-elect (brother of the Emperor Joseph II) sent him to Vienna to study under Haydn (q.v.), whom he had already met twice at Bonn. But Haydn was little interested in teaching, while B. was impatient of it, so that little came of the connection. But B. worked his way by genius and by further study under Albrechtsberger (counterpoint), Aloys Förster (quartet writing), and Salieri (vocal setting), and in a few years was a 'personage' in the musical world of Vienna, in spite of an ungovernable temper and rude manners. For example, at the house of Count Browne, he was playing a duet when a young nobleman in the room persisted in talking to a lady. B. stopped suddenly, saying loudly: 'I play no longer for such hogs.' Of a suspicious nature, he was insulting to those he suspected, even people of high rank. Haydn nicknamed him 'The Great Mogul.' Yet the aristocracy bore with it all for the sake of his genius. Princesses and countesses would forgive any rudeness, would receive his lessons whenever he pleased, and put up with his storming and tearing up their

music if they were careless. He had no tact or discretion in matters of ordinary life. He was peculiar in appearance: 5 ft 5 in. in height, broad-shouldered, large-headed, and ruddy in complexion. As a teacher he was impatient but painstaking; in piano playing he was quiet, but extravagant in conducting. He was so absent-minded that he once insisted on paying a waiter for a dinner he had not had or even ordered. It must be said in excuse for his peculiarities that his early troubles had affected his health and spirits. When he *d.* a post-mortem examination proved that he had suffered since childhood from an incurable disease aggravated by want of home comfort and good food, and later by unskilful medical treatment. His liver had shrunk to half its proper size, and there were serious ailments of old standing in the ears and pharynx. His family, too, tried him greatly; his father's character has already been mentioned, and his brothers, Johann and Caspar, the latter in particular, caused him endless trouble, and when the latter *d.* his son turned out an even worse trouble to his uncle and guardian, whose self-denying endeavours on his behalf were unfortunately made very trying to the thoughtless boy, by moral preaching alternating with an oppressive affection. In a pathetic document written by B. as far back as 1802 he complains of the harsh judgments passed upon him by those who knew nothing of the years of suffering he had endured, and tells of the dread which he felt of his growing deafness, which would incapacitate him for the enjoyment both of society and of his beloved art. This deafness in time became so complete that although he still played and conducted he heard nothing of the music. His finest works were composed after he had lost the power of enjoying them. His life ended sadly. In the winter of 1826-7 he was staying at the house of his brother Johann, and was taken ill. His brother would neither let him have a fire in his room nor give him the food he required, and at length sent him back to Vienna, during bad weather, in an open chaise; he took a severe chill, which brought on dropsy, and he *d.* on 26 Mar. As a musician B. stands alone. In his earlier work the influence of previous masters, especially Haydn, may be traced, but gradually he built up a style of his own, more and more noble as years went on. His total production is broadly divisible into three periods. In the first although influenced by his predecessors he already began to show such individuality that, for example, Haydn advised him not to publish his Trio in C minor (Op. 1, No. 3), probably as being too daring for public taste. To this first period belong his Sonata for pianoforte in E flat (Op. 7); Trio for pianoforte and strings in B flat (Op. 11); *Sonate Pathétique*; First Concerto for pianoforte and orchestra in C (Op. 15); the song *Adelaide* (1797); also the famous Septet (Op. 20) and the first Symphony (Op. 21) (the last 2 works pub. in 1800). His second period, which included his *Sinfonia*

Eroica, *Fidelio* (including the *Leonora* overtures), the overtures to *Prometheus*, *Coriolanus*, and *King Stephen*, the *Egmont* music, and the *Appassionata*, with other sonatas, merged imperceptibly into that of his latter years (about 1816 onwards), which in originality of conception and construction transcended anything previously achieved. To this period belong the enormous pianoforte Sonata in B flat (Op. 106), the 9th (choral) Symphony, the *Missa Solemnis*, the marvellous Quartets for strings (Opp. 127, 130, 132, 135), the 33 Variations on a waltz by Diabelli (Op. 120), and the Mass in D. The influence of B. on the form and growth of musical art has been immeasurable. The B. literature is enormous, especially in German and English. It includes A. W. Thayer, *The Life of Ludwig van Beethoven* (3 vols.), New York and London, 1921; A. Leitzman, *Ludwig van Beethoven* (companions, letters, and personal characteristics) (2 vols.), Leipzig, 1921; W. Nohl, *Ludwig van Beethoven als Mensch und Musiker in täglichen Leben*, Stuttgart, 1922; M. Grusemann, *Beethoven*, Munich, 1923; A. Albertini, *Beethoven*, 1924; P. Bekker, *Beethoven*, 1925; L. Schiedermaier, *Der junge Beethoven*, Leipzig, 1925; W. J. Turner, *Beethoven*, 1927; E. Newman, *The Unconscious Beethoven*, 1927; A. Hécsey, *Beethoven the Man*, 1927; R. Specht, *Beethoven as he lived* (trans.), 1933; W. J. Turner, *Beethoven: the Search for Reality*, 1933; Marion M. Scott, *Beethoven* (Master Musicians series), 1931; E. Schrade, *Beethoven in France*, 1942; E. Ludwig, *Beethoven: Life of a Conqueror* (trans.), 1945. See also G. Grove, *Beethoven and his Nine Symphonies*, 1903; T. Helm, *Beethovens Streichquartette*, Leipzig, 1921; C. E. Lowe, *Beethoven's Pianoforte Sonatas* (hints on rendering and form), 1921; E. Evans, *Beethoven's Nine Symphonies* described and analysed (2 vols.), 1923; Eric Blom, *Beethoven's Pianoforte Sonatas discussed*, 1938; D. F. Tovey, *Beethoven* (musical exercises), 1944.

Beetle, common name for an order of insects, the scientific name of which is *Coloptera* (q.v.), possessing hard and horny fore-wings. The word B. is also loosely applied to cockroaches (q.v.) of the *Blattidae* family of orthopterous insects.

Beetle, Colorado, see COLORADO.

Beetling, process designed for the finishing of linen and cotton goods in which a beetling machine hammers down the cloth by means of wooden stamps which rise in succession and fall by their own weight. This flattens the surface of the cloth and gives it a hard appearance.

Beeton, Isabella Mary (1836-65), writer on cookery, b. London. Her maiden name was Mayson, and she was educ. at Heidelberg. In 1856 she married Samuel Orchard Beeton, a leading publisher. In 1861 appeared her *Book of Household Management*, a colossal manual of cookery

and household economy which had taken 4 years to prepare and which at once became an accepted classic. Mrs Beeton was still in her twenties when she *d.* of puerperal fever. See H. Montgomery Hyde, *Mr and Mrs Beeton*, 1951.

Beets, Nicolaas (1814-1903), Dutch poet and author, *b.* Haarlem. He was a parson, and prof. of theology at the univ. of Utrecht, 1875-84. He is remembered chiefly for his stories of Dutch life. His *Camera Obscura* (1st ed. 1839, under the pseudonym Hildebrand) has been trans. into many European languages. The continuation, *Na Vijftig Jaar*, appeared in 1887. He also wrote critical and theological essays, of which *Stichtelijke Uren* may be mentioned. His poetry was pub. in 4 vols. (1873-81). See J. J. Duproix, *N. Beets et la littérature hollandaise*, 1907, and G. Tazelaar, *De cultuur-waarde van Hildebrands Camera Obscura*, 1939.

B.E.F., see BRITISH EXPEDITIONARY FORCE.

Befana (corruption of Epiphany), name of a legendary old woman who, being busy sweeping her house when the 3 wise men of the E. passed on their way to offer gifts to the Infant Christ, excused herself from going to the window on the ground that she would see them on their return. The wise men returned another way, and B. was punished by being obliged to wait for them ever since. Her festival is held in Italy on 5 Jan., when her effigy is carried through the streets amid great rejoicing. On Twelfth Night It. children hang up a stocking before the fire, and B. brings presents to good children, but to bad children ashes. The tradition appears to be confused, for although she is the counterpart of Santa Claus, her name is used, like that of a bogey, to frighten naughty children.

Belfroi, Belfry, or Breaching Tower, movable tower used in medieval times during military sieges. It moved on wheels, was sev. storeys high, and was usually covered with raw hides to protect the besiegers in the lower storey from boiling oil and fire. An upper storey held a hinged drawbridge to be let down upon the city wall for the landing of the assailants. Such a tower is mentioned by Froissart. See also BELLRY.

Beg (Turkish; Ottoman Turkish *Bey*), title. It has 3 meanings: noble as opposed to commoner; ruler of a small tribe or state as opposed to *khan* (q.v.); a gov. official. In Turkey it was given to the higher officers in the army, the sons of pashas, and, popularly, to rich and influential persons. The ruler of Tunis was called *bey*.

Begarelli, Antonio (c. 1479-1565), It. modeller in terra-cotta, *b.* Modena. He was the friend of Correggio. There are few of the works of B. left; the prin. are the 'Descent from the Cross,' and a 'Pieta' at Modena, containing many figures in the round rather larger than life.

Begas, Karl (1794-1854), Ger. painter, *b.* Heinsberg; was court painter to the King of Prussia and prof. in the Academy of Arts, Berlin.

Begas, Reinhold (1831-1911), Ger. sculptor, son of Karl B., *b.* Berlin and studied there and in Rome. In 1866 he returned to Berlin, where he spent the rest of his life. He executed statues and architectural designs for public places, as well as numerous portrait busts. Among his best-known works are statues of Schiller, 1863; Humboldt, 1882; Bismarck, 1901; the sarcophagus of Frederick III in the mausoleum of the Friedenskirche at Potsdam; the statue of Borussia for the Hall of Glory and the national monument to the Emperor William, both in Berlin; and the Neptune bronze fountain in the Schlossplatz, Berlin.

Hulton Picture Library

BEFFROI OR BREACHING TOWER

Begg, Alexander (1840-97), Canadian writer, *b.* Quebec. He took part in the NW. rebellion against Riel. Author of *The History of the North-West*, 1894, *The History of British Columbia*, 1895, and, in collaboration with W. R. Nursey, *Ten Years in Winnipeg: a Narration of the Principal Events in the History of the City from 1870 to 1879 inclusive*, 1879.

Begg, James (1808-83), Free Church leader, *b.* New Monkland, Lanarkshire; educ. at Glasgow Univ. He was strongly opposed to anything savouring of liberalism in theology and church practice—particularly the projected union with the

United Presbyterian Church. See life by T. Smith (1885-8).

Beggar, word of uncertain origin, used in speaking of a person who asks alms, usually habitually, and who generally lives on the money and goods which he thus receives. See MENDICANCY; POOR LAWS; VAGRANTS.

Beggar-my-Neighbour, game of cards, played by 2 or more persons. The players, holding their cards with backs upward, play down a card alternately, until one player turns up a court card, when his neighbour must pay him 4 cards for an ace, 3 for a king, 2 for a queen, and 1 for a knave, and in addition he wins the cards already thrown on the table and places them all under those in his hand. At last one player obtains all the cards in the pack and wins the game.

Beggars, The, see GUEUX, LES.

Beghards, association of men formed during the early part of the 13th cent. in the Low Countries, corresponding to and probably in imitation of the female *Béguines* (q.v.). Many vagabonds and mendicants adopted the title who did not belong to the brotherhood. They were denounced by the Pope and councils, and suffered persecution from the Inquisition. Their communities had almost disappeared by the end of the 14th cent., but survived till the Fr. Revolution.

Begharmi, see BAGIRMI.

Bégin, Louis Nazaire, Cardinal (1840-1925), Canadian archbishop, b. Point Lévis, 10 Jan. He was educ. at the Little Seminary, Quebec, and at the Laval Univ., where he was awarded the Prince of Wales's gold medal in 1862, being the first to receive this prize. He was ordained in 1865 at Rome, where he remained to make a special study of eccles. hist. and oriental languages, 1866-7. He was prin. of the Laval Normal School, Quebec, 1885-8; Bishop of Chicoutimi, 1888-91; coadjutor to Cardinal Taschereau, with the title Archbishop of Cyrene, 1891-8; and Archbishop of Quebec from 1898. He was made cardinal in 1914. B. wrote *La Primauté et l'infaillibilité des souverains pontifes*, 1873; *Le Culte catholique*, 1873; *La Sainte Ecriture et la règle de foi*, 1874; *Aide-mémoire ou chronologie de l'histoire du Canada*, 1886; *Catéchisme de controverse*, 1902.

Beglerbeg, or **Beylerbey**, Turkish word which signifies bey of beys; applied in the Turkish Empire to the Governor-General of a prov. who had under him sev. beys and was second in rank to the grand vizier.

Bégles, Fr. tn in the dept of Hironde. It has paper manufs., and a trade in wine and market-garden produce. Pop. 22,300.

Begonia, genus of succulent herbs, native to moist tropical countries, about 350 species, family Begoniaceae; widely grown in gardens.

Begoniaceae, family of tropical dicotyledonous plants, comprising 4 genera, Haplophragma, Hillebrandia, Symbegonia, and Begonia, the chief. All begonia have fleshy leaves, often richly coloured with crimson, succulent stems, and pink

flowers growing in panicles; the leaves are root-leaves, and have one side larger than the other—hence the name of elephant's ear sometimes given to the plant.

Béguines, order of sisters belonging to the Rom. Catholic Church, traditionally founded by St Begga in 698, but, as now accepted, by a priest, Le Béguie, in the 12th cent. They were first known in Holland and Germany. They took no vows, and they lived in close proximity, in separate houses called *béguinages*. Their houses often received large donations, which were devoted to charitable purposes. A hospital adjoined each institution, and frequently a church also. The sisters lived in purity and poverty, giving their services in nursing, and tending the aged as well as educating the children. The sisterhood is still in existence in the Rom. Catholic Church. The most famous of the institutions is at Ghent, under the name of St Elizabeth's *Béguinage*.

Begum (origin uncertain; Persian and Urdu *begam*), Muslim queen or lady of high rank.

Behaim, Behem, or Boenheim, Martin (c. 1459-1506). Ger. cosmographer, b. Nuremberg. He studied under Regiomontanus (Johann Müller). In 1484 he accompanied the fleet of the Portuguese Diogo Cão on a journey of discovery along the Congo coast, W. Africa. He acquired fame for his methods of finding the lat. at sea, for his maps, and for the globe which he bequeathed to his native city, but it is now recognised that serious errors occurred in these and it is believed that his reputation has been greatly exaggerated. See E. G. Ravenstein, *Behaim: his Life and his Globe*, 1909.

Behar, see BIHAR.

Behaviourism, name given to the teaching in a primarily Amer. school of psychology which originated in the early years of the 20th cent. The name arose from the study of the behaviour of animals, but it was not till the results of these studies had been applied to human psychology that the teaching was so designated. The best-known exponent of B. is Dr J. B. Watson, and it was his 2 monographs, *Psychology as the Behaviourist Views it* and *Image and Affection in Behaviour*, both pub. in 1913, and his book, *Behaviourism: an Introduction to Comparative Psychology* (1914), that first crystallised the doctrines of B. It was Watson who first applied to man the characteristic principle of B. that all that could properly be studied was observable behaviour and that no concepts could be used that were not based on observations of behaviour or of structure. This principle excluded the study of experience and the use of concepts (such as imagery) that were derived from one's own experience and that could not be observed by an outside observer. It is obvious that, in the study of animal psychology, the experimenter is limited to the observation of behaviour. The implications of this limitation were recognised earlier by the Brit. psychologist C. Lloyd Morgan, whose *Animal*

Behaviour (1900) embodied a study of animal behaviour without the speculations about what passed through the animal's mind which had been a feature of much earlier animal psychology. This tradition was carried on by Thorndike in America and by Köhler in Germany in their work on the intelligence of chimpanzees and, in our own time, it is the characteristic method of the Ethologists led by Lorenz.

The essential contribution of Watson was the suggestion that human psychology should accept the same limitations. As an instrument for the study of human beings without asking for subjective reports, he suggested the use of the 'conditioned reflex' or acquired automatic response discovered by the Russian Pavlov. This radical reorientation of human psychology met with considerable opposition from those who regarded the subjective as an essential part of the study of psychology. The extreme position of J. B. Watson has now generally been abandoned, and a more moderate version of the programme is put forward by such writers as Tolman under the name of 'neo-behaviourism.' At the same time all modern psychology has discarded much of the subjectivism or mentalism that was attacked by Watson. See J. B. Watson, *Behaviourism*, 1925; Bertrand Russell, *Analysis of Mind*, 1927; E. C. Tolman, *Purposive Behaviour in Animals and Men*, 1932.

Behbahan, dist. and tn in the prov. of Khuzistan, Persia. Ruins of Arrajan are in the vicinity. Pop. of tn 24,000.

Behading, see DECAPITATION.

Behem, Martin, see BEHAIM.

Behemoth (Heb., 'large beast'), is a large herbivorous animal mentioned in Job xl. 15-34. It is supposed by many interpreters to mean the hippopotamus. Cf. Herodotus, ii. 70 f.

Behera, or **Beheira**, prov. of Egypt, forming part of the delta of the Nile, W. of the Rosetta branch of the riv. The chief tn of the dist. is Damanhur (q.v.). Pop. 1,244,495 (1947).

Behistun, or **Bisitun**, rocky mt side in Ardalan, Persia, 22 m. E. of Kermanshah. It rises to a height of 1700 ft, and bears an inscription, at a height of 300 ft, in cuneiform writing in 3 languages, Persian, Sasanian or Elamitic, and Babylonian, besides some minor records in Arabic and Greek. The main inscription, first read and copied by Sir Henry Rawlinson (1837-1845, q.v.), relates the exploits of Darius the Great (d. 485 BC), and led to the decipherment of the Akkadian (Assyrian-Babylonian) script.

Behmen, Jakob, see BOEHME, JAKOB.

Behn, Aphra (1640-89), novelist and dramatist, b. Wye in Kent, daughter of a barber named Johnson. She was taken as a child to S. America and brought up at Surinam, where she became acquainted with the celebrated slave Oroonoko, hero of one of her novels. She married a Dutch merchant, B., on returning to England, and later was employed on a diplomatic service in Flanders by the king. When left a widow she supported

herself by her pen. Her works suffer from coarseness, but show considerable ability. Her best drama is *The Rover*, 1677, and her most famous novel *Oroonoko*, 1688. Her works (6 vols.) appeared in 1871; also ed. by M. Summers in 1915. See V. Sackville West, *Aphra Behn*, 1927, and G. Woodcock, *The Incomparable Aphra*, 1948.

Behrens, Peter (1868-1940), Ger. architect, b. Ilamburg. He became a pioneer of the 'Modern Movement' in architecture. After working in Munich, Darmstadt, and Düsseldorf he moved c. 1907 to Berlin and in 1922 to Vienna. He was prof. of architecture at Vienna, 1922-7. He designed many important industrial and commercial buildings in Germany. Among his pupils were Gropius (q.v.), 'Le Corbusier' (q.v.), and Van der Rohe (q.v.).

Behring, Emil von (1854-1917), Ger. bacteriologist, b. Hausdorf, Prussia. Graduated in medicine at Berlin, 1878, and served as an army surgeon for 7 years. With S. Kitasato he discovered antitoxin (q.v.) and estab. the possibility of securing immunity from tetanus by the use of a serum developed from an infected animal. Similarly he developed a diphtheria antitoxin from a culture of diphtheria bacillus, making immunisation possible. He was the first recipient of the Nobel prize for medicine (1900). His works include (titles translated): *Theory of Serotherapy*, 1892; *History of Diphtheria*, 1893; *Aetiology of Tetanus*, 1901. See life by H. Zeiss and R. Bieling, 1910.

Behring, Vitus, see BERING.

Behring Island, **Behring Sea** and **Strait**, **Behring Sea Question**, see BERING.

Beibars, **Baybars**, or **Bibars**, 2 Egyptian rulers: (1) Beibars I (1269-77), sultan of the Mamelukes. He fought against the Christians and the Mongols. He defeated the crusaders under Louis IX. of France, captured Antioch in 1268, and ravaged the country round Mecca in 1269. In that year he murdered his master, the Egyptian sultan Kotuz, and became sultan in his place. He subdued the Armenians, and at one time extirpated the Syrian Assassins. The mosque at Cairo which bears his name was erected by him. (2) Beibars (Jashengir) II (1309-10) was a Circassian by birth. He was made ruler of Egypt by the Bahri Mamelukes, but was assassinated by a rival within a year.

Beijerland, or **Bayerland**, name of 3 Dutch vils. known as Oud, Nieuw, and Zuid B., situated on the is. of Hoekelward, prov. of S. Holland. Total pop. 11,500.

Beilby, Sir George (1854-1924), Scottish scientist. Educ. privately and at Edinburgh Univ. His researches in low-temperature carbonisation of coal were of service to the nation. During the First World War, when the conservation of oil for the navy became an anxious problem, the distillation of bituminous coal at low temperatures provided a way of obtaining fuel oil from home sources. The Fuel Research Board, of which B. became chairman, was set up in 1917. B.

then set up the Fuel Research station at Greenwich for inquiring into the systematic survey and classification of Brit. coals and the treatment of coal by carbonisation and gasification so as to make the best use of its by-products. Another service B. rendered to the country was the institution of the therm system of charging for a tn's gas, whereby the consumer pays not for vol. irrespective of quality but for calorific power. He pub. a number of papers on the physical properties of solids and summarised these in *Aggregation and Flow of Solids*, 1921, which book won him the fellowship of the Royal Society.

Beilstein, Friedrich Konrad (1838-1907). Russian chemist, b. St Petersburg in 1838. In 1866 he was made prof. of chemistry at the St Petersburg Technological Institute, from which position he retired in 1896. His pub. are numerous.

Beira, chief tn of the B. dist., Portuguese E. Africa, a seaport at the mouth of the It. Pungwe. It is connected by a line 200 m. in length with the Rhodesian railway system, and is the outlet for the copper of Katanga (Belgian Congo) and of Rhodesia. Transit traffic through the port to and from the Federation of Rhodesia and Nyasaland was assessed at 2,906,918 tons (1954) and will increase with the continual harbour extensions. Pop. 30,544 natives, of whom 6626 are Europeans.

Beira Alta, prov. of central Portugal, containing most of the dists. of Viseu and Guarda, and a small part of the dist. of Coimbra (q.v.). It is bordered on the E. by Spain, and is generally mountainous. The prin. tn is Viseu (q.v.). Area 3682 sq. m. Pop. 691,700.

Beira Baixa, prov. of central Portugal, containing the dist. of Castelo Branco, and parts of the dists. of Coimbra and Santarém (q.v.). It is bordered on the E. and SE. by Spain, and on the SW. by the Tagus (q.v.). It is mountainous, but has many fertile riv. valleys. The prin. tn is Castelo Branco (q.v.). Area 2896 sq. m.; pop. 355,800.

Beira Litoral, prov. of W. Portugal, containing most of the dists. of Aveiro and Coimbra, and smaller parts of the dists. of Leiria and Santarém (q.v.). It has a long coastline on the Atlantic, and is generally low-lying and fertile, but is hilly in the E. It is watered by the Vouga and the Mondego. The prin. tn is Coimbra (q.v.). Area 2930 sq. m.; pop. 969,200.

Beiram, see BAIRAM.

Beirut, cap. and prin. seaport of Lebanon, 55 m. WNW. of Damascus on a bay of the Mediterranean. Pop. 400,000. The walls are 3 m. in circumference, and the suburbs beyond the walls are greater than the enclosed tn. B. is a progressive commercial centre, with good communications by road and rail, sea, and air. Large ships generally anchor in the harbour and unload by lighter. B. is clean, plentifully supplied with springs, and contains large bazaars, an Amer. Protestant Univ. and a Fr.

Jesuit college, the palaces of a Gk and a Maronite bishop, and many missions and other institutions. The prin. exports are silk goods and wool, oils, oranges, and other fruits. B. was bombarded in Feb. 1912, during the Italo-Turkish war. In the First World War it was occupied by Gen. Allenby's victorious army on 8 Oct. 1918. In the Second World War B. was bombed by Brit. planes on 4 June 1941, during the short period of hostilities between the allied forces and the Fr. troops in Syria under the orders of the Vichy Gov. Since the estab. of B. as the

The Matson Photo Service, American Colony, Jerusalem

cap. of the independent rep. of Lebanon (q.v.), the tn has greatly increased in pop. and prosperity.

Beisan (Bethshan in the O.T., Scythopolis in the N.T., and Bessan in the crusades), tn in Israel, at SE. end of plain of Esdraelon. During the First World War B. was captured from Turks by Gen. Allenby, 20 Sept. 1918. Was scene of Arab disturbances in April 1920, and again in Aug.-Sept. 1929 during the Zionist-Arab trouble over the Wailing Wall (q.v.). Excavations begun in 1921 by the Museum of Pennsylvania Univ. have produced a complete hist. of the site from about the 16th cent. bc. The earliest city level reached was that of Thothmes III, but older levels have been cleared. Among the relics unearthed were a Canaanite temple, dedicated to 'Mekal, the lord of Beth-shan,' and a basalt tablet showing a lion and a dog representing respectively Nergal, the god of death, and the guardian of the temple.

Other temples found point to B. as a centre of serpent cult in some form and suggest that the anct name, Bethshan, was derived from Shakhān, the name of an early Mesopotamian serpent deity. Other finds of archaeological value, as representing types unknown elsewhere in Palestine, include a large Graeco-Rom. temple, various stelae of Canaanite and Egyptian kings, and a circular Byzantine church. Some of these finds are now lodged in the Jerusalem museum.

Beit, Alfred (1853-1906), S. African financier and philanthropist, b. Hamburg. He was a close friend of Cecil Rhodes, and assisted him in the amalgamation of the Kimberley mines into the De Beer's Consolidated Mines. After 1888 he was engaged in developing the Transvaal gold-mines, and in 1889 became a director of the Brit. S. Africa Co. for the administration of Rhodesia. In 1905 he founded professorships at Oxford in colonial hist., and left large sums to various charities.

Beit, Sir Otto (1865-1930), S. African financier and philanthropist, brother of Alfred B., b. Altona, Germany. In 1898 he settled in England as a stockbroker. He was much interested in the problem of developing S. Africa by land settlement schemes, and in order to remain in close touch with that country he accepted a post as director of the Brit. S. Africa Co. He contributed large sums for public purposes, including the provision of sanatoria, libraries, and an institution for homoeopathic research. In memory of his brother he founded the B. memorial fellowships for medical research. He was made F.R.S. and knighted in 1920 and created baronet 1924.

Beit (Heb. *beth*). Arabic word which properly signifies a tent or hut, but is also used to denote any edifice or abode of men. It is often found as a component part of proper names, e.g. Beit-al-harām, i.e. the sacred edifice, or the edifice of the sanctuary, a designation frequently given to the temple of Mecca.

Beit Guvrin (Rom. Eleutheropolis and the Beth Gabelin of crusading times), vil. of Israel, W. of Hebron. It is of archaeological interest. The churches of Sandahanna in the vicinity furnish examples of Rom. technique applied to Christian buildings. In 1921 a fine Rom. mosaic of the 3rd cent. AD was excavated. The Israelitish tn of Mareshah (Gk Marissa) near by has also recently been excavated. Among the most striking finds are painted tombs of the Heb. period, wall paintings, rock caverns, etc. A 2nd-cent. tomb, that of Apollophanes, with gabled roofs, is said to be the only one of its kind found in Palestine. Consult Luke, *Handbook of Palestine*, 1930.

Beith, John Hay, pseudonym Ian Hay (1876-1952), novelist, ednc. at Fettes and St John's College, Cambridge. In the First World War he served as a captain in the Argyll and Sutherland Highlanders, was awarded the M.C. and made a C.B.E. He wrote a number of stirring war books, *The First Hundred Thousand*, 1915, being followed by *Carrying on*, 1917. His light and humorous novels, which

were very popular, include *Pip*, 1907, *The Right Stuff*, 1908, *A Man's Man*, 1909, *A Safety Match*, 1911, *A Knight on Wheels*, 1914, and *The Willing Horse*, 1921. His plays *Tilly of Bloomsbury*, 1919, and *The Housemaster*, 1936, are light comedies, while *The Lighter Side of School Life*, 1914, is a series of amusing pen-pictures. During the Second World War B. was Director of Public Relations at the War Office.

Beith, tn of N. Ayrshire, Scotland, 11 m. SW. of Paisley, with cabinet-making and upholstery industries. Pop. 6900.

Beja: 1. Dist. of S. Portugal, in Baixo Alentejo prov. (q.v.). It is bordered on the W. by the Atlantic and on the E. by Spain, and is watered by the Guadiana (q.v.) and the Sado. It has extensive cork-oak forests. Area 3968 sq. m.; pop. 286,800.

2. (Anct *Pax Julia*), tn of Portugal, cap. of B. dist. and of Baixo Alentejo prov. (q.v.). It has Rom. remains, a cathedral, and a 14th-cent. castle. Textiles and pottery are manuf., and there is a trade in agric. produce, wine, and olive-oil. Pop. 13,000.

Beja, or **Boja** (Bisharin), African people N. of Ethiopia, between the Nile and the Red Sea, widely spread in Nubia. They are probably Hamitic, and include the Ababda, Hadendoo, Bisharin, and other tribes. They are Muslims. They represent the Blemmyes of Strabo.

Bejan, or **Bajan** (medieval Lat. *bejanus*; Fr. *bec jaune*, yellow beak, i.e. fledgling), name applied to freshmen in the univs. of the Middle Ages, still surviving in St Andrews and Aberdeen. Benjaminia, or payment for students entering the univ., was part of an opening ceremony which led to horse-play and rowdiness.

Béjar, Sp. tn in the prov. of Salamanca, on a high ridge (3068 ft) above the R. Cuervo de Hambre. It has a 16th-cent. palace belonging to the dukes of B., and a 13th-cent. church. B. is an important textile centre. Pop. 14,000.

Bek, Antony (d. 1310), Eng. bishop, created Bishop of Durham in 1283 by Edward I. He was renowned for his magnificent retinue. He was one of the royal commissioners to negotiate a marriage between the king's son, Edward, and Margaret, infant Queen of Scotland, 1290. In 1296 he took part in Edward I's expedition against Scotland, and received Balliol's submission in the castle of Brechin. After his return from the battle of Falkirk he appears to have lost Edward's favour. In 1302 B. set out to Rome to lodge an appeal against Richard de Hoton, prior of Durham, without asking the king's leave; in consequence the temporalities of his see were confiscated, but he afterwards regained them. Clement V made him patriarch of Jerusalem in 1305, and 2 years later Edward II granted him the sovereignty of the Isle of Man.

Bek, Thomas (d. 1293), Eng. bishop, brother of Antony B. (q.v.). In 1260 he became Chancellor of Oxford Univ.; keeper of the wardrobe to Edward I. 1274; keeper of the great seal during Edward's absence in France, 1279; Bishop

of St Davids, 1280. He protested unsuccessfully against Archbishop Peckham's visitation of his diocese in 1284.

Beka'a, El, or Elbika, see COELE-SYRIA.

Beko, Charles Tilstone (1800-74), explorer, b. Stepney. He joined an expedition to Ethiopia in 1840, and pub. the result of his travels in *Abyssinia: a Statement of Facts* (2nd ed.), 1846, and *On the Sources of the Nile*, 1849. In 1864 he visited Harrar, and 4 years later he set out for Ethiopia to urge the release of certain Brit. captives, but was unsuccessful.

Békés, in of Hungary, in B. co., on the White Körös (q.v.), 8 m. NNE. of Békéscsaba (q.v.). It is the mkt tn for a dist. of the Alföld (q.v.), and has textile, furniture, and brick manufs. Pop. 29,500.

Békés County, see BÉKÉSCSABA.

Békéscsaba, in of SE. Hungary, cap. of Békés co., near the Körös (q.v.), 110 m. SE. of Budapest (q.v.). A previous tn on the site was destroyed by the Turks in the 16th cent. The first inhab. of the present tn were Slovaks (q.v.), and the Lutheran cathedral of B. is the largest Slovak church in Hungary. B. is the centre of an agric. dist. of the Alföld, and has textile and poultry-processing industries. There is an airfield. Pop. 48,000.

Bekker, August Immanuel (1785-1871), Ger. classical scholar and philologist, b. Berlin, where he held the chair of philology, 1811-71. He revised the texts of many of the classics from the MSS. in the large libraries of Europe, independently of other printed eds. He also ed. 25 vols. of the *Corpus Scriptorum Historiae Byzantinae*, and *Anecdota Graeca* (3 vols.), 1814-21.

Bekker, Balthazar (1634-98), Dutch Protestant theologian, b. Friesland; educ. Groningen and Franeker; pastor at Franeker, and after 1679 at Amsterdam. His *De Philosophia cartesiana admonitio sincera*, 1665, worked out a relationship between Descartes' philosophy and theology. His most famous work, *Die Beloovertde Wereld, or The World Bewitched*, 1691, an early critical study of comparative theology, expresses a disbelief in sorcery, magic, and even the existence of the devil. On its pub. B. was removed from the ministry.

Bekker, Elisabeth (1738-1804), Dutch poetess and novelist, the wife of Adrian Wolff. She resided in France for some time with Agatha Dekon, and it was in conjunction with this friend that she wrote her novels, sentimental works in the style of Richardson. Perhaps her most popular works were *Historie van den Heer Willem Leerend*, 1785, *Historie van Mejuffrouw Sara Burgerhart*, 1782, *Abraham Blankaart*, 1787, and *Cornelie Widschut*, 1793-6.

Bektashi, name applied to a class of dervishes (q.v.) estab. in 1357 by Hadji Bektash, the venerable Islamic saint. When called upon by Amurath I to bless his soldiers, he gave them the name of *yenishery* (Turkish 'new soldiers'). From

this term was derived the form janizary (see JANTZARIES).

Bel, or Belus, deity of the Babylonians and Assyrians, known to the Hebrews as Bael, the name signifying 'lord' in both languages. B. was later identified with Marduk (q.v.) and corresponds to the Gk Zeus and the Rom. Jupiter.

Bel, Joseph Achille Le, see LE BEL.

Bel and the Dragon, The Story of, one of the deuterocanonical additions to the book of Daniel in the Bible, of which the original text, if Hebrew or Aramaic, has been lost. It forms part of the Rom. Catholic Bible and of the Anglican apocrypha. The tale is generally accepted as an edifying romance written to impress the futility of idol worship. It runs as follows:

Daniel declines to worship an image of Bel (Baal), and when the King of Babylon points out how great a quantity of food the image consumes each day, Daniel has all the entrances to the temple closed, first sprinkling the floor with fine ashes. In the morning footprints show that the food has been removed by the priests through a secret door. Whereupon the king has the image destroyed and the priests put to death.

This has been described as the first detective story. It continues thus:

Daniel refuses to worship a dragon, which he kills by throwing a ball of pitch down its throat. Yielding to the angry people, the king has Daniel cast into a den of lions, where for 6 or 7 days Daniel lives unharmed. On discovering this the king has Daniel's accusers thrown in and devoured, while Daniel is released.

Béla, name of 4 kings of Hungary in the Arpad dynasty. B. I., 1061-3, who succeeded his brother Andrew, encouraged trade, pacified the country, consolidated Christianity, and introduced the representative system into the diet. B. II, known as the Blind, 1131-41, succeeded his second cousin, Stephen II, and was the son of the pretender, Almu. The kingdom was administered by his wife, Helena of Siberia, at whose instigation the ministers of the preceding king were massacred at the diet of Arad. B. III, 1173-96, was grandson of B. II, and succeeded Stephen III. He had been educ. at Constantinople, and introduced Byzantine customs into Hungary. B. IV, 1235-70, grandson of B. III, deposed and succeeded his father Andrew II. He was a supporter of the freemen against the great nobles, whose power he attempted to break. In 1241 and 1261 Hungary was overrun by the Tatars, and B. successfully resisted both invasions, though in return for Austrian help he had to surrender some ter. to the Duke of Austria.

Belasco, David (1853-1931), Amer. dramatist, b. San Francisco, son of Humphrey Abraham B., an Eng. Jew. He appeared at the Metropolitan Theatre, San Francisco, in 1874 as the young Duke of York in *Richard the Third*. Later he was stage manager of the Madison Square Theatre in New York, but he is best known for his original plays. These

include *Hearts of Oak*, 1880, *La Belle Russe*, 1882, *May Blossom*, 1884, and *Valerie*, 1886. After these came 4 plays in collaboration with H. D. de Mille, including *The Wife*, 1887, and *Lord Chumley*, 1888. Then, among others: *Madame Butterfly*, of which the plot was taken from John Luther Long's novel, 1900; *Du Barry*, 1901; *The Darling of the Gods* (with J. Luther Long), 1902; *The Girl of the Golden West*, 1903.

● **Belaya**, navigable riv. in the E. of European Russia, left trib. of the Kama, rising in the Ural Mts, some 800 m. long. Its chief port is Ufa.

Belaya Tserkov' (Ukrainian *Bila Tserkva*), tn in Kiev Oblast of the Ukraine, 60 m. SW. of Kiev. It has food industries. Pop. (1956) 43,000, before the war half Jewish. Known since 1155, it was a centre of Ukrainian Cossacks in the 17th cent.; it became Russian in 1793. There have been sev. Jewish pogroms since 1648.

Belcher, Sir Edward (1799-1877), Eng. admiral. He was present at the bombardment of Algiers in 1816, and took part in the 1825 expedition to explore the Bering Strait. He took part in the war in China, 1840-1, and in 1852 was given command of the unsuccessful expedition to search for Sir John Franklin.

Belcher, George Frederick Arthur (1875-1947), painter and illustrator, son of a doctor of medicine. He was educ. at King Edward VI school and went to Gloucester school of art. He made a reputation as a painter of still life and *genre* and as a humorous draughtsman. It is for his studies of London life that he will be chiefly remembered, his humorous drawings being a familiar feature of *Punch*, the *Tailor*, and other periodicals. His favourite characters, generally drawn with an element of caricature, were charwomen, public-house loafers, and the like, whose sharp Cockneyisms supplied the aptest captions while really reflecting these strata of London life. B. also produced serious figure drawings such as his etchings of James de Rothschild and Sir Frederick Ponsonby with backgrounds illustrative of their activities. In oils B.'s interests were also chiefly in low-life character portraiture. A.R.A., 1931; R.A., 1945.

Belcher, James (1781-1811), Eng. prize-fighter, b. Bristol. He was put to the trade of a butcher, but his local success as a pugilist soon induced him to follow that career in London. In 1803 he lost an eye while playing racquets. He was defeated by H. Pearce in 1805 and in 1807 by Tom Cribb. Soon after this he became a publican in Soho, where he died.

Belcher, John (1841-1913), architect, b. London, son of an architect. After some travel abroad, he joined his father. His earliest work shows the influence of the Gothic Revival prevailing at the time; but all his later buildings have a monumental and Rom. character, doubtless the result in part of the great book on *The Later Renaissance in England* which he was then compiling with Mervyn Macartney. His chief designs were:

The Institute of Chartered Accountants, Moorgate Street, 1890; Colchester Town Hall, 1902; Electra House, Finsbury, 1902; Holy Trinity Church, Kingsway, 1909; Whiteley's Store, Bayswater, 1912. He was President of the R.I.B.A., 1904-6, and was elected R.A. in 1909.

Belcher, Jonathan (1681-1757), Amer. administrator, b. Cambridge, Massachusetts, and graduated at Harvard, 1699. In 1730 he was appointed governor of Massachusetts and New Hampshire: his freedom of thought made him many enemies, who went so far as to forge letters to encompass his ruin: the influential people of New Hampshire, who wanted a separate gov., were opposed to him, and he was superseded in 1741. In 1747 he was appointed governor of New Jersey, an office he held till his death.

Beled, or **Balad**, Arabic word signifying a tn, prov., or country, occurring in many E. geographical names, e.g. Beledulgerid — Balad-al-Jarid, or the country of palm-trees.

Belém, tn of Portugal, at the mouth of the Tagus (q.v.), a W. suburb of Lisbon (q.v.). It has a magnificent Gothic monastery (now an orphanage), which belonged to the Hieronymites (q.v.), and which commemorates Vasco da Gama's (q.v.) discovery of the sea route to India. Da Gama and Camoens (q.v.) are buried in the church. The palace of B. is the residence of the President of Portugal.

Belem, or **Pará**, cap. of the prov. of Pará (q.v.), Brazil. Situated with a good harbour on Pará R. it exports various tropical products. It was founded in 1616 to secure the Amazon against the English, Dutch, and French. The modern city contains many fine buildings, including a cathedral, bishop's palace, and gov. house. Pop. 230,200.

Belemnites, fossil dibranchiate cephalopod molluscs, allied to the squids and cuttlefish (Sepioidae) and octopuses (Octopoda); they are common in Mesozoic rocks. Fossil B. represent the internal shell of the animal's body, but the guards alone are usually fossilised; long ago they were thought to be thunderbolts.

Belfast, city, co. and parl. bor., and cap. city of N. Ireland. It is 112½ m. N. of Dublin by rail and is a railway centre, connected with other parts of Ireland by the Great N. Railway and the Ulster Transport Authority. Situated at the entrance of the R. Lagan to B. Lough, B. is a seaport of the first rank; regular passenger communication is maintained with Liverpool, Heysham, Glasgow, and Ardrossan, and, through the port of Larne, with Stranraer; there is also a goods ferry service through Larne to Preston, and air services to London, Manchester, Liverpool, Birmingham, Glasgow, and the Isle of Man. On the landward side it is surrounded by mts. The city, in its earliest days, was a crossing place of the R. Lagan near its mouth, hence its name 'Bealfearset', the ford at the sand-bank. A castle was built about 1177 by John de Courcy to support the greater Carrickfergus Castle a few miles

away; it was destroyed and rebuilt on sev. occasions. In 1316 both tn and castle were destroyed by Edward Bruce. At the beginning of the 16th cent. B. was a mere vil. owned by the O'Neill family. Hugh O'Neill lost it in 1571 to Sir Thomas Smith, a favourite of Queen Elizabeth I; he in turn forfeited it to Sir Arthur Chichester, who became Baron Chichester of B. in 1612. B. received a charter in 1613, and under Wentworth's wise policy started on a career of prosperity and progress, which came to its height with the rise of the shipbuilding and linen

Academical Institution, Campbell College, and the Stranmillis Training College. In addition to the public and univ. libraries, the Linenhall Library, founded in 1788, still flourishes as a subscription library. The grounds of B. Castle, presented to the city by Lord Shaftesbury in 1934, lie on the slopes of Cave Hill, as do the public parks of Hazelwood and Bellevue, where there is a municipal zoo. The harbour of B. is under the management of the B. Harbour Commissioners, estab. by the B. Harbour Act in 1847. Extensive reclamation of land is continuously carried

The British Travel and Holidays Association

BELFAST: THE CITY HALL

industries in the 19th cent. The centre of the city is a memorial to the skill of Ulster engineering, for it is built on reclaimed 'slob-land,' the larger buildings being supported on piles sunk deep into alluvial deposits. Although B. is a comparatively modern city (its pop. in 1851 was only 87,062) it possesses some fine buildings, including the city hall (1906), the royal courts of justice (1933), the college of technology (1901), the museum and art gallery (1929), the public library (1888), the harbour office (1896), Broadcasting House, Queen's Univ., St Anne's Cathedral (1904), and Parliament Buildings, Stormont (1932). The univ. was founded as Queen's College in 1845 and received its royal charter as an independent univ. in 1909. B. also contains Presbyterian and Methodist colleges and sev. schools, including the Royal B.

out, the B. harbour airport being opened on reclaimed land in 1937. The harbour has a quayside of 35,411 linear ft, and an area of over 4 sq. m. of land and water, including 5 graving docks, the Thompson Dock being one of the largest in the world. In 1952, 8194 vessels were cleared from the port, with a total tonnage of 4,605,268. B. is an important centre for ship and aircraft building, for the manuf. of linen, rope, tobacco, and mineral waters, and for food canning. The shipyards have employed up to 30,000 men and in 1952 the gross tonnage of ships launched was 130,000. Irish linen, most of it exported from B., is famous throughout the world. B.'s other chief exports are potatoes, livestock, flour, and grain. B. was created a city in 1888 and a co. bor. in 1899. In 1892 the title of lord mayor was conferred upon the mayor of the city, and, in 1923,

the right to preface that title by the words 'The Right Honourable.' B. returns 4 members to the U.K. Parliament and 20 to the N. Ireland Parliament, including 4 from Queen's Univ. The first Parliament of N. Ireland sat in the city hall in B., the state opening being performed in 1921 by King George V. Parliament Buildings at Stormont, the present seat of gov., were opened by the then Prince of Wales in 1932. Queen Elizabeth II (then Princess Elizabeth) and the Duke of Edinburgh received the freedom of the city during their visit to N. Ireland in 1949 and made a state visit to Belfast in July 1953. B. suffered extensive damage during air-raids in April and May 1941. Pop. 443,670. See G. Benn, *A History of the Town of Belfast, 1877*; R. M. Young, *Historical Notices of Old Belfast, 1896*; D. J. Owen, *History of Belfast, 1921*; E. E. Evans, *Belfast, the Site and the City, 1944*; *Planning Proposals for the Belfast Area (I.M.S.O.), 1945*; R. Hayward, *This is Ireland: Ulster and the City of Belfast, 1950*; *Belfast in its Regional Setting: a Scientific Survey* (British Association for the Advancement of Science), 1952.

Belfast Lough, inlet on the E. coast of N. Ireland, situated between the tns of Autrim and Down. It is an estuary of the Lagan, and is 7 m. wide at its mouth. It extends 15 m. inland, and has the tns of Belfast, Carrickfergus, Holywood, and Bangor on its shores.

Belford, tn and par. of N. Northumberland, England, 14 m. NNW. of Alnwick, and the centre of B. rural dist. It was once the scene of constant border raiding; later it became known as a famous fox-hunting centre. Pop. 900 (approx. 1954).

Belfort, Fr. tn, cap. of the Territoire de B. (part of the pre-1871 Haut-Rhin), on the Savoureuse, in the depression called the Trouée de B., between the Vosges and the Jura. It dates from Rom. times, was ceded to France by Austria in 1648 (see WESTPHALIA, TREATY OF), and was fortified by Vauban (q.v.). It has suffered many sieges, including a siege of 3 months' duration in the Franco-Prussian War (q.v.). Throughout the First World War, B. was the right-hand pivot of the allied line on the W. front (see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN). In the Second World War there was again fighting here. B. has textile and machinery manufs., and a trade in wine and grain. Pop. 36,000. (Area of Territoire de B. 235 sq. m.; pop. 87,000).

Belfry, term originally applied to a tower used in medieval warfare, later a watch-tower, or one from which an alarm bell was rung, and finally a bell-tower, usually confined to eccles. buildings. It generally is part of the church, but is sometimes a separate building, as with the It. campaniles. Such B.s are found in England at Evesham, Berkeley, Chichester, Beccles, and sev. places in Cornwall and Scotland, where the church stands in a glen, the B. then being placed on the hillside above it. Municipal B.s,

attached to the tn hall, are common on the Continent, as at St Quentin, Douai, Brussels, etc., and are also found at Glasgow and Aberdeen. The famous B. at Bruges has a carillon of 48 bells. The framework of a B. is made to rest either upon stone corbels or upon recesses in the wall, in order to mitigate the effect of the vibration upon the masonry. The higher the bells are hung the more this is felt. See also BEFFROI.

THE BELL-TOWER AT EVESHAM, WORCS

Belgae. The historical B. seem to have been formed in the 2nd cent. BC by the fusion of Celtic and Germanic tribes in the region of the Lower Rhine. Caesar, in *De Bello Gallico*, is the main authority regarding the Belgae in Gaul, the references in I, i; II, iv; and V, xii being the most important. According to Caesar, the B. inhabited one of the three great parts of Gaul, that N. and E. of the Seine and Marne. They were the bravest because they were farthest from the civilisation and refinement of Rom. culture, and they had conquered the previous Celtic inhab. of their territories. Following Germanic aggression, and later in revolt against the conquest of Rome, the B. invaded Britain, and their coming bridges the period between the prehist. and hist. of that country. In archaeology, they are regarded as belonging to the third phase of the Early Iron Age, that is Iron Age 'C.' The first group

arrived about 75 BC in Kent, where the cremation cemeteries at Aylesford and Swarling throw much light on their culture, and then spread northwards over the Thames. About AD 10 their cap. was set up at Colchester (q.v.) under the famous King Cunobelin (q.v.). The second group entered Wessex about 50 BC, and spread westwards perhaps as far as the Bristol Channel and the lower reaches of the Severn. The B. in Britain were far removed from the savage tribes described by Caesar. With their heavy ploughs they extended the range of cultivated land; their rulers minted their own inscribed coins, and industry and an organised political life flourished. The decorative art exemplified by metal work and pottery is especially noticeable. The archaeology of the Iron Age in Britain, in which the B. play an important part, is under constant study and it has a highly specialised bibliography. The main source is still Hawkes and Dunning, 'The Belgae of Gaul and Britain,' in *Archaeological Journal* LXXXVII for 1930; recent views are set out by C. A. R. Radford in *Proceedings of the Prehistoric Society* for 1954, 1.

Belgard, see BIALGORAD.

Belgaum, tn of Bombay State, India. The tn is situated 2500 ft above sea level, and contains an old fort and two fine Jain temples. Under Brit. rule it was a military centre.

Belgian and Dutch Architecture may be considered here as a whole, for the present state of Belgium only dates from 1830, when it was separated from the Kingdom of the Netherlands, estab. in 1815. Before that date the two countries had formed part of larger empires from time to time, and were subject to architectural influence from France on the S. and from Germany on the E. Both became rich during the Middle Ages, but both—especially Belgium—have suffered much damage to historical buildings during times of war. Ever since the Reformation Holland has been predominantly Protestant, whereas Belgium has remained predominantly Catholic.

Though both countries were included in the Rom. Empire, no Rom. buildings of note survive. Christianity arrived late on the scene, and the earliest important historical monument is the nave of the cathedral at Tournai (1070). The transept and towers of that cathedral are about 80 years later. Other Romanesque buildings are very scarce. The prin. surviving Gothic buildings are the cathedrals of Antwerp, Bruges, Brussels, Ghent, Louvain, Malines, and Ypres; the tn halls of Bruges, Brussels, Ghent, Louvain, and Oudenarde; the battered Cloth Hall at Ypres; the lovely church of Notre-Dame du Sablon at Brussels; and the collegiate church at Huy—all these in Belgium; the cathedrals of Dordrecht, Haarlem, and Utrecht; the tn halls of Middelburg and Veere—all in Holland; also picturesque gabled houses in both countries.

The Renaissance movement from Italy reached Belgium and Holland late. It is

natural that its earlier works closely resemble our 'Elizabethan' and 'Jacobean' buildings, for Eng. architects of that period derived many of their ideas from Flem. Dutch, and Ger. books. Picturesque examples of this style are to be found in gabled house fronts all over the two countries, and also in some civic buildings, e.g. the meat market at Haarlem (1603), the tn hall at Leyden (1579), and the steeples of many churches. The tn hall of Antwerp (1565) is a more conservative design, but its central gable, its mullioned windows, and its bold carves give it a Flem. picturesqueness. The Munitshuis (1630) at The Hague, the Huis ten Bosch (1645) not far away, and many of the quiet streets of Haarlem, Amsterdam, and other Dutch cities, recall the dignified domestic architecture of Wren, built in the days of 'Dutch William.'

Baroque architecture, favoured in all the Catholic countries of Europe, made little appeal to the Dutch, who stripped all trappings from inside their churches after they became Protestant at the Reformation; but in Catholic Belgium there was great activity, not only in building new churches at Antwerp (Jesuit church, 1614-21), Brussels (Notre-Dame du Béguinage, 1664), Louvain (St Michel, 1650), Namur (St Loup, 1621-53); but in decorating existing churches internally with ornate pulpits, confessionals, and altar-pieces.

The wonderful row of Guild houses in the Grande Place at Brussels, erected between 1697 and 1752, are baroque or rococo in character.

B. and D. A. of the 19th cent. calls for little comment. The Bourse at Brussels (1874) is typical of Fr. architecture of the period. Neither the overpowering Palais de Justice at Brussels (1866-83), nor the railway station at Amsterdam (1889, by Cuypers), nor the grandiose Palace of Peace at The Hague (finished 1913) can find many admirers to-day. From Holland, however, has come some of the impulse that created the so-called 'Modern Movement in architecture' early in the present cent. One of the pioneers of that movement was H. P. Berlage (q.v.), designer of the Bourse at Amsterdam (1899-1903); and a prominent leader of the movement was W. M. Dudok (q.v.), most of whose work was done in Hilversum. The extensive housing schemes carried out in Holland after the First World War aroused great interest, as did some of the factories and dept stores built at the same period. The rebuilding of Rotterdam since the Second World War has been notable.

Belgian Art Museums. The Antwerp Museum of Fine Arts was built in 1890 to house the Rubens and Van Dyck collections consisting of paintings from suppressed religious foundations and churches, from the Steen Museum, and from the tn hall, together with numerous engravings and photographs. Like the Palais des Beaux Arts in Brussels, the Antwerp Museum is rich in pictures by Van Eyck and Rogier van der Weyden,

in the earlier period, as well as in paintings of the great florid period of Rubens. Notable among the paintings here are Van Eyck's 'St Barbara,' painted as far back as 1437, and 'Madonna of the Fountain,' of the same period, and Van der Weyden's 'Seven Sacraments.' But pride of place is naturally given here to Rubens and Van Dyck, both men of Antwerp—as indeed was also Jacob Jordaens, who is well represented by his 'Family Concert' and boldly imaginative 'Last Supper.' Among the Antwerp Museum's outstanding examples of Rubens's prolific art are the triptych of St Thomas with contemporary portraits of the donors in the wings and the 'Descent from the Cross'—regarded as the masterpiece of the gallery—the huge 'Adoration of the Kings,' and 'Christ Crucified between Two Thieves.' In a different mood is his 'Venus Frigida.' There are many typical portraits by Van Dyck, including that of Charles II of England as a child. Other notable pictures are Memling's famous 'Heavenly Choir,' the 'Salome' of Quentin Matsys, 'Cornelis de Vos's portrait of the old guildsman, Jan Steen's 'Dutch Wedding Feast,' and pictures by Brueghel, Brouwer, Coques, Abel Grimmer, Hals, Hobbema, De Hooch, Rembrandt, Schalken, Ter Borch, Van de Capelle, Van Goyen, De Vries, and Vermeer.

Among outstanding Flem. pictures, apart from the works of Rubens, in the Palais des Beaux Arts, Brussels, are Memling's 'Martyrdom of St Sebastian'; a 'Virgin and Child' by Gerard David; an 'Annunciation' attributed to 'the maître de Flémalle' (Robert Campin); and a beautiful 'Holy Family' by Hugo van der Goos. Rubens, however, outshines all others here, the *primo favourite* being his great 'Adoration.' Other great pictures of his are the 'Assumption of the Virgin' and 'Venus at the Forge.' There are also a number of his sketches for paintings. The Brussels Van Dycks include representations of St Francis of Assisi and St Anthony of Padua. Among the finest paintings by Jordaens is his 'Pan and Syrinx.' Here too are works by Nicholas Maes, a rare painter outside Holland, and the 'Weaver's Repose' by Ostade; 'The Gift' (a landscape) by Wynants; and pictures by the Brueghels, Snyders, Cornelis de Vos, Gaspard de Crayer, Ter Borch, and also some pictures by the Eng. school—Reynolds, Raeburn, Constable, and Lawrence.

Belgian Congo, *see* CONGO, BELGIAN.

Belgioiosa, It. tn in Lombardy (q.v.), 8 m. E. of Pavia (q.v.). Pop. 4500.

Belgioioso, Cristina, Princess of (1808–1871), It. patriot and authoress; b. Milan, she was the daughter of the Marquis Trivulzio, marrying the prince of Belgioioso. In 1848 she supported the It. revolution, and at her own expense raised a troop of volunteer patriots. On the defeat of her party in the following year her property was confiscated and, an exile, she returned to Paris, where she lived till 1861. *See* *do.* at Milan. *See* life by H. R. Whitehouse, 1906.

Belgium (Fr. *Belgique*; Flem. *Belgie*),

country of NW. Europe. Since 1830 constituted as an independent kingdom, it was anciently a part of Gallia Belgica, so called from the tribe the Belgae (q.v.). It is bounded on the N. by the Netherlands, on the S. and SW. by France, on the E. by Luxembourg and Germany, and on the NW. by the N. Sea. It lies between lat. 49° 30' and 51° 30' N. and long. 2° 33' and 6° 25' E. and has an area of about 11,775 sq. m., about one-eighth of the area of Great Britain. Its greatest length is a line drawn from Ostend to Arlon, about 174 m. B. is divided into 9 provs. (*see* under *Population*). Its cap. is Brussels (Fr. *Bruxelles*). In general B. is a flat country; the greatest height to which any elevation rises is about 2270 ft. In the S. and E. it takes the general aspect physically of N. France, while in the N. and NW. it resembles the Netherlands. A continuation of the Ardennes uplands separates the riv. valleys of the Meuse and the Moselle, and extends in a NE. direction into the Rhineland. The provs. of Liège, Luxembourg, and Namur are divided by numerous ravines and streams, by valleys and ridges of hills. The vegetation is poor and the country in this part is covered with forests, which become less extensive as approach is made to the coast. The N. and W. provs. consist of well-watered and extensive plains, which are easily cultivated. In the provs. bordering the sea and the lower Scheldt the inundations of the sea are only kept back by the dykes which have been built. Nearly 200 sq. m. of land are thus artificially protected from the inroads of either the sea or rivs. Those lands under sea level are locally called *polders*.

The shallowness of the N. Sea and the entire absence of coastal indentations are incompatible with the existence of good seaports, though the port of Antwerp to some extent compensates for the disadvantages of the coast. The length of the coastline is 42 m. The sand dunes are a feature of the coast of W. Flanders, and among the well-known watering-places are Ostend, Blankenborgh, Knocke, and Nieuport Bains.

Rivers and Canals. The waterways of B. fall into 2 great divs., the navigable rivs., such as the Scheldt and the Meuse, and the system of canals. The 2 great rivs. of B., the Scheldt and the Meuse, enter that country from France, where they have their source, and enter the sea in the Netherlands. They are navigable throughout the whole of their course in B., and are supplemented by a number of tribs. which enter them during their course through B., and some of which are themselves navigable. The course of the Scheldt through B. is about 110 m., its prin. tribs. being the Lys, the Dender, the Durme, and the Ruppel. The Meuse has about 115 m. of navigable water in B. and receives in its course the waters of the Sambre and the Ourthe. Another riv. of B. is the Yeer, which enters the sea at Nieuport, and which is navigable for about 30 m. In addition to these systems of natural waterways, the country is also supplied with an excellent

canal system. These canals number 26, and have a total length of over 550 m. The chief canals are from Bruges to Ostend, from Brussels to Charleroi, from Brussels to Willebroeck, and from Ghent to Bruges. The most important is the Albert Canal, 81 m. in length; it runs from Antwerp to Liège, and was constructed for the traffic of 2000-tonners. For connections with the Rhine, riv. navigation has to pass through Dutch ter.

Population. B. is one of the most densely populated countries of Europe. The pop., including Eupen and Malmédy (q.v.), was 8,896,246 at the end of 1955, which may be roughly divided into 5 millions of Flemings and 3½ millions of Walloons, while there are about 70,000 Ger.-speaking Belgians and some 400,000 foreigners. The pop. of Brussels, with 17 adjacent coms., is 1,362,000, of Antwerp with 8 adjacent coms., 547,000. The next tns of importance are Liège and Ghent.

Areas and pop. of the 9 provs. are shown in the table below.

Province	Area. sq. m.	Pop. Dec. 1955
Antwerp	1104	1,362,908
Brabant	1267	1,887,782
E. Flanders	1147	1,249,435
W. Flanders	1248	1,032,169
Hainaut	1436	1,261,125
Liège	1525	994,185
Limbourg	930	528,123
Luxembourg	1705	216,394
Namur	1413	364,125
Total	11,775	8,896,246

Climate. The climate of B. is similar to that of England; it is, however, a little colder in winter and hotter in summer. The SE. part is to be preferred to the damp and hazy atmosphere of the N. and NW. The mean ann. temp. is about 50° F., while the mean ann. rainfall of Brussels is about 28 in., or about 3 in. less than that of London. The rainfall, however, varies from an average of 27 in. on the W. to a little over 40 in. in the E. of the country.

Agriculture and forestry employ well over one-fifth of the working pop. About 4.5 million ac. are cultivated, and there are around 1.4 million ac. of forests, half of which is scientifically exploited under gov. superintendence. Over 60 per cent of the cultivated area is covered by little farms of less than 12 ac. Cultivation in B. is so intensive that the country produces about 80 per cent of its own agric. needs. The chief products are wheat, rye, oats, barley, potatoes, sugar beet, hops, flax, and tobacco. There is an important floriculture in the Ghent region. To improve the breeds and to introduce modern farming methods national, provincial, and local exhibitions of horses, cattle, agric. implements, and produce are regularly held, at which prizes are given. Breeding of live-stock is also an important industry.

Minerals. The mineral wealth of B. is of great importance. Mining employs

175,000 workers. The prin. minerals are coal and stone. The iron deposits are nearly exhausted. The lead and zinc mines, too, are more or less entirely exhausted. Coal is found principally in 2 basins: (i) The S., which may be divided into an E. basin of 100,000 ac., and a W. basin of more than double that area. The chief centres of the W. basin are Mons, Charleroi, and Namur, while the centre of the E. is Liège. (ii) The N. basin, which covers 250,000 ac. of the Limbourg prov. This rich reserve of coal deposits has only been exploited since 1917. The chief centres are Beringen, Genk, and Eisden. The coal found in B. varies from anthracite to the richest of gas coal. The output was 30 million metric tons in 1955 (29.5 in 1938 and 15.7 in 1945). In 1952 the coal and steel (see under *Industry*) resources were combined with those of other W. European countries under the European Coal and Steel Community (q.v.). An increasing proportion of miners are foreign workers, and there is a tendency for the native pop. to leave the mines. The production of freestone, porphyry granite, marble, gravel, limestone, and sand for glass is also of great importance.

Industry. The metallurgic industry is the most important of B. The manuf. of iron is centred in the Sambre and Meuse valleys, which cross the S. coal basin. In 1955 10.57 million metric tons of iron were produced, and 5.90 million metric tons of steel. The Belgian iron and steel industry is influenced mainly by the former large industrial combines of John Cockerill and Ougrée-Marihaye, which were merged into one company (Cockerill-Ougrée) in 1955. There are numerous lead, zinc, copper, silver, and other non-ferrous metal works throughout the country. An important amount of the raw material goes to the Belgian factories producing power installations, locomotives, wagons, ships, weapons, bicycles, motor-cars, cables, and tools of all shapes and sizes. Next to this industry comes the manuf. of textiles, which is now far above its pre-war level. The chief centre of the cotton industry is Ghent. Woollen manuf. is carried on in the region of Verviers. Linen is the chief industrial product of the Lys valley and the Courtrai area. Lace is made at Brussels, Malines, and Bruges. Other important industries include food, chemicals, leather, glass, furniture, paper, tobacco, pottery, clothing, building, and transport.

Trade. B. being a manufacturing country the import of raw materials and the export of manuf. articles are necessarily complementary. B.'s situation at the cross-roads between other manufacturing countries, its easy communications with the sea, as well as inland, make it also a transit country. Provided with a good canal system and railways covering 6000 m. quick transport is assured. Seven thousand barges are in use for the riv. and canal transport. The Belgian merchant navy was badly affected during the Second World War, but is again increasing in importance. In 1956 it had

reached a total of 84 vessels. Imports and exports for 1955 were as below:

<i>Imports</i>			
Metric tons	49,386,000		
Value:	142,202	million	Belgian francs
<i>Exports</i>			
Metric tons	30,170,000		
Value:	138,961	million	Belgian francs

With Luxembourg B. has had a customs union since 1922. In June 1947 an agreement was signed with the Netherlands to join, and in 1948 the Benelux union (q.v.) came into force.

Government and constitution. The gov. is based upon the strictest liberal principles; all power emanates from the people. Justice is free to all, the press is free, the people are surrounded on every side by safeguards designed to ensure to them the proper gov. of their country and their own personal liberty and freedom of conscience. The gov. is a constitutional representative and hereditary monarchy (constitution of 1831). Those sections of the Belgian constitution which regulate the legislative power were revised in 1921. The legislative power is vested in the king, the Chamber of Representatives, and the Senate. Judicial power is exercised freely without dependence upon any authoritative influence and provincial affairs are governed by provincial councils. The royal succession is in the direct male line in order of primogeniture. The right of successors is forfeited by marriage without the king's consent, but may be restored by the king with the consent of both Houses of Parliament. The person of the king is inviolable, and the ministers are responsible for all his acts. He cannot suspend or dispense with the laws. He has power to nominate to all civil and military offices, and he commands both army and navy. He can declare war, make peace, and conclude offensive and defensive alliances and commercial treaties, which he must communicate to the Chambers. He has power in default of male heirs of nominating his successor with the consent of the Chambers. He can only appoint one regent, and under a regency the constitution cannot be altered. The legislature (Chamber and Senate) meets annually in Nov., and must sit for at least 40 days. The king has the power of dissolution, and on dissolution a fresh election must take place within 40 days. The Chamber of Representatives is chosen by the people, and consists of 1 member for every 40,000 inhab. To be a general elector it is necessary to be a Belgian by birth, or to have received the 'grand naturalisation,' to be not less than 21 years of age, and to have resided in the constituency for a minimum period of 6 months. In order to be eligible as a deputy it is necessary to be a Belgian, to live on Belgian soil, to be in full possession of civil and electoral rights, and to be at least 25 years old. For the Senate the minimum age limit is

40 years, and candidates must fulfil one out of twenty special conditions. Each deputy has an ann. allowance of 225,000 francs and a free pass all the year over gov. and companies' railways. Senators receive 144,000 francs per annum. The Senate is composed of: (i) Senators elected directly, their number being equal to half the number of members of the Chamber of Representatives; (ii) senators elected by provincial councils in the proportion of 1 to every 200,000 inhab. of the prov.; (iii) senators co-opted by the Senate itself, equal to half the number of provincial senators. The king has the right of appointing his own ministers. They have the right of access to the Chambers, must appear on request of the Chambers, and may take part in debates. They may vote when they are members. They can be dismissed at pleasure, and may be charged by the House of Representatives before the Court of Cassation. For judicial purposes B. is divided into 26 arrons. and 230 cantons, for administrative purposes into 41 arrons., 211 cantons, and 2670 coms. The provs. and coms. enjoy a considerable measure of local gov. Proportional representation applies to the provincial and communal elections. Each prov. has its prov. council elected at the same time as the members of the legislature. The governor is appointed by the king. Each com. has a council re-elected every 6 years. The council nominates its aldermen. The burgomaster is appointed by the king.

Armed forces. Every Belgian male is liable to military service. The Belgian forces were increased in 1950 to provide troops for the joint N. Atlantic Treaty (q.v.) forces and the W. European Union (q.v.). In 1951 a law introduced a 2-year period of service for conscripts instead of the earlier period of 1 year, but in 1954 it was reduced to 18 months. The armed forces in 1955 numbered 168,000 men. (For the army during the Second World War see under *History*.)

Language. B. is mainly bilingual, the 2 official languages being French and Flemish. Walloon, a dialect of anct France, is spoken by a minority in the S. The Fr. dialect prevails in the S. and the E., the Flemish or Dutch in the provs. of Antwerp, Brabant (N. half), Flanders, and Limbourg. Officially the two languages are equally used. While the educated in Flanders have mostly a good knowledge of the Fr. language—which, to some extent, they prefer to Flemish—the Walloons are not so likely to learn the other national tongue. German is spoken in the E. part of Liège prov. and in the Eupen and Malmédy dists., where French too is generally understood throughout. In 1944, conjointly with the Dutch Gov., it was decided to simplify the written language. Since May 1947 the use of the new rules for the writing of the Dutch language is obligatory in all gov. services. In most schools the new system was being taught a year earlier.

Religion. The religion of the country generally is Rom. Catholic, although full liberty of conscience is granted to all, and

all ministers, no matter of what denomination, are paid by the State. In 1954 there were 6669 Rom. Catholic ministers, 29 Protestant, 17 Jewish, and 9 Anglican. No inquiry about profession of faith is made by the census authorities. The kingdom is divided into 6 Rom. Catholic dioceses, an archbishop having his see in Malines. There are also a number of conventual houses.

Education. Besides primary, secondary, and higher educational institutions,

the State subsidies to Rom. Catholic schools. There are 4 univs. in B. The 2 State univs. at Ghent and Liège were erected under the Dutch Gov. (1816-17). In 1930 the Ghent univ. became a Flem. univ. The Catholic univ. of Louvain was founded in 1426. The free univ. of Brussels dates from 1834. There are also technical, engineering, agric., mining, commercial, military, and navigating schools. In 1923 the Colonial School at Antwerp (estab. in 1920) and the School

Belgian Embassy

SAND DUNES: TYPICAL SCENE ON THE BELGIAN COAST

training colleges, known as Écoles Normales, have been estab. by the gov. and some provs. to train teachers for elementary and lower secondary schools. In addition, confessional schools are run by the Rom. Catholic Church, which has a great influence on the educational system in B. Since 1914 all children from 6 to 14 are bound to go to school, and it is a duty of the State to give this primary education free of charge. Those schools which are subsidised by the gov. are under frequent inspection and the programmes must be in accordance with a model State programme.

In 1955 a new educational bill was passed by the Socialist-Liberal coalition in power, recognising the right of the State to open official secondary and technical schools when needed, and cutting

of Tropical Medicine were constituted a colonial univ., now known as Institut Universitaire des Territoires d'Outre-Mer. There are various royal academies and conservatoires devoted to the fine arts, besides well-endowed museums and libraries, and numerous scientific and literary societies.

Literature. As there is no Belgian language it is impossible to speak about a Belgian literature. Nevertheless Fr. as well as Flem. works were being produced in the Middle Ages. (See also under FLEMISH LANGUAGE AND LITERATURE.) The Fr.-writing authors, Jean Bodel (13th cent.), *Chanson des Saxons*, Jean Froissart (1337-1410), *Chronique de France, d'Angleterre, d'Écosse, d'Espagne, de Bretagne*, Philippe de Commines (c. 1447-1511), *Mémoires*, 1464-98, and Jean

Lemaire de Belges (1473-1525), *Illustration des Gaules et singularités de Troie*, took an important part in the formation of Fr. prose in B. After the Middle Ages, with the sustained oppression of other countries, all literary activity ceased for centuries. Only in the 19th cent. did Belgian literature assume a national character, distinct from the French. Charles de Coster (1827-79), with his *Légende d'Uylenspiegel*, the story of a kind of Flem. Robin Hood, was one of the most important precursors of the revival. The combination of the Walloon and Flem. temperament—the one sensitive and delicate, the other meditative, simple, and close to nature—found its expression in the literature that sprang up, mainly under Fr. influence, in the second half of the cent.—in the personal and spiritual poetry of Émile Verhaeren (1855-1916) or the peasant novels of Camille Lemonnier (1844-1913). The latter, although he may have derived much from Zola, may be said to be the first distinctive force in Belgian literature. His *Contes flamandes et wallons* was pub. in 1879, and his best novel, *Un Mûle*, in 1881. Maurice Maeterlinck (q.v.) was b. in 1862 and achieved a European reputation with his mystical and allegorical plays. Later in life he turned to writing essays in which he expressed his thought in more direct fashion. More narrowly Flemish in his outlook, though writing in French, is Georges Rekhoud (1854-1927), whose novels and stories were realistic and emotional portrayals of the life of his time. Besides Verhaeren, the other major Belgian poet of the 19th cent. was Georges Rodenbach (1855-98), whose poetry is also Flemish in character rather than French, and Charles van Lerberghe (q.v.) (1861-1907). Among other poets whose work continued into the 20th cent. must be named Albert Giraud, Fernand Séverin, Max Elskamp, Paul Spaak, Henry Carton de Wiart, and Albert Mockel, whilst among the younger writers Émile Cammaerts (q.v.) is pre-eminent. Belgian drama fl. during the 20th cent. under the combined influence of Verhaeren and Maeterlinck. Crommelynck and Vanuype may be mentioned in this connection. The First World War gave an added impetus to the Fr. literature of B., and the Académie Royale de Langue et de Littérature Française de Belgique was founded in 1920. During the thirties, however, the tendency was more towards literature becoming independent of Fr. influence, while at the same time Fr. critics came to value the individual merits of Belgian writers, among whom Charles Plisnier, Pierre Bourgeois, Marie Gevers, Henri Michaux, André Baillon, Franz Hellens may be named from a generation of distinguished poets and novelists whose reputations date from the years before the Second World War.

History. The hist. of B. as an independent kingdom dates from the 1830 revolution, but its hist. as part of the Netherlands goes back to the time of the Romans. The ter. covered by B. to-day was already inhabited in the early Stone

Age (Palaeolithic). Accounts of modern research in prehistoric and Rom. B. may be read in the various bulletins of the Académie Royale de Belgique, and in the pubs. of the Cinquantenaire Museum, Brussels. Recorded hist. starts with the conquest by Caesar. In the Rom. period it formed part of Gaul, and was distinguished by the name of Gallia Belgica. It was inhabited chiefly by Celtic tribes, although there were many traces of tribes of Germanic origin. By the influx of the Franks into this part of the country the Ger. tribes were increased, and it is the hist. of the Franks in Europe that forms the early hist. of the Netherlands. The Salic Franks settled in the region between the lower Rhine and the N. Sea. At the end of the 5th cent., under Clovis, they had conquered the whole of Gaul (France). In the beginning of the 9th cent. the whole country formed part of the empire of Charlemagne. After his reign his empire was gradually divided. Flanders and the W. provs. went to France, the E. provs., including Brabant, to Germany. During the feudal Middle Ages different hereditary counties, duchies, bishoprics, and lordships were estab. In the meantime the tns rose to power. Flanders with its cities became one of the most important counties, and had to struggle constantly against France to maintain her independence. Towards the end of the 14th cent. the line of Flem. counts became extinct, and their ter. passed into the hands of the Dukes of Burgundy, and at the beginning of the 15th cent., through various marriages and by inheritance or purchase, all the provs. became united, and the industry of the Netherlands fl. greatly. In 1477 the daughter of Charles the Bold, Mary, married the Archduke Maximilian. In this way began the connection of the Netherlands with the house of Austria. The Netherlands were passed on by the emperor to his son Philip, who married the daughter of Ferdinand and Isabella of Spain, and was the father of the Emperor Charles V. Dying before his father, Philip left the Netherlands to his son, by whom they were incorporated with the Sp. crown, and who began the connection of the Netherlands with Spain which lasted up to the treaty of Utrecht, 1713. During the reign of Philip II the N. provs. broke away from Spain, but the area of the Netherlands now known as B. remained under Sp. rule. In the cent. which followed, dist. after dist. was ceded to France during the wars with Spain and following the war of Devolution. By the treaty of Ryswick (1697) a great amount that had been lost at Nimegen (1678) was restored. By the treaty of Utrecht, which concluded the war of the Sp. Succession, the Sp. Netherlands were ceded to Austria. During the cent. which followed, the fortunes of the Austrian Netherlands underwent many vicissitudes. In the war of the Austrian Succession they were overrun by France, but all conquests were restored by the treaty of Aix-la-Chapelle of 1748. The Seven Years War left them unmolested, and under Maria Theresa they prospered.

But Joseph II, the enlightened despot, roused anger by his reforms and danger by his attempt to open the R. Scheldt, and before his death a revolt had broken out in the Austrian Netherlands which had to be subdued by an Austrian army. Then followed the Fr. Revolution and Napoleon. The battles of Jemappes and Fleurus placed the Austrian Netherlands in the hands of the French, the treaty of Campo Formio (1797) confirmed that possession, and for the rest of the Napoleonic period they became to all intents and purposes an integral part of France, ruled by the Code Napoleon. After the abdication, 1814, they again passed to Austria, and were administered by an Austrian governor-general, but in 1815, by the Congress of Vienna, they were united to Holland, and William Frederick of Nassau became King of the Netherlands (i.e. the modern Netherlands and the modern B.), taking the oath in Sept. 1815. It was an unfortunate alliance, for the two communities were separated by cents. of tradition, and, to a large extent, by racial, linguistic, and religious differences. Though the Belgians prospered, discontent increased, engendered by suspicion that the Dutch language was being forced on them. When the revolution of 1830 was successful in Paris the revolutionary spirit seized the Belgians, and the cry 'Imitons les Parisiens' roused them to successful imitation of the citizens of Paris.

The Belgians again declared in favour of independence and were successful in defeating the forces of the Dutch. At a congress of the 5 great powers held in London, it was agreed that the country of B. should be independent, that it should be a constitutional monarchy, not a rep., and that the Orange Nassau family should be permanently excluded. The election of Leopold of Saxe-Coburg was the signal for a fresh Dutch invasion. The crisis was terminated in 1839 by the action of the great powers, who forced a settlement which was in effect the treaty of XXIV Articles, drawn up 8 years before. By its terms B.'s share in the national debt of the Netherlands was reduced and the ters. in dispute were partitioned, but to compensate for territorial losses the neutrality of B. was guaranteed. It was this treaty which became known as 'the scrap of paper.' From 1839 to 1914 B. maintained its independent neutrality. From about 1850 the constitutional party began that series of reforms which gained for B. the position of one of the freest countries in Europe. The question of Luxembourg threatened the peace of Europe in 1867, and B. took part in the congress which prevented war breaking out. In 1870, on the outbreak of hostilities between France and Germany, B., fearing invasion, mobilised her troops, but her neutrality was recognised. In 1885 the Congo Free State was acknowledged to be under the presidency of the King of B., Leopold II, and it became a Belgian colony in 1908. Leopold II d. in 1909, and was succeeded by his nephew, Albert.

At the beginning of his reign King Albert was credited with progressive sympathies, and in 1913 a general strike was called with the object of obtaining equal manhood suffrage and the abolition of the system of plural votes. In 1899 proportional representation had come into being, but it was not until 1918 that plural voting was abolished. Manhood suffrage was estab. 1921. Women obtained the right to vote at the parl. elections in 1948. Although the majority of the people relied on the 1839 treaty, especially as it had been respected during the Franco-Prussian war in 1870, it had been the policy of Leopold II to make B. secure from invasion, and this policy was also adopted by Albert. Leopold had encountered parl. opposition in obtaining the credits necessary for the fortification of Liège, Namur, and Antwerp, and although under Albert compulsory military service was estab., it had not had time to take effect before B. was invaded by Germany on 3 Aug. 1914. The reduction of Liège (see LIEGE) took the Germans 12 days, and the Belgian army was driven back to Louvain, whence it was further driven back to Antwerp. Louvain was looted (see LOUVAIN). On 20 Aug. a Ger. army under von Kluck entered Brussels, while another army under von Bulow subdued the fortress of Namur. The way to France now lay open, but the Ger. army was harassed by the Belgians, who were entrenched at Malines and Antwerp. On 10 Oct. Antwerp surrendered after a successful withdrawal of the army to the W., and the whole of B. was occupied by the Germans save for the small SW. corner from Nieupoort to Ypres. B. was now under Ger. military occupation, and von Bissing was made governor. After a period of terrorism, attempts were made to set industry going again. Men who would not work for the benefit of the enemy were deported, and from 1916 to 1917 nearly 150,000 men were sent to work in Germany. When it was found in 1917 that the passive resistance of the workers could not be broken, Belgian industry was dismantled and many of the machines were transported to Germany. One aim of von Bissing's policy was to divide B. against itself by supporting the Flem. movement and to corrupt the loyalty of the Flemings by setting them against the Walloons. The assumption was that B. was an artificially created state without any real national unity.

Meanwhile the remains of the Belgian army were stationed on the extreme left of the allied front, and withstood severe fighting in the valley of the Yser. (See FRANCE AND FLANDERS, CAMPAIGN IN.) After the fall of Antwerp the coast ins. of Zebrugge and Ostend had fallen into Ger. hands, but in 1917 they were rendered ineffective as submarine bases by some ships being sunk by a Brit. squadron at the entrance of the harbours, thus partially closing them (see ZEEBRUGGE). The treaty of Versailles, which ended the war, gave B. the status of a sovereign state, free to make what alliances she

wished, but the 1839 treaty guaranteeing Belgian neutrality was abrogated. The logical outcome of this was that B. contracted a defensive alliance with France and England. B. also gained the dists. of Eupen and Malmédy, and the com. Moresnet, ceded by Germany, thus adding 380 sq. m., which in 1925 were made part of the prov. of Liège.

At the end of the Ger. occupation B. was faced with the task of reconstruction. Belgian industry, which had always been a formidable competitor with Germany, had been designedly disabled. In the 10 years following the war reconstruction was rapid. B. weathered a serious financial crisis in 1925-6. As a drastic measure the gov. obtained plenary powers, and rehabilitation was brought about by the 'industrialisation' of the State railways and the telephone and telegraph services.

A conspicuous feature of Belgian politics after the First World War was the rise of the Socialist party, which soon won a large proportion of the working-class vote. In 1925 the Socialists forced a general election, and gained such success that in July 1925 Pouillet formed a Socialist-Catholic coalition gov., in which Vandervelde, the Socialist leader, was foreign minister. It was he who signed on behalf of B. the ill-fated Locarno treaty, the aims of which he had done much to further. In May 1938 Spaak (q.v.) became B.'s first Socialist premier.

In 1929 there was a crisis over the language problem. In 1930 the univ. of Ghent was made Flemish, and provision was made for the teaching in schools to be given in the language prevalent in the dist. Both French and Flemish are now official languages.

On 17 Feb. 1934 King Albert was killed while mountaineering alone in the Meuse valley and was succeeded by his son, Leopold III. The latter's first wife, Queen Astrid, was killed in a motor accident at Lake Lucerne, 29 Aug. 1935.

Since 1925 B. had placed its faith in the Locarno treaty, and supported the policy of collective security. In 1936, however, Germany's repudiation of Locarno increased Belgian fears of another European conflagration, and the failure of the League of Nations successfully to impose sanctions against Italy in the same year produced in B. a tendency away from collective security towards isolation, self-dependence, and rigid neutrality. Consequently at the end of 1936 King Leopold gave a new direction to Belgian policy. With the concurrence of Great Britain and France, B. was released from its Locarno obligations, and at the same time received from the 2 W. powers a unilateral promise of support in the event of aggression. Some months later, on 13 Oct. 1937, Germany also confirmed the inviolability of B., and undertook to respect Belgian ter. except in the event of Belgian participation in military action directed against Germany. It followed from the policy of neutrality and rejection of military alliances that B. should increase its dependence on its own armaments, and

expenditure between 1936 and 1940 was the highest in Belgian hist. On 26 Aug. 1939, 5 days before the Ger. invasion of Poland, the Ger. ambas. to B. repeated his country's assurances of respect for the integrity of B., and on the outbreak of war on 3 Sept. B. reaffirmed its strict neutrality.

On 10 May 1940, before dawn, the Ger. Air Force launched an attack on selected airfields and centres of communication. King Leopold took over command of the army, and the Belgian Gov. ordered

E.N.A.I.

FLEMISH PEASANT GIRL MAKING
BRUSSELS LACE

general mobilisation and declared martial law. On 28 May the Belgian Army capitulated on King Leopold's orders. The Belgian premier, Pierlot, however, broadcasting from Paris, declared that Leopold's capitulation had no legal validity, and that his decision had been taken against the will of his ministers, that Belgian officials were thenceforth absolved from their oath of allegiance to the king, and that B. would continue the struggle at the side of the Allies. The Belgian Gov. soon moved to London and was regarded as the legal gov. of B., not only by all the Allies, but also by neutral states. Meanwhile the Germans confined King Leopold in Laeken Castle.

All through the occupation the Belgians were sustained by confidence in their ultimate liberation and numbers of Belgians fled to England to serve in the forces there, or to find civilian employment. For information on the fighting in B. during the Second World War see

FLANDERS, BATTLE OF and WESTERN FRONT in the SECOND WORLD WAR.

On 2 Sept. 1944 Brit. armoured units reached Tournai, the first Belgian town to be liberated, and Brussels was freed on the following day, 3 Sept. Belgian forces co-operated with the Brit. and Amer. armies, and by 3 Nov. the whole of B. was liberated, following the end of the final Ger. resistance at Zeebrugge and S. of the Scheldt. In April 1949 some minor frontier modifications in B.'s favour were made on the Belgian-Ger. frontier.

With the overthrow of the enemy Europe faced a long process of readjustment, and progress was slow. Of the countries in W. Europe the one to show the greatest progress the most quickly was perhaps B., where a relatively high degree of political and economic stability was attained. But the issue of the return of King Leopold III soon threatened to divide the country. In the final stages of the war the Germans had removed the king and his family to Germany. On his liberation by the Allies, he wished to resume his functions. The resistance movement, which naturally was a strong influence in the country, had become predominantly associated with the left, and was opposed to the return of the king, who, in the opinion of many, was associated with undue subsmissiveness to the Germans. His second marriage was also highly unpopular. In view of this hostility, therefore, the Belgian Gov. refused to take responsibility for the return of the king. Hence the country remained under the regency of Prince Charles, the king's brother, who had been appointed regent after the liberation of B., when Leopold was still in Germany. In 1949 the Socialists lost control of the gov. In 1950 the Christian Socialists, committed to support for the king's return, held a referendum on the subject, which produced a majority in favour of Leopold's restoration. But it was not a large majority and in the Walloon dists. more votes were cast against the return than for it. The regency was ended, and Leopold returned to B. Rioting and strikes broke out and civil war and a possible div. of the country seemed imminent. In Aug. 1950 Leopold agreed to delegate his powers to his eldest son, Baudouin. He finally abdicated in July 1951, being succeeded by his son as Baudouin (q.v.).

After the Second World War much progress was made in the field of social services, the whole concept of Belgian social security being based on the law of Dec. 1944. This was supplemented by further legislation in 1945 and 1948. B. is a member of Benelux, of the European Coal and Steel Community, and of N.A.T.O. (qq.v.).

Belgorod ('White Town'); 1. Oblast in central Russia, NE. of Khar'kov, situated in the central Russian upland, in the black earth belt. It has large iron ore deposits. Area 10,500 sq. m.; pop. (1956) 1,190,000 (Russians and Ukrainians). Sugar-beet, wheat, and sunflowers are grown, and there are food industries and some engineering. The prin. towns are B. and Staryi Oskol.

2. Cap. of the above, 40 m. N. of Khar'kov. It has large chalk quarries. Pop. (1956) 44,000. It has been known since the 13th cent., was the centre of the Muscovite S. defence line in the 17th cent., and in 1913 the scene of bitter fighting between the Germans and the Soviet Army.

Belgorod-Dnestrovskiy (Rumanian *Cetatea Alba*, Turkish *Akkerman*, ditto Russian, 1806–1944, Ukrainian *Bilhorod*), in S. Bessarabia at the Dniester estuary (Odessa Oblast of the Ukraine). Pop. (1956) 22,000 (1885, 41,000; c. 1914, 33,000; 1920, 40,000); Ukrainians, Russians, Jews, Moldavians (Rumanians), Greeks, Armenians. The anct Gk colony Tyras, in the Middle Ages it belonged variously to Kiev, Galicia, Tartars, Genoese, Moldavians; it became Turkish in

1479, Russian in 1806, and was Rumanian 1918-40, 1941-4. Cap. of Akkerman Oblast 1940-1 (renamed Izmail Oblast).

Belgrade (Serbo-Croatian *Beograd*, the white city; anct *Singidunum*), cap. city of Serbia and also of Yugoslavia. It is built on 7 hills on the r. b. of the Danube and the Sava, at the junction of the 2 rivs.

History. The Rom. tn of *Singidunum*, said to stand on the site of a Celtic settlement, developed into a prin. tn of Pannonia (q.v.). In the 6th cent. it was destroyed by the Avars (q.v.), and reappeared in the 9th cent. as *Beograd*.

archbishop, and has a univ. (1864). Part of the anct fortress on the site of the Rom. *castrum* remains, and there is a 19th-cent. cathedral. It is, in general, a very modern city, having been largely rebuilt since 1945, and has many fine streets and beautiful gardens. There are scientific and literary institutions, art galleries, museums, and 4 large libraries. The tn is a commercial rather than an industrial centre, and is the 2nd largest port on the Danube. Manufs. include textiles, machinery, leather goods, and foodstuffs. Pop. 469,900.

BELGRADE

General view showing the National Theatre.

E.N.A.

Due to its strategic position, B. has been subjected to frequent sieges, and in the Middle Ages was successively Bulgarian, Byzantine, Hungarian, and Serbian. It became the cap. of Serbia (q.v.) at the beginning of the 15th cent. and rapidly developed in importance. The Turks besieged it unsuccessfully in 1456, being defeated by Janos Hunyadi (q.v.), but captured it in 1522 and held it until 1688, in which year it was taken by the Austrians. The Turks took it again in 1690, lost it to Prince Eugene (q.v.) in 1717, and regained it in 1739. They lost it again 1789-91, and finally withdrew in 1867. It was occupied by the Austrians for most of the First World War. During the Second World War the tn was severely damaged by Ger. air bombardment, and was occupied by the Germans 1941-4.

Belgrade to-day. B. is the seat of an Orthodox patriarch and a Rom. Catholic

Belgravia, fashionable residential dist. of London, N.W. of Victoria station, lying mostly within the city of Westminster. It was developed by the builder Thomas Cubitt (q.v.) on ground belonging to the 1st Marquess of Westminster (q.v.) after special powers had been obtained through an Act of Parliament of 1826. Sev. of the names of streets, etc., are derived from the family name (Grosvenor) and titles, among them the viscounty of Belgrave, of the dukes of Westminster.

Belial, compound Heb. word, meaning that which is without profit or worth. It is often treated in the Bible as a proper name, having acquired personification by usage in such phrases as 'a son of Belial,' and, 'What concord hath Christ with Belial?' In the N.T. the changed form of Beliar is due to Syrian pronunciation. In Apocalyptic literature B. = Satan.

Belief, mental attitude towards a statement which entails willingness to

assert that the statement is true and (on the side of behaviour) to act as if it were true. Most of the puzzles about B. arise from conflict between these verbal and behavioural criteria of B. A man may, for example, sincerely assert his B. in another world while behaving as if there were no other world than the present one. We are then inclined in ordinary speech to say: 'He doesn't really believe it.' See D. Hume, *A Treatise of Human Nature* (Bk I, *Of the Understanding*), 1739; James Mill, *Analysis of the Phenomena of the Human Mind*, 1829; A. Bain, *The Emotions and the Will*, 1859; W. James, *The Will to Believe*, 1931.

Beligrad, see BERAT.

Belinskiy, Vissarion Grigor'yevich (1811-1848), famous Russian literary critic, one of the leaders of the Westernisers (q.v.) and the first representative of the non-noble radical intelligentsia (see INTELLIGENTSIA). He founded the sociological school of literary criticism which was dominant in Russia until the end of the cent. and has been revived by the Communists. See his *Selected Philosophical Works*, Moscow, 1948, and the study by H. E. Bowman, 1954.

Belisarius (c. 505-65), Byzantine soldier, b. probably in Germania, in Illyria. He is first mentioned about 525, during the war between the Byzantine empire and Persia. About this time Procopius, from whose hist. the events of the life of B. are gathered, became his secretary. In 530 B. was commander of the E. imperial army, and brilliantly defeated a large Persian force at Dara, in N. Mesopotamia. In the next year the Persians invaded Syria, and B. was defeated at Callinicum on the Euphrates. He was recalled to Constantinople, where he married Antonia, a wealthy woman who was a friend of the Empress Theodora. In 533 he was sent into Africa to recover the imperial provs. held there by Gelimer, King of the Vandals. He landed in Sept. at Caput Vada, and advanced to Decimum, where he gained a victory. He then entered Carthage. The king was finally captured at Mt Pappua, and B. returned to Constantinople, where he was honoured with a triumph. In 535 he was made sole consul. Later in that year he set out to recover Italy from the Goths. In 536 he took Naples and occupied Lower Italy, and at the end of the year entered Rome by amicable arrangement with the Gothic garrison. During 537 he was besieged there by Vitiges, the Gothic king, the siege being abandoned early in 538, when Vitiges retired to Ravenna. In 540 B. captured Ravenna, and took Vitiges prisoner, but was recalled by Justinian before completing his conquests. During 541-2 he was engaged in a campaign against the Persians, but in 544 the Ostrogoths, under Totila, again invaded Italy, and B. was sent by Justinian to lead the expedition against them. He regained possession of Rome, but on the whole this It. campaign was unsuccessful, and after 5 years he was recalled to Constantinople, where he stayed in retirement till 559. In that year he defeated the

Bulgarians, who were threatening Constantinople. In 563 he was imprisoned on a charge of conspiracy against Justinian, but his innocence was soon estab., and he was released after 6 months. See study, *Count Belisarius*, by Robert Grant, 1938.

Belitoeng, or Belitung, see BILLITON.

Belize (Belice), cap. of Brit. Honduras and of B. dist., on the Bay of Honduras, at the mouth of the R. B. or Rio Viejo. The riv. divides the tn into 2 parts. The harbour is shallow and impaired by sand-bars, so that large vessels must load and unload by means of lighters; small vessels enter by a channel through the reefs. Logwood, mahogany, and chicle gum are exported. Half the tn was destroyed by a hurricane on 10 Sept. 1931. It has been gradually rebuilt. B. is connected with other tns in Honduras by means of telephone and telegraph lines. Air services connect with Jamaica, Havana, Miami, Guatemala, El Salvador, Nicaragua, and Costa Rica from Stanley airfield 10 m. W. Pop. 21,880. The ter. is claimed by Guatemala.

Belknap, Sir Robert, jurist, chief justice of the court of common pleas from 1374 to 1388, when he was removed for having, unwillingly, signed an affirmative to the question of Edward III, 'Whether I might by my regal power revoke that which was acted in parliament.' In the succeeding Parliament all the judges were arrested in Westminster Hall on a charge of high treason, but B. escaped with his life through the intercession of the bishops (*Fuller's Worthies of England*.)

Bell, Alexander Graham (1847-1922), inventor, b. Edinburgh; educ. at the Edinburgh High School and Edinburgh and London univs. Going with his father, Alexander Melville B., to Canada in 1870, he became prof. of vocal physiology at Boston Univ. In 1872, where his experiments resulted in the patenting of the telephone in 1876. He also invented the photophone and graphophone, and wrote many papers on electrical matters and work in connection with deaf-mutes.

Bell, Alexander Melville (1819-1905), Scottish-Amer. educationist, b. Edinburgh, Scotland. He devised the system of 'visible speech,' by which deaf-mutes are taught to speak.

Bell, Andrew (1753-1832), educationist, b. St Andrews, Scotland; educ. at the univ. there. After acting as tutor to the family of a Virginian planter he returned to England, where he took orders and sailed for India to become a chaplain. In 1789 he became superintendent of the Madras Male Orphan Asylum, founded by the E. India Co. for the education of the sons of military men. The grave shortage of efficient teachers led him to think that the work might be done by the pupils themselves. Clever boys were placed in charge of small groups for the purpose of learning to write the alphabet. B. thought the system could be extended, and on his return to England pub. (1797) *An Experiment in Education made at the Male Asylum of Madras*. His subsequent writings merely expanded views

expressed in this pamphlet. Joseph Lancaster (q.v.) put forward a similar scheme in 1803 and founded a school. The two men knew each other and were at first on friendly terms. The issue which divided them and their followers was whether the Church should control the education of children. B. advocated a national system through the existing organisation of the Church and under the control of parochial clergy. To this end the National Society for Promoting the Education of the Poor was estab. B. became its superintendent and by the end of his life there were 12,000 Society schools. He did not wish the poor to be educ. too much, however, and although many of his methods were enlightened and he wished to do away with corporal punishment his achievements were probably less than his friends supposed. His monitorial system certainly reduced the cost of teaching but failed as a complete system of education. Out of it grew the pupil-teacher system of training introduced in 1846. Denominational controversy of the kind engaged in by B. continued to dog educational development. B. d. at Cheltenham and was buried with great ceremony in Westminster Abbey.

Bell, Sir Charles (1774-1842), surgeon and neurologist, b. Edinburgh, where he studied anatomy and surgery under his brother John (q.v.). In 1804 he moved to London, where he taught anatomy and in 1811 took over the famous Windmill Street School founded by John and Wm Hunter. He was appointed surgeon to the Middlesex Hospital, 1814, and raised that institution to the highest repute. He was called to the chair of surgery at Edinburgh in 1836 and remained there until his death. B.'s anatomical work was the most important in Britain during the early part of the 19th cent. His *System of Dissections*, 1799-1801, with its exquisite drawings by his own hand, was pub. while he was still a student; his *Idea of a New Anatomy of the Brain*, 1811, was the first of his works discovering the anatomy and functions of the spinal nerves. In 1807-9 he pub. his *System of Operative Surgery*, in 1821 his *Illustrations of the Great Operations of Surgery*; in 1830 he first described facial palsy ('Bell's palsy'), and in 1833 appeared his Bridgewater treatise on *The Hand: its Mechanism and Design*. Many of his discoveries in the physiology of the nervous system were described in his *Nervous System of the Human Body*, 1830. B. attended the wounded after Corunna and Waterloo. He was a genial, unaffected man, with a captivating twinkle behind his eye-glasses, a bit of a dandy in his attire. He was knighted in 1829. See A. Pichot, *Life and Labour of Sir Charles Bell*, 1860.

Bell, Sir Charles (1870-1945), civil servant and traveller, b. Douglas, Isle of Man; educ. Winchester and New College, Oxford; joined the Indian Civil Service, 1891. B. is best remembered as a great champion of Tibetan independence and the author of sev. important works on

Tibet. He was present at the Tibet Conference (1913-14); conducted a diplomatic mission (1920) to Lhasa, where he stayed 11 months; was knighted in 1922. In 1934 and 1935 he travelled in Tibet, Mongolia, Manchuria, and Siberia; and in 1937 was awarded the Lawrence Memorial Medal by the Royal Central Asian Society. His writings include *Tibet: Past and Present*, 1924, *The People of Tibet*, 1928, *The Religion of Tibet*, 1941, and *Portrait of the Dalai Lama*, 1946. See also his *English-Tibetan Colloquial Dictionary* (2nd ed.), 1920.

Bell, Charles Frederic Moberly (1847-1911), Eng. journalist, b. Alexandria, and educ. in England. In 1880 he was one of the founders of the *Egyptian Gazette*. He became famous as a *Times* correspondent during the Arabi revolt of 1882. In 1890 he returned to England as manager of *The Times*, in succession to J. C. McDonald. His enterprises included *The Times Atlas*, 1895, the *History of the South African War*, 1900-9, and *The Times Book Club*, 1905. In 1908 he became managing director of the reconstructed Times Publishing Co. See F. H. Kitchin, *Moberly Bell and his Times*, 1925; E. C. H. Moberly Bell, *The Life and Letters of C. F. Moberly Bell*, 1927.

Bell, Clive (1881-), art and literary critic; educ. Marlborough and Cambridge. His *Since Cézanne*, 1922, and *Landmarks in Nineteenth-century Painting* are contributions to the comparative study of French and other schools of painting. Other works: *Art*, 1914; *Poems*, 1921; *Civilisation*, 1928; *Proust*, 1929; *An Account of French Painting*, 1931; *Enjoying Pictures*, 1934; *The French Impressionists*, 1954. He became chevalier of the Legion of Honour in 1936.

Bell, Currer, Ellis, and Acton, see BRONTË.

Bell, Gertrude Margaret Lowthian (1868-1926), traveller and archaeologist, b. Washington Hall, Durham, daughter of Sir Hugh B., ironmaster and colliery owner. Educ. at Queen's College, London, and Lady Margaret Hall, Oxford. She learnt Persian with the view of joining her relative, Sir Frank Lascelles, ambas. in Persia, in Teheran, whither she went in 1892. At Teheran she acquired a knowledge of the E. by taking a desert journey in 1900 to Jerusalem and Syria. Later she took lessons in Arabic and Persian from 2 sheikhs at Haifa. A polyglot by nature, she learned enough Hindustani to find her way about India without an interpreter. In 1905 she continued her Persian studies under Reinach in Paris, and afterwards made her name with *The Desert and the Sown*, pub. in 1907, and *The Thousand and One Churches*, a description of ruins and inscriptions of churches in Lycæonia written in collaboration with Sir Wm Ramsay. A few years later saw her once more in the E., first in Damascus and then in Bagdad, where she was destined to take a leading part in the administrative development of the new Arab state, Iraq, during its most critical years under the high commissionership of Sir Percy Cox. The knowledge she had

acquired of the Arab tribes proved of value during the First World War, and from 1915 she was interpreter of all reports received from central Arabia. Later, in Cairo, she assisted Col. Lawrence (Lawrence of Arabia) by doing propaganda work for dealing with the revolt in the desert. At Basra she prepared political memoranda and performed staff work under Sir Percy Cox, later being made assistant political officer at Baghdad. She received the C.B.E. in 1917, and attended the Peace Conference in Paris in 1919. Later in that year she returned to Baghdad, where she was thenceforth known as the Mother of the Faithful, the last woman who bore the name being Ayesha, the wife of the Prophet. In 1926 she completed the arrangement of the Bagdad museum of which she was honorary director of antiquities, and was preparing to return home to England when she died peacefully in her sleep. She was buried with military honours in the cemetery outside Bagdad. Other publs.: *Safar Nameh or Persian Pictures*, 1894; *Poems from the Divan of Hafiz*, 1897; *Amurath to Amurath*, 1907; *Palace and Mosque at Ukhaider*, 1914; *Review of the Civil Administration of Mesopotamia*, 1921. *The Letters of Gertrude Bell*, 1927, were ed. by her stepmother, Lady B.

Bell, Henry (1767-1830), marine engineer, one of the originators of steam navigation, *b.* Torphichen Mill, Linlithgow. Served in a shipbuilding yard at Bo'ness, with an engineering firm in London, and in 1790 he settled in Glasgow, but removed in 1807 to Helensburgh, where he studied mechanics. In 1812 the *Comet*, a small vessel 40 ft long, built under his direction and with an engine constructed by himself, was launched on the Clyde, being one of the first steam vessels in Europe. See SHIPS AND SHIP-BUILDING.

Bell, John (1691-1780), Scottish traveller, commonly called B. of Antermomy, who followed the medical profession. In 1714 he went to St Petersburg, where he joined an embassy to Persia. He returned to St Petersburg, where he was appointed to another embassy, this time to Peking; and returned to Moscow, 1722. Of these travels he wrote a most entertaining account. He returned to Scotland c. 1725. He undertook in 1737 another mission for Russia to Constantinople, where he settled as a merchant. He married, 1746, and retired to Antermomy. His travels were printed and pub. at Glasgow, 1763.

Bell, John (1745-1831). Brit. publisher. Defying the combination of some 40 London publishers who joined in bringing out Johnson's ed. of the poets, B. pub. *The British Poets* in his own ed. of over 100 vols., including the chief poets from Chaucer to Churchill with the exception of a few that were copyright. B. was the first publisher to discard the long s (f) from his fount of type. He was one of the founders of the *Morning Post* and was proprietor of a Sunday newspaper, *Bell's Weekly Messenger*, and of the sporting paper *Bell's Life in London*.

Bell, John (1763-1820), anatomist and surgeon, *b.* Edinburgh, educ. at the High School there. Opened, 1790, a private school of anatomy; 1793, pub. his *Anatomy*; next *Discourse on the Nature and Cure of Wounds*, 1795; *Principles of Surgery*, 1801-8. He is regarded as the founder of surgical anatomy. He *d.* at Rome.

Bell, John (1811-95), sculptor, *b.* Hopton, Suffolk. Statues by him of Lord Falkland and Sir Robert Walpole were commissioned for the Houses of Parliament. The memorial to the guards who fell in the Crimea is also by B.

Bell, Joseph (1837-1911), surgeon, *b.* Edinburgh. He was surgeon to the Royal Infirmary and Royal Hospital for Sick Children, Edinburgh (1864), lecturer on clinical surgery (1879), and editor of the *Edinburgh Medical Journal*, 1873-96. His publs. are *Manual of Surgical Operations* and *Notes on Surgery for Nurses*. He was the prototype of Sir A. Conan Doyle's celebrated detective, Sherlock Holmes.

Bell, Robert (1800-67), journalist, *b.* Cork. He was educ. at Trinity College, Dublin, where with others he founded the Dublin Historical Society. In 1828 he became editor of the *Atlas* in London. The best-known of his works are *Lives of the English Poets* (2 vols.), 1839, and an annotated ed. of Eng. poets (24 vols.), 1854-7.

Bell, Robert (1811-1917), Canadian geologist, *b.* Toronto. He made topographical and geological surveys in nearly all parts of Canada; was medical officer, naturalist, and geologist to the *Neptune, Albert*, and *Diana* expeditions, 1884-97, and surveyed many rivers and lakes of the dominion. He pub. upwards of 200 reports and papers—mostly on geological, biological, and geographical subjects—together with folklore.

Bell, Robert Anning (1863-1933), artist and designer, *b.* London, and educ. at Univ. College School. His illustrations for books are notable, as also his stained-glass designs. He designed the mosaic panels in the Houses of Parliament and in Westminster Cathedral. A.R.A., 1914; R.A., 1922.

Bell, Robert Charles (1806-72), engraver, *b.* Edinburgh. His largest work was an engraving of 'The Battle of Prestonpans', after Sir Wm Allan. Between the years 1850 and 1872 a number of his best plates appeared in the *Art Journal*.

Bell, hollow, metallic, percussion instrument, in shape resembling a reversed cup, suspended by its apex, or 'crown.' It may be sounded by striking with a hammer, or suspending a clapper within it, and either pulling the clapper against it, or swinging the B., when the clapper will be caused to strike the B. by its own movement.

Bell-founding. B.s are made of a kind of bronze, known as B.-metal (q.v.). In early times, B.s were not cast, but were made of thin plates of hammered iron, riveted together. The B. called *Clog-an-zadhacha* *Phatraic* (the B. of Patrick's

will) at Belfast, mentioned in the *Annals of Ulster* as early as AD 552, is quadrangular in shape and of this primitive type, as are also some of the Scottish B.s. The small B.s. discovered by Layard in the palace of Nimrod, on the site of the ancient city of Nineveh, are made of copper and tin, in the proportion of 10-1. During the Middle Ages, the quantity of tin used was increased, to harden the alloy and provide B.s. of greater vibrance. In modern times the approximate ratio is 4-1 (see BELL-METAL). It was formerly thought that a mixture of silver with B.-metal sweetened the tone, but it has been proved that silver in any quantity is injurious to the tone of a B., great or small. B.s. have also been made of antimony, brass, steel, gold, and thick glass. B.s. cast of steel have a fair tone but a less sustained vibration, and give a higher note than a B. of similar size and weight in B.-metal. The casting of B.s. in England was originally practised in monasteries. It was then adopted as a trade by itinerant artificers.

The art of casting in England has undergone many changes since the Middle Ages. Then, B.s. were cast much as they are on the continent to-day, the process being as follows: after the initial design was prepared, 2 moulding boards were made, one a template of the inside shape, the other a template of the outside. The boards were bolted to a central pivot so that they could be revolved by hand, and a core mould was then made of brick work covered with clay, using the board for the inside mould as a guide to smooth off the clay. This was dried and with the outer shape board a replica of the B. was struck up on the core, in clay, and all decorative work applied to it in wax. This in turn was covered with a thick coating of clay strengthened with iron bands to withstand the pressure of the molten metal which it was later to hold. This was then dried, during which time the wax melted leaving its impression in the clay. The outer clay mould, or 'cope' was lifted off and the clay 'false' B. chipped away. The 2 moulds were then finally dressed and clamped together and the B.-metal run into the space previously occupied by the 'false' B. To-day, in place of the moulding boards, a template of the actual section of the B. is used and the two moulds made from it independently. The core is struck up on a brick foundation as before, while the 'cope' mould is prepared by striking up the clay inside a perforated iron moulding case. Apart from moulding technique, advances have been made in the tuning of B.s., particularly in the control of the partial or harmonic tones, of which the prin. are: (1) Hum-note (the deepest). (2) Fundamental note (an octave above the hum-note). (3) The minor third interval above the fundamental. (4) The fifth interval above the fundamental. (5) The nominal or octave above the fundamental. These at least must be correct to produce a good B. and others are sometimes brought under control. The tuning is done after casting by turning the B.s. on a boring machine and cutting the metal away from the inside.

While modern B. castings as such are no better than those produced 400 years ago, tonally B.s. produced to-day are far superior. The following are recognised to be fair proportions for a B.: the thickness of the edge to be between one-tenth and one-fifteenth of the diameter, and the height just over three-quarters of the diameter.

History of bells. Hand-B.s. or cymbals were employed by the Egyptians at the festival of Isis. Aaron and the Heb. high priests wore golden B.s. alternating with pomegranate knobs on the blue robe of the ephod. The Greeks used B.s. in their camps; and the Romans employed them to announce the hour of bathing, and as a signal to begin selling in the market-place. The introduction of B.-ringing into the Christian Church has been ascribed to Paulinus, Bishop of Nola in Campania (AD 353-431), probably because *nola* and *campana* are late Lat. words for B.; but the date of their introduction is a cent. later. They were introduced into Gaul about AD 500. In the 7th cent., Bede mentions a B. brought by Benedict from Italy for his abbey at Wearmouth, and says B.s. were used at Whitby Abbey at the time of the death of St Hilda, 680. Pope Sabinianus ordained the ringing of B.s. to announce canonical hours in 604. It appears that B.s. were not used in Switzerland and Germany for religious purposes till the 11th cent. For a long time B.s. were comparatively small, and were often only hand-B.s. The *Clog-an-eadhachta Phratraic*, already mentioned, is 6 in. high, 4 in. deep, and 5 in. broad. Larger B.s. began to be cast in the 13th cent. The largest B. in the world is the *Tsar Kolokol* of Moscow, which was cast in 1733. It is 20 ft 7 in. in height, 22 ft 8 in. in diameter, and weighs 432,000 lb. In 1737, owing to a fire, it was cracked while still in its casting pit, by water played on it. In 1837 it was raised after much trouble, and placed on an octagonal pedestal of granite. It is believed that the interior was used as a chapel for a time, the piece that came out when it cracked providing the door. Among other large B.s. are the *Amarapoora*, in Burma, 260,000 lb.; those at Roten and Vienna, each about 40,000 lb.; Montreal Cathedral, 28,560 lb.; 'Big Ben' of the Houses of Parliament, 30,000 lb.; Great Paul of St Paul's Cathedral, 37,500 lb.; and Great George of Liverpool Cathedral, 33,100 lb. The B.s. of Liverpool Cathedral are the heaviest in the world rung for change ringing. Great Tom of Oxford, which was originally a pre-reformation B. at Osney Abbey, was recast in its present form in 1680; weighing 14,000 lb., it was then the largest B. in England. Another B. of interest is the Liberty B. which proclaimed the U.S. Declaration of Independence on 4 July 1776. The original was cast at the Whitechapel Foundry but broke soon after it was hung; it was recast in Philadelphia, and was cracked again when being tolled for the death of Chief Justice Marshall. A Festival B. weighing 2352 lb. was cast for the 1951 S. Bank Exhibition, the process being televised

from the foundry; it now hangs at Kelvedon, Essex.

The uses of bells. B.s have been chiefly associated with ceremonies of a sacred character. In the Anglican and Rom. churches they are consecrated, have sponsors, are sprinkled with water, anointed, and receive names. Inscriptions on old B.s are of interest, and show that superstitious ideas prevailed as to the power of B.s over evil spirits, in dispelling storms, and putting an end to famine, pestilence, etc. The *Passing B.* was rung in order to terrify evil spirits from the dying body, as well as to admonish the living. By the 18th cent. tolling took place after death. The *Sanctus* or *Sacring B.* was rung during the celebration of mass. The *Pardon B.*, of pre-Reformation date, was tolled before or after service to call men to pray for the forgiveness of their personal sins. Other B.s, connected with religious services, are the *Gabriel* or *Ave B.*, the *Vesper B.*, and the *Bridal* or *Marriage B.* B.s were also employed for secular purposes. They were used as a call to arms, as a warning of danger, particularly of flood and fire, and by watchmen at night. The *Curfew B.*, supposed to have been introduced by William the Conqueror, was rung at eight o'clock as a warning to men that it was time to extinguish their lights and go to rest. It was abolished by Henry I in 1100. B.s were, and still are, attached to cows and sheep (usually only to the leader of the herd or flock), as a signal to the shepherd. These B.s or crotals are also attached to the front horse of a sleighing team in N. Europe, Russia, and N. America. The hanging of B.s, with wire connections, in houses was adopted during the 18th cent., but has been replaced by the electric B.

The ringing of B.s so as to admit changes was at one time a fashionable art, for the *School of Recitations or Gentleman's Tutor* (1684) has a chapter on 'Advice to a Ringer.' The first known work on the subject is *Tintinnologia*, pub. by Fabian Stedman in 1668. The muffled peal is effected by covering half the clapper with a cap of leather. The art of pealing B.s has been carried to great perfection in England. See also CAMPANOLOGY; CARILLON; CHIMES. See T. North, *English Bells and Bell Lore*, 1888; A. S. Pease, *Notes on the Uses of Bells among the Greeks and Romans*, 1904; J. J. Raven, *Bells of England*, 1906; E. Morris, *The History and Art of Change Ringing*, 1931; F. P. Price, *The Carillon*, 1933; H. B. Walters, *Church Bells*, 1937.

Bell, Book, and Candle, popular phrase used to describe solemn ceremonial excommunication as practised in the Church of Rome. The officiating ecclesiastic, after pronouncing his malediction, closes his book, throws a lighted candle to the ground, and tolls the bell as for the dead. The symbolic significance of the first 2 actions is that the anathematised person is removed from the book of life, and his soul is cast from the sight of God as the candle from the sight of men. See ANATHEMA.

Bell-bird, name given to sev. birds on account of their notes, but applied in particular to the Brazilian campanero, a species of Cotingidae. It is a white, frugivorous bird, and is noted for a long black fleshy appendage dotted with feathers which hangs from its forehead. When the bird utters its cry this caruncle becomes elongated.

Bell-casting, see BELL.

Bell-flower, name applied to different species of Campanula (q.v.).

Bell Island, in Conception Bay, near the S.E. extremity of Newfoundland. It is about 6 m. long by 3 m. broad. The soil is fertile, and there are rich deposits of hematite iron ore (estimated at 3,500,000,000 tons). The cliffs are rocky and imposing, some standing 400 ft high. The main tn is Wabana (pop. 7837).

Bell-metal, an alloy, composed of a mixture of copper and tin, used for making bells. There is from 18 per cent to 30 per cent tin, with 80 per cent to 70 per cent copper, the proportion of tin being larger in the case of small bells.

Bell Pepper, see GUINEA PEPPER.

Bell Rock, or *Inchcape Rock*, reef off the E. coast of Scotland, at the opening of the bay formed by the Red Head in Angus and Fife Ness, nearly opposite the mouth of the Tay. It is nearly 12 m. S.E. of Arbroath, and is about 2000 ft long. A lighthouse, 120 ft high, designed by Robert Stevenson and Rennie, was erected in 1807-11; a new light-room was built in 1902. The old tradition of the bell hung on a tree by the abbot of Aberbrothock (Arbroath) is celebrated in Southey's ballad, *The Inchcape Rock*.

Bella, Stefano della (1610-64). It. etcher, b. Florence. He was influenced by Callot, worked in France for Cardinal Richelieu, is noted for a graceful, mannered style. His etchings, which reached a high standard, probably number about 15,000.

Bella, It. tn, in Basilicata (q.v.), 16 m. NW. of Potenza (q.v.). Pop. 4000.

Bellac, Fr. tn, cap. of an arron., in the dept of Haute-Vienne. It is a picturesque tn, on a hill overlooking the valley of the Vienne. There are leather industries. Pop. 4300.

Belladonna, see ATROPA.

Belladonna Lily (*Amaryllis B.*), family Amaryllidaceae, the single species of its genus; native of Cape Prov. It is devoid of a corona, and is zygomorphic, in which it differs from its allies, the daffodil and snowdrop.

Bellagio, It. tn, in Lombardy (q.v.), beautifully situated on the promontory dividing the 2 arms of Lake Como (q.v.). It is a popular resort. Pop. (tn) 1400; (com.) 3000.

Bellamy, Edward (1850-98), Amer. social reformer and author, b. Chicopee Falls, Massachusetts. He studied in New York and Germany. He attracted attention by *Looking Backward, 2000-1887*, in which book he pictured life under socialistic conditions. In 1897 *Equality*, sequel to *Looking Backward*, was pub.

Bellamy, George Anne (c. 1727-88), actress, illegitimate daughter of Lord

Tyrawley; educ. at a Fr. convent. She lived with her mother in London, and associated with Mrs Woffington and Garrick. She became a famous actress, and, till 1770, played in London, Edinburgh, and Dublin. Her extravagance and licence, which were as renowned as her career was brilliant, caused her sorrow and poverty in her later years. Released from the debtors' prison in 1785, she pub. her *Apology*.

• **Bellamy, Jacobus** (1757-86), Dutch poet, b. Flushing of poor parents. His first verses, *Gezangen mijner jeugd*, 1782, and *Vaderlandsche Gezangen van Zeelandus*, 1782-3, expressed his love for his native country. Aided by wealthy admirers, he went to Utrecht, with the intention of studying divinity. These studies, however, he soon left for the pursuits of literature. He gained great popularity, especially with his verse romance *Toosje*, 1874. See J. A. Nijland, *Leven en Werken van J. Bellamy* (2 vols.), 1918.

• **Bellarmino, Robert** (Roberto Francesco Romolo Bellarmino), St (1542-1621), It. prelate, b. Tuscan. He entered the Society of Jesus in 1560; was ordained priest at Ghent by Jansenius in 1569, and appointed prof. of theology at the univ. of Louvain the year after; having filled this chair for 7 years he went to Rome in 1576; created cardinal, 1599; Archbishop of Capua, 1561-5. He then became chief theological adviser to the Pope. A model of Christian asceticism, and one of the greatest theological controversialists of the Rom. Church. Canonised 1930; declared a doctor of the Church 1931. Among his most important works are his *Disputationes de Controversiis Christianae Fidei* (3 vols.), 1581, 1582, 1583, *De Potestate Summi Pontificis*, and *De Scripioribus Ecclesiasticis*. See J. Brodrick, *The Life and Work of Blessed Robert Bellarmine* (2 vols.), 1928.

• **Bellary**, tn of Mysore State, India. The tn is 300 m. from Madras by rail, and was formerly a military station. The fort, built on a bare granite rock, rises abruptly from the plain to the height of 450 ft. A high point opposite it is called the Copper Mt.; Hyder Ali is said to have worked it, but found the expense exceeded the profit.

• **Bellasis, Edward** (1800-73), Eng. serjeant-at-law. He was educ. at Christ's Hospital, and was called to the Bar in 1824. He became serjeant-at-law in 1844. From 1833 to 1845 he was interested in the Oxford Movement, and became acquainted intimately with Newman, Pusey, Ward, and Manning. He left an interesting autobiography and a number of theological treatises, besides taking a prominent part in the controversy aroused by the bull of Pius IX in 1850, in which year he became a Rom. Catholic.

• **Bellatrix (γ Orionis)**, white star of the second magnitude in the shoulder of Orion, and W. of Betelgeuse (q.v.).

• **Bellay, Joachim du** (1525-60), Fr. poet, b. Liré, near Angers, of a noble and powerful family. He studied law and humanities at the Collège de Coqueret with Ronsard, Baif, and others. In 1549 he pub. his *Déffence et illustration de la langue*

françoise, the manifesto of the Pléiade poets, advocating the use of French, but made a worthy vehicle of expression by modelling it on Greek and Latin. In the same year appeared a series of love sonnets, *L'Olive*, which, however, are too Petrarchan in inspiration. From 1553 to 1557 he was in Rome as secretary to his cousin, the ambas. Jean du B. On his return he pub. his *Antiquités de Rome*, and *Les Regrets*, the latter his best and most characteristic work, a collection of sonnets expressing his longing for Franco and his native Anjou, and satirising the corruption of modern Rome. His poems reveal a melancholy mind which muses on the flight of time and the passing of human greatness, a melancholy increased by his growing deafness. His poetry, like Ronsard's, is the spontaneous expression of a lyrical genius, but Du B. is perhaps the more sincere poet, and might, had he lived longer, have surpassed his friend. His other works include *Divers jeux rustiques*, 1558, *Le poète courtois*, 1559, and 4 books of Lat. poems. See A. Chamard, *Joachim du Bellay*, 1900, and J. Vianey, *Les 'Regrets' de Du Bellay*, 1930.

• **Belle Alliance**, name of a farm, the centre of the position of Napoleon's army at the battle of Waterloo. It lies 13 m. S. of Brussels. Wellington and Blücher met here. The battle of Waterloo is known as that of B. A. by the Germans.

• **Belle-Ile-en-Mer**, is. of France, dept of Morbihan, in the Atlantic Ocean, 8 m. S. of Quiberon Point. Its length is nearly 12 m. and its greatest breadth about 7 m. The chief industry is pilchard and sardine fishing; fine draught-horses are reared, and the soil is fertile and well cultivated. Adm. Hawke defeated the Fr. fleet under Conflans off the coast in 1759; the is. was captured by the English in 1761, but restored to France 2 years later. The chief tn is Le Palais. Pop. 2200.

• **Belle-Isle, Charles Louis Auguste Fouquet** (1684-1761), Fr. marshal, a grandson of the intendant Fouquet, b. Villefranche. After distinguishing himself in the wars of the Sp. Succession, he was made governor of Metz and a marshal of France. He, with Broglie, had command of the forces in the war of the Austrian Succession, and stormed Prague in 1741. In the year following he led the brilliant retreat to Eger. He became minister of war in 1758.

• **Belle Isle**, is. in the Atlantic, lying between Newfoundland and Labrador, about 15 m. from either coast. Area about 15 sq. m. There is a lighthouse, 470 ft high, visible at a distance of 28 m.

• **Belle Isle, Strait of**, channel between Newfoundland and Labrador, forming an entrance to the Gulf of St Lawrence from the Atlantic Ocean; it is the main route from Great Britain to the St Lawrence R., but during the winter months it is blocked with ice. It is about 80 m. in length, the breadth varying from 10 to 18 m.

• **Belleau, Rémy** (c. 1528-77), Fr. poet, member of the Pléiade, b. Nogent-le-Rotrou. He was tutor to Charles, Marquis d'Elbeuf, who, under B.'s tuition, became a noted patron of the muses. He

produced the first Fr. trans. of Anacreon and achieved celebrity by his *Amours et nouveaux échanges des pierres précieuses*, 1576, describing the properties of precious gems. His chief work, however, is *La Bergerie*, 1565, a prose and verse pastoral in imitation of Sannazaro. His *Avril* is a stock item in Fr. anthologies. See D. Dolacourelle, *Le sentiment de l'art dans la "Bergerie"*, 1945.

Belleau Wood, forest to the NW. of Château-Thierry in France. At Château-Thierry Amer. troops took a large share in preventing the Germans from advancing across the Marne towards Paris in May-June 1918. As a continuation and part of that battle came the intense fighting in B. W., where the offensive was undertaken by the 2nd Div. of the Amer. Expeditionary Force. This was largely made up of the U.S.A. Marines and of regiments from the regular U.S.A. Army. After nearly 3 weeks of intensive fighting, in which their losses were severe, the Americans cleared the Germans and their machine-gun nests out of the forest, and not only held it, but also the little tn of Vaux.

Belleek, vil. of co. Fermanagh, N. Ireland, on the Donagall border, which gives its name to the B. china made there. Pop. included in rural dist. of Irvinestown (q.v.).

Bellegarde: 1. Fortress, situated on a peak, 1380 ft above the sea, in the dept of Pyrénées-Orientales, France, on the Sp. border, 17 m. S. of Perpignan. Philip III of France (q.v.) was defeated in the neighbourhood by Peter III of Aragon (1285). The fortress was captured by the Spaniards in 1793, but was retaken, 1794.

2. Fr. tn in the dept of Ain, at the confluence of the Rhône and the Valserine. The Génissiat dam near by, part of a hydro-electric scheme, is one of the largest in Europe. Pop. 5400.

Bellême, Robert, Earl of Shrewsbury, fl. 1098. Anglo-Norman noble, knighted by William the Conqueror in 1073. During Rufus's reign he became the most powerful lord in the realm and became Earl of Shrewsbury in 1098. He rebelled against Henry I, and in 1102 he lost his Eng. estates and returned to Normandy. He d. in prison, to which he had been committed by Henry I.

Bellême, or Bellesme, Fr. tn in the dept of Orne. It has a market. To the N. is the small forest of B. where there are some mineral springs. Pop. 1700.

Bellenden, John (c. 1533-c. 1587), translator, educ. at St Andrews and Paris. His *Chroniklis of Scotland*, 1536, is a free trans. of the *Historia Gentis Scotorum* of Roce (q.v.), and is the earliest existing specimen of Scottish literary prose; B. also trans. the first 5 books of Livy. He enjoyed the royal favour, and became archdeacon of Moray.

Bellenden, Sir John (d. 1577), courtier, eldest son of Sir Thomas B. of Auchinvoile. In 1547 he was made a lord of session by the queen regent. In 1551 Mary Queen of Scots appointed him one of her privy council, and he was believed to be implicated in the murder of the queen's favour-

ite, Rizzio; he fled from Edinburgh, but was soon restored to favour, and supported the queen's marriage with Bothwell.

Bellenden, William, Scottish classical scholar, and writer on Cicero, who fl. in the early part of the 17th cent. He held a chair at the univ. of Paris, and was favoured by James I of England.

Bellerophon, son of Glaucus, King of Corinth, and Eurymede (Homer, *Iliad*, vi). His name was changed to B. from Hipponous, after having killed Bellerus by accident. He was sent for ritual purification to Proetus, King of Argos, and unwittingly won the love of Antea, his wife. He spurned her advances, whereupon she sought to turn her husband against him. Proetus sent him to Iobates, King of Lycia, with sealed instructions to put B. to death. Iobates, unwilling to kill him directly, imposed upon him the impossible task of killing the monster Chimaera. But by the aid of Pallas, who gave him the winged horse Pegasus, he succeeded. He defeated the Amazons, and cut down the Lycian ambuscade, which Iobates had set to kill him. Thereupon the king gave him his daughter Philonoe in marriage. See Wm Morris, *The Earthly Paradise*.

Belles-lettres, term borrowed by the English and other languages from the French, signifying any writing of a refined or elegant character, but more particularly applied to essays, poetry, and criticism.

Belleville: 1. E. dist. of Paris, formerly a vil.

2. Tn of Essex co., New Jersey, U.S.A., 3½ m. NE. of Newark. It manufs. leather, machinery, tools, electrical equipment, chemicals, and food products. Pop. 32,019.

3. City and co. seat of St Clair co., Illinois, U.S.A., railway centre near E. St Louis. It manufs. stoves; clay, metal, and enamel products; clothing, chemicals, etc.; coal-mines and clay and sand deposits are found near by. Pop. 32,700.

4. Tn in Ontario, Canada, on the Bay of Quinte and the Moira R. The Albert Univ. was founded here in 1857. Pop. 20,658.

Bellevue, Fr. tn in the dept of Seine-et-Oise, part of the com. of Meudon (q.v.). It grew up around a château, now destroyed, built by Madame de Pompadour (q.v.). Pop. 5000.

Bellew, Harold Kyrle (1857-1911), actor, b. Prescott, Lancs; entered the navy, and later went to Australia, where he first appeared on the stage in 1874. In 1878 he joined Henry Irving's company at the Lyceum, and in 1879 Marie Litton's at the Imperial. Later he formed a touring company with Mrs Brown-Potter. The partnership broke up in 1898, when he appeared successively at the Criterion and Lyceum.

Belley, Fr. tn, cap. of an arron., in the dept of Ain. It was the ant. cap. of Bugey (q.v.), and is a bishopric. Brillat-Savarin (q.v.) was b. here. There are leather and printing industries. Pop. 5300.

Belli, Giuseppe Gioachino (1791-1863), It. satirical poet, b. at Rome. Most of his poetry is written in the Rom. dialect, and is directed against Rom. society. See *I sonnetti romaneschi* (6 vols.), 1886-9, ed. by Morandi.

Belligerents, Rights and Duties of. The conduct of war involves the relations first between the 2 parties engaged in the war, the B., and secondly between either or both of those parties and neutrals. (See NEUTRALITY and CONTRABAND.) By the Articles of the Hague Convention, 1907, the armed forces of the B. must alone carry on the war, and to them alone do the rights, duties, and laws of war apply; besides the regular army, militia, or volunteer forces, may be regarded as belligerent troops, and not as mere marauders, only if they are commanded by someone responsible for his men's acts, carry emblems distinctive and recognisable at a distance, carry arms openly, and conduct war in accordance with accepted laws and customs. The last 2 conditions will suffice when the pop. of an invaded country take up arms and have not time to organise under the other conditions. Enemy property on land, where it belongs to the state, can be seized by an army of occupation; also all appliances for transmission of news, persons, or goods and munitions of war belonging to private persons can be seized, but must be returned with compensation after peace. Private property on land is not immune in war. Enemy private property on sea is also liable to capture and confiscation. It is forbidden to use poison or poisoned arms; to kill or wound persons belonging to the enemy nation or forces treacherously, or those who have surrendered at discretion; to declare 'no quarter' shall be given; to use arms or projectiles, etc., which will cause superfluous injury; to use flags of truce, enemy's flags or uniforms, or red-cross badges improperly; to bombard undefended places or dwellings, except on a refusal after formal summons to furnish supplies; to destroy and seize property except when urgently necessary for purposes of war; or to pillage a tn or place, even if taken by assault.

Prisoners of war must be treated humanely; they are in the power of the enemy's gov., not of those that took them; they may be confined, but only as a measure of necessity; they may be authorised to work, but not for any purpose of the war; they are treated on the same footing as the soldiers of their captors in respect of food, etc. Escaped prisoners are subject to punishment if caught before rejoining their own army or before leaving the country occupied by their captors; if captured a second time after escaping successfully, they are not liable to punishment for first escape. A prisoner released on parole and recaptured bearing arms forfeits his rights as a prisoner of war. For treatment of sick and wounded in war see GENEVA CONVENTION; it may be noted that the Hague Convention, 1907, drew up rules on the lines of the Geneva Convention for the conduct of hospital ships and the treatment of sick and

wounded in naval warfare. Although the great powers had been formulating international law for the half cent. before the First World War no opportunity had occurred for testing the various agreements reached, and finding out by actual experience their working value. One feature of the First World War was the invention and use of new weapons (e.g. tanks), yet no international agreement was reaching adapting the use of them to the general principles of international law already estab. The blockade of Germany caused Great Britain to declare by proclamation that she attached enemy character to companies, wherever incorporated, carrying on business in enemy country. Direct trading with the enemy was forbidden, but this did not prevent indirect trading via neutrals, and in order to stop this the 'Trading with the Enemy (Extension of Powers) Act, 1915' prohibited persons resident in U.K. from trading with persons in neutral countries likely to have association with the enemy. Internment of enemy subjects was dealt with variously in practice. Great Britain, France, Italy, and U.S.A. gave enemy subjects a certain time to leave their ter., but Germany and Austria detained all enemy subjects at the outset, but later released those not of military age. Enemy subjects allowed to remain in belligerent states were also treated variously; in Great Britain, France, and Germany they were interned; in the U.S.A. they had a fair measure of freedom, and in Japan no restrictions were imposed. The Hague Conference in 1907 agreed that merchant ships in enemy ports should be given some days' grace to clear from those ports, but Article 6 provided that the convention should only be applicable to a war in which all the B. were parties to it. Neither Italy, Serbia, nor U.S.A. came within this category. Germany offered days of grace to Great Britain, who replied with a counter-offer, to which no reply was received. The term 'merchant ships' in the convention was also debated. Great Britain held that it did not apply to tugs and lighters used in a port or to pleasure yachts, but Germany adopted the opposite view. The distinction between armed forces and the civil pop. is now disappearing owing to (a) the organised employment of a nation's manpower, (b) the employment of aircraft for bombing civilians as well as troops, (c) the inability of democratic govts. to conduct war without the active support of the electorate they represent, (d) the importance of conducting an economic war. Under the Washington Treaty, 1922, Great Britain, France, Italy, Japan, and U.S.A. agreed not to use any kind of gas, but this treaty is no longer operative. It was hoped, through the League of Nations, to postpone recourse to war in disputes between nations by the procedure under the Covenant of the League. Under the Covenant (q.v.) the members of the League agreed 'that if there should arise between us any dispute likely to lead to a rupture, we will submit the matter either to arbitration or to inquiry by the Council, and . . . in no case resort to

arms until 3 months after an award has been made by the arbitrators or a report has been made by the Council.' This procedure was intended to delay the opening of hostilities, and permit of the dispute being considered by a third party. But the arbitrary action of the 'totalitarian' powers, as illustrated by the Jap. invasion of China, the It. invasion of Abyssinia, and the Ger. seizure of Austria and Czechoslovakia, went far to destroy this hope even before the outbreak of the world war in 1939. The events of the war weakened the validity of much international law in so far as it concerned the rights of B. Nevertheless, the Hague Convention retained an authority on which could be based much of the prosecution of the war criminals at the trials conducted at Nuremberg in 1946. Even the defence had recourse to them. For instance, according to the evidence of Kottel (former chief of staff of the Ger. Army), Hitler gave Himmler plenary powers as Reichsführer of the S.S. so as to enable it to become a factor in the direction of the war against Russia by the side of the *Wehrmacht* on the 'legal thesis' that the Soviet Gov. had not ratified either the Hague rule of land warfare or the Geneva Convention (q.v.), and had thus knowingly and willingly exempted themselves from the rules of international law.

Bellincioni, Gemma (1864-1950), It. soprano singer, b. Como. She is remembered particularly for her interpretations of Santuzza in *Cavalleria rusticana*, of Violetta in *La Traviata*, and of Salome in Strauss's opera. She began by playing light and comic parts. Tamberlik, the tenor, noticing her ability, engaged her to tour with him abroad. Also established herself as an actress in stage plays, the *Dame aux Camélias* being one of her most marked successes. Pub. *Io ed il Palcoscenico* (Myself and the Stage), Milan, 1920.

Bellingham: 1. Markt tn of Northumberland, England, on the l. b. of the R. Tyne. The church dates from the 11th cent. and has a roof of hexagonal stone ribs overlaid with slabs of stone which is believed to be unique. Near by is the site of the battle of Otterburn (q.v.). Pop. 1300.

2. City of Whatcom co., Washington, U.S.A., on B. Bay, 80 m. N. of Seattle; an important shipping centre. Prin. industries: saw-milling, salmon canning; manufs. tin cans and machinery. Pop. 34,112.

3. Dist. in the E. of the bor. of Lewisham, London, with a large L.O.C. housing estate.

Bellingshausen, Fabian Gottlieb von (1778-1852), Russian naval officer and explorer, b. Oesel Is., Livonia. Entered Russian Navy in 1797. In 1803 he circumnavigated the world, and, later, led a Russian expedition to the Antarctic, reaching as far S. as 70° S. lat. He was present at the battle of Varna, 1828.

Bellingshausen Sea, portion of the Antarctic Ocean, SW. of Drake Strait and W. of Graham Land. It is named after the Russian explorer (q.v.).

Bellini, Gentile (c. 1429-1507), It. painter, eldest son of Jacopo B., b. Venice. He was trained by his father and was much employed in Venice on scenes from the city's history. His love of ceremonial scenes appears in his 'Procession in the Piazza San Marco' (Accademia, Venice). In 1469 he was made Count Palatine by the Emperor. Some of B.'s pictures were taken to Constantinople, and Mohammed II invited the artist to his court. He was courteously received by the sultan, who sat to him for his portrait, and commissioned him to paint various historical works. Among them was the 'Decoliation of St John'; this picture was admired by Mohammed, who pointed out some inaccuracy in the marking of the dis severed neck; and, in order to prove the justice of his criticism, he ordered the head of a slave to be struck off in the presence of the artist. From this moment B. never enjoyed an hour's tranquillity until he had obtained leave to return to Venice. Mohammed, whose portrait he painted (National Gallery), dismissed him with marks of favour, placing a gold chain round his neck and giving him letters to the Venetian senate expressive of his satisfaction. He was engaged in various public works after his return to Venice, for which he was requited by the rep. with an honourable pension for life and the order of St Mark. His 'St Mark preaching at Alexandria' (now in the Brera Gallery, Milan) was left to be finished by his brother Giovanni (q.v.).

Anderson

GIOVANNI BELLINI

Self-portrait in the Uffizi Gallery, Florence.

Bellini, Giovanni (c. 1422-1516), It. painter, the son of Jacopo and the brother of Gentile B., b. Venice. He contributed perhaps more than any painter

of his time to the creation of the great Venetian school. From Mantegna (q.v.) he acquired firm design (as in the National Gallery 'Agony in the Garden') and from Antonello da Messina (q.v.) richness in colour. He ornamented the public edifices and churches of Venice and other cities of Italy with a prodigious number of paintings, had many pupils and followers, and continued his labours to a very advanced age. Some of his small pictures are in England; but it is only by his large works in Italy that a full idea of his power can be formed. See G. Gronau, *Klassiker der Kunst, Bellini*, 1930.

Bellini, Jacopo (c. 1400-70), It. painter, b. Venice, was one of the earliest artists in oil painting, and his works had considerable merit and influence. He painted portraits and frescoes. A few of his works survive, but his manner is best judged from the book of his sketches, which is in the Brit. Museum. He is better known as the father of Gentile and Giovanni B. (q.v.), and the father-in-law of Mantegna (q.v.).

Bellini, Laurentio (1643-1703), It. physician, b. Florence. After receiving in his native place the elements of a classical education, he proceeded to Pisa, where he made such progress in his studies that, when only 20 years of age, he was appointed prof. of philosophy and of theoretical medicine. He taught anatomy and practised medicine at Pisa, with great success, for 30 years, when he was invited to Florence and made chief physician to the Grand Duke Cosmo III. His best work is the treatise *Gustus organum novissime deprehensum* (Bologna, 1665), in which he pointed out the papillae of the tongue to be the essential organs of taste. He discovered and described the straight tubules of the kidney named after him (*De structura et usu renum*, Florence, 1662). His works were collected and pub. in 2 vols. (Venice, 1708, reprinted 1732).

Bellini, Vincenzo (1801-35), It. operatic composer, b. Catania, Sicily, and descended from a family of musicians. Entered the Neapolitan conservatoire, studying under Zingarelli. Wrote a cantata and some masses. His first opera, *Adelson e Salvini*, was performed in 1824 at an obscure theatre in Naples, but his second, *Bianca e Gerardo*, produced in 1826 at the San Carlo, Naples, made his name. The following year he wrote *Il Pirata* for the Scala of Milan; and this was succeeded by *La Straniera*, at the same theatre. The more familiar of B.'s operas are *I Capuletti ed i Montecchi*, 1829, based on *Romeo and Juliet*, in which the part of Romeo became a favourite of the great contraltos of 6 or more decades; *La Sonambula*, 1831, *Norma*, his best and most serious work, 1831, and *I Puritani*, written for the It. opera in Paris in 1835 and influenced to some extent by Fr. music. He received a commission to write a work for the Paris Opéra, but while studying Fr. verse and prosody for this work he was seized with a sudden and fatal illness. He wrote flowing melody, and gave the voice every opportunity to reveal its natural charm and its acquired technique. His

popularity soon after his death was enormous.

Bellinzona, cap. of the canton of Ticino, Switzerland, 8 m. ENE. of the head of Lago Maggiore, commanding the St Gotthard route. B. played a considerable part in the early cents. AD, being a key to sev. Alpine passes. It has 3 old castles, and railway repair shops. Pop. 12,600, Italian-speaking.

Bellis, family Compositae, genus of ann. to perennial herbs, 15 species. *B. perennis* is the Daisy (q.v.), a native weed of grassland, but with sev. cultivated garden forms.

Bellmann, Carl Michael (1740-95), Swedish poet, b. Stockholm. He studied at the univ. of Upsala. At first a civil servant, he was enabled to devote himself entirely to literature by the liberality of Gustavus III, who appointed him to a nominal office, with the title of secretary of the court. His first literary efforts were religious poems. But his reputation rests on his lyrics, which he himself set to music, especially *Fredmans Epistlar* and *Fredmans Sångar*, written between 1768 and 1774. His poems give a vivid picture of Stockholm, often peopled by rogues and drunkards. His realism is combined with humour and a supreme technical skill. B. is one of the few Swedish poets of universal importance. See H. W. Van Loon and G. Castagnetta, *C. M. Bellman, the last of the Troubadours*, 1939; A. Ståhlhane, *En Bellmans bok*, 1947; C. Elling, *Bellmaniana*, 1947; A. Blanck, *C. M. Bellman*, 1948.

Bello, Francesco (c. 1450-1505), It. epic poet, known as Cieco da Ferrara on account of his blindness. Lived in great poverty at Mantua and Ferrara. His *Il Mambriano* (45 cantos), dealing with the romantic and chivalrous adventures of an oriental potentate, had a considerable influence on Ariosto's *Orlando Furioso*.

Belloc, Joseph Hilaire Pierre (1870-1953), poet, essayist, and historian, b. La Celle, Saint-Cloud, son of Louis Swanton Belloc, advocate. He was, as a Rom. Catholic, educ. at the Oratory School, Edgbaston, under Newman, and afterwards served for a year as a driver in the Fr. artillery. After a brilliant career at Oxford, where he took first-class honours in hist., and was President of the Union, he became a naturalised Brit. subject in 1902. In 1906 he was elected M.P. for S. Salford as a Liberal. Becoming disillusioned with Eng. politics, he retired from Parliament, 1910; and, in conjunction with Cecil Chesterton, estab. in 1911 the *Eye-Witness*—afterwards the *New Witness*. His numerous writings range from political pamphleteering to works of serious historical study, and although his reputation may be said to be mainly that of a historian, his name is also estab. as a poet and essayist. In addition, he wrote some 16 novels, nearly all of which were illustrated by G. K. Chesterton. As an essayist he has an engaging style, and the easy variety of his choice of subject is shown in *Hills and the Sea*, 1906, *On Nothing*, 1908, *On Everything*, 1909, *On Something*, 1911, *This and That and the*

Other, 1913. Sev. other vols. of essays followed, among which may be mentioned *Essays of a Catholic Layman in England*, 1931. His historical and biographical works were written from the point of view of a Catholic controversialist, and he looked at Eng. hist. in particular with the eye of a continental writer. His major historical works are *History of England, 1688-1910* (vol. xi of Lingard's *History*), 1914, *The Last Days of the French Monarchy*, 1916, *Europe and the Faith*, 1920, *The Campaign of 1812 and the Retreat from Moscow*, 1924, *A History of England* (4 vols.), 1925-31; *Six British Battles*, 1931, *The Tactics and Strategy of the Great Duke of Marlborough*, 1933, *A Shorter History of England*, 1934, and *Monarchy: a Study of Louis XIV.*, 1938. B.'s biographical writings include studies and lives of Danton, 1899, Robespierre, 1901, Marie Antoinette, 1909, James II, 1928, Joan of Arc, 1929, Richelieu, 1929, Wolsey, 1930, Cranmer, 1931, Napoleon, 1932, Charles I, 1933, William the Conqueror, 1933, Cromwell, 1934, and Milton, 1935. He also wrote a number of books which sprang from his enthusiasm for travel and his love of places. They include *The Historic Thames*, 1907, *The Stane Street*, 1913, and *The Cruise of the 'Nona'*, 1925; and the same spirit animates many of his essays, while the best known of his books, *The Path to Rome*, 1902, is the story of a journey by road from the N. of France through Switzerland to Rome. Among his writings on contemporary politics, *The Party System*, 1911, with Cecil Chesterton, and *The Servile State*, 1912, should be mentioned, and in a lighter vein *But Soft—we are observed!*, 1928. His first financial success was in the different field of books for children with *The Bad Child's Book of Beasts*, 1896, followed by *More Beasts for Worse Children*, 1897, *Cautionary Tales for Children*, 1908, and *New Cautionary Tales*, 1930. B. also ranks high as a poet of both serious and light verse, and pub. 4 vols. of verse between 1896 and 1923, also *The Chanty of Nona*, 1928, and *Ladies and Gentlemen*, 1932. His latest works were *The Great Heresies*, 1938, and *The Last Rally*, 1940. The official biography is by Robert Speaight, 1957; see also a study by J. B. Morton, 1955.

Belloc Lowndes, Marie Adelaide (1868-1947), novelist; only daughter of Louis Belloc and sister of Hilaire Belloc. Educ. at Mayfield convent, Sussex, she married, 1896, Frederick Sawrey Lowndes. Her novel, *The Heart of Penelope*, was pub. in 1904, and after that she estab. her reputation as a teller of stories with exciting incident combined with psychological interest. Among the best known are *Barbara Rebell*, 1905, and *The Lodger*, 1913, the latter being trans. into a number of foreign languages. Her play, *With All John's Love*, was produced in 1932, and was followed by 2 others. She was also the author of 3 vols. of memoirs, *I too have lived in Arcadia*, 1941, *Where Love and Friendship dwelt*, 1943, and *The Merry Wives of Westminster*, 1946.

Bellona, the Rom. goddess of war, sister

or wife of Mars. During the Samnite war (296 BC) Appius Claudius vowed a temple to her, afterwards erected (293 BC) in the Campus Martius.

Bellet, Joseph René (1826-53), Fr. naval officer and Arctic explorer, b. Paris. He won the cross of the Legion of Honour in the Fr. expedition against Tamatave in 1845. In 1851 he joined the party in search of Sir John Franklin under Wm Kennedy. In Mar. 1853 he was drowned while on the expedition under Capt. Inglefield. An obelisk at Greenwich commemorates him. His memoirs and jour. were pub. in English in 1855. See *Polar Record*, No. 39, 1950.

Bellet Strait, sea channel between N. Somerset Is. and Boothia Felix, N. Canada; discovered by Joseph Bellet.

Bellows, Albert F. (1829-83), Amer. landscape painter, b. Milford, Massachusetts, studied and painted in France, Belgium, and England. His early work was in oils, but later he turned to water-colour. Among his works are 'Afternoon in Surrey', 1868, and 'Sunday in Devonshire', 1876.

Bellows, see BLOWING-MACHINE.

Bellows-fish, see CENTRISCUS.

Bellou, Dormont de (real name **Pierre Laurent Buirette**) (1727-75), Fr. dramatist and actor, b. Saint-Flour in Auvergne. He was intended for the legal profession, but he preferred the stage. He played principally at St Petersburg. His tragedy, *Tibris*, which was introduced in France in 1758, was a failure, and thus disappointed B. returned to Russia. His next play, *Zelmire*, in 1762, and *Le Siège de Calais*, in 1765, were successful when produced in Paris. He was mainly responsible for the innovation of having Frenchmen as heroes of plays, rather than figures from classical hist. and legend.

Bells, nautical term, used in describing the time. See **WATCH**.

Bells, Electric, see ELECTRIC BELLS AND ALARMS.

Bellshill and Mossend, tn of Lanarkshire, Scotland, 4 m. NE. of Hamilton. At Mossend are extensive steelworks. Combined pop. 21,500.

Belluno, Duke of, see VICTOR, PERRIN CLAUDE, DUKE OF BELLUNO.

Belluno: 1. Prov. of Italy, in N. Veneto (q.v.). It is in the Alps (q.v.), and is bounded by Austria on the N. In the W. are peaks of the Dolomites (q.v.). There are many steep valleys of the Piave and its triba. The prin. tns include Belluno and Feltr (qq.v.). Area 1450 sq. m. Pop. 242,000.

2. (Anct. **Bellunum**), It. tn, cap. of the prov. of Belluno, on a spur above the Piave, 48 m. N. of Venice (q.v.). It has a 16th-cent. Palladian cathedral, the façade of which is still unfinished. There are silk and wax industries, and a trade in agric. produce, timber, and fruit. Pop. 29,000.

Bellunum, see BELLUNO.

Belmez, Sp. tn in the prov. of Córdoba, in a coal-mining dist. Pop. 12,000.

Belo Horizonte, cap. of the state of Minas Geraes, Brazil; formerly (before 1897) called Curral del Rey. The neighbourhood produces gold, manganese, and

iron, coffee, grapes, malze, etc. It has a univ., textile mills, and the metal industry is well represented. It was the scene of fighting in the Civil war of 1930. Bp. of President Kubitschek. Pop. 346,200.

Beloit, city of Wisconsin, U.S.A., on the Rock R. at the Illinois state line, in dairying area. It manufs. paper-making and woodworking machinery, Diesel engines, and agric. implements. It is the seat of B. College and the L. Wright Art Hall. Pop. 29,600.

Belon, Pierre, Fr. botanist, b. in a par. of the Fr. prov. of Maine c. 1517. Nothing is known concerning his family. Medicine and botany were his studies at a very early period of his life. He visited Germany, Bohemia, Italy, Greece, Egypt, Palestine, and Asia Minor, and appeared in Paris, after 3 years of absence, in 1550, with an extensive collection, which he arranged, and from which he proceeded to pub. various works. In 1557 he traversed Italy, Savoy, Dauphiné, and Auvergne. In 1564 he was murdered in the Bois du Boulogne as he was returning to Paris.

Belorussia, or White Russia (Belorussian *Belarus'*), constituent rep. of the U.S.S.R., situated in the W. of the country, adjacent to the Polish border. It lies in the W. part of the Russian plain and is traversed from SW. to NE. by the Belorussian moraine upland with lowlands in the N. and NW. (W. Dvina and Niemen valleys) and in the S. (the Dnieper and Pripyet lowland, *see* POLES'YIE). B. has a moderate humid continental climate. About one-quarter of the area is covered by mixed forests, about 10 per cent by marshes. B. has large peat deposits, but little else of mineral resources. Area 80,100 sq. m.; pop. (1956) 8,000,000, mostly Belorussians (four-fifths of total pop.) and Russians (since 16th cent.), before the Second World War also many Jews and Poles (both since 14th cent.). There are engineering, wood-processing, food, and light industries, coarse grain, potato, and flax growing, dairy farming, and hog raising. The prin. tns are Minsk (cap.), Gomel', Vitebsk, Mogil'ev. B. is divided into 7 administrative Oblasts: Brest, Gomel', Grodno, Minsk, Mogil'ev, Molodechno, and Vitebsk. In the 9th cent. AD the whole area of B. was inhabited by the Russian (E. Slav) tribes Krivichi, Dregovich, Polochane, Radimichi, and Buzhane, all of whom fell under the sway of Kiev (*see* KIEVAN RUSSIA). An early local centre of authority developed in Polotsk (q.v.). The weakening of Kiev in the 12th cent. resulted in the emergence of the new principalities of Turov-Pinsk, Smolensk, and Volhynia (q.v.). In the 13th-14th cents. all these were incorporated into the Grand Duchy of Lithuania. In the Polish partitions of 1772-95 all B. was annexed by Russia, but in 1920-39 W. B. once again belonged to Poland. In both world wars B. was the scene of bitter fighting and suffered greatly. In the 19th cent. B. was affected by the Polish uprisings of 1830 and 1863, in which not only the Polish or Polishised gentry but also a

section of the Belorussian peasantry took part. Later the Populist (*see* POPULISM), the Social Democratic (*see* BUND), and the Zionist (*see* ZIONISM) movements were strong in B. From the beginning of the 20th cent. demands for the territorial autonomy of B. began to be voiced by the Belorussian Revolutionary (later Socialist) Hromada, which failed, however, to attract much support. The Bolshevik seizure of power in 1917 was followed by a struggle between Bolshevik, Ukrainian, Polish, and Belorussian organisations and units of the Russian W. Front, by Ger. occupation in 1918 under which an independent Belorussian rep. was

'Soviet Weekly'

A BELORUSSIAN FOLK-DANCE

proclaimed, and by the Polish occupation in 1920 marked by Jewish pogroms. After an attempt in 1919 to set up a united Lithuanian-Belorussian Soviet rep. the Communists estab. In 1921 a small Belorussian rep., which in 1922 became a constituent rep. of the U.S.S.R. Its area was increased 1924-6 by the inclusion of the neighbouring ters. to the E., and in 1939 by the inclusion of W. B. During the Nazi occupation 1941-4 B., together with the Baltic States, belonged to the Reich Commissariat 'Ostland.' As in many other national reps. of the U.S.S.R. in the 1920's, the power in B. was largely concentrated in the hands of National Communists (*see* NATIONAL COMMUNISM). They were eliminated when Stalin estab. his supremacy in Russia, but accusations of nationalist deviations in B. have continued. *See* R. Pipes, *The Formation of the Soviet Union*, Cambridge, Massachusetts, 1954, and W. Kolarz, *Russia and Her Colonies*, 1952.

Belorussians, or White Russians, E. Slav people closely related to the Russians

(Great Russians) and Ukrainians, live in Belorussia and the surrounding area. B. developed a separate identity in the 13th-14th cents. when the whole area belonged to the Grand Duchy of Lithuania. The Russian element greatly outnumbered the Lithuanians and was culturally superior, and Belorussian was the official language of the Grand Duchy until its union with Poland in 1569. The ensuing advance of Catholicism and the Polishising influences were resisted by the Orthodox Church and the *bratstvos* (see BRATSTVO), and the majority of B. remained Russian and Orthodox. They did not, however, develop a national consciousness of their own until the late 19th to early 20th cent., when a Belorussian literature and press appeared.

Belostok, see BIALYSTOK.

Below, Fritz von (1853-1918), Ger. general. He first saw service in the Franco-Ger. war of 1870-1. In 1912 he was appointed to the command of the 21st Army Corps, and at the beginning of the First World War his corps formed part of the Ger. Sixth Army on the W. front. In 1915, however, his corps was transferred to the E. front, where it played a distinguished part against the Russians. He was appointed to the command of the First Army in 1916 and was opposed to the British on the Somme in Nov. of that year. He d. in a field hospital on the W. front.

Below, Otto von (1857-1944), Ger. general. On outbreak of the First World War he was commanding an infantry div. in E. Prussia. At the battle of Narva he commanded the 1st Reserve Corps against the Russians. In the Masurian winter battle of Feb. 1915 he commanded the Eighth Army, which played a distinguished part in the capture of Lyck. In the summer of 1915 he became commander of the Army of the Niemen. In Oct. 1916 he was sent to the Macedonian front to take command of the operations in that theatre. In 1917 he commanded a mixed Ger.-Austrian force in Italy, which defeated the Italians at the battle of Caporetto, a defeat which would have had more serious results for the Entente had B. not advanced too far ahead of his transport. In the Ger. offensive of Mar. 1918 B. was in command of the Seventeenth Army during the battle of the Somme. After the armistice B. commanded a force in E. Prussia, and retired in 1919.

Bolpasso, tn of Sicily (q.v.), in the prov. of Catania in the E. of the is., 7½ m. NW. of Catania. B. lies on the S. slope of Mt Etna (q.v.): since its destruction by a lava stream in 1669 it has twice been rebuilt. It is chiefly engaged in fruit-growing and viniculture. Pop. 9500.

Belper, mrkt tn on the Derwent, 7½ m. from Derby in Derbyshire, England. It is noted for its cotton mills and hosiery factories. Pop. 15,700.

Belsen, site of a Ger. concentration camp, 10 m. NW. of Celle, Hanover. Allied troops stormed their way into it in mid-April, 1945. In it all the horrors of Buchenwald (q.v.) were found repeated.

There were at one time 10,000 persons in the camp. These included some political prisoners. Sev. Brit. Red Cross relief teams went to the camp on 22 April to tend the sick and starving prisoners, many of whom d. after liberation as a result of the treatment they had received from the Germans. It was ascertained that 17,000 people were cremated by the Germans in Mar., before the increasing number of deaths began to 'get out of hand.' Some internees and corpses bore the obvious marks of torture. Josef Kramer, aged 38, the camp commandant, and 29 others were tried by a military court held at Lüneburg, and of these 11, including Kramer, were, on 17 Nov. 1945, sentenced to death for the torture, whipping, and shooting of prisoners, and for selecting victims for death by the gas-chamber.

Belshazzar, Babylonian *Bel-sharru-usur* ('Bel has protected the kingship'); GK, 'Belthazar,' eldest son of Nabonidus, the last king of the Chaldaean dynasty. Contemporary documents show that B. was co-regent from c. 555 BC during his father's absence in Arabia. B. perished at the fall of Babylon in 539 BC, an event following the great feast of B. described in Dan. v, which has been a favourite subject for poets and other artists. See R. P. Dougherty, *Nabonidus and Belshazzar*, 1929. See also BABYLONIA.

Belsk, see BIELSK.

Belt Case, libel suit brought by Richard Claude Belt, a sculptor, against a former pupil, Sir Charles Bennet Lawes (afterwards Lawes-Wittowronge). Lawes had accused Belt, in *Vanity Fair* and elsewhere, of acknowledging as his own certain pieces of sculpture which had been executed or finished by other persons. The case, *Belt v. Lawes*, was heard at Westminster before Baron Huddleston, and lasted 43 days, from 21 June till 28 Dec. 1882. The jury decided in Belt's favour, with £5000 damages.

Beltane, or **Beltein** (Gaelic *bealltinn*, *bealtuinn*), name applied to a Celtic festival, formerly celebrated in Ireland, Scotland, and Cornwall, traces of which still remain in different parts of the Brit. Isles. It was originally a May Day festival, when bonfires were lighted on the hill-tops, sheep were driven through fire, and, possibly, human sacrifices were made. The name is still used in the Gaelic parts of Scotland for May Day. The popular etymology of the word from Celtic *tienc*, fire, and *Bel*, the Phoenician god of the O.T., is no longer accepted.

Beltrami, Eugenio (1835-1900), It. mathematician, b. Cremona. B. lectured on mathematical physics at the univ. of Rome, and was elected president of the Lincei. His chief contribution to mathematical science resulted from his researches on the so-called non-Euclidian geometry. The formula known as Beltrami's theorem is: 'The centre of a circle circumscribing a triangle is the centre of gravity of the centres of its inscribed and escribed circles.' His most important essays are *Saggio di interpretazione della geometria non-euclidea* and

Teoria fondamentale degli spazii di curvatura costante.

- Beltrami, Giulio Cesare** (1779-1855), It. traveller, b. Bergamo. He was connected with the Carbonari (q.v.) societies, and in consequence was obliged to leave Italy for America in 1821. He accompanied Maj. Long on an expedition in 1823, and in the following year he discovered the sources of the R. Mississippi. He pub. a hist. of his journey at New Orleans, *La Découverte des sources du Mississippi*, 1824.

Belts and Ropes. Power may be transmitted from a main driving shaft in a factory or machine shop to subsidiary shafts by leather belts or ropes passing over pulleys on the two shafts. If an endless belt stretched from one pulley to another is open, the two pulleys rotate in the same sense; if crossed between the pulleys, the shafts rotate in opposite sense. If there is no slipping of the belt on the pulleys, the velocity of the belt equals that of the surface of either pulley, and the ratio of the angular velocities, or rev./min., of the two pulleys is the inverse of the ratio of their diameters. If the driving shaft runs at a constant speed, and it is required to increase or diminish the speed of the driven shaft, speed cones are used. These consist of pulleys of different diameters placed side by side on each shaft, so arranged that a smaller pulley on one shaft is directly opposite a larger pulley on the other, so that the length of belting passing round the pair remains constant. The speed of the driven shaft can thus be altered without tightening or loosening the belt. Belts may be used to drive pulleys which are at right angles to the driving shaft, in which case the belt takes a quarter twist. When 2 pulley shafts are not parallel, whether their directions intersect or not, the belt may be passed round and kept in place by guide-pulleys. The only condition to be observed is that the point at which the belt leaves each pulley must be in the same plane as the next pulley.

Materials. Belts are usually made of leather tanned by oak-bark; the thickness varies from $\frac{3}{8}$ to $\frac{1}{2}$ in. in single belting and twice that amount in double belting. The strength of single belting is from 750 to 1500 lb. per sq. in. of width. Rawhide is sometimes used, and is of considerable strength. The strips of leather are joined by paring down the ends, cementing them together with glue, and lacing or riveting them. It is usual to leave one joint uncemented, so that the belt may be tightened when required. Cotton belting is cheaper and stronger than leather, 8-ply cotton belting being twice as strong as double leather belting. Indiarubber is sometimes used in wet places, where leather is unsuitable, but is easily damaged by contact with oil. Chain belting consists of links of leather strung together on wire pins which are not bent as the belt passes over the pulley. Ropes are made of hemp or cotton, wire cables usually of steel wire.

Pulleys. A belt passing round a conical pulley in motion has a tendency to creep

up to the larger end. Pulleys are therefore made with the rims slightly convex, so that the belt remains in the middle of the rim. Pulleys are sometimes cast in two halves, so that they may be fixed on a shaft without interfering with the shaft bearing. Wrought-iron pulleys are often made with split rims, which are closed up by a screwed-on piece after the pulley is on the shaft. The pulleys used for hemp or cotton ropes are provided with grooves so shaped that the ropes do not reach the bottom, but are wedged in by the sides, and so give a very effective drive. Wire cables must not be wedged in the grooves of the pulleys; the driving force is exerted by the weight of the cable hanging between the two pulleys. The rope may meet the pulley at an angle, so that the shafts need not be exactly parallel. Another advantage of rope gearing is that many ropes may be run from the same driving drum to sev. machines. See W. H. Atherton, *Conveying Machinery*, 1937, and *Mechanical World Year Book* (ann.).

Belts, Jupiter's, see JUPITER.

Belts, The, straits in Denmark, which connect the Baltic with the Cattegat. The Great Belt separates Zealand and Fyn, and is nearly 40 m. long, from 10 to 15 m. broad, with a depth of from 5 to 20 fathoms. The Little Belt divides Fyn and Slesvig. It is half as wide as the former. At Fredericia it is less than a mile wide. Navigation of the B. is difficult because of the sand-banks and small low is.

Belurbet, tn in co. Cavan, Rep. of Ireland, 10 m. NW. of Cavan, on the R. Erne, with opportunities for boating and salmon-fishing. Pop. 1300.

Beluchistan, see BALUCHISTAN.

Beluga, or the white whale (*Delphinapterus leucas*), belongs to the family of Dolphins. It is found chiefly round Greenland, but occurs in many parts of the Arctic seas, and occasionally has been seen off Scotland. Its body measures 12 to 16 ft in length, and is a creamy white colour. Its head is arched, its snout short and rounded, its teeth are few, small, and conical, and it has short flippers. Young whales are at first a bluish-grey. B.s. associate in herds.

Belur, vil. of the Hassan dist. of Mysore State, India, which contains a famous temple dating from the 12th cent., carved by the same artist as at Halebid (q.v.).

Belur-Tagh, see BOLOR-TAGH.

Belus, son of Poseidon, and father of Aegyptus and Danaus. He was the legendary founder of Babylon. The patronymic Belides is given to Aegyptus and Danaus; to Lynceus, son of Aegyptus; to Palamedes; and to the Danaides, the daughters of the Danaus.

Belvao, see BILBAO.

Belvedere (from It. *bel vedere* = fine view), in architecture, a structure erected on the top of a palace or house, open to the air on one or more sides. There are many examples in It. Renaissance palaces.

Belvedere (*Kochia scoparia*), species of Chenopodiaceae which is native to E. and

central Asia. It is cultivated in Britain as an ornamental plant on account of its leaves, which resemble those of a cypress; hence it is called the summer cypress.

Belvedere College, Dublin, secondary and preparatory school for boys, conducted by the Society of Jesus. It was founded in Hardwick Street in 1832 and transferred to Great Denmark Street in 1841.

Belvisia (*Napoleona imperialis*), family Lecythidaceae, a S. Nigerian glabrous tree that grows to a height of 7 or 8 ft and is loaded with large, broad, bright blue, red, or white flowers. The fruit resembles a pomegranate.

Belvoir Castle, situated 4 m. S. of Bottesford in Leicestershire, England. Since the time of Henry VII it has been in the hands of the Manners family, and is now the seat of the Duke of Rutland. The present castle is a fine castellated pseudo-Gothic building built in the last cent. to replace the former castle which was destroyed by fire. During the Civil war it was a royal stronghold, whilst its hist. goes back to the days when William the Conqueror granted its site to Robert de Todeneil, who founded a priory at the foot of the isolated mound from which the castle commands so wide a prospect. Its picture gallery contains paintings by Vandyck, Murillo, Reynolds, Holbein, etc.

Bely, see BELYX.

Belyta, genus of hymenopterous insects of the family Proctotrypidae. They are cosmopolitan, and their larvae live in the bodies of insects and spiders or in their eggs. These parasites are minute, have 4 wings, and frequent sandy places.

Belyx, **Andrey** (real name **Bugayev**, **Boris Nikolayevich**) (1880-1934), Russian poet, novelist, and literary theorist, a leader of the younger Symbolists. His poems and novels (*Petersburg*, 1913-16), full of linguistic innovations and experiments, are partially obscure and difficult to read.

Belzoni, **Giovanni Battista** (1778-1823), It. traveller and antiquarian, b. Padua, but lived during his youth at Rome, where he intended to enter the monastic life, but in 1800 he left Italy and visited most countries in Europe. In 1803 he came to England and married; he lived by exhibitions of feats of strength. He was interested in hydraulics, and went to Egypt with a plan for irrigating that country; the jealousy of the natives frustrated his intentions. He shipped many monuments of Egyptian anc. civilisation to England, and discovered many unknown tombs along the course of the Nile. In England he pub. an account of his travels and excavations.

Bem, **Joseph** (1795-1850), Polish general, b. Tarnow, Galicia. He was educ. at the univ. of Craoov, and admitted as a cadet in the corps founded by Napoleon at Warsaw. After 13 years' military service, he took part in the Polish rebellion, 1830-1. He then left for Paris, where he lived for 16 years. In 1848 he joined the Hungarians, and received command of 10,000 men. In 1849 he defeated the Austrians, driving

them and their Russian allies into Wallachia. He also expelled Puchner from the Banat and returned to Transylvania. Here he was forced to retreat before the superior forces of the Russians, and escaped to Hungary where he fought in the battle of Segesvár. He escaped to Turkey, and there embraced the Muslim faith. He was appointed to the sultan's army as Amurat Pasha.

Bemba, Bantu-speaking tribe of N. Rhodesia. Practising the slash-and-burn system of shifting cultivation, they are divided into many clan groups, in which descent is traced through the mother's line. They have a king, the *Citimukulu*. To-day they are one of the foremost providers of labour for the N. Rhodesia copper-mines. See A. I. Richards, *Land, Labour and Diet in Northern Rhodesia*, 1939. See also BANTU.

Bembex, typical genus of the hymenopterous family of insects known as Bembecinae. They are peculiar to hot climates and resemble wasps in size and colour.

Bembo, **Pietro** (1470-1547), It. historian, b. Venice, the son of a Venetian patrician; studied at Padua and Ferrara. He ed. the lt. poems of Petrarch. At Urbino he became acquainted with Giuliano de' Medici, brother to Leo X, whose secretary by Giuliano's influence, B. became. In 1530 he was commissioned by the Council of Ten to write the hist. of the Venetian rep.; he wrote this in Latin, completing it up to the year 1513. In 1530 he became a cardinal.

Bembridge Beds, Oligocene deposits, formed principally in fresh water, and consisting of the B. limestone and the overlying B. marls. The latter contain a marine bed near the base. Found in the Hants basin. Named after the type locality in the Is. of Wight.

Bemselberg, **Konrad von**, see BOYNEBURG.

Ben, first syllable in many Semitic names, meaning 'son', literally or metaphorically; e.g. Ben-hadad is the son, or the worshipper, of Hadad, the chief god of the anc. Aramacs. Benjamin, Ben-hanan, Ben-layil, are other biblical examples of names compounded with B.

Ben, rarely **Been**, or **Bin**, word in Scottish Gaelic (from Gaelic *beann* and Old Celtic *benns*, *bends*, meaning 'peak', 'conical point', 'horn') which has been adopted to indicate the most elevated summits of mt ranges, particularly mt peaks of a pyramidal form, which stand unconnected (cp. B. Alder, B. Lomond, B. More, B. Nevis, etc.). The Brythonic (Welsh, Cornish) term *pen*, meaning 'head', occurs in many place-names in Cornwall and Wales.

Ben, **Oil**, of, extracted from the seeds, called Ben-nuts, of a tree found in the E. Indies and Arabia, and known as the horse-radish tree (*Moringa pterygosperma*). When first exposed to intense cold the oil deposits a whitish, flaky substance and, this being removed, is unaffected by cold, on which account it is of value to watch-makers. Oil of B. is also used by painters, and by perfumers to extract the scent

from flowers. When pure it retains its sweetness.

Ben Cruachan (3689 ft), mt in Argyll, Scotland, between Lochs Awe and Etive, some 12 m. E. of Oban.

Ben Lawers (3984 ft), mt in Perthshire, Scotland, about 32 m. WNW. of Perth, on the NW. side of Loch Tay, noted for its alpine flora, and for good skiing in winter.

Ben Ledi (Gaelic *Beinn le Dai*, the hill of God), mt in Perthshire, Scotland, 4 m. WNW. of Callander, height 2873 ft.

any size in Scotland being visible. From 1883 to 1904 meteorological observations were taken at the summit from an observatory (now in ruins). The base of the mt, which in circumference measures about 30 m., is composed principally of granite and gneiss, while the upper part (the visible cliff) is formed chiefly of andesite, lavas, and agglomerate.

Ben Rhydding, Ilkley, spa in the W. Riding of Yorks, England, on the bank of the R. Wharfe, 16 m. NW. of Leeds. Pop. 2800.

A. D. S. Macpherson

BEN NEVIS

The Carn Mhor Dearg *arête* is in the middle ground; beyond is the Allt a'Mhuillin glen.

Ben Lomond (3192 ft), mt in Stirling-shire, Scotland, E. of Loch Lomond, and about 26 m. NW. of Glasgow, terminated on the N. side by a precipice of 2000 ft. There is an extensive view from the summit.

Ben Macdhui, mt in Aberdeenshire, on the border of Banffshire, Scotland, the second highest mt in Great Britain, height 4296 ft. Its summit is flat and bare.

Ben More (Great Hill), mt name recurring frequently in Scotland. Best known are (1) 3843 ft in Perthshire; (2) 3273 ft (B. M. Assynt) in Sutherland; and (3) 3169 ft on the is. of Mull.

Ben Nevis, highest mt in Brit. Isles, situated in Inverness-shire, Scotland, 4½ m. ESE. of Fort William; height 4406 ft. The NE. side has a precipice of 1500 ft. Near its summit, which consists of a large plateau, snow lies in some gullies all the year round. An extensive view is obtained therefrom, every mountain of

Ben Venue (Hill of the Caves), mt of Perthshire, Scotland, on Loch Katrine, 9 m. W. of Callander, height 2393 ft.

Ben Vorlich, Scottish mts: 1. 3224 ft high, in Perthshire, 7 m. N. of Callander; 2. 3092 ft, in Dunbartonshire, 13 m. E. by N. of Inveraray.

Ben Wyvis (3429 ft), mt of Ross and Cromarty, Scotland, some 8 m. NW. of Dingwall, usually snow-capped in winter.

Benacus, **Laous**, see GARDIA, LAKE OF.
Benalla, tn of Victoria, Australia, on Broken R., 122 m. NE. of Melbourne, centre of an agric., pastoral, and mining dist. Pop. 6030.

Benares, or now (more correctly) **Banaras**, famous tn in Uttar Pradesh state, India. B. is one of the most ancient cities in the world, and one (possibly the most sacred) of the 7 Hindu sacred cities. The others are Hardway, Ujjain, Mathura (Muttra), Ajodhya, Dwarka, and Conjeevaram (Kanchipuram) (qq.v.). Buddha

(563-483 bc) came to B. from Gaya to establish Buddhism. It was sacked by Muslims in AD 1194, and most temples were then destroyed and replaced by mosques. Practically no building now in B. dates from earlier than the time of Akbar (AD 1556-1605). It was ceded to the British in AD 1775. The city is narrow, crooked, and crowded, but the riverside presents a memorable sight. A million or more pilgrims visit the city each year and bathe in the holy water of the R. Ganges. The Panch Kosi road, which is traversed by most pilgrims, circles the city and is over 36 m. in length. Since the belief exists that whosoever dies within that circuit is transported direct to heaven, the burning-ghats on the river, where the dead are cremated, are very

between N. and S. Uist, and about 20 m. W. of Skye. It belongs to Inverness-shire. Its area is about 36 sq. m. Three-quarters of the land is taken up by farming. Pop. 924.

Benbow, John (1650-1702), Eng. vice-admiral, spent his whole life in active service at sea. In 1702, when cruising near Jamaica, he attacked a Fr. squadron. His leg was shattered by a shot, but he sat on deck to take charge of the attack. He was defeated owing to the want of support from other officers. He returned to Jamaica, where his officers were court-martialled, and he d. of his wounds on 4 Nov.

Bench-warrant, order issued by the court to enforce obedience, as in the case of delinquent jurymen, for contempt of

Canadian Pacific

BATHING GHATS ALONG THE GANGES AT BENARES

busy. The B. Hindu Univ. was founded in 1916. B. is also noted for the manuf. of brass-ware and of silks, embroidery, and brocades containing gold and silver thread.

Benavente, Sp. tn in the prov. of Zamora, on the Esla. It has a ruined castle, 2 medieval churches, and a silk spinning industry. Sir John Moore (q.v.) began his retreat to La Coruña here. Pop. 9500.

Benavente y Martínez, Jacinto (1866-1954), Sp. playwright, b. Madrid. He entered the univ. there and studied law, but devoted himself to literature. He travelled over Europe and for a time was manager of a Russian circus and an actor. In 1896 he wrote his first notable play *Gente Conocido*. In 1922 he was awarded the Nobel prize. His plays are elegant and polished comedies, satirising the aristocracy and upper middle class. Among the best known are *El Hombrecito*, 1903, *Rosas de Otoño*, 1905, *Los intereses crea dos*, 1907, and *La Malquerida*, 1913. Many of the plays have been trans. into English by J. G. Underhill (4 series), 1919-24. See W. Starkie, *Jacinto Benavente*, 1924.

Benbecula, is. of the Hebrides, lying

court. These warrants are used extensively in the U.S.A.

Benchler, see INNS OF COURT.

Benchley, Robert Charles (1889-1945), Amer. humorist and actor, b. Worcester, Massachusetts. Educ. at Harvard, he took up journalism and became dramatic critic of *Life* in 1920 and of the *New Yorker* in 1929. Next year he pub. *The Treasurer's Report*, which was later made into a skit in which B. himself appeared; later still it was filmed as the first all-talking motion picture. Among his other works are *20,000 Leagues Under the Sea*; or, *David Copperfield*, 1928, *From Bed to Worse*, 1934, *My Ten Years in a Quandary*, 1936, *Inside Benchley*, 1942, *Benchley Beside Himself*, 1943, and *One Minute, Please*, 1945.

Benckendorf, Count Alexander (1849-1917), Russian diplomat, b. Berlin, educ. in France and Germany, a Rom. Catholic. Ambas. to England, 1903. Under his auspices the Anglo-Russian Agreement was signed in 1907, completing the Triple Entente.

Benecoolen, see BENKULEN.

Benczur, Julius (1844-1920), Hungarian painter, b. Nyiregyháza. Studied under Karl Piloty in Munich, and in 1883

became director of the Academy of Budapest. His most noteworthy paintings are 'Arrest of Rákóczy in 1701,' 1869, 'Family of Louis XVI during the Assault on Versailles,' 1872, 'Bacchanti,' 1881, and various portraits.

Bend, Bande, or Balteum, see HERALDRY, *Ordinaries* (5).

Bend (dyke), see **BAND**.

Benda, Jiří (Georg) (1722-95), Czech composer, *b.* Stáře-Benátky, Bohemia. He was one of a noted musical family. He became musical director at Berlin in 1742 and at Gotha in 1748. From 1778 until his retirement in 1785 he visited many important musical centres. His works include church music, cantatas, chamber music, and works for the stage, among which 3 'melodramas' with spoken words accompanied by the orchestra are historically important. He *d.* at Köstritz, Thuringia.

Benda, Julien (1867-), Fr. critic, philosopher, and novelist, *b.* Paris. Almost wilfully opposed to the spirit of the age in all things, he regards dissent as a sign of degeneracy. This is revealed in his *L'Ordination*, 1913 (a story of winter in Paris); in *Marie Claire*, 1911; and also in the *Dialogues d'Eleuthère* and in his pamphlet *Le Bergsonisme*. He is an anti-Bergsonian, and hostile to the neo-vitalists for their effusiveness and mobility. His reputation rests mainly in his *Trahison des clercs* (1927), in which he inveighs against the prostitution of literacy or artistic powers to political ends. In *Belphegor* he is a stern critic of democracy. He has been well described as a 'die-hard' intellectualist. This attitude is exemplified in his novel *Les Amoureux*, 1927. His later writings include *Un Regulier dans le siècle*, 1938, *La grande épreuve des démocraties*, 1940, and a book on Kant, 1940. See Herbert Read, *Julien Benda and the New Humanism*, 1930.

Bendali, Cecili (1856-1906), Eng. Sanskritist. Prof. of Sanskrit, Univ. College, London (1885-1903) and Cambridge Univ. (1903-6). His main works are *Catalogues of Sanskrit and Pali Books*, 1893, and of *Sanskrit MSS.*, 1902, in the Brit. Museum; *Subhāṣita-samgraha*, 1903; and, with Prof. Poussin, *Bodhisattva-Chāṁī*, 1905.

Bendamir, Bendameer, Bendamur, Bundameer, properly **Band-i Amir**, dam on the Kur R. in Fars, Persia, built by Azud ud-Dawla in 10th cent.

Bendemann, Eduard (1811-89), Ger. painter, *b.* Berlin. His master was Friedrich Wilhelm Schadow, whose daughter he married later. In 1832 he produced his picture of the 'Captive Jews' at Berlin. In 1838 he was appointed to the professorship at the Academy of Art in Dresden. His paintings were correct and elegant, but lacking in passion and force. In 1858 he succeeded his former master, Schadow, in the directorship of the Düsseldorf Academy.

Bendery (Rumanian *Tighina*; Turkish **Bender**), in N. Bessarabia (Moldavian Rep.), on the Dniester. It is a major transportation centre, and has food industries. Pop. (1930) 32,000 (c. 1914,

60,000). B. was founded by the Genoese in the 12th cent., was a strong Turkish fortress from 1558, Russian from 1812, and Rumanian 1918-40 and 1941-4.

Bendigo, formerly **Sandhurst**, prin. gold-field city in Victoria, Australia, 100 m. NNW. of Melbourne, centre of a farming and tomato-growing area. Commonwealth ordinance and many other factories are in B., which is the seat of both Anglican and Rom. Catholic bishoprics. It has a school of mines. Suburbs include Golden Square, Long Gully, and White Hills. Pop. 30,800.

Benda, Karl Knutsson, see **CHARLES VIII** (of Sweden).

Bendsbuk, see **BEDZIN**.

Bendy, heraldic term applied to a shield divided by diagonal lines (dexter to sinister) into 6 equal partitions of alternate tinctures. If the number of partitions (which must always be an even number) is more than 6, the shield is described as *B. of eight, ten*, etc. If the lines are undulating, the shield is said to be *B. wavy*.

Bendzin, see **BEDZIN**.

Benedek, Ludwig August von (1804-81), Austrian soldier, *b.* Ödenburg, Hungary. He joined the army in 1822. In 1846 he took part in the suppression of the Polish peasants in Galicia. In 1847 he commanded a regiment in Italy, and again received command during the Hungarian campaign of 1849. Then he returned to Italy. He repelled the Piedmontese at Solferino. In 1860 he became governor of Hungary. Six years later, 1866, he had command of the N. Austrian army in the war with Prussia. He was defeated at Sadowna, and subsequently retired.

Beneden, Pierre Joseph van (1809-94), Belgian zoologist and naturalist, was appointed head of the Louvain Natural Hist. Museum in 1831. In 1881 he was appointed president of the Academy of Sciences. Among his most notable works are *Zoologie médicale* (in collaboration with Gervais); *Ostéographie des récents vivants et fossiles*, 1868; and *La Vie animale et ses mystères*, 1863.

Benedetti, Vincent, Count (1817-1900), Fr. statesman, *b.* Bastia in Corsica. He entered the Foreign Office, and in 1845 he was appointed consul in Egypt, and in 1848 consul at Palermo. In 1864 he was ambas. at Berlin. He drafted a secret treaty between France and Prussia, which was made public when war broke out in 1870. For this he was criticised, and retired to Corsica. He was exonerated before he *d.* in Paris. He pub. *Ma Mission en Prusse*, 1871, in which he defended his actions in Germany.

Benedicite, canticle or hymn, beginning in Latin 'Benedicite omnia opera Domini,' and in English, 'O all ye works of the Lord, bless ye the Lord.' It is probably an enlargement of Ps. cxlviii. It occurs in the Gk and Lat. Bible in Dan. iii, under the title of the Song of the Three Children. It is said to have been sung by the 3 young Jews, Shadrach, Meshach, and Abednego in the burning fiery furnace. This hymn formed part of the Christian service from the time of

St Chrysostom (q.v.), and is still used in the Anglican Church, especially during Lent.

Benedict, name of 15 Popes, of whom the most outstanding were:

Benedict XIV (1740-58), Archbishop of Bologna, where he was b. in 1675, and elected to the papal chair in 1740. He was an eminent canonist and devoted to learning and literature. It was he who finally fixed the procedure for the canonisation of saints. His policy was marked by an attitude of conciliation towards all secular govs. He was lenient towards the Jansenists and friendly towards Protestants and unbelievers, though he repeated the condemnation of freemasonry. While permitting the condemnation of Voltaire's works he accepted and acknowledged gracefully the dedication to himself of the latter's *Mahomet*. He d. in May 1758.

Benedict XV (Giacomo della Chiesa) (1914-22), b. 1854, a learned occupant of the papal chair, whose diplomatic training stood him in good stead during the First World War. Trained at first for the law at the Ateneo, he abandoned a legal career and was ordained in 1878, becoming secretary to the papal embassy in Madrid in 1882. Five years later he was a member of the household of Cardinal Rampolla; then secretary of state of Leo XIII. In 1907 he was Archbishop of Bologna and in 1914 was elected Pope. His sev. attempts to bring about peace were rendered nugatory by his extreme neutrality, which delayed his protests against Ger. infractions of international law and usage until too late to be effective. But he interceded with success with the Fr. and Ger. Govs. for the exchange of prisoners of war, and, again, was instrumental in stopping the pro-Ger. propaganda of the Carlist Rom. Catholics in Spain. It was during his régime that the Brit. Gov., for the first time for cents., accredited a diplomatic representative to the Vatican and that the Fr. Gov. resumed diplomatic relations after a lapse of nearly 20 years. See POPES, LIST OF THE.

Benedict, St (c. 480-547), founder of the Benedictines (q.v.). b. Nursia in Italy. At the age of about 14 he left home, whither he had gone to study, and lived for 3 years as an anchorite in a cave near Subiaco. His fame spread, and the religious of a monastery at Vicovaro invited him to direct them. They were not, however, amenable to discipline, and B. returned to his cave. During the next years as many as 12 communities gathered in the neighbourhood, looking to B. for spiritual guidance; and he thus became, as it were, the unofficial ruler in a rep. of anchorites. Eventually, in 529, B. was driven from Subiaco by the envy of a local priest, and founded the celebrated monastery at Monte Cassino (q.v.), where he wrote his rule and died. See I. Herwegen, *St Benedict* (Eng. trans.), 1924.

Benedict, Sir Julius (1804-85), Eng. composer and conductor of Ger. origin, b. Stuttgart. He was a pupil of Hummel and Weber, conductor in Vienna, 1823-5,

and after visits to Italy and Paris settled in London as conductor and operatic composer. His best opera was *The Lily of Killarney*, produced in 1862.

Benedict Biscop (c. 628-89), monk, b. of a noble Northumbrian family. During his early life he was a courtier at the court of King Oswin. After two journeys to Rome (he later made sev. more) he became a monk at Lerins. In 669 he escorted Theodore of Tarsus to Canterbury, and was made abbot of St Peter's Monastery there. Some years later he made his third journey to Rome and returned with a vast store of books and MSS. He built and endowed with these a monastery at Wearmouth, on land given him by King Ecgfrith of Northumbria. In 682 he erected a dependent house at Jarrow. Bede (q.v.) was his pupil, and drew on B.'s vast library as sources for his writing. At B.'s death the two monasteries he had founded possessed a collection of books, relics, and objects of religious art unique in England.

Benedictines, order of monks, known also as Black Monks, to distinguish them from the white-habited monks of the Cistercian observance. They follow the rule of St Benedict (q.v.). The aim of the order is personal sanctification through the prescriptions of the rule, which lays particular stress upon the choral office, study, and work, all within the framework of obedience to the abbot or other superior. The B. were a powerful civilising influence throughout the so-called Dark Ages, and they have always been prominent in the fields of scholarship and education. They were introduced into England by St Augustine of Canterbury (q.v.) and his fellow missionaries, and by the time of the Dissolution there were some 300 flourishing houses. All the cathedral priories and most of the greatest abbeys in England were Benedictine, and 5 colleges at Oxford and Cambridge owe their origins to Benedictine foundations. A number of European univs. likewise developed from Benedictine monastic schools. To-day the Eng. congregation of the order includes 7 monasteries—the abbots of Downside, Ampleforth, Douai, Belmont, Fort Augustus, Ealing, and the priory of Worth—and 4 nunneries. Houses of other congregations are at Ramsgate, Buckfast, Prinknash, Farnborough, and Quarr. See C. Butler, *Benedictine Monachism*, 1919, and D. Knowles, *The Benedictine Order*, 1929.

Benediction (Lat. *benedictus*, to bless), the conferring of a blessing or an earnest wish for the welfare of a person or project. Among Protestant churches the term is applied to the words used by the minister in dismissing his congregation. In the Rom. Catholic Church B. is an extra-liturgical service. The sacred host is exposed in a monstrance (q.v.), and with it the celebrant blesses the congregation by making the sign of the cross. Accompanying devotions vary; only the ceremony of exposition, the 'Tantum ergo' (i.e. the last 2 verses of St Thomas Aquinas's hymn *Pange lingua*), with

versicle, response, and prayer is of universal obligation.

Benedictus (Lat. 'blessed'), song of thanksgiving uttered by Zachary at the circumcision of his son St John the Baptist (Luke i. 67-8). It commences in Latin with the words 'Benedictus Dominus Deus Israel', and is used in the Rom. Catholic Church as the canticle for the office of Lauds.

● **Benediktsson, Einar** (1864-1940). Icelandic poet, administrator, and politician. He travelled widely and often resided abroad for long periods (in London for 10 years). Many of his themes are foreign, and yet no poet is more intensely Icelandic than he. His poem on the shipyards at Newcastle is one of the noblest encomiums ever sung in praise of the Brit. Navy.

Benedix, Julius Roderick (1811-73), (Ger. author and dramatist, b. Leipzig. He was in succession tenor, journalist, lecturer, and stage manager. He was gifted with a vivid imagination which was evident in his dramatic works, and a fund of humour that was displayed in his comedies, which abound in witty dialogue and humorous intricate plot, with a continual variety of scene and incident. His *Gesammelte dramatische Werke* were pub. in 27 vols. (1846-74). He wrote also popular Ger. stories, and the novel *Bilder aus dem Schauspielerleben*, 1847.

Benefice (*Beneficium*), term first used in reference to life interests in land by the Lombards and in the laws of Charlemagne's constitutions. These lands were generally given as incentives to martial prowess. Later they became grants of a hereditary feudal nature. To-day the word refers to any variety of church dignity, and in particular those of rectories and vicarages which are B.s with the cure of souls and so differ from bishoprics and cathedral dignities. Exempt, or peculiar, B.s are those not under the jurisdiction of a bishop, though regarding residence they are under episcopal administration. The holding of a B. is dependent upon 4 conditions: the first Holy Orders; the second Presentation by the patron; the third Institution (q.v.); fourthly, Induction (q.v.).

Beneficiary, in the law of both England and Scotland, term used to denote any person who is in the enjoyment of, or is entitled to, any interest or estate held in trust by other persons. It is often doubtful in the case of charitable bequests who the B.s really are, and the courts or commissioners occasionally, as a result of their inquiries, reform the charity, and so change the class of B.s. (*See CY-PRUS*.) The trustees are liable to give an account of their actions to the B.s, and an interdict or injunction may be issued against them by the latter if they make a wrongful use of their funds.

Benefit of Clergy was formerly the right of clergy accused of felony (q.v.) to be tried in the eccles. courts. The privilege was later extended to anyone who could read. From the 15th cent. this right was curtailed, and it was finally abolished in 1827. In Scotland the benefit was never recognised.

Benefit Societies, *see* FRIENDLY SOCIETIES.

Beneke, Friedrich Eduard, Ger. psychologist, b. Berlin, 1798. He pub. many books on metaphysics and ethics, of which the best known are *Theory of Knowledge*, 1820, and *Foundation of All Knowledge*, 1820. In 1854 he suddenly disappeared; 2 years later his body was discovered in the canal at Charlottenburg.

Benelux, customs union of Belgium, the Netherlands, and Luxembourg, an agreement for which was signed in London by the 3 govts. in exile in 1944, and ratified in 1947. It came into force in 1948, with the form of a tariff union: the same duties are imposed by all 3 countries on imports from abroad, but no import duties are levied on goods exchanged between the 3 countries. Further stages in the B. union are progressive abolition of quotas, licences, excise and consumption taxes, culminating in final economic union when goods will move within the 3 countries as easily as they do in the U.K. or U.S.A. *See also* BRUSSELS TREATY and CUSTOMS UNION.

Beneš, Eduard (1884-1948), Czech statesman. Of peasant stock, he was educ. at the Czech Univ. at Prague, at the Sorbonne and elsewhere in France. He became a lecturer in economics and, later, in sociology in the univ. of Prague.

Karsh, Ottawa

EDUARD BENEŠ

At the beginning of the First World War he fled from Bohemia to Paris. He then assisted T. G. Masaryk (q.v.) and Gen. Stefanik in the foundation of the Czechoslovak National Council, and a Czech national army was brought into being. In 1919 B. was chosen with Dr Kramarz as Czech delegate to the Inter-Allied Peace Conference at Paris, and he was a signatory of the peace treaties. He

became the first foreign secretary of the newly created Czechoslovak Rep., of which Masaryk was the first president. He succeeded Masaryk as president in Dec. 1935. B. was largely instrumental in the fashioning of the Little Entente (q.v.), a pact between Czechoslovakia, Yugoslavia, and Rumania, the main object of which was to prevent any Hungarian or Hapsburg attempt to upset the settlement of 1919. An alliance with Russia was concluded during B.'s presidency. He was a persistent advocate of the principle of compulsory arbitration in international disputes. B. resigned the presidency in October 1938 as a result of the Munich Pact. He went to Chicago as a univ. lecturer, and, after the outbreak of the Second World War, came to England and took the lead in the movement for the restoration of Czech freedom in co-operation with the W. Allies. In 1940 when the Czech National Committee was recognised as a provisional gov. B. again assumed the functions of president. After the defeat of Germany B. returned to Prague in May 1945 at the head of the Second Czechoslovak Rep. Under his continued presidency the country settled down to a programme of reconstruction with a pronounced Socialist bias, which included the nationalisation of some thousand large industrial concerns. The first elections in the liberated rep. were held in May 1946: the Communists emerged as the leading party, and in July 1946 Klement Gottwald (q.v.), the Communist leader, became Prime Minister. Subsequently, in Feb. 1948, Gottwald turned Czechoslovakia into a Communist state. In June 1948 B. resigned his office as president, and was succeeded by Gottwald. See Pierre Crabitès, *Beneš: Statesman of Central Europe*, 1935; also Compton Mackenzie, *Dr Beneš*, 1946.

Beneschau, see **BENEŠOV**.

Benešov (Ger. **Beneschau**), Czechoslovak tn in the region of Prague (q.v.). It has a trade in horses and agric. produce. Pop. 8300.

Béné, Stephen Vincent (1898-1943), Amer. poet and novelist, b. Bethlehem, Pennsylvania, and educ. at Yale. During his college days he wrote *Five Men and Pompey*, 1915, and *Young Advocate*, 1918, both in verse. His first novel, *The Beginning of Wisdom*, 1921, exploits his college experiences. The poems in *Heavens and Earth*, 1920, *King David*, 1923, *A Ballad of William Sycamore*, 1923, and *Tiger Joy*, 1925, are decorative in style, but mature. His best work is the long narrative poem of the Civil war, entitled *John Brown's Body*, which was pub. in 1928, and was awarded the Pulitzer prize. His novels include *Young People's Pride*, 1922, *Jean Huguenot*, 1923, and *Spanish Bayonet*, 1926. *Tales before Midnight*, 1939, consists of short stories.

Benevento: 1. Prov. of Italy, in NE. Campania (q.v.). It is in the Apennines (q.v.) and is generally mountainous but is crossed E.-W. by the broad and fertile valley of the Calore, a trib. of the Volturno (q.v.). Area 812 sq. m.; pop. 334,000.

2. (anct **Beneventum**), It. city, cap. of the prov. of B., situated in the valley of the Calore, 32 m. NE. of Naples (q.v.). It was the chief city of the Samnites (see **SAMNIUM**), and was taken by the Romans in the 3rd cent. BC. It was the cap. of a duchy of the Longobards (q.v.) from 571 to 1038, and was part of the States of the Church (q.v.) from 1052 to 1860, with the exception of a period during which it was in Fr. hands, 1799-1815. In 1806 Napoleon I made Talleyrand (q.v.) Prince of B. The tn suffered very severe damage during the Second World War. The 12th-cent. Romanesque archiepiscopal cathedral was ruined in the fighting of 1943; only the façade and the tower remain. There is a Rom. theatre, as well as a splendid triumphal arch of the Emperor Trajan (q.v.). Leather goods, confectionery, and liqueurs (*Sirega*) are manuf. Pop. 50,200.

Benevolence, type of compulsory loan exacted by kings who dispensed with legal justification. It originated with Edward IV, though similar contributions had been levied in previous reigns. They were not, however, officially called B.s. They were declared unlawful by Parliament in 1484, but Richard III often resorted to this way of raising money, as did Henry VII and Henry VIII. James I attempted to raise B.s, though without material success. B.s were rendered illegal both by the Petition of Right, 1628, and by the Bill of Rights, 1689.

Benezet, Anthony (1713-84), Amer. Quaker schoolmaster, and anti-slavery pioneer, b. St. Quentin, France, migrated with his Huguenot parents to Philadelphia (1731). He wrote and circulated many philanthropic tracts, chiefly on slavery, and collaborated with John Woolman (q.v.). In his last years he taught Negro children. His book *Some Historical Account of Guinea and the Slave Trade*, 1772, led Thomas Clarkson (q.v.) to devote his life to its abolition. See George Brooks, *Friend Anthony Benezet* (Life and Letters), 1937.

Benfeld, Fr. tn in the dept of Bas-Rhin, on the Ill. It produces tobacco and hops. Pop. 2600.

Benfey, Theodor (1809-81), Ger. philologist and Sanskritist. Prof. in Göttingen Univ., 1862 onwards. Main works: *Griechisches Wurzellexikon*, 1839-42; *Indien*, 1840; *Sāmavedārcikam*, 1848; *Handbuch der Sanskritsprache* (2 vols.), 1852-3; *Practical Grammar of Sanskrit Language*, 1863-8; *Sanskrit-English Dictionary*, 1866. In his celebrated work *Pantochoalantra*, 5 vols., 1859, he proved the Indian origin of many E. and W. tales and fables.

Benfleet, urb. dist. of Essex, England, adjacent to Southend-on-Sea, formed in 1929 out of the Rochford rural dist., and comprising the pars. of Hadleigh, South B., and Thundersley. Pop. 20,000.

Bengal, Bay of, part of the Indian Ocean. It stretches between India and Burma and Malaya, washing the whole of the E. side of the country. It is visited by the monsoons, which prevail over the

whole area of the ocean. Many large rivers empty themselves into the bay—the Ganges and Brahmaputra from the N., while from the E. it receives the Irawadi, and from the W. the Mahanadi and Godavari. There are good ports on the E., but few on the W. The Andaman and Nicobar are the chief groups of is., which are numerous.

Bengal, Presidency of, prov. of India Until the 1947 partition, bounded on the S. by the Bay of Bengal, on the W. by Nepal, Bihar, and Orissa, on the N. by Sikkim and Bhutan, and on the E. by Assam and Burma. In 1947 the prov.

NATIVE OF BENGAL
A Pujara Brahman.

E.N.A.

was divided into two, W. B. (chiefly Burdwan div.) falling to India, with an area of 26,912 sq. m. and a pop. of 19,341,000. E. B. prov. (Pakistan), including the Sylhet div. of Assam, had an area of 56,008 sq. m. and an (estimated) pop. of 44,081,000. For details of the 2 divisions see BENGAL, WEST, and PAKISTAN, EAST.

History. The Muslim conquest of B. took place early in the 13th cent. It was first administered by governors appointed by the Muslim emperors; then for 2 cents. the governors ruled precariously as independent sovereigns. In 1576 it became a portion of the great Mogul empire and for a further 200 years was ruled by Mogul governors. In 1765 it passed under the administration of the E. India Co., which had here made its first settlements in 1633. An important event was the founding of Calcutta by Job Charnock, 1692. In 1858 administration was transferred to the Crown. The rights of proprietors and cultivators were assured

and protected by the Permanent Settlement of the Land Revenue Act and the Tenancy Act, 1793 and 1859 respectively. The former presidency of B. included most of NE. India; the prov. later consisted of B. proper, Bihar, Orissa, and Chota Nagpur; in 1905 the Sambalpur dist. was transferred to it from the Central Provinces, and the dists. of Rajshahi, Dacca, and Chittagong were detached and added to Assam. This partition, the cause of much political unrest, was revoked in 1911, and in 1912 B. was reconstituted, Bihar, Orissa, and Chota Nagpur being formed into a separate prov. (see BIHAR). A very grave situation arose in 1943. Famine conditions threatened as early as April, and from Aug. until the end of the year they were acute. Many thousands died of starvation. Cholera and other epidemic diseases followed in the wake of famine, and between 27 June and 13 Nov. 77,938 deaths from cholera were recorded. Altogether the total of deaths from all causes due to famine and disease was estimated at 690,000 during the year. Relief centres were estab. and nearly 6000 kitchens set up for the free distribution of food; at the same time the price of rice was controlled. The prov. gov. of B. was severely criticised for its maladministration, and a gov. inquiry was set up in 1944 under the chairmanship of Sir Archibald Rowlands. The report of this committee was pub. in Oct. 1945; the prov. was found to be under administered, its communications had been allowed to decline, and in particular the public health and medical services were inefficiently run. In Mar. 1945 the prov. gov. was defeated in the Assembly over the budget proposals, and resigned. As a result the normal administrative machinery broke down, both bodies were suspended by proclamation on 30 Mar. 1945, and the governor, Mr R. G. Casey, took over the direct administration of the prov. See also BENGAL, WEST, and PAKISTAN, EAST.

Bengal, West, state of India made up of the part of B. left to India after the 1947 div. (see BENGAL), together with a dist. of Bihar (q.v.) added in 1956. For its hist. see BENGAL. Most of B. is deltaic, alluvial land along the lower Ganges and its mouths, with a fringe of Himalayan mt. country. The climate is tropical in the plains, not excessively hot but oppressive due to the humidity.

Development. The long settled, densely populated delta is cultivated wherever crops can possibly be grown—and rice takes up most of the area; jute, tea, oilseeds, sugar, and tobacco are also grown. W. B. has some coal. Round Calcutta are many industries—nearly all the jute mills in India, her most important paper factories at Titagbur, chemicals, textiles, engineering, and leather goods industries. Fisheries and inland waterways are assets of importance; Bengalis, unlike most other Indians, eat a lot of fish. The Damodar valley project and the Kasai R. scheme will help the future development of the state.

Culture. B. was the first area in India to come under Brit. rule; it was the first to respond to the challenge of W. ideas—by accepting W. education, by social and religious reform movements, and by the literary and artistic renaissance. Calcutta Univ. (estab. 1857) is probably the largest in India. Bengal has produced writers like Tagore (q.v.), scientists like Bose (q.v.). At Santiniketan is the cultural centre founded by Tagore.

Government. The governor acts through ministers responsible to an elected assembly of 238. In India's Parliament W. B. has 16 and 36 seats in the Upper and Lower Houses respectively. The cap. is Calcutta (pop. 2,549,000). The other large tn is Howrah (pop. 434,000) across the riv. from Calcutta. Area 33,809 sq. m.; pop. 26.3 millions. See also HENGAL and CALCUTTA.

Bengal Hemp, name given to a species of Indian hemp (*Cannabis sativa*), from which bhang (q.v.) and hashish (q.v.) are derived. See also HEMP.

Bengal Light, or blue light, as it is called, is a vivid signal light used at sea. It is a composition of nitre, sulphur, and black sulphide of antimony, ground to a powder, dried, and mixed, by weight, in the proportion nitre 6, sulphur 2, and black sulphide of antimony 1. When this is lighted a brilliant blue light which illuminates the sea for miles around is the result. The B. L. is used in cases of shipwreck. Owing to the poisonous fumes from it the light cannot be used safely in enclosed spaces.

Bengali Language, belonging to the E. group of the Indo-Aryan languages, is spoken by about 55 million people in the prov. of Bengal. It is divided into sev. dialects, but literary B. is used all over the country in books and newspapers and when speaking formally. Orisa or Odri, spoken mainly in Orissa; Bihari, spoken in Bihar, Chota Nagpur, Oudh, etc.; and Assamese, spoken in the Assam valley, the most E. of the Indo-Aryan languages, are sister languages to B. B. literature goes back at least as far as the 15th cent. AD.

Bengawan, see SOLO.

Bengel, Johann Albrecht (1687–1752), Ger. scholar, b. Winnenden, near Stuttgart, pub. an ed. of the Gk Testament. His theological works were esteemed by John Wesley.

Benghazi, seaport, cap. of Cyrenaica, situated on the N. coast of Africa, in a prov. of the same name. It lies on a tongue of land separated from the mainland by a lagoon-like salt lake and a salt marshy tract. The harbour is only accessible to vessels of light draught. There are 2 narrow-gauge railways, and before the Second World War it was in regular steamship communication with Naples, Syracuse, Tripoli, and other tns. Many noteworthy buildings were erected and broad streets constructed under the It. occupation. The prov. and tn of B. were incorporated in the national ter. of Italy by a decree of 9 Jan. 1939. B. was captured by the Australians on 7 Feb. 1941, in spite of hard fighting by the

Italians under Gen. Bergonzoli. On 3 April, however, the Brit. and imperial forces evacuated the tn, and it was twice bombarded by the R.N. during May. It was again occupied by Brit. and imperial troops on 24 Dec. in an advance by Gen. Auchinleck, but was recaptured by the Ger. and It. forces under Rommel on 29 Jan. 1942. After the battle of El Alamein, B. once more, and finally, fell to the Brit. forces under Gen. Montgomery on 20 Nov. 1942. By this time, owing to repeated bombardment from the air, the tn presented a scene of utter desolation. Pop. 70,533 (Italians, 19,500; Jews, 3000; the remainder Arabs).

Benguela, cap. of the dist. of that name in Angola; terminus of the B. railway, which extends to Katanga (q.v.) in the Belgian Congo, the connection with the Bas-Congo-Katanga line being completed 1931. In 1956 the B. railway was linked to the Rhodesian system. The total cost, including the Lobito Bay port, was about £13,000,000, the greater part being provided by Brit. capital. Pop. (1951), all races, 14,690 (whites, 3346). See also LOBITO BAY.

Benguet, sub-prov. of Mt Prov. (pop. 278,120), Philippine Is. Rice is grown and there is lumbering. Copper- and gold-mining are concentrated in Mt Prov. Baguio, in B., has an administration independent of Mt Prov.

Ben-Gurion, David (1886–), Israeli statesman, b. Plonsk, Poland. On his arrival in Palestine in 1906 he became an agric. labourer. He soon achieved a prominent position in the Socialist-Zionist faction (*Poalei Zion*). Expelled by the Turks in 1915, he joined the Royal Fusiliers (Jewish Battalion), was promoted corporal and served in Egypt and Palestine. Under the Brit. mandatory gov. he adopted a more nationalistic approach towards Zionism than did Weizmann (q.v.), and carried with him the majority of the Jewish pop. of Palestine. In 1930 the Labour Zionist party (*Mapai*) was founded, with B.-G. as one of the leaders. He held the posts of chairman of the Jewish Agency Executive and leader of the Labour wing of the World Zionist Organisation, 1935–48. In 1942 he was the leading protagonist of the 'Biltmore Programme', claiming the whole of Palestine as a Jewish commonwealth. As leader of the majority party, he was appointed Prime Minister of Israel in May 1948 and retired in Dec. 1953. He returned to the gov. as Minister of Defence under M. Sharett in Feb. 1955 and resumed the premiership in Oct. of the same year. In domestic politics his main achievements have been to hold together diverse coalitions, to find common ground for the religious and secular elements, and to reduce friction between the oriental and occidental Jews. The military successes of Israel can partly be attributed to his firm measures in securing the unification of the differing defence forces *Haganah*, the *Palmach* special corps, and the *Irgun*. Against bitter opposition he secured the Ger. reparations agreement of 1952,

which has been of great value to Israel's precarious economy. In Oct. 1956, with Fr. support, he planned the invasion of Egypt and the Gaza Strip (q.v.), but felt compelled to order a withdrawal in accordance with the resolutions of the U.N. See B. Litvinoff, *Ben-Gurion of Israel*, 1954.

State of Israel:
Government Press Division

DAVID BEN-GURION

Benhadad, name of certain kings of Damascus mentioned in the Bible. B. I, son of Tabrimmon, ally of Abijam of Judah (915-913 BC), and of his son Asa (913-873 BC) whom he helped against Baasha, King of Israel (1 Kings xv. 19-20). He conquered Omri, King of Israel (885-874 BC), compelling him to surrender some cities and grant him trading ports in Samaria (1 Kings xx. 34), thus securing the road to the coast that Syria needed. Later in his reign Ahab, son of Omri (874-853 BC), fought unsuccessfully with his son B. II (c. 875-845), and was finally besieged in his cap., Samaria, but repentance saved him, and he not only recovered what Omri had lost, but had his trading posts set up in Damascus instead. The rise of Shalmaneser III of Assyria (859-824 BC) caused an alliance of the rivals, with other small states in self-defence, and the Assyrian was checked at the battle of Karkar on the Orontes in 853, where B. II put 1200 chariots, 1200 horse, and 20,000 foot in the field (D. D. Luckenbill, *Ancient Records of Assyria and Babylon*, 1926). Later that year Ahab again fought B. II for possession of Ramoth Gilead, and Ahab was mortally wounded in the siege (1 Kings xxii). B. III succeeded Hazael c. 800 BC. The dramatic story of the siege of Samaria,

miraculously relived in 2 Kings vi and vii, may have occurred in the reign of Jehoahaz, King of Israel (814-798 BC), rather than of his son Jehoash (798-783 BC) who respected Elisha. Jehoash defeated B. III thrice (2 Kings xiii. 25), and drove the Syrians from Cisjordan.

Benham, William (1831-1910), theologian, was tutor at St Mark's College, Chelsea, 1857-64; prof. of hist. at Queen's College, London, 1864-73; and rector of St Edmund's, Lombard St, in 1882. He trans. Thomas à Kempis's *Imitation of Christ*, 1874, and brought out an ed. of Cowper's letters in 1883. His best-known works are *A Short History of the Episcopal Church in America*, 1884, *A Dictionary of Religion*, 1887, and (in collaboration with Dr Davidson) *Life of Archbishop Tait*, 1891. He was chief editor of the *Ancient and Modern Library of Theological Literature*.

Benham, Sir William Gurney (1859-1944), compiler. He was educated at Merchant Taylors', then took up journalism, and from 1884 onwards was editor and proprietor of the *Essex County Standard*. His great work was his *Book of Quotations, Proverbs, and Household Words*, 1907. In addition he wrote sev. books on the archaeology of Essex. Three times elected Mayor of Colchester, he was knighted in 1935.

Beni: 1. Riv. in NW. Bolivia. It rises in the La Paz dept. and has a course of about 600 m. to join the Mamoré at Vila Bella. Its current is very strong, but it is navigable for some 500 m.

2. Dept. of Bolivia, with a good climate and fertile soil, yet thinly populated. Tropical rubber-bearing lowlands are in evidence. Trinidad is the chief tn. Area 80,300 sq. m.; pop. 73,900.

Beni, plural of the Arabic word *ibn* or *ibn*, a son. It occurs in E. geography as a component part of many names of families or tribes, as B. Temim, the sons of Temim, or the Temimides.

Beni-Hassan-el-Qadim, or **Old Beni-Hassan**, vil. of Middle Egypt, situated near the E. bank of the Nile. In the neighbourhood are catacombs.

Beni Saf, seaport, with harbour of 262 ft depth, in Algeria, 30 m. N. of Tlemcen, in the prov. of Oran. It exports iron ore found in the dist.

Beni-Suef, tn and prov. in central Egypt. The tn is on the W. bank of the Nile, 63 m. SSW. of Cairo, and is the centre for the produce of the prov. of Fayum. It has a cotton factory and alabaster quarries. Pop. of tn (census 1947) 57,464.

Benicarló, Sp. tn in the prov. of Castellón de la Plana, on the Mediterranean. It produces brandy and a rich, red wine, some of which is exported to Bordeaux for mixing with lighter wines. Pop. 8000.

Benin, former African kingdom, and now the name of a tn, dist., and riv. in the Federation of Nigeria, W. Africa. The inhab. (Beni) are pure negroes. B. was a great slaving centre, and was taken by the British in 1897, who found in the tn human remains everywhere, pits encumbered

with bodies in all degrees of decomposition, and altars reeking with human blood. The present Oba (chief) is an enlightened and educ. man. Products of the dist. include palm oil and kernels, and some rubber. The indigenous arts of B., particularly bronze, wood, and ivory crafts, are famous, being considered among the finest examples of non-W. art anywhere in the world (see NEGRO). Pop. 54,000 (of tn. 15,000). See also A. M. Boisragon, *The Benin Massacre*, 1897.

Benin, Bight of, in the Gulf of Guinea, between Capes Formosa and St. Paul. It consists of a continuous line of low, marshy, sandy shore, intersected by numerous rivs. and estuaries, more especially towards Cape Formosa, where they form alluvial ls., which are part of the delta of the Niger.

Benin River, riv. of Federation of Nigeria, W. Africa, which flows into the Atlantic after a course of 70 m.

Benjamin, youngest son of Jacob and Rachel, who d. at his birth and gave him the name 'Son of my sorrow' (Ben-oni). Jacob altered it to B., 'Son of my right hand', i.e. of Good Fortune (Gen. xxxv. 16-18).

Benjamin, tribe descended from the youngest son of Jacob and Rachel. It settled in an area bounded by Ephraim, Dan, and Judah. Its numbers declined under the Judges, but were increased again by the rape of 400 virgins from Shiloh. Although its ter. lay to the W. and E., it had contact with Judah, and it owed its increasing importance to its position between Judah and Ephraim. Though 'the least of the tribes,' it gave the nation its first king, Saul. Benjaminites were notoriously left-handed (cf. Judges iii. 15; xx. 16; and 1 Chron. xii. 1). They were also famous bowmen (1 Sam. xx. 20; 2 Sam. i. 22; 1 Chron. viii. 40; xii. 1; xiv. 8). Their battle-cry is recorded in Judges v. 14 and Hos. v. 8.

Benjamin, Arthur (1893-), Australian pianist and composer, b. Sydney. He came early to London to study at the Royal College of Music and after a short time as piano prof. at Sydney (1919-21) returned to England, becoming prof. at the R.C.M. in 1926. His works, which are numerous and varied, include 3 operas, a symphony, concertos, chamber and piano music, and songs. The opera *Prima Donna* has been very successful and the *Jamaican Rumba* for orchestra or 2 pianos is a great favourite.

Benjamin, Judah Philip (1811-84), Amer. lawyer and politician, b. at Croix, W. Indies. From 1853 to 1861 he represented Louisiana in the U.S. Senate. In the latter year he withdrew from the Senate to become attorney-general in Jefferson Davis's provisional gov. of the S. Confederacy, being subsequently appointed secretary of war, 1861-2, and secretary of state, 1862-5. Nicknamed 'the Soul of the Southern Confederation.' After the surrender of the Confederates B. escaped to England, and, entering Lincoln's Inn, was called to the Bar in June 1866. He practised on the N.

circuit, and in 1872 was made queen's counsel. He enjoyed a wide practice in appeal cases to the Judicial Committee of the Privy Council. His book *Benjamin on Sales* is a legal classic. Owing to ill health he retired to live in Paris in 1883, where he d.

Benjamin of Tudela, Jewish rabbi and author of the *Itinerary*, the son of Jonas of Tudela, was b. in the kingdom of Navarre in the 12th cent. Between 1140 and 1173 he travelled from Constantinople through Alexandria in Egypt and Persia to the frontiers of China. He wrote an account of his journey, which reveals the position of the Jews in the countries he visited, and this has been trans. from the Hebrew in French, English, and Latin.

Benjamin Tree (*Styrax benzoin*), tree of the family Styracaceae, native of Sumatra and Java. It yields the fragrant resin called gum benzoin or gum Benjamin, which is used in the manuf. of incense and in perfumery. See BENZOIN.

Benkoelen, see BENKULEN.

Benkovac, tn in Croatia, Yugoslavia. It is in a vine-growing dist. of Dalmatia, and has an anct. castle. Pop. 16,600.

Benkulen, Benkoelen, or Benecoolen, port on the SW. coast of Sumatra, Indonesia. The English settled there in 1885, and estab. an extensive trade. B. was ceded to the Dutch in 1825, and is now a trade centre. Pop. 13,000.

Benmore, see FAIRHEAD.

Benn, Gottfried (1886-1956), Ger. surgeon, poet and essayist, b. Mansfeld, son of a Lutheran parson. He studied medicine at the univ. of Berlin and, after the First World War, settled in Berlin as a specialist in skin disease. His early poems (*Morgue*, 1912; *Fleisch*, 1917) were about his profession. His works being banned during the Nazi régime, the first vol. to be pub. after the war was *Statische Gedichte*, 1948, followed by various poems and essays (*Der Polemder*, 1949; *Doppelleben*, 1950; *Apfelsäure*, 1953). B. developed a profound cynicism and pessimistic attitude in his poems and essays, and had a considerable influence on Ger. expressionism and lyric writing.

Benn, Sir John Williams (1850-1922), publisher and politician, b. Hyde. His work as a councillor on the London County Council earned for him the sobriquet of 'father of the L.C.C.' At first the whip, and afterwards the leader, of the 'Progressives,' he became chairman of the General Purposes and the Highways Committees and, in 1904-5, chairman of the council. He was made a baronet in 1914.

Benne Oil, also called gingili or teel oil, is expressed from the seeds of *Seamum indicum*, and is used in cookery, also for lighting, lubrication, medicine, and cosmetics. A favourite Indian cake is made with a mixture of this oil, honey, and citron.

Bennet, Henry, see ARLINGTON, EARL OF.

Bennett, Enoch Arnold (1867-1931), novelist and playwright, b. Shelton, Hanley-in-the-Potteries, N. Staffs. 27 May, and educ. at the Endowed Middle

School. Newcastle under Lyme, and London Univ. In 1889 he went into a solicitor's office in London, and stayed there till 1892, when he became assistant editor of *Woman*, of which paper he became editor, 1896-1900. His first story was *A Man from the North*, 1893. In the same year appeared *Journalism for Women*, and the next, *Polite Fancies*—his first plays. His prose fiction, from the first, he divided into novels and fantasies: by the latter (some in collaboration with Eden Phillpotts) he obtained fame and money; by the former, estab. himself as a literary artist. He first attracted the attention of the critical world with a description of life and conditions in the Five Towns of the Potteries, making his name with *Anna of the Five Towns*, 1902; and he was at his best when he returned to that theme—for, with all his acquired culture, B. was essentially a provincial. He was understood not to admire Dickens; yet it is in the delineation of the 19th-cent. Eng. eccentric that he, like Dickens, excels. Perhaps his best novel is *The Old Wives' Tale*, 1908. Other later works of fiction are *Clayhanger*, 1910, *The Card*, 1911, *Hilda Lessways* (sequel to *Clayhanger*), 1911, *The Regent* (sequel to *The Card*), 1913, *The Price of Love*, 1914, *These Twain* (sequel to *Hilda Lessways*), 1916, *The Pretty Lady*, 1918, *Mr Prohack*, 1922, *Lilian*, 1923, *Riccyman Steps*, 1923, *Lord Itango*, 1926, *The Strange Vanguard*, 1928, and *Acrident*, 1929. Among his plays are *Cupid and Common-sense*, 1908, *What the Public Wants*, 1909, *The Honeymoon*, 1911, *Milestones* (with E. Knoblock), 1912, *The Great Adventure*, 1913, *The Tittle*, 1918, *Judith*, 1919, *The Love Match*, 1922, *Body and Soul*, 1922, *London Life* (with E. Knoblock), 1924, and *Mr Prohack*, 1927. B. resided much in France, and, as touching his personal experiences, wrote *The Truth About an Author*, 1903, *The Reasonable Life*, 1907, *The Human Machine*, 1908, *How to Live on Twenty-four Hours a Day*, 1912, *From the Log of the Velsa*, 1920, *Things That Have Interested Me* (3 series), 1921, 1923, and 1925, and *Journal*, 1930-3. See studies by Georges Lafourcade, 1938; W. Allen, 1948; Reginald Pound, 1952.

Bennett, James Gordon (1795-1872), Amer. journalist, founder and editor of the *New York Herald* (q.v.). b. Newmillis, Banffshire, in Scotland. Was educ. for the Rom. Catholic priesthood, but emigrated to America in 1819. He founded the *New York Herald* in 1835.

Bennett, James Gordon (1841-1918), son of the above. He succeeded to the management of the *New York Herald* on his father's death, dispatched H. M. Stanley to central Africa to find Livingstone, bore half the expense of Stanley's Congo expedition of 1874, arranged the *Jeanette* polar expedition, and promoted, with J. W. Mackay, the Commercial Cable Co. in 1883. He d. at Nice, and left money to found a home for journalists in New York.

Bennett, John Hughes (1812-75), pathologist, b. London. He was educ. at

Exeter and Edinburgh, and studied for 4 years in Paris and Germany. In 1841 he began to lecture on histology in Edinburgh, and from 1843 to 1874 was prof. of the institutes of medicine at Edinburgh. He pub. numerous treatises on medicine. He gave the first definite description of the blood disease leukaemia and he drew attention to the medicinal value of cod-liver oil.

Bennett, Richard Bedford, 1st Viscount (1870-1947), Canadian statesman. Descended from United Loyalist stock settled in Fundy Bay, his forebears began colonial life with a shipyard in N. Brunswick and building ships for riv. and coastwise trade. After taking his law degree at Dalhousie Univ., B. practised in New Brunswick. Later he went into partnership in Calgary, and entered the Legislature of the NW. Ter. First became prominent in politics as an opponent of the provisions for separate Catholic schools in the proposed prov. constitutions of Alberta and Saskatchewan. This gave him the leadership of the small band of Conservatives in Alberta's first legislature in 1905. At the 'reciprocity' elections of 1911 he was returned as a Conservative by Calgary by a large majority. He enhanced his reputation by his opposition to the railway policy of the Borden Gov. Being opposed also to the ministerial policy during the First World War, he withdrew from politics in 1917 and resumed the practice of law. Returned again for Calgary in 1925. In 1926 he was minister of finance. Soon in opposition again, he estab. himself as the best parliamentarian on the Conservative side, and was selected in 1927 to take the place of Mr Meighen as leader, and thereafter was chiefly responsible for getting the Conservatives back to power in 1930. He was an ardent champion of protective tariffs, came to London in 1930 as the head of the Canadian delegation to the Imperial Conference. Presided over the Ottawa (Imperial Economic) Conference, 1932. In the election of Oct. 1935 he sustained a crushing defeat. He was succeeded by Mr Mackenzie King as premier, and later by Manion as Conservative leader. In 1938 he took up permanent residence in England. Created viscount in 1941.

Bennett, Sir William Sterndale (1816-1875), composer and pianist, b. Sheffield. For 10 years he studied in the Royal Academy of Music and then visited Germany, where, at Düsseldorf and Leipzig, he made the acquaintance of Mendelssohn and Schumann (qq.v.). Returning to England he received a warm reception, and in 1838 was elected member of the Royal Society of Musicians. In 1849 he founded the Bach Society. In 1856 he became prof. of music at Cambridge, and was engaged as conductor to the Philharmonic Society the same year. This latter post he resigned on being appointed principal of the Royal Academy of Music in 1866. He received the honorary degree of D.C.L. from Oxford Univ. in 1870, and the following year was knighted. With the exception of opera, B. attempted

almost every form of vocal and instrumental composition. *The Naiads* and *The Wood Nymphs* (overtures), 4 piano concertos, and *The May Queen* (a cantata), were among his best-known works.

Bennettiales, important group of fossil gymnosperm plants of Mesozoic age. They are similar to cycads in habit and stem structure, but differ in the reproductive organs.

Bennigsen, Levin August Theophil, Count (1745-1826), Russian general, b. Brunswick. After a period in the Hanoverian service he entered the Russian Army and gained distinction in the Turkish and Polish wars. Aided in the assassination of Tsar Paul V. Commanded the Russian armies against Napoleon at Pultusk (1806) and Eylau (1807) and was present at Borodino (1812) and Leipzig (1813).

Bennington, township of the co. of R., Vermont, U.S.A. It has woollen mills, and manufs. textiles, paper, clothing, pottery, plastics, and wood products. Pop. 12,411.

Benoît, Camille (1851-1923), Fr. composer, b. Roanne, Loire. He was a pupil of César Franck. His works include an opera *Cléopâtre* and a symphonic poem *Merlin l'enchanté*. He was curator of the Louvre museum from 1895.

Benoît, Peter (1834-1901), Flem. composer, b. Harlebeke. In 1851 B. entered the Brussels Conservatoire, where he studied till 1855. There he composed an opera, *Le Village dans les montagnes*, but his later operas were set to Flem. librettos and began a Flem. national revival. He also wrote oratorios, cantatas, etc.

Benoît, Pierre (1886-), Fr. novelist, b. Albi, Tarn. He won an international reputation with his *Koenigsmark* (1918), a novel which is concerned with the fates of Count Philip Königsmark and Countess Platen. Among his other more notable works are *L'Atlantide*, 1922 *La Chaussée des géants*, 1922, on the Dublin riots of 1916; *Le soleil de minuit*, 1930; and *Le désert de Gobi*, 1941.

Benoît de Sainte-More (fl. c. 1150), Fr. trouvère. He wrote a long poem in octosyllable verse entitled *Chronique des Ducs de Normandie* at the suggestion of Henry II of England. His *Roman de Troie* (30,000 lines) is based on the *Historia de exilio Trojæ* of Dares Phrygius, and the *Æphemerides belli Trojani* of Dictys Cretensis. The story, told as though it were a medieval romance, commences with Jason's theft of the Golden Fleece and ends with the return of the Gk heroes after the sack of Troy. B. is largely responsible for the popularity of the story of Troy in the Middle Ages.

Benoni, tn in the Transvaal prov. of S. Africa, 19 m. from Johannesburg, an important engineering and industrial centre. Pop.: Whites, 36 738; Bantu, 66,650; Coloureds, 3913; Asiatics, 1683.

Bensberg, Ger. tn in the Land of North

Bensley, Thomas (d. c. 1835), printer and producer of some of the finest and most magnificent books of his period. His chief production was Maoklin's folio Bible (1800) and his octavo Shakespeare is also well known. He was associated with Koenig in developing the first steam printing press, which was used by *The Times* in 1814.

Benson, Arthur Christopher (1862-1925), poet and essayist, the eldest son of Edward White B. (q.v.). Educ. at Eton and King's College, Cambridge. He became a master at Eton in 1885, continuing there until 1903, when he was elected a fellow of Magdalene College, of which he became master, 1914. In 1886 he produced his first work of fiction, *The Memoirs of Arthur Hamilton*, under the pseudonym of Christopher Carr. Two vols., *Poems and Lyrics*, pub. in 1893 and 1895 respectively, gave him a reputation as a writer of verse. Further literary productions of his were *Archbishop Laud, a Study*, 1887, *Lord Vyet and other Poems*, 1897, *The Life of Archbishop Benson*, 1899, *Fasti Etonenses*, 1899, *The Schoolmaster*, 1902, and *The House of Quiet*, 1904. He also wrote studies of D. G. Rossetti, 1904, Edward Fitzgerald, 1905, and Walter Pater, 1906. Among his other pubs. are *Peace and other Poems*, 1905, *The Upton Letters*, 1905, *From a College Window*, 1906, *The Thread of Gold*, 1906, *Beside Still Waters*, 1907, *Joyous Gard*, 1913, *The Orchard Pavilion*, 1914, *Hugh* (memoir of his brother), 1915, *Meanwhile*, 1916, *Cambridge Essays on Education*, 1917, *Magdalene College*, 1923, *Memoirs and Friends*, 1924, *Chris Gascoyne*, 1924, *The Canon*, 1926, *Basil Neherby*, 1926, and *Cressage*, 1927. The last 4 are novels. He also ed. with Lord Esher *The Correspondence of Queen Victoria*, 1907, and he was the author of the words of 'Land of Hope and Glory,' for which Edward Elgar (q.v.) composed the music. See E. H. Kyle, *A. C. Benson as seen by some Friends*, 1925.

Benson, Edward Frederic (1867-1940), author, b. Wellington College, 24 July, the son of Edward White B. (q.v.). He was educ. at Marlborough and King's College, Cambridge. From 1892 to 1895 he was engaged in investigations at Athens on behalf of the Brit. Archaeological Society. In 1893 he pub. his first novel *Dodo*, a story of society life. Other novels: *Vinlage*, 1898; *The Caprina*, 1899; *The Challoners*, 1904; *The Image in the Sand*, 1905; *The House of Defence*, 1907; *The Osbornes*, 1910; *Dodo the Second*, 1914; *The Countess of Lowndes Square*, 1920; *Dodo Wonders*, 1921; *David of King's*, 1924; *Mezzanine*, 1926; *Paying Guests*, 1929; *Travail of Gold*, 1933. He was also the author of 2 plays, *Aunt Jeannie*, 1902, and *Dinner for Eight*, 1915. His study of the life of Charlotte Brontë was pub. in 1932, and *King Edward VII* in 1933. He dealt with the hist. of his own times in two volumes of his own memoirs, *As We Are*, 1932, and *As We Were*, 1934.

Benson, Edward White (1829-96), archbishop, b. Birmingham. Entering Trinity College, Cambridge, in 1848, he

was elected fellow in 1853. From this date until 1859 he was a master at Rugby, being appointed in the latter year headmaster of the newly opened Wellington College. In 1869 he was made prebendary, and in 1872 chancellor, of Lincoln. In 1877 he was appointed first Bishop of Truro, and on the death of Dr Taft succeeded him as Archbishop of Canterbury (1883). As primate he cultivated cordial relations with the E. churches. He imparted new vigour to church life in England and reorganised the internal administration of the Church. Many of his numerous writings possess considerable scholastic and antiquarian value. See life by A. C. Benson (son), 1899.

Benson, Sir Francis Robert (1858-1930), actor manager; educ. at Winchester and Oxford. While at Oxford he played the part of Clytemnestra in the *Agamemnon* of Aeschylus, and was invited to join Sir Henry Irving's company at the Lyceum. In 1883 he founded a Shakespeare repertory company, which continued until 1916, giving performances not only in London and the provs., but also in U.S.A. and Canada. In 1920, after the war, a new company was started and toured S. Africa. B. himself played about 100 parts, the majority from Shakespeare, and estab. a school of acting which had a marked influence on the Eng. stage. He was also responsible for many of the Shakespearian festivals at Stratford upon Avon. He was knighted in 1916, and in 1934 awarded a civil list pension of £100 in recognition of his services to drama. In 1886 he married Gertrude Samwell, who was a member of his company under the name of Constance Featherstonhaugh.

Benson, Richard Meux (1824-1915), missionary and founder of the Cowley Brotherhood. Author of *Spiritual Readings*, 1879, and *War Songs of the Prince of Peace*, 1901, both mystical in conception.

Benson, Robert Hugh (1871-1914), author and priest of the Rom. Church, the son of Edward White B. (q.v.). He was educ. at Eton and Cambridge, and held curacies for some years as a priest of the Eng. Church, but in 1903 was converted to Rom. Catholicism. He wrote both novels and religious works. Some of his novels are historic romances and most of his later works of fiction are vehicles for Catholic propaganda. The best known are *The Light Invisible*, 1903, *By What Authority?*, 1904, *The King's Achievement*, 1905, *The Sentimentalists*, 1906, *The Queen's Tragedy*, 1906, *Lord of the World*, 1907, *The Conventionalists*, 1908, and *The Dawn of All*, 1911. His poems were pub. shortly after his death. See *Hugh*, 1915, by his brother, A. C. Benson, and life, 1916, by Father C. C. Martindale.

Benson, Stella (1892-1933), novelist, b. Much Wenlock, Shropshire, a niece of Mary Cholmondeley (q.v.). She was educ. privately. During the First World War she worked in London on social services, for the women's vote movement, and on the land. Later for reasons

of health she travelled in the U.S.A. In 1921 she married J. C. O'Gorman Anderson of the Chinese Customs Service, and lived in China, dying at Tongking. Her novel *Tobit Transplanted* won the Femina Vie Heureuse prize in 1931. She left a jour. of 20 vols. to Cambridge Univ. for pub. in 50 years' time. Other novels include *I Pose*, 1915, *This is the End*, 1917, *Living Alone*, 1919, and *Good-bye, Stranger*, 1926. Her short stories have been pub. in a collected ed. See R. Ellis Roberts, *A Portrait of Stella Benson*, 1939.

Bent, James Theodore (1852-97), traveller and archaeologist, b. near Leeds. He was educ. at Repton and Oxford. He visited Italy and Greece, and in 1885 began investigations in Asia Minor. In 1891 he visited S. Africa, exploring the great Zimbabwe ruins in Mashonaland. In 1893 he explored parts of Arabia and Abyssinia. Chief works: *The Cyclades, or Life among the Insular Greeks*, 1886; *The Ruined Cities of Mashonaland*, 1892; *The Sacred City of the Ethiopians*, 1893.

Bent Grass, see AGROSTIS.

Bentham, George (1800-84), botanist, b. at Stoke, near Plymouth. A nephew of Jeremy B., he was attracted to the study of botany through the applicability thereto of the analytical methods learnt from his uncle. For some years he lived in France managing his father's estate, eventually coming to England to study law and to assist his uncle. On his uncle's death in 1832 he was able to follow his scientific inclinations, and in 1842 removed to Herefordshire to devote himself entirely to science. The cost of maintaining his herbarium proved too expensive, and in 1854 he presented his collection to Kew Gardens, where he worked until his death. He wrote sev. important treatises, the chief being *Genera Plantarum*, and was elected F.R.S.

Bentham, James (1708-94), writer on architecture. Educ. at Trinity College, Cambridge, he became prebendary of Ely Cathedral in 1779. B. directed his attention to the study of church architecture, and his *History of the Church of Ely* was pub. in 1771.

Bentham, Jeremy (1748-1832), writer on law and political economy; the son of Jeremiah B., a solicitor of London. Educ. at Westminster and Oxford. Studied law and was called to the Bar about 1772, but did not practise to any great extent. He had attended, at Oxford, Blackstone's lectures on Eng. law, but was not satisfied with him. His first pub., *Fragment on Government*, 1776, was an attack on Blackstone, and was attributed by Johnson to Dunning. In 1780 he wrote his *Principles of Morals and Legislation*; it was printed but not pub. until 1789. In 1785 he went abroad and travelled over the greater part of Europe, and on his return in 1791 pub. his *Panopticon or The Inspection House*, a valuable work on prison discipline. This was his proposed circular prison with cells round the warders' well in the centre, and it was taken up by the gov., experimented upon at great expense,

and dropped. At this time B.'s fame abroad was greater than here, and every embryo rep. looked to him. Borrow met an *alcaide* near Finisterre who spoke of the 'great Baltham.' From about 1817 on he was a bencher of Lincoln's Inn; he d. at Westminster. He left his body to be dissected, and the skeleton may be seen at Univ. College, London. Among his other works are *Discourse on Civil and Penal Legislation*, 1802, *Punishments and Rewards*, 1811, *Parliamentary Reform Catechism*, 1817, and *A Rationale of Judicial Evidence*, 1827. The prophet of utilitarianism and the herald of all manner of social and legal reforms, the greatness of B. grows with time and with the realisation of his amazing grasp of so many and

JEREMY BENTHAM

diverse subjects, his power of unerring prophecy, and his universal tolerance in an age which, judged by modern standards, was harsh in the extreme. The older Benthamites had misjudged him. Even thinkers like James Mill regarded him as a visionary, an obscure jurist among greater jurists, a kind of catfish among the lawyers, a philosopher whose hedonistic calculus was devoid of practical value, and the defender of moneylenders. This misconception was due to his works not being read or not closely read by those who criticised him. The human and sensitive B., too, was forgotten in this hasty appraisal. The reforms for which B. was directly or indirectly responsible in the process of time, eloquently proclaim alike the catholicity of his learning and the liberality of his opinions. These reforms include the reform of the representative system of Parliament; the mitigation of the terrible criminal law, the abolition of transportation, and the improvement of prisons; the abolition of imprisonment for debt; the overhauling of the jury system; reforms in merchant shipping; the introduction of uniform and scientific methods of drafting Acts of

Parliament; the reform of the Poor Laws; the abolition of religious tests; the development of savings banks, friendly societies, cheap postage, census returns, registration of births and deaths, real property registration, national educ., protection of inventors, and public health legislation. It is also to be remembered that B., in his proposals for perpetual peace in the shape of a congress or diet working towards disarmament and the abolition of secret diplomacy, gave what was practically an outline of the modern Covenant of the League of Nations. (On this last point see C. John Colombas, *Outline of League of Nations Constitution*—(Grotrius Society Publications.)) B. also played no inconsiderable part in the building up of the Brit. Empire, in which connection the colonisation of Australia and the Indian penal code both owed much to his inspiration. It is small wonder that Talleyrand could say of him: 'Pillé par tout le monde, il est toujours riche.' B.'s numerous works have never been adequately or completely pub., a number of MSS. and much correspondence never yet having been printed. His total output would probably fill some 60 vols. of the size of the *Travail*. His works, in 11 vols. (closely printed), including a biography and selected letters, were ed. by Sir John Bowring (q.v.), 1838-43. Bowring also ed. the *Deontology*, 1834. B.'s MSS. are preserved and catalogued in Univ. College, London Univ. (consult T. Whittaker's *Report*, 1892). There are trans. of his works in most languages, in which connection it may be recalled that B., early in his career, was almost a Frenchman. The work of Prof. Élie Halévy, of the *École Libre des Sciences Politiques*, Paris, has done much to make B. and his work better known to the scholars of his native land. See CLASSICAL ECONOMISTS. See also L. Stephen, *The English Utilitarians*, 1900; C. M. Atkinson, *Jeremy Bentham*, 1905; G. Wallas, *Jeremy Bentham*, 1922; C. Philipson, *Three Criminal Law Reformers*, 1923; J. S. Mill, *On Bentham and Coleridge* (ed. F. R. Leavis, 1950).

Bentham, Sir Samuel (1757-1831), naval architect and author of sev. works on naval administration, the brother of Jeremy B. He travelled for some years in Russia, and became an officer in the Russian service. On his return to England he became inspector-general of naval works.

Benthamia, genus of plants now included in *Cornus* (q.v.).

Bentheim, Ger. tn in the Land of Lower Saxony (q.v.), 107 m. W. of Hanover (q.v.). It is the chief tn of the B. dist. on the Dutch border, and has a 12th-cent. castle. There are minor industries, and mineral springs near by. Pop. 10,000.

Bentinck, Hans William, 1st Earl of Portland (c. 1649-1709), son of Henry B. of Diepenheim, Overijssel. As a boy he was attached to the Orange household and grew to be William III.'s close friend and confidential adviser. He helped to negotiate William's marriage with Mary, daughter of James II, and was entrusted

with the preparations for William's landing in England in 1688, the success of which placed William and Mary on the Eng. throne. He served with distinction at the battle of the Boyne, 1690. B. was rewarded for his services by being created Earl of Portland and receiving other honours.

Bentinck, Lord William George Frederick Cavendish (1802-48), politician and sportsman, third son of the 4th Duke of Portland. He entered the army in 1819 but retired in 1822 to become private secretary to his uncle, George Canning, and in 1828 became M.P. for King's Lynn. He voted with the Tories until 1846, when he became leader of the Protectionist party, created in consequence of Sir Robert Peel's conversion to Free Trade principles. B. was also famous as a race-horse owner.

Bentinck, William Henry Cavendish, 3rd Duke of Portland (1738-1809), statesman. He entered Parliament as a Whig in 1761, and held office under Rockingham in 1765 and 1782. He was put forward as nominal leader of the coalition ministry by Lord North and Fox in April 1783, but resigned in Dec. With the outbreak of the Fr. Revolution his interest in politics reawakened, and for 7 years he was home secretary in Pitt's Tory administration (1794-1801). He again became Prime Minister, 1807, but being unequal to the task resigned in Oct. 1809.

Bentinck, Lord William Henry Cavendish (1774-1839), general and administrator, second son of the 3rd Duke of Portland. He entered the army in 1791, and in 1803 was nominated Governor of Madras. He introduced reforms which provoked a Sepoy mutiny, and was recalled in 1807. He became Governor-General of Bengal in 1827, and first Governor-General of India, 1833-6.

Bentiv, or Bientveo, *Tyrannus sulphuratus*, species of Tyrannidae. The former is the Portuguese and the latter the Sp. name of the bird. It is related to butcher-birds (see SHRIKES), and feeds on carrion and reptiles. W. H. Hudson gives its scientific name as *Ptilanus volitans*. He states that it has a wide range in S. America down to Buenos Aires, and that it is named from its trisyllable cry in which some people fancy there is a resemblance to the words Bientveo (I see you well).

Bentivoglio, Ercole (1506-73), It. poet, grandson of Giovanni B. (q.v.). He addressed some sonnets to Tullia d'Aragona, wrote sev. satirical works mocking the cult of Petrarch, and 4 comedies, 2 of which are extant: *Il Geloso*, 1544, and *I Fantasmi*, 1547.

Bentivoglio, Giovanni (d. 1508), It. ruler of Bologna, son of Annibale B., who, governing Bologna for sev. years, was murdered by a rival faction in 1446. Giovanni was then a boy of 6 years of age, but in 1462 he made himself master of Bologna. Though stern and vindictive in his gov., B. was a patron of the arts and of learning; he adorned Bologna with fine buildings and made collections of statues and paintings, and of MSS. Pons

Julius II expelled him from Bologna in 1506, and he was obliged to escape with his family into Milanese ter., where he d. 2 years later. In 1512 the surviving members of his family emigrated to Ferrara, where they settled under the protection of the Duke d'Este.

Bentivoglio, Guido (1579-1644), It. statesman, b. Ferrara, a descendant of the B.s who had been rulers of Bologna in the preceding cent. He studied at Padua, and returned to Ferrara in 1597. In 1601 he was made a prelate of the papal court. After the death of Clement in 1605 his successor, Paul V. sent him as nuncio to Flanders, where he wrote a hist. of the 16th-cent. Flemish revolt against Sp. rule. In 1616 B. was sent as nuncio to France, where he gained great influence at Louis XIII's court.

Bentley, Edmund Clerihew (1875-1956), journalist and novelist, b. London. He was educ. at St Paul's and Oxford, where he was president of the Union and captain of the boat club. After studying law he turned to journalism and wrote first for the *Daily News* and then for the *Daily Telegraph*. In *Biography for Beginners*, 1905, he produced a new literary medium, called after him the clerihew (q.v.), a four-line poem with extreme metrical licence, which has come to rival the limerick as a vehicle for nonsense. Two more collections of these four-line biographies appeared in 1929 and 1939. Meanwhile his novel, *Trent's Last Case*, 1936, showed new possibilities in the detective story, which he treated with a light-hearted abandon which has since found many imitators. It was followed by *Trent's Own Case*, 1936, in which he collaborated with H. Warner Allen, and *Trent Intervenes*, 1938, a vol. of short stories. In 1940 appeared *Those Days: an Autobiography*.

Bentley, John Francis (1830-1902), architect, b. Doncaster, was trained as an engineer and builder. In 1862 he joined the Church of Rome, and started practice as an architect. Up to 1895 his work consisted of houses, schools, and churches in the Gothic style—notably the fine Church of the Holy Rood at Watford, 1887. In 1895 he was appointed architect for the great new Rom. Catholic Cathedral at Westminster. The authorities having decided that the building must be Byzantine in style (in order to avoid rivalry with the Gothic of Westminster Abbey not far away), B. made an extensive tour of south-eastern Europe in order to study Byzantine architecture. His design, as carried out, shows an original treatment of the style; but he did not live to see the completion of the building, and the decoration is still (1957) unfinished. See biography by W. de l'Hôpital, 1919.

Bentley, Richard (1662-1742), clergyman, scholar, and critic, b. Oulton, Yorks, son of a farmer. Educ. at Wakefield and St John's College, Cambridge, he became a schoolmaster at Spalding, 1682, but left this to be private tutor to the son of Dr Stillingfleet (afterwards Bishop of Worcester). He accompanied his charge to Oxford, and was soon admitted to the

degree of M.A. Here he had access to the Bodleian library, and gained the friendship of Mill, the editor of the *Gk Testament*, and Bernard, then Savilian prof. He laid the foundation of his reputation in a dissertation on an obscure chronicler, John Malalas or John the Rhetor (real name John of Antioch), which was pub. with an appendix to Dr Mill's ed. of the author in 1691. In 1692 he was appointed Boyle Lecturer and in 1694 keeper of the Royal Library; his degree of D.D. he took at Cambridge in 1696. To the ed. of Callimachus by Graevius in 1697, he contributed a collection of fragments of that poet. It was now that his famous quarrel with the Hon. C. Boyle began. The latter was to edit the *Epistles of Phalaris*; and noticing (rightly or not some want of courtesy on the part of B regarding the loan of a certain MS. in the king's library, inadvertently upon it with some petulance in his proface. B. who had decided before (as was right) that these epistles were spurious, said so in Wotton's *Reflections on Ancient and Modern Learning*, and criticised Boyle's performance with some asperity. In 1700 he became master of Trinity College, Cambridge, and next year he married Joanna Bernard. He helped Kuster with an ed. of Suidas, effected the pub. of Cotes's ed. of Newton's *Principia* 1709-1713, and pub. an ed. of Horace, 1711; he wrote 2 critical letters on Aristophanes, and in 1708 sent to Hemsterhuis a valuable letter containing emendations of the fragments of comic writers in Julius Pollux's *Onomasticon*, an ed. of which Hemsterhuis had just pub. If his learning was great, his manners were harsh and overbearing, and he quarrelled with the fellows of his college, and was deprived by the visitor, Bishop Greene. B., however, by a great number of expedients, resisted the deprivation for 4 years, and the matter was dropped. In 1717 he was, by his bold and unscrupulous manoeuvres, elected regius prof. of divinity; litigation followed as usual, and as usual B. won. His valuable ed. of Terence appeared in 1726. He undertook an ed. of *Paradise Lost* in 1731, supposing that Milton's amanuensis was likely to have committed blunders in taking down the poet's words; if his criticisms and emendations are prosaic, they are ingenious, and Pope had no business to put him into the *Dunciad*. Of B. we can only say that what he lacked in manners and modesty (and he lacked a good deal) he made up in learning. His style was strong and flexible. Swift's *Battle of the Books* has an account of B's quarrel with Boyle. See J. H. Monk, *Life of Richard Bentley*, 1830; Sir R. C. Jebb, *Bentley*, 1882; H. C. Beeching, *Francis Atterbury*, 1909; J. W. Mackail, *Bentley's Milton*, 1924.

Bentley: 1. coal-mining tn (Bentley-with-Arksey) of the W. Riding of Yorks, England, near Doncaster. Pop. 19,826.

2. Vil. of Hants, England, 4 m. SW. of Farnham. A considerable amount of Rom. pottery of the 1st to 4th cents. AD was unearthed in Alice Holt Forest, near B. in 1945. Pop. 800.

Benton, Thomas Hart (1782-1858), Amer. statesman, b. Hillsboro, N. Carolina. He represented Missouri in the U.S. Senate 1821-51, being eventually rejected on account of his opposition to slavery. His attitude on this question, his opposition to the proposed estab. of a U.S. bank, and his advocacy of Amer. expansion in the W., made him prominent in Amer. politics. Editor of *An Abridgment of the Debates of Congress from 1789 to 1856* (16 vols.), 1857-61. See his autobiography, *Thirty Years' View* (2 vols.), 1854-6.

Benton Harbor, city in Michigan, U.S.A., on St Joseph It. across from St Joseph, at Lake Michigan, in a fruit-growing area. It is a resort with mineral springs and beaches. It has canning plants and manufs. hardware, tools, machinery, and boats. The House of David, a religious settlement, is here. Pop. 18,800.

Benue, largest and most important affluent of the It. Niger, W. Africa, which it joins at Lokoja, 230 m. above its mouth. It rises in Adamawa, and flows through fertile country, navigable for 700 m., thus affording a highway into the centre of Sudan. Explored by Baikie in 1854 and 1862, and Flegel, 1879-83.

Benvenuto Cellini, see CELLINI, BENVENUTO.

Benvenuto Tisio, see GAROFALO.

Benyowsky, Moritz August, Count von (1741-86), Hungarian soldier and adventurer; b. Hungary; in 1756 fought for Austria in the Seven Years War. In 1767 he joined the Poles in their struggle against Russia; he was captured and subsequently took part in various intrigues against the Russian empress, but eventually escaped to France. The French gave him permission to establish a settlement in Madagascar, where he ultimately lost his life in a skirmish. See his *Travels*, trans. into English, 1790.

Benz, Karl (1844-1929), Ger. engineer, who, as long ago as 1885 built a motor-car driven by benzine at a speed of 15 m.p.h. His work was a valuable basis for subsequent developments of the internal-combustion engine.

Benzaldehyde (C_6H_5CHO), colourless liquid with an odour of bitter almonds. It is produced naturally in bitter almonds, cherries, and peaches in the form of amygdalin (q.v.). It is also prepared from toluene which is converted into benzal chloride and then heated with milk of lime. Alternatively toluene is oxidised by means of chromyl chloride, or a mixture of manganese dioxide and sulphuric acid with copper sulphate as catalyst. See ALMONDS, OIL OF.

Benzamide ($C_6H_5CONH_2$), organic compound formed by reaction of ammonia with benzoyl chloride. It crystallises in leaflets which melt at 130° C. and boil at 288° C.

Benzedrine, α -benzyl-ethylamine ($C_6H_5CH_2CH(CH_3)NH_2$). It may be inhaled under medical advice to relieve hay fever, etc. Administered internally, it is a powerful nerve stimulant, and produces a temporary sensation of well-being.

Benzene (C_6H_6), compound of carbon

and hydrogen produced in the distillation of coal-tar and on a large scale by petroleum cracking (q.v.). It occurs naturally in Borneo petroleum. It was discovered by Faraday in 1825 as produced in the distillation of certain oils and fats, and Hoffman in 1845 showed that it was a constituent of coal-tar. To separate the various hydrocarbons in coal-tar, the substance is distilled in a tar-still, the products being drawn off at different temps. The first fraction is taken up to 210° C., and contains a large percentage of B. The distillate, known as 'light oil,' is again fractionated, producing separate distillates of 'first runnings,' 'heavy benzols,' and 'carbolic oil.' A further distillation of the benzols in a steam-still produces pure or nearly pure B. B. is a light, colourless liquid with a pleasant odour. It crystallises in rhombic form at 0° C., melts at 5.4° C., and boils at 80.4°. It is insoluble in water, but dissolves in alcohol, ether, acetic acid, and carbon disulphide. It readily dissolves gums and fatty substances, as well as phosphorus, sulphur, and iodine. B. is interesting chemically as being the parent of the aromatic compounds. The atoms of carbon are represented in a graphic formula as being arranged in a closed ring, each atom being connected with an atom of hydrogen. The replacing of these atoms by other atoms or groups gives rise to a large number of derivatives, which have in general more strongly marked characteristics and are more stable than the aliphatic or fatty compounds. B. is used commercially as a solvent, and as a starting-point in the production of many valuable dyes. The name is often applied to benzol, which consists of B. and toluene. This mixture is largely employed as a fuel for internal combustion engines. Benzine (q.v.) is a distillate from Amer. petroleum, and is much used as a solvent. Benzoline is a name applied to a form of benzine; it is used as a solvent and as a fuel.

Benzidine ($C_6H_4N_2$, or $p:p'-H_2N-C_6H_4-C_6H_4-NH_2$), primary aromatic amine produced by the reduction of nitrobenzene to hydrazobenzene and heating this in acid at c. 80° C. Crystallises from water in large silky plates, melting-point 127.5-128° C. It is mainly used in the preparation of disazo direct cotton dyes (see DYES).

Benzil ($C_6H_5CO \cdot CO \cdot C_6H_5$), organic solid, crystallising in trapezohedra, melting-point 95° C. It is produced by treating benzoin ($C_6H_5 \cdot CHOH \cdot CO \cdot C_6H_5$) with chlorine and nitric acid, or by fusing it with an alkali.

Benzine, volatile liquid obtained from petroleum. The name has been applied to different organic compounds. The hydrocarbon now known as benzene (C_6H_6) (q.v.) was originally known as B., and the name was afterwards and is still applied to the partially purified coal-tar which contains benzene as its prin. constituent. The term B. is, however, most commonly applied to the lower boiling-point fractions in the distillation of petroleum, and has thus a kinship with

petrol, petroleum spirit, motor spirit, benzoline, etc. It is valuable as a solvent, and is used for cleaning wearing apparel, etc. It is also produced on a large scale from the cracking of petroleum (q.v.).

Benzoic Acid ($C_6H_5 \cdot COOH$), aromatic acid, occurring naturally in some resins, especially gum benzoin and in Peru and Tolu balsams. It may be obtained from gum benzoin by sublimation, from toluene by oxidation, and from hippuric acid by hydrolysis. It crystallises in light feathery plates, which melt at 121.4° C. and boil at 250° C. It is readily soluble in hot water, alcohol, etc. When heated with lime benzene is produced, and salts called benzoates are formed by combination with the oxides of many metals. In medicine it is used as an antiseptic, expectorant, and diuretic. Moderate doses remain unchanged in the blood, but unite with glycocoll in the kidneys to form hippuric acid. It is useful in mild chronic cystitis and in urethral affections.

Benzoin (from Arabic *luban Jawa* (*lubān-jawī*), incense of Java), balsamic resin obtained from *Styrax B.* It is produced by cutting the bark of trees, and is apparently the result of the wound, and is not secreted by the plant under ordinary conditions.

There are different varieties containing varying proportions of the active ingredient, benzoic acid, while in some samples this is partly or wholly replaced by cinnamic acid. B. has a fragrant odour, and is much used for incense, perfumery, and pastilles. It became a favourite medicament on account of its antiseptic property and its soothing influence in affections of the respiratory organs. The most popular form of the medicine is the compound tincture, or friar's balsam, which is used externally for sores, ulcers, etc., and internally for throat troubles. Inhaling the vapour produced by adding a small quantity of friar's balsam to hot water may give relief for catarrh and influenza.

Benzoline, mixture of hydrocarbons (also known as benzine, petroleum spirit, or petrol). It is not a definite chemical compound, and consists of the lighter fractions in the distillation of petroleum or paraffins. It is used as a solvent in industry, and in medicine for heating cauteries and for cleansing the skin in acne. It is also used in oil engines to provide the inflammable vapour which, mixed with air, produces the explosion or expansion of gases which actuates the piston. It must be distinguished from benzol or benzene, which are products of coal-tar distillation, though, like them, it has valuable solvent powers.

Benzoyl, organic radical represented by the formula $C_6H_5 \cdot CO$. In 1832 Baron Liebig, in association with F. Wöhler, published a paper showing that throughout a series of compounds formed from benzaldehyde, or oil of bitter almonds, a group which he called B. behaved as a unit. A new era in chemical theory was thus inaugurated which led to far-reaching results. See RADICAL.

Benzoyl-glycocol, see HIPPURIC ACID.

Benzyl, organic group $C_6H_5.CH_2$, is the radical of a large number of types of organic compounds. It is not stable in the free state (see **RADICAL**).

Benzyl Alcohol ($C_6H_5.CH_2.OH$), or **Phenyl Carbinol**, organic compound found in Peru and Tolu balsams and in storax. It may be prepared by reducing benzoyl chloride or by shaking up caustic potash with benzaldehyde, when the product is partly potassium benzoate and partly B. A. It is a colourless liquid with pleasant odour, and boils at $206^\circ C$.

Benzyl Chloride ($C_6H_5.CH_2.Cl$), organic substance produced by the action of chlorine on boiling toluene. By the addition of potassium carbonate, benzyl alcohol is produced, and heating with lead nitrate produces benzaldehyde, or oil of bitter almonds.

Beograd, see **BELGRADE**.

Beowulf, O.E. epic poem of over 3000 lines, possibly the oldest poem in a modern language. It recounts 2 adventures of B., a legendary hero. In the first he slays Grendel, a monster which has been terrorising the land of Hrothgar, King of the Danes; in the second he slays a dragon, but is himself mortally wounded. Historical events mentioned in the poem belong to the 5th cent., but the date of its composition is less certain. Recent authorities suggest that it was written about the end of the 7th cent. in Northumbria by a Christian poet working on older pagan material. The MS., which is of the late 10th cent., formed part of Sir R. Cotton's collection, and is now in the Brit. Museum. Eds. by F. Klaeber (3rd ed.), 1950, and C. L. Wrenn, 1953. Verse trans. by W. Morris, 1892, and G. D. Bono, 1945; prose trans. by J. R. Clark Hall, revised C. L. Wrenn, 1950. See also R. W. Chambers, *Introduction to Beowulf* (2nd ed.), 1932, and D. Whitelock, *The Audience of Beowulf*, 1951.

Bequest, **Bequest**, 2 words strictly applicable in Eng. law to the disposition of personal property by will, 'devise' being the technical term applicable to dispositions of real property. See **WILLS AND TESTAMENTS**.

Beracans, see **BERRANS**.

Béranger, Pierre Jean de (1780-1857), Fr. poet, b. Paris. At the age of 9 he came under the protection of an aunt at Péronne and became a printer's apprentice for 3 years at the age of 14. B. subsequently returned to Paris, and devoted himself to literature. At this time he lived in a garret, which forms the subject of one of his songs. Adversity shattered some of his dreams, and he was forced to solicit help from Lucien Bonaparte. In 1815 he pub. his first collection of songs, and was immediately hailed as the foremost of his country's song-writers. His popularity increased, and also his courage in airing revolutionary ideas, for which in 1821 he was imprisoned in St Pélagie. By his influence with the people, especially with the younger generation, he contributed largely to the downfall of the Bourbons. Many of his best-known verses were printed satires against the gov. which succeeded the fall of Napoleon. The

mocking irony of his famous *Rot d'Yvetot*, saluting the awakening of more truly liberal ideas, had a pronounced effect. In 1828 he was condemned to 9 months' imprisonment and to pay a fine of 10,000 francs. This was paid by public subscription, and B.'s popularity increased as a result of his conviction. In 1830 *Chansons nouvelles* were pub., and 10 years later his life story. The versatility of theme and delicacy of his humour and pathos easily explain his hold upon a public so warm as the working class of France, while his technique and literary quality endeared him no less to the literary scholars of his day. See J. Janin, *Béranger et son temps* (2 vols.), 1866, and J. Lucas-Dubreton, *Béranger*, 1934.

Béranger's Balance, see **BALANCE**.

Berar, an area in Madhya Pradesh state, India, lying to the N. of the state of Hyderabad (q.v.). Up to the beginning of the 19th cent. it was under the rule of an independent rajah with cap. at Nagpur, and later passed to the control of the nizām of Hyderabad, who assigned the ter. to the British in 1853. In 1902 it was leased in perpetuity by the nizām, and incorporated with the Central Provs, now Madhya Pradesh, on 1 Oct. of that year.

Berat, or **Bellgrad**, tn of Albania, on the Semen R. in a fertile valley, the cultivation of which is mainly tobacco, vines, and olives. There is an oil pipeline to Avlona (Vlonë) on the coast. The tn was occupied by the Austrians and later the Italians during the First World War, and was again the scene of fighting between the It. invaders and the Albanians in Jan. 1941. Pop. 12,000.

Béraud, Henri (1835-), Fr. dramatic critic and author, b. Lyons, son of a baker. Was a silk-pattern designer and then a lawyer's clerk. His *Twenty Portraits of the French Revolution* contains vivid descriptions of Mirabeau, Saint-Just, Marat, Danton, Mme Roland, and Charlotte Corday, but is marred by a blurred historical background. In 1922 he won the Goncourt award for 2 books: *Le Virolier de Lune*, a political novel on the death of Louis XV, and *Le Martyre de l'obèse*, a humorous story.

Beraun, see **BEROUN**.

Berber, tn and prov. in the Sudan, near the junction of the Athara and the Nile. The tn was the starting-point of the old caravan route across the Nubian Desert to the Red Sea, at Suakin. Pop. 5000.

Berbera, or **Berberah**, prin. harbour and tn in Brit. Somaliland, N.E. Africa, on a bay of the Gulf of Aden. Pop. 15,000, which is nearly doubled during the cooler months from Oct. to May when an ann. fair is held.

Berberis, large genus of shrubs, about 450 species, chiefly found in Asia and S. America, of family Berberidaceae. Leaves simple, evergreen or deciduous, stems usually spiny; flowers solitary, umbellate, racemose, or paniculate, usually yellow in Asiatic species; orange in S. America. *B. vulgaris* is the common barberry (q.v.), found wild in Britain. Good garden

species are *B. aggregata*, *B. concinna*, *B. darwini*, *B. pratii*, *B. x rubrostilla*, *B. thunbergii*, and *B. wilsonae*.

Berbers, term applied to the different branches of the indigenous inhab. of N. Africa, who have inhabited the region between the Mediterranean and the Sahara since the earliest times. The derivation of the name is yet undiscovered, though it may have come from the Gk *barbaroi*, non-Greeks. Egyptian inscriptions of the 17th and 13th cents. do speak of the Barabara and Beraberata tribes. They were called Lebu, Mashuasha, Tamahu, Tehennu, and Kahaka by the Egyptians. There are a host of tribes called by this term to-day, the main sections being Zouaoua and Jobalia (in Tripoli and Tunisia), the Chauwia, Kabyles, and Beni-Mزاب (in Algeria); the

E.N.A.

A BERBER (KABYLE) OF ALGERIA

Shlûh, Amazigh, and B. (in Morocco); and the Tuareg, Amôshagh, Soryu (in the Sahara). The actual origin of the race is still obscure, and it is to be noticed that, notwithstanding the alterations in feature, usually brought about in the process of time by foreign conquest at the hands of successive invaders, the type is still surprisingly like that of the Stone Age. The usual facial characteristics are dark hair and hazel eyes, while the complexion marks them as a 'white' race. The Arabs have been the prin. invaders, and yet the races are almost as distinct as if some barrier had existed between them. In character the Berber is independent, sturdy, and self-reliant, honest, intelligent, and scrupulous. The gov. of the B. extends over each state, which in most cases is the vil. and there is no attempt at centralisation. Yet the poorest of them has as large a share in the gov. as the richest. They are warlike, and have never yet been thoroughly subdued. Their religion is Mohammedanism, though not strict. Berber women occupy an inferior position, and are procurable by purchase, and easily disposed of at will, yet they are protected by laws, and have a voice in making them. See G. Marçais, *Les Arabes berbères du XI^e au XIV^e siècle*, 1913; P. Hacoun-Campredon,

Studies in the Evolution of Kabyle Customs, 1921; R. Millet, *Les Almohades: histoire d'une dynastie berbère*, 1923; also works on dialect: S. Bearnay (Rif dialects), 1917; Dostaing, 1920; Lacoust, 1920.

Berbice, E. co. of Brit. Guiana. It is bounded on the E. by Dutch Guiana and R. Corentyn. Its area is 16,920 sq. m. In 1831 it was joined to Essequibo and Demerara under one gov., while formerly it formed a distinct prov. Its chief products are rice, sugar, tropical fruit, cattle, mostly along the coast, bauxited kaolin, whilst greenheart wood and balata are to be found in the interior. The R. Berbice is fed by the Canje and is navigable for 100 m. New Amsterdam is the cap. Pop. 96,620.

Berceo, Gonzalo de (fl. 1230), Sp. poet, one of the earliest known poets in the vernacular. He was educ. in the Benedictine monastery of San Millán de la Cogolla, and became a priest. He followed the troubadour school of Langue d'Oc. His poems, mostly based on Lat. originals, are sacred in theme and are composed in single-rhymed Alexandrine quatrains. His most noteworthy poems are *Milagros de Nuestra Señora*, *Vida de Santa Pía*, *Vida de Santo Domingo de Silos*, and *La Estoria de Santo Millán*.

Berceuse (from Fr. *berceau*), literally a cradle song; a soft lulling melody with an accompaniment to imitate rocking.

Berchem (or Berghem), Nicolas (1620-1683), Dutch landscape painter and etcher, b. Haarlem. Some of his best pictures are at Amsterdam. He d. at Haarlem.

Berchem, suburb of Antwerp (q.v.), Belgium. Pop. 46,800.

Berchem-Sainte-Agathe (Flem. Sint-Agatha-Berchem), suburb of Brussels, Belgium, 3 m. W. of the city. It has manufs. of chicory, ceramics, billiard balls, stoves, and gas-ranges. Pop. 13,200.

Berchta (the original of the Eng. Bertha), fairy in S. Ger. legend. She corresponds to Hulda (gracious, benign) in N. Ger. mythology.

Berchtesgaden, Ger. tn in the *Land of Bavaria* (q.v.), near the Austrian border, 74 m. ESE. of Munich (q.v.). It is in the Alps (q.v.), on the Untersberg, in a thickly wooded dist., and is overlooked by sev. majestic peaks: Watzmann (8820 ft); Hochkalter (8473 ft); and Hoher Göll (8196 ft). It was already known at the beginning of the 12th cent. for its monastery of Augustinian Canons; the monastery was granted the salt monopoly of the dist. in 1156; and in 1495 the priors of B. were made princes of the empire. The principality was secularized in 1803. The tn is now a health and winter sports resort. The salt-mines (which have a subterranean salt lake) still exist, and there is a porcelain factory. Pop. 26,090.

B. acquired new fame in modern times as the site of Hitler's (q.v.) mt retreat. Hitler (as well as Goering and Goebbels, q.v.) had here a large chalet in the middle of a compound containing barracks for some 20,000 troops. It was in

this chalet that Hitler received the majority of his guests; but intimate friends, or important foreign visitors whom he wished to impress, were invited to the fantastic 'Eagle's Nest,' or Berghof, high above the tn. The Berghof was a mushroom-shaped, solid stone structure, set squarely on the mt top, 6000 ft above sea level. It had 13 floors, of which 12 were underground and built into the core of the mt; from the valley the building looked like part of the mt. There were no bedrooms, but in the top storey a series of salons, from the great windows of which there were magnificent views over the valley below, and glimpses of the blue-green waters of the Königssee and of the foaming Salzach R. (in Austria). Hitler's reception room was octagonal in shape and 30 yds in diameter; the stone floor was covered with a superb Chinese carpet, in the centre of which stood an enormous octagonal table. Leading from this room there was a great rectangular banquetting hall. In the underground storeys were the food and wine cellars, the guard-room, and the servants' bedrooms. The whole mt was honeycombed with passages and defence rooms, and the Berghof was protected by 5 rings of fortifications. Slave labour was used for all this immense construction, and the sordid wooden barracks in which the captives had lived stood amid the pine-trees on the hillside in sharp contrast to the luxury of the buildings which their labour had created. B. was taken by the troops of Gen. Leclerc's (g.v.) Div. on 5 May 1945. Previously the chalets of Hitler, Goering, and Goebbels, together with the surrounding camp, had been wrecked in allied air-raids. The Berghof itself survived the war, but was subsequently destroyed.

Berchtold, Leopold, Count (1758-1809), Ger. medical writer, who travelled through Europe, Asia, and Africa with a view to mitigating human suffering, and pub. works against hasty interment and concerning sicknesses incident to seamen. He pub. at Vienna, 1797, directions for the treatment and prevention of plague, and was active in making known the advantages of vaccination.

Berchtold, Leopold Antonius Johann, Count von (1867-1942), Austro-Hungarian minister and diplomat, b. Vienna. He entered the diplomatic service and in 1912 he succeeded Aehrenthal as foreign minister. At first he thought the dual monarchy's Balkan problems could be settled without war, but after the Balkan wars (1912-13) he became a convert to the belligerent solution. The assassination of Francis Ferdinand at Sarajevo gave his party in Vienna the opportunity they sought. There is little doubt from documentary evidence, that B. was a party to the conspiracy to hasten the ultimatum to Serbia in such circumstances that Serbia might not have time to offer satisfaction. His influence later declined, and he resigned in 1915.

Berck, Fr. seaside tn in the dept of Pas-de-Calais. It is in 2 parts: B.-Ville, a fishing port, and B.-Plage, a holiday and

health resort with a fine beach and clinics and sanatoria. Pop. 11,500.

Bercy, former Fr. com. situated on the r. b. of the Seine; it has been joined to Paris since 1860, and is the chief depot for the wines, oil, vinegar, and wood for Paris; boat-building is carried on.

Berdaches, see SHAMANISM.

Berdiansk, see OSIPENKO.

Berdichev, tn in the Zhitomir Oblast of the Ukraine, 116 m. SW. of Kiev. It is a local industrial centre. Pop. (1956) 47,000 (1914, 75,000), before the war mainly Jewish. B. has been known since the 14th cent.; in the 19th cent. it was the centre of Hassidism and was often called 'the Jerusalem of Volhynia.'

Berdyaev, Nicolai (1874-1948), Russian philosopher, b. Kiev. Early a revolutionary agitator and student of Marx, he attacked the anti-religious attitude of the Russian intelligentsia. After the revolution of 1917 he was elected by the faculty to the chair of philosophy, Moscow Univ., but was expelled in 1922 and settled in Berlin, where he founded the Russian Academy of Philosophy and Religion. Later he removed to Clamart, near Paris, where he remained till his death. Appointed to a lectureship at the Sorbonne, 1939. His first book, *Subjectivism and Individualism in Social Philosophy*, was pub. in 1901. He was at this time in strong sympathy with the revolutionary movement in Russia, and in 1907 he wrote an article in which he forecast the victory of the Bolsheviks in the revolutionary struggle. He was at issue with them, however, over the rights of human creativeness, and the freedom of the spirit to which he believed orthodox Marxism to be inimical. Therefore, although the revolution of Nov. 1917 was, in his view, 'inevitable and just,' a conflict arose between his social and his spiritual ideals, and he was expelled from the country in 1922. He remained an idealist thinker, and his philosophy of personalism had considerable influence on European thought. In a book written just before the Second World War, *Slavery and Freedom* (Eng. trans., 1944), he sought the way whereby man could free his creative personality from spiritual, economic, and political forms of bondage. He wrote as a Christian philosopher, and in *The Meaning of History* stated the Christian philosophy of hist. As a Christian apologist he sought to free religion from the objectivity and materialism into which it has fallen as a social force. Other works which have been trans. into English include *Freedom and the Spirit*, 1935, *The Destiny of Man*, 1937, *Solitude and Society*, 1938, *Spirit and Reality*, 1939, *Slavery and Freedom*, 1944, *The Russian Idea* (an interpretation of Russian thought as a whole), 1947, and *Towards a New Epoch*, 1948. He also wrote a scholarly and judicial account of the development of Communism under the title *The Origin of Russian Communism*, 1937.

Berdvansk, see OSIPENKO.

Bere, see BARLEY.

Bere Alston, see BERE FERRERS.

Bere Ferrers, tn and par. of S. Devon, England, 6 m. from Plymouth. In the par. is Bere Alston, which prior to 1832 was a parl. bor.; in the 15th cent. it had silver and lead mines. Pop. 2000.

Berea: 1. Ridge of hills overlooking Durban, Natal prov., S. Africa, forming part of Durban municipality.

- **Berea College**, non-sectarian co-educational institution situated in Madison co., Kentucky, U.S.A. Founded in 1855 to promote the spiritual and material welfare of the mt region of the S. It stands on a ridge of the Appalachians, 1075 ft above sea level. There were 1167 students in 1955.

Bereans, almost extinct sect of Christians founded in Scotland in the 18th cent. by the Rev. John Barclay (1734-1798) (q.v.). They are so called after the people of Berea, of whom it is said in Acts xvii. 11 that they received the word with all readiness of mind. The B. hold that the knowledge of the existence and character of God can be obtained from the Bible alone, not from nature or reason; that the Psalms of David refer to Christ alone; that assurance is of the essence of faith, and that lack of faith is an unpardonable sin. The rest of their doctrine is practically identical with that of the Calvinists. See CALVINISM.

Berengar I (or **Berenger** or **Berengarius**) (d. 924), King of Italy, 888-924, son of Eberhard, Duke of Friuli, and grandson of Louis le Debonnaire. Elected to the throne in preference to Guido, Duke of Spoleto, he maintained his position against all rivals until 923, when he was defeated by Rudolf, King of Burgundy. The following year he was assassinated.

Berengar II (d. 966), King of Italy, 950-61, grandson of Berengar I. In 952 the Emperor Otto I compelled B. to become a feudal dependant of Germany. In 961 B. was dethroned by the emperor, and d. in a Bavarian prison.

Berengaria (d. c. 1230), Queen of England, daughter of Sancho VI of Navarre. She married Richard I in Cyprus in 1191, and went with him to Palestine. She remained at Acre until Sept. 1192, when she left in advance of the king, and safely reached Sicily, and eventually France. She saw little of Richard after 1192, but may have been with him when he d.

'Berengaria', The liner, originally built for the Hamburg-Amerika line and launched in 1912 as the *Imperator*. After the First World War it passed to the ownership of the Cunard Steamship Co. It was at that time one of the fastest steamships afloat, and also one of the largest vessels to be fitted for liquid fuel. It was a turbine steamer with quadruple screws; gross tonnage, 52,226; 883 ft long, 98 ft broad, 57 ft deep; speed, 26½ knots. The B. was a favourite with the transatlantic traveller by reason of its speed, comfort, and luxurious equipment. One of its fastest transatlantic journeys was from Cherbourg to Ambrose Light in 5 days, 13½ hrs. The ship was retired from

service in 1936 after the inclusion of the new Cunard-White Star liner, *Queen Mary*, in the company's service.

Berenger (called **Berenger of Tours**) (998-1088), Fr. divine, b. Tours, of a rich and distinguished family. After studying at Chartres under Fulbert, he returned to Tours in 1031, and was made teacher in the monastery of St Martin. He continued to reside at Tours, though he was made archdeacon of Angers in 1040. B. agreed with the doctrine expressed by Scotus Erigena in the preceding cent., and openly taught it. He denied transubstantiation, and saw nothing but a symbol in the Holy Eucharist. He developed these views in a letter to Lanfranco, prior of Bec, and was condemned for them by the Councils of Vercelli in 1050, Tours in 1054, and Rome in 1059. He recanted, and burnt his documents expressing them, but later again went back to his heretical opinions. On being condemned by Rome, however, he repented, and finished his life as a rigorous ascetic.

Berenger de la Tour (d. c. 1550), Fr. poet, b. Aubenas. He studied law with the view of filling some post in the magistracy, but devoted himself mainly to poetry. His verse is characteristic for elegance and verve, if at times it shows a want of good taste. His works include *Le Siècle d'or*, 1551, *Chortide ou Louange du bal, aux dames*, 1556, *L'Amie des amies*, an imitation of Ariosto, 1558, and *L'Amie rustique*, with other poems and epistles, 1558—thus last a very rare and curious work.

Berenice, Macedonic form of *Phenice*, meaning Bringer of Victory: 1. One of the 4 wives of Ptolemy I, the founder of the dynasty of the Lagidae in Egypt, and the mother of Ptolemy II, called Philadelphus. B. had a son, Magas, by a former husband, who was afterwards King of Cyrene.

2. Daughter of Ptolemy Philadelphus by Arsinoë, the daughter of Lysimachus. She was the sister of Ptolemy III (Euergetes), and was given in marriage, 252 BC, by her father to Antiochus II, King of Syria, called Theos (God), who divorced his wife Laodice on the occasion. After the death of Philadelphus, Antiochus divorced B. and took back Laodice, who poisoned her husband and had B. murdered, together with a son whom she had by Antiochus. To avenge his sister's death, Ptolemy III (Euergetes), invaded Syria, put to death Laodice, and overran the empire of the Seleucidae.

3. B. II, wife (c. 248 BC) of Ptolemy III, daughter of Magas, King of Cyrene. On the eve of her husband's departure to invade Syria, B. dedicated a lock of her hair in the temple of Arsinoë-Aphrodite at Alexandria. This lock the court astronomer, Conon, soon after professed that he had discovered in the sky, transformed into a new constellation. The poet, Callimachus of Cyrene, wrote the poem about it, which is now only known from the beautiful trans. by Catullus, *De Coma Berenices*. B. was put to death

by her son, Ptolemy IV, and his infamous minister, Sosibius.

4. B. III, the only legitimate child of Ptolemy VIII, associated with her father on the throne, 88 BC; married Ptolemy IX (Alexander I), and after his death Ptolemy X (Alexander II), who immediately had her murdered, and was himself assassinated by the mob in consequence.

5. Daughter of Ptolemy XI (Auletes), and sister of the famous Cleopatra. During the absence of her father in Rome, B. was made regent, which office she held from c. 58 to 55 BC. Gaius, about the close of 55 BC, came to Egypt with an army and restored Auletes, who put his daughter to death.

6. Daughter of Agrippa I. King of Judaea. She was married to her uncle, Herod of Chalcis, but after his death in AD 48 she lived, not without suspicion of incest, with her brother, Agrippa II. Married again, to the Cilician king Polimon, she soon deserted him and returned to her brother, with whom she was living in AD 60 when St Paul appeared before him (Acts xxvi). In 75 B. followed Titus (q.v.) to Rome as his intended bride, but the match proving unpopular, he dismissed her on his accession in 79.

Berenice, seaport of ancient Egypt, situated on the W. coast of the Red Sea, S. of Ras Benâs. It was founded in 285 BC by Ptolemy II. It stands at the head of a gulf, and has been almost sanded up. Among its ruins is a temple.

Berenice's Hair, see COMA BERENICES.

Berenson, Bernard (1865-), Amer. historian and art critic; educ. Boston Lat. School and Harvard Univ. He became a foremost authority on It. painting and painters of the Renaissance, and in this connection his work on the Venetian painters was pub. in 1894, on the Florentine in 1896 and 1903, on the Central It. in 1897, and on the N. It. in 1907. Other works include *Lorenzo Lotto, an Essay in Constructive Art Criticism*, 1895, *The Study and Criticism of Italian Art* (3 series), 1901, 1902, 1916, *Essays on the Study of Sienece Painting*, 1918, *Three Essays in Method*, 1927, *Sketches on Medieval Painting*, 1930, *The Italian Painters of the Renaissance*, 1932, *Italian Pictures of the Renaissance*, 1932, *Sketch for a Self-Portrait*, 1949, *Aesthetics and History*, 1950, and *Caravaggio—His Incongruity and Fame* (Eng. ed.), 1953.

Beresford, Charles William de la Poer (1846-1919), 1st Baron B. of Metemneh and Curraghmore, naval officer, son of the 4th Marquess of Waterford, b. co. Waterford, Ireland. He was educ. in private schools, and entered the navy as a cadet of the *Britannia* in 1859. He became lieutenant in 1868, captain in 1882, and rear-admiral in 1897. He was naval A.D.C. to the Prince of Wales (King Edward VII) on his visit to India (1875-1876), and to Queen Victoria (1896-7). He was in command of the *Comor* at the bombardment of Alexandria in 1882, when he distinguished himself for bravery; he served in the Nile expedition under

Lord Wolseley, 1884-5; he was in command of the naval brigade at the battles of Abu Klea, Abu Kru, and Metemneh, and commanded an expedition up the Nile to rescue Sir Charles Wilson's column. He was elected M.P. for Waterford, 1874-80; Marylebone, 1885-9; York, 1897-1900; Woolwich, 1902. He was appointed a lord commissioner of the Admiralty, but resigned in 2 years on a question of the increase of the fleet. He was in command of the Mediterranean Fleet, 1905-7, and of the Channel Fleet, 1907-9. He retired in 1911, in which year he was created G.C.B. He was raised to the peerage in 1916. His autobiography, *Memories*, was pub. 1914.

Beresford, James (1764-1840), author, b. Upham, Hants, and educ. at Charterhouse and Oxford. In 1812 he became rector of Kebworth Beauchamp, Leics. His chief work, *The Miseries of Human Life*, 1806-7, was praised by Scott.

Beresford, John (1738-1805), Irish statesman, b. Dublin and graduated at Trinity College in 1757. He sat in Parliament, representing Waterford, from 1760 till his death. He was made privy councillor, 1768; first commissioner of revenue, 1780; privy councillor of England, 1786. B. was Pitt's chief adviser in his Irish policy. B. suggested the clauses in Orde's Bill, regarding the removal of the commercial restrictions of Ireland, but was successfully opposed by Grattan (q.v.). Lord Fitzwilliam dismissed B. from office in 1795, on the ground that his influence in Ireland was displeasing to the Grattan party, and therefore a hindrance to the gov. Fitzwilliam was recalled on this account, and B. reinstated. B. was instrumental in bringing about the union of Ireland with England, and superintended the fiscal arrangements between the 2 countries. His second wife was Barbara Montgomery, one of the 'Graces' of Sir Joshua Reynolds's picture in the Royal Academy.

Beresford, John Davys (1873-1947), novelist, b. Castor, near Peterborough, son of the rector of Castor. Educ. at Oundle, he went to London at the age of 18, and was articled to a firm of architects. His first novel, *The Early History of Jacob Stahl*, 1911, was followed by *A Candidate for Truth*, 1912, and *The Invisible Event*, 1915, the remaining two novels of a trilogy. Although his themes are varied, he estab. a reputation as a writer of the realist school deriving from Gissing. He also owed much to the influence of Samuel Butler. In the same year as *Jacob Stahl* came the short novel, *The Hampshire Wonder*, a study of a small boy endowed with the most precocious intellectual gifts, and a highly original story. But in his preoccupation with abnormal psychology, B. tended to lose much imaginative power and, except for *These Lynnekers*, 1916, and *The Prisoners of Hartling*, 1922, his novels began to decline noticeably in artistic interest. Among his later books were his second trilogy, *The Old People*, 1931, *The Middle Generation*, 1932, and *The Young*

People, 1933. Besides novels he pub. sev. vols. of short stories, also a study of H. G. Wells, 1915, *The Case for Faith Healing*, 1934, and *What I Believe*, 1938. He collaborated in two plays and wrote a third, *The Compleat Angler*.

Beresford, Lord John George de la Poer (1773-1862), primate of all Ireland; Bishop of Cork and Ross, 1805; Archbishop of Dublin, 1820; Archbishop of Armagh, and Primate of all Ireland, 1822. In 1851 he was elected chancellor of the Dublin Univ., having been vice-chancellor since 1829. The cathedral of Armagh was restored through his liberality.

Beresford, William Carr, 1st Viscount (1768-1854), Brit. general, the illegitimate son of the 1st Marquess of Waterford. He entered the army in 1785 and served with distinction at Toulon, in Egypt, the Cape, and Buenos Aires. In Feb. 1809 he undertook the reorganisation of the Portuguese army and achieved great success. He was rewarded by being created a K.B. and a peer of Portugal. At Albuera he was in command, and he was also present at Badajoz, Salamanca, and other Peninsular battles. In 1814 he was made Baron, and in 1823 Viscount B. He left Portugal in 1822, entered into Eng. politics, and became master-general of ordnance in Wellington's administration, 1828-30.

Beresina, see **BEREZINA**.

Berezinski, see **CORTONA**, P. DA.

Berezhany (Polish Brzezany), tn in the Ternopol' Oblast of Galicia (q.v.), W. Ukraine, 30 m. W. of Ternopol'. It has the 16th-cent. castle of the Potocki family. Pop. (1930's), 17,000. B. had considerable trade in the 18th and 18th cents. It was the scene of a great battle in June 1917.

Berezina, right affluent of the Dnieper, in Belorussia; length, 280 m. It is memorable historically for the disastrous passage of Napoleon's troops in their retreat from Moscow in 1812. In the Second World War the Germans defeated large Soviet forces on the B. (1941).

Berezniki, Russian tn on the Kama, in the Molotov Oblast. It is one of the chief industrial centres of the Urals (vast chemical combine). Pop. (1956) 93,000 (1926, 16,000). It was founded in 1883 as a sodium plant, and absorbed Usol'ye (founded in 1606, saltworks since the 16th cent.).

Berëzovo, Russian settlement in the Tyumen' Oblast, W. Siberia. A pipeline is under construction from the natural gas fields near B. to Sverdlovsk. It was founded in 1593 as a fort. tn and administrative centre of the Lower Ob' area. It has been a place of banishment since the 18th cent.

Berg, Alban (1885-1935), Austrian composer; b. Vienna. He won recognition with his opera *Wozzeck*, which uses the twelve-note system of his teacher Schoenberg (q.v.) in a modified way. B.'s first pub. work was the piano sonata in B minor, 1908. He developed his later style in *Four Songs*, 1908, a string quartet, 1910, and *Three Orchestral Pieces* (Opus 6), 1914, a *Lyrical Suite* for string quartet,

1926, a violin concerto, 1935, and the unfinished opera, *Lulu*. *Wozzeck* was written during 1914-20 and first produced at the Berlin State Opera in 1925.

Berg, Lev Semënovich (1876-), Russian zoologist and geographer of Jewish origin, b. Bessarabia. He has pub. many works on ichthyology, the physical geography of Russia, the origin of the loess soils, etc. His theory of 'nomogenesis,' an anti-Darwinist vitalistic theory of evolution, has attracted much attention. See his *Nomogenesis*, London, 1926, and *Natural Regions of the U.S.S.R.*, Washington, D.C., 1950.

Berg, see **STUTTGART**.

Berg, or **Berg-Gladbach**, former duchy of Germany, now part of the Land of North-Rhine-Westphalia (q.v.). It lay on the E. bank of the Rhine (q.v.), and had for its boundaries Kleve on the N. and Cologne on the W. (q.v.). It became a duchy in 1380, when it was in the hands of the Jülich family. In 1815 the Congress of Vienna (q.v.) gave it to Prussia.

Berg Wind, name applied on the S. coast of Cape Prov. to a rough, hot, dry northerly wind. This wind is frequent during the months of May and Aug. Its duration is normally one day, but occasionally it blows steadily for 2 days.

Berga, Sp. tn in the prov. of Barcelona. Pop. 5800.

Bergaigne, Abel-Henri-Joseph (1838-1888), Fr. linguist and Sanskritist. In 1885 he was appointed to the chair (created for him at the Sorbonne) of Sanskrit and Comparative Grammar of the Indo-European languages. In his works he lucidly explained the theory of the unity of the Indo-European languages, and their relationship. Main works: *La Religion védique* (3 vols.), Paris, 1877-83; *Chronologie de l'ancien royaume Khmer*, 1884; *Manuel pour étudier la langue sanscrite*, 1884; *Études sur le lexique du Rig-Veda*, 1885; and *Manuel pour étudier le sanskrit védique*, 1890.

Bergamo: 1. Prov. of Italy, in central Lombardy (q.v.). The N. of the prov. is in the Alps (q.v.); the S. belongs to the great N. plain of Italy, and is watered by the Chero and the Serio, a trib. of the Adda (q.v.). In the E. is the W. shore of Lake d'Iseo (q.v.). The prin. tns include B. and Clusone (qq.v.). Area 1088 sq. m. Pop. 716,000.

2. It. city, cap. of the prov. of B., 25 m. NE. of Milan (q.v.). It stands at the foot of the Alps, between the R.s Brembo and Serio. It was once cap. of the Cisalpine Rep. (q.v.), and was the first seat of the republican gov. set up by Mussolini (q.v.) after his escape from custody in 1943 (see **ITALY, History**). The upper tn has ant. fortifications, a medieval cathedral, other fine old churches, and two 16th-cent. palazzi. The Accademia Carrara, in the lower tn, contains notable paintings. There is a school of music, and organs and textiles are manuf. Bartolommeo Colleoni (q.v.) was b. here. Pop. (tn) 99,500; (com.) 105,400.

Bergamot (*Citrus bergamia*), variety of

C. aurantium, the orange (q.v.). Essence of B. is an essential oil obtained both by pressure and distillation from the rind of the ripe fruit of the B. The essence smells of oranges, and is used as a perfume.

Bergara, see VERGARA.

Bergedorf, Ger. tn in the Land of Hamburg (q.v.), 8 m. SE. of Hamburg. It was the scene of a Fr. defeat by the Prussians in 1813. The dist. is called the *Vierlande* and is known for its vegetables, fruit, and flowers. Pop. 50,000.

Bergen (Belgium), see MONS.

warehouses, is still in use. Mariakirken, an old stone-built church, dates from the 12th cent., as does also the wooden stave-church at Fantoft. An explosion in the harbour in 1944 laid Bergenhus, seat of the Norwegian kings until the middle of the 14th cent., in ruins, but rebuilding has begun. The centre of the tn, around the wide Torvalmenningen street, has been extensively modernised. Old buildings worth preserving but which have to be removed under tn-planning schemes are now being re-erected at a site called 'Old Bergen' at Sandviken. Norway's

Norwegian State Railways

Bergen, second largest city and seaport of Norway, situated on the W. coast, in lat. 60° 23' N. The central part lies between Vågen Harbour and Puddefjord, but it has spread considerably in recent years. The vegetation is unusually prolific for that particular lat., and is accounted for by the heavy rainfall and the warm climate due to the beneficent influence of the Gulf Stream. B. was founded by King Olav the Peaceful in 1070, and for the next 200 years it was not only a leading commercial tn, but also a political centre and royal seat. From the 14th cent. the Hanseatic merchants estab. themselves in the tn and played an important part in the development of its commerce, so that it became one of the prin. trading ports of N. Europe. The tn, set amid the beauty of the surrounding 'Seven Mountains,' is picturesque. Although ravaged many times by fire, much of the old town of white wooden houses has survived. 'Bryggen' (the 'Quay'), with its medieval

second univ., opened in 1946, is in B., as is also the Norwegian School of Economics and Business Administration. B. is also the national centre for oceanographical and marine biological research and fisheries administration. From the Middle Ages B. has been an important centre of culture. There are sev. good museums and art galleries, including the Museum of Arts and Crafts and the Hanseatic Museum. B. has its own National Theatre where Ibsen was manager for 6 years. B. was also the home of composer Edvard Grieg, in whose homage an International Festival of Music and Drama has been held annually since 1953. It was also the home of violin virtuoso Ole Bull, and Ludvig Holberg, the dramatist, was born there. The prin. export is fish and fish products; industry also includes shipbuilding and engineering. Since 1909 B. has been linked with Oslo by rail over the mts. An airfield for the city was opened at Flesland in 1955. Bergen is an important port of ingress for visitors from

abroad, and a leading tourist centre. It is linked with Newcastle by fast passenger liners crossing the N. sea sev. times weekly. Much of the important coastal shipping traffic for passengers and freight is based on B. Pop. (including the adjoining dists.) c. 150,000.

Bergen, see DOMINOES.

Bergen-op-Zoom, tn in the prov. of N. Brabant, Netherlands, at the junction of the K. Scheldt and the Zoom. It has large tile and pottery works, and the oyster and anchovy fishery is important. Sugar-beet is a new industry. In the 15th cent. its cloth trade and fisheries made it an important tn. Fortified in 1576, it was unsuccessfully besieged by the Spaniards in 1588, 1605, and 1622. It was more strongly fortified by Coehorn (q.v.), and was captured by the French in 1747, and again in 1795. Sir Thomas Graham (Lord Lynedoch) failed in the assault on the tn, 1814. The fortifications were destroyed in the 19th cent. Pop. 32,471.

Bergerac, Savinien Cyrano de (1619-55), Fr. writer, b. Paris. He served as an officer in the Guards, 1639-40; his enormous nose, his adventures, including a fight with a hundred opponents, and the duels which persisted throughout his life, are recorded by his friend Lebrét; he then turned to writing, producing (1654) *Le Pédant joué*, a comedy which influenced Molière, and the tragedy, *Mort d'Agrippe*, which the orthodox suspected of atheism. His satirical scientific romances *Histoires comiques des états de la lune*, 1654, and *du soleil* (pub. posthumously, 1661) have been regarded as the forerunners of Swift's *Gulliver's Travels*, or as an echo of Rabelais's *Pantagruel*. Edmond Rostand founded his play, *Cyrano de Bergerac*, 1897, on the adventures of the real Cyrano. See L. R. Lefèvre, *Cyrano de Bergerac*, 1927.

Bergerac, Fr. tn, cap. of an arron., in the dept of Dordogne, on the Dordogne. It was a Huguenot (q.v.) stronghold, and the revocation of the Edict of Nantes (q.v.) adversely affected its prosperity. It has distilleries and spinning mills, and trades in truffles, wine, and flour. Pop. 22,500.

Bergh, Johan Edvard (1828-80), Swedish painter, b. Stockholm. His paintings are chiefly landscape, and he was noted for representing idyllic moods of nature in Sweden. In 1861 he was appointed prof. in the Academy of Stockholm. His best picture is perhaps his 'View of Uri,' which went to Berlin.

Berghaus, Heinrich Carl Wilhelm (1797-1884), Ger. geographer, b. Cleves. In addition to many valuable geographical works, e.g. *Grundriss der Geographie*, 1842, his chief work is the great *Physikalischer Atlas*, 1838-48, new ed. 1886, by his nephew Hermann (1828-90).

Berghem, Nicolas, see BRECHEM.

Bergisch-Gladbach, Rhineland, Germany, see MÖNCHEN-GLADBACH.

Bergk, Theodor (1812-81), Ger. philologist, b. Leipzig. Appointed prof. of classical literature at Marburg; later at Freiburg and Halle. In 1868 he resigned

his chair, settled at Bonn, and devoted the remainder of his life to the study of Gk literature. He produced eds. of Anacreon, Sophocles, and Aristophanes; but his prin. works are *Poetae Lyrici Graeci*, 1843, and *Griechische Literaturgeschichte*, 1872-87, which was completed by Hinrichs and Peppmüller. See J. E. Sandys, *History of Classical Scholarship*, vol. iii, p. 146 (1908).

Bergler, Joseph (1753-1829), Ger. painter, b. Salzburg; sent to Italy, 1776, and studied in oil and fresco with Knoller, Mengs, Canova; obtained the prize at the Academy of Parma, 1784, with a picture of Samson delivered to the Philistines by Delilah. Returned to Germany, 1786, and painted many altar-pieces for churches in the neighbourhood of Passau.

Bergman, Hjalmar (1883-1931), Swedish novelist and playwright, b. Örebro, son of a wealthy banker. He frequently lived abroad, although much of his work was inspired by his native Örebro. His pessimism and realistic clarity of vision are tempered by humour, as in his novel *Clownen Jac*, 1930, or by irony and brilliant satire, as in *Markurello i Wadköping*, 1919. He was equally popular as a playwright (*Svedenhielms*, 1925; *Patrasket*, 1928), and one of the few Swedish authors to compose genuine comedies. He also wrote scripts for films and radio. See R. G. Berg, *H. Bergman*, 1935, and E. H. Linder, *H. Bergman*, 1940.

Bergman, Ingrid (1917-), Swedish actress, educ. at the Lyceum for Flickor and the Royal Drama Theatre School, Stockholm. Her first Amer. film was *Escape to Happiness*, 1939. She made a series of films in Hollywood, including *For Whom the Bell Tolls*, 1943, and *Joan of Arc*, 1948, but during her marriage to it. film producer Roberto Rossellini she lived mainly in Italy. She won the Academy Award for the best actress of the year in 1944 (*Murder in Thornton Square*), and in 1957 (*Anastasia*).

Bergman, Torbern Olof (1735-84), Swedish chemist, b. Katrineberg, in W. Gothland. In 1767 he was appointed prof. of chemistry at Upsala. Notable for researches in dyes and on tungsten. His writings have been collected in 6 octavo vols., *Opuscula Torberni Bergman Physica et Chemica*.

Bergmann, Ernst von (1836-1907), Ger. surgeon, b. Rügen, Livonia, Russia. In 1866 he was attached to Prussian troops in the hospital service through the Bohemian campaign and the Franco-Prussian war, and was appointed prof. of surgery at Dorpat, 1871-8. From 1878 to 1882 he was prof. at Würzburg, and then occupied the chair of surgery in the univ. of Berlin. In 1887 he attended the crown prince of Germany, afterwards Emperor Frederick III, who was attacked with cancer of the throat; this case gave rise to a controversy due to the different diagnosis of his colleague in attendance, the specialist, Sir Morell Mackenzie (q.v.). He was a pioneer in antiseptics. B. wrote numerous treatises, including *Die Lehre von der Fettleibigkeit*, 1863, *Die Lehre von*

den Kopfverletzungen, 1880, and *Die chirurgische Behandlung von Hirnkrankheiten*, 1888.

Bergmehl, or Mountain Flour, geological deposit in the form of very fine greyish-white powder, also called kieselguhr, fossil farina, and diatomaceous or infusorial earth. It is largely composed of the indestructible siliceous frustules or cell-walls of diatoms. Beds of earth of considerable thickness that have accumulated in past geological ages are now being found on the bottom of some freshwater lakes and on the sea floor. B. has valuable abrasive properties. It is employed in manufacturing dynamite as an absorbent; and is used as insulating material for boilers and steam-pipe coverings.

Bergner, Elisabeth (1898-). Ger. actress who made her reputation, in England, on her first appearance in Margaret Kennedy's *Escape Me Never* at the Apollo Theatre, 1933-4. Previously she had won early fame in Germany in *La Dame aux camélias*, and also in a Ger. rendering of Margaret Kennedy's *The Constant Nymph* and Shaw's *St Joan*. She played Rosalind at Stratford-on-Avon Shakespeare performances. Among her films were *Die Traumenden Munde* and *Catherine the Great*. In 1935-6 Sir J. M. Barrie wrote the play *The Boy David* especially for B.

Bergschlund, mountaineering term for a crevasse between a glacier and the upper snow or ice slope of a mt peak. B.s are usually too wide to be strided, and resort must be had to a snow bridge.

Bergson, Henri Louis (1859-1941), Fr. philosopher, b. Paris. His father was a musician of Jewish birth; his mother was British. Although he spoke English fluently, his education was entirely French at the Lycée Condorcet and the École Normale. He held the post of prof. of philosophy at the Lycée d'Angers, 1881-1883, and after a number of similar appointments in the prov., he became prof. at the École Normale Supérieure, 1897-1900. In 1900 he was elected to a professorship at the Collège de France, holding the chair of philosophy there until 1921. In 1914 he was elected to the Académie Française, and in 1927 was awarded the Nobel prize for literature. His thesis, *Essai sur les données immédiates de la conscience* (Eng. trans. *Time and Free Will*, 1910), was delivered to the univ. of Paris in 1889, and won him immediate recognition. He was perhaps the first philosopher to recognise sufficiently the importance of change. His view was that much of the confusion in early metaphysics arose from the attempt to state reality in terms of *space* and to eliminate *time*. This attempted elimination of time is, he asserted, characteristic only of knowledge dominated entirely by conceptions of utility; and if the relation between knowledge and its objects is stated in terms of time instead of space, many antinomies, e.g. those of Idealism and Realism, will be resolved. Throughout his work, and particularly in *L'Évolution créatrice*, 1907. B. insisted on the

distinction between the nature of experience of time and that of experience of space: that time, properly understood, and freed from certain spatialising notions that have become entangled with it through the infirmities of thought, is a process of change in which none of the parts is external to another, but all are interpenetrating; where the past is carried on into the present; where therefore there is no repetition, but a continual creation of what is new—whereas space is that whose parts are external to one another and can be simultaneously apprehended, and in which recurrence of the same thing in the same position is possible. Like Heraclitus, B. regards everything as in a state of flux; ceaseless change in which there is, strictly speaking, no repetition or recurrence. There being no recurrence, there cannot well be any guiding rules of conduct to meet each new and unique contingency. His original aim, like that of many other philosophers, was to relieve himself of the oppressive chain of cause and effect, to assert free will as against mechanistic determinism. This he was able to do as a result of his meditations on time—reaching the conclusion that, despite the apparent progress of successfully predictive science, the future remains, not only unpredicted, but essentially unpredictable, because essentially uncertain. For B. there is a continual drama, of Life or Consciousness struggling against Matter and not conforming to its laws. At first, B. was purely dualistic on this question; but it was noticed that in *L'Évolution créatrice* he conceded something to the monistic tendency, and regarded matter as 'a vital impulse arrested.' This principle of the *élan vital* in evolution, the urge to create, was put forward by B. as an alternative to the Darwinian theory of natural selection, which, in his view, did not sufficiently explain the evolution of intellect. His theories had a profound influence on biological studies, and were corroborated by later developments in the study of psychology. His other works include *Matière et mémoire*, 1896 (Eng. trans., 1911), *Le lître*, 1900 (Eng. trans., 1911), *L'Énergie spirituelle*, 1919, *Durée et simultanéité*, 1923, and *Les Deux Sources de la morale et de la religion*, 1932 (Eng. trans., 1935). See A. D. Lindsay, *The Philosophy of Bergson*, 1911; H. Wildon Carr, *Henri Bergson: the Philosophy of Change*, 1912; E. Hermann, *Eucken and Bergson*, 1912; Hugh S. Elliot, *Modern Science and the Illusions of Professor Bergson*, 1912; V. Jankelevitch, *Henri Bergson*, 1931.

Bergson, Thórir, see JÓNSSON, THOR-STEINN.

Bergthórsson, Guðmundur (1657-1705), one of the foremost Icelandic poets of his time and after S. Breiddjörð (q.v.) the greatest of all the *rimur* (q.v.) poets. The bulk of his work still awaits pub., but in 1947 the Icelandic Gov. and the Althing caused his *Olgeirs rimur dásaka* (Ogier the Dane) to be pub. and dedicated to Sir Wm Craigie. This cycle consists of 60 cantos and 842 stanzas.

Bergues, Fr. tn in the dept of Nord, 5 m. SSE. of Dunkirk. Preserves are manuf. Pop. 3200.

Bergylt, or **Berguylt** (Norwegian *bergylt*), European name for the rose-fish, or *Sebastes marinus*, a fish of the family Scorpaenidae. It is found on both shores of the N. Atlantic, and is known by many names, amongst them being Norwegian haddock, red-fish, hemdurgan, red-perch, red-snapper. The grown fish is of a nearly uniform orange-red colour. The same name is used in Scotland for the black goby.

Berhampur, tn in Bengal, India, near Murshidabad on the Bhagirathi. The Indian mutiny broke out here. The old and abandoned tn of Cossimbazar is within the boundaries.

Beria, Lavrentiy Pavlovich (1899-1953), Georgian Communist, one of the most sinister figures of the Communist regime in Russia. He joined the Bolshevik party in 1917. From 1921 to 1931 he worked in leading positions in the Cheka and G.P.U. (q.v.) organs of Transcaucasia. From 1932 to 1938 he was first secretary of the Transcaucasian committee of the Communist party and virtual dictator of Transcaucasia. He was U.S.S.R. Commissar (Minister) for Internal Affairs, 1938-45; and 1941-53 also deputy prime minister in charge of security matters. In 1945 he was made a Marshal of the Soviet Union. B. ended the Great Purge (q.v.) by liquidating his predecessor Yezhov (q.v.), and many N.K.V.D. (q.v.) officials, and organised all the subsequent terroristic measures, including deportation of many hundreds of thousands from E. Poland, the Baltic States, and ters. formerly occupied by the Germans. He was also in charge of the security police in the satellite states of E. Europe. In the struggle for power after Stalin's death B. was defeated, arrested, and shot as an 'imperialist agent.' A confidant of Stalin, B. inaugurated in 1935 the Stalino-centric fictitious historiography which prevailed in the U.S.S.R. until the 20th Congress of the Communist party in 1956. See his *On The History of the Bolshevik Organisations in Transcaucasia*, London, 1939.

Beri-beri, disease due to dietary deficiency of vitamin B₁, or aneurin, the anti-neuritic vitamin (see VITAMINS). B. is mainly a disease of tropical and far E. countries where people feed on polished rice, i.e. rice which has had the vitamin-containing husk removed. B. also occurs in some parts of Europe and the U.S.A. under any conditions of dietary deficiency. It was prevalent in prisoner of war camps. Vitamin B₁ is found mostly in whole grain and cereals, yeast, kidney, liver, ham, and pork. Spaghetti and macaroni are lacking in B₁. The Japanese eradicated B. from the crews of their ships in 1881 by supplying unpolished rice in the place of the customary polished variety, but the significance of this empirical observation was not realised at this time. Sir F. Gowland Hopkins (q.v.) estab. in 1912 the presence of essential food factors in milk and yeast. Funk suggested 4

separate vitamins—anti-rickets, anti-scurvy, anti-B₁, and anti-pellagra—and his theory was subsequently verified. Fraser and Stanton in the Malay States proved that the cause of B. was the absence from the diet of a chemical substance found in the whole rice grain and the whole wheat germ. It was not until 1927 that efforts to isolate the anti-B₁ substance were successful, and the substance thus obtained was analysed by Jansen and Conath working in the Netherlands E. Indies. This substance was later identified with the vitamin B₁, or aneurin, the discovery of which was made independently by scientists working in the U.K. following the lead given by the work of Sir Gowland Hopkins. Aneurin was synthesised in 1937.

B. is usually insidious in onset, the symptoms being polyneuritis, with patchy areas of numbness, cardiac irregularities, weakness, and wasting. These symptoms are sometimes accompanied by oedema, when it is called wet B. Alcoholic polyneuritis is a form of secondary B., so called because the vitamin B₁ in the diet though not deficient is prevented from being absorbed as a result of damage to the digestive system by alcohol. A mild form of secondary B. may also occur during pregnancy.

Bering, Vitus (1681-1741), Dan. explorer; entered the navy of Peter the Great, and made sev. attempts to settle the question of the junction of Asia and America. On returning from one of these expeditions B. was taken ill and the expedition was obliged to spend nine months on an uninhabited is., afterwards called B. Is., where B. died shortly afterwards.

Bering Island is situated in SW. B. Sea. It is the most westerly is. of the Aleutian group. Bering (q.v.) was wrecked here, and, without food or shelter, d. miserably in 1741.

Bering Sea and Strait. The latter divides the continents of America and Asia, and also joins the N. Pacific with the Arctic Ocean. It is about 38 m. wide at its narrowest part, but is wider at the N. and S. extremities. There are numerous bays on either side of the strait, of which the waters are frozen over for sev. months in the year. B. Sea, which is sometimes called the sea of Kamchatka, is a part of the N. Pacific Ocean, and is situated between B. Strait and the Aleutian Is. It is the haunt of the whale, walrus, and fur seal.

Bering Sea Question, international dispute, between the govs. of the U.S.A., Great Britain, and Canada, connected with the unlicensed fishing of Canadian sealers in the Bering Sea. In 1886 certain Canadian sealers started on a business basis the hunting and killing of seals beyond the 3-mile limit in the Bering Sea, in which Great Britain had commercial privileges, granted by Russia in 1825. The gov. of the U.S.A. took steps to prevent Canadian fishing, and in 1892, by the Blaine-Pauncefote treaty, it was agreed that a court of arbitration should be held in Paris to settle the

question at issue. This court decided *inter alia* that the U.S. Gov. had no right of protection of property in seals beyond the 3-mile limit, and no exclusive rights of jurisdiction in the Bering Sea. The U.S.A. also paid a sum of £92,700 to the Canadian Gov. as a compensation for the ships she had unlawfully seized or damaged. Consult Stanton, *The Bering Sea Controversy*, 1892, and *Report of the Bering Sea Commission*, 1893.

Bériot, Charles Auguste de (1802-70), Belgian violinist and composer, b. Louvain; he married Malibran, the famous singer, who died in 1836; he was prof. in the conservatory of music of Paris, 1843, and of Brussels, 1843-52. He wrote a manual for the violin, composed 7 concertos and numerous other pieces. He had 2 noted pupils, Vieuxtemps and Léonard.

Beris, genus of dipterous insects of the family Xylophagidae. The species are small, metallic-coloured flies which frequent the leaves of plants, and the larvae feed on putrescent wood. *B. clavipes* lays its eggs in the form of a little chain of single oval eggs glued together.

Beriya, see BERIA.

Berja, Sp. tn in the prov. of Almería. It manufs. paper and cotton, has a trade in wine, oil, and esparto, and there are lead-mines near by. Pop. 14,100.

Berkeley, name of an Eng. noble family, many of whose members had distinguished military careers, whose hist. centres round the tenure of the great castle at Berkeley, Glos, where Edward II was murdered. A clear descent can be traced from Robert Fitz-Harding, who d. in 1170, and was a wealthy citizen of Bristol. In 1165 he obtained a grant from the king of the manor of B. Thomas B. was summoned to Parliament in 1295, when the barony of B. was created. The earldom of B. was created in 1679. On the death of the 9th Earl of B. in 1810, an important and interesting lawsuit took place. In 1796 he had married a Mary Cole, by whom he had already had sev. children; his eldest son was declared illegitimate, but inherited B. castle and estates but not the title. He was, however, raised to the peerage as Baron, later Earl, Fitz-Harding; his brother who succeeded him was made a baron with the title of Fitzhardinge. The 3rd Baron d. without heirs in 1916. The earldom of B. remained in the legitimate branch of the family and became extinct in 1942. There have been many branches of the family, such as the Lords B. of Stratton (1658-1773), with which the philosopher George B. (q.v.) was connected.

Berkeley, George (1685-1753), Irish philosopher and bishop, b. near Dysert, Co. Kilkenny. In 1700 he entered Trinity College, Dublin, of which he became fellow in 1707. Here he studied Descartes and Newton, while Locke's *Essay*, pub. 1690, was already influencing the study of philosophy. The early trend of his mind is shown by his valuable *Commonplace Book* (1705-6), first pub. in 1871, which gives the first working out of his new principle in philosophy, viz.

that matter, substance, and cause have no meaning apart from the conscious spirit. In 1709 he pub. *A New Theory of Vision*, followed by a fuller statement in *Principles of Human Knowledge*, 1710. In 1711 appeared a *Discourse on Passive Obedience*. In 1713 Swift introduced him to the court and the intellectual society of London, and a popular exposition of his new theories in the form of *Dialogues between Hylas and Philonous* was pub. From 1714 to 1720 he travelled in Europe as chaplain to Lord Peterborough and as tutor to the son of Bishop Ashe. On his return, the disastrous condition of society, due to the collapse of the South Sea Bubble, led to his *Essay towards Preventing the Ruin of Great Britain*, 1721. In 1722 he was made dean of Down, and in 1724 dean of Derry. He then embarked on a scheme for the founding of a college in the Bermudas, to christianise from there the Amer. continent. Through Walpole he obtained a promised grant of £20,000, and in 1728 he went to Rhode Is., where he lived till 1731, returning when he realised the money promised would not be paid. In 1733 he pub. *Aliphron, or the Minute Philosopher*, a Platonic dialogue on the philosophy of religion, with criticism of the free-thinking of the age. B. was made Bishop of Cloyne, 1734. He pub. *The Analyst*, 1734, and *The Querist*, 1735-7, the latter a series of questions on sociology and economics. In 1744 was pub. his last work, *Siris*, which, nominally dealing with the use of tar-water as a specific in small-pox and other diseases, contains some of his most profound metaphysical speculations. In 1752 he resigned his bishopric and moved to Oxford, where he d.

B. is the direct successor to Locke, and much of his work consists of attempts to solve the problems that Locke had failed to solve. The central principle of B.'s philosophy was suggested to B.'s mind by an early study of Locke; and Kant has left it on record that he was awakened from his 'dogmatic slumber' by Hume's trenchant but not altogether accurate attack on B. B.'s *New Theory of Vision*, *Principles of Human Knowledge*, and the *Dialogues between Hylas and Philonous* (Everyman's Library, 483), although written before he was 30 contains, nevertheless, the main exposition of his philosophy. This main principle was that nothing existed apart from perception (*esse est percipi*), a principle which B. declared to be intuitively obvious and manifest common sense. But the *soldier* men of common sense among his contemporaries—including Dr Johnson—persisted in regarding B.'s doctrine, at best, as a subtle metaphysical paradox, at worst, as an ingenious sophistry. He was charged with attempting to prove the non-existence of matter, and that everything in the universe was merely ideal. B. protested against this assumption, asserting that everything that is seen, felt, heard, or in any way perceived, is a real being, i.e. exists, whilst, on the contrary, a thing which is not perceived cannot be

known, and, not being known, cannot exist. The only intelligible cause of all phenomena is a mind. Neither pain nor pleasure exist apart from their being felt. The complete works of B. have been ed. by A. C. Fraser (1871). See also G. Dawes Hicks, *Berkeley*, 1932, and J. Wild, *George Berkeley: a Study of his Life and Philosophy*, 1936.

Berkeley, Lennox (1903-), composer. He was educ. at Oxford Univ. and studied music in Paris. Much of his work is distinguished by a Fr. elegance and neatness, but he has also developed a more powerful style, especially in his opera *Nelson*, produced in 1954. Other works are a Symphony and *Sinfonietta*, concertos for piano, 2 pianos and flute, 2 string quartets, instrumental sonatas, piano works, songs, etc.

Berkeley, Miles Joseph (1803-89), botanist, b. Biggin Hall, Northants; educ. at Rugby and Cambridge. In 1880 he became rector of Sibbertoft. He was one of the earliest investigators on potato blight, grape mildew, and diseases of vegetables. His chief works are *Introduction to Cryptogamic Botany*, 1857, and *Outlines of British Fungology*, 1860.

Berkeley: 1. Tn in (Glos., England; situated in the Vale of B., a rich dairy and pasture country, once celebrated for its 'double Gloucester' cheese. The B. Ship Canal admits small vessels to Gloucester from the docks at Sharpness. The church is Early English and Decorated. B. Castle, where Edward II was murdered, to the SE. is one of the finest in England. Dr Edward Jenner, the discoverer of vaccination, was b. and buried here. Cloth was once manufactured. It was a bor. in the 13th cent., but the corporation was dissolved in 1885. Pop. (approx.) 1000.

2. Tn in Alameda co., California, U.S.A. It is a popular residential dist. for San Francisco, 7 m. distant across San Francisco Bay. It is the site of the univ. of California, Armstrong College, 4 divinity schools and state schools for the deaf and blind. It is largely residential, with an industrial water-front (industrial gases, soap, paint, chemicals, metal products). Pop. 113,805.

Berkeley Sound, opening on the NE. coast of E. Falkland Is.

Berkhamsted (Great Berkhamsted), urb. dist. and tn of Herts, England, 28 m. from London, on the Bulborne R., and near the old Grand Junction Canal. The grammar school dates from 1541, and the church of St Peter is of many styles and dates, chiefly Perpendicular. There are remains of the once important castle. Chemical manufs. form the chief industry; there are also manufs. of ladies' clothing and timber milling. Pop. 11,300.

Berkhamsted School for Girls, opened in 1888 at Berkhamsted, Herts, on the same foundation as B. School for Boys (founded in the reign of Henry VIII by Dean Incent of St Paul's, London).

Berkeley, city in Oakland co., SE. Michigan, U.S.A., suburb of Detroit (q.v.). Incorporated as vil. 1924, as city 1932. Pop. 17,931.

Berkovitz, tn of Bulgaria, in Vratsa (q.v.) prov., at the N. side of the B. Mts, 38 m. NNW. of Sofia (q.v.). It has a ruined fortress, is in a fruit-growing dist., and has food-preserving and furniture industries. Pop. 7000.

Berkshire (A.-S. *Berroc-scir*, from the 'wood of Berroc where the box-tree grows'), co. of England, in the S. midlands, lying between Oxford and Bucks, N.; Hants, S.; Surrey, E.; and Wilts, W. The area is 454,725 ac. Pop. 427,300. There are 3 co. parl. divs.: Abingdon (N. div.), Newbury (S.), and Windsor (E.). Reading, the co. tn, returns 2 bor. members. The Thames forms the natural N. boundary, on which are situated the old tns of Abingdon, Wallingford, Maidenhead, Reading, and Windsor. In the NW. is the Vale of the White Horse, so called from the rude figure of a horse, 374 ft long, cut out of the chalk on White Horse Hill (856 ft). It is probably of far greater antiquity than Alfred's Dan. victory it is said to commemorate. Through the rich pastoral vale in which lies Wantage runs the Ock. S. and E. are the valleys of the Pang, meeting the Thames at Pangbourne (near by is Bradfield College, estab. 1850), and of the Lambourn, draining to the Kennet, a beautiful trout-fishing stream, which runs to the Thames at Reading; on its SW. reaches lie Hungerford and Newbury. Near by are Inkpen Beacon (955 ft) and Walbury Camp (975 ft), the highest point in the co. Windsor Forest, the castle, and the tn are on the E. border, and SE., stretching into Surrey, are the sandy pine-clad heaths of Bagshot, where are Ascot and Wokingham, near which are the Royal Military College at Sandhurst and Wellington College. The co., except for Reading, is chiefly agric., sheep-farming on the chalk B. downs and dairying being of great importance. The B. breed of pigs is famous. See F. A. Brabant, *Berkshire*, 1911; Arthur Mee, *Berkshire*, 1939; R. P. Beckinsale, *Companion into Berkshire*, 1951; I. Yarrow, *Berkshire*, 1952.

Berkshire Hills, name given to the mt dist. of Berkshire co., Massachusetts, U.S.A. The scenery and healthy situation attract thousands of visitors annually; the mts are a continuation of the Green Mts of Vermont. The highest point is Greylock (3505 ft).

Berkshire Regiment, The Royal, 1st Batt. (formerly 49th Foot), was formed in 1714 in the W. Indies from independent companies which were regimented in 1744; it fought in the Amer. war of Independence and in 1782 became the Herts Regt. As marines it served in Baltic fleet in 1801. It took part in the Amer. war, 1812-14, the China War of 1840-2, and the Crimean War. In 1881 became the Berks Regiment, title 'Royal' being granted in 1885. 2nd Batt. (formerly 66th Foot) raised 1755; served under Wellington in the Peninsula. Garrisoned St Helena during Napoleon's captivity. During the First World War it raised 16 battalions for service in France, Flanders, Italy, and Macedonia. In the Second World War

the B. R. fought in France and Belgium and in Burma. They were the 56th (London) Div., and took part in the last stage of the Tunisian campaign, and in the allied landing in Salerno Bay on 9 Sept. 1943. The next month they crossed the Volturno and Garigliano, being engaged in battles fought over difficult terrain. Afterwards their div. was moved to the Anzio 'beach-head' (Jan.-Feb. 1944), and in Aug. of that year was moved to the Adriatic coast and thereafter took part in the thrust in April 1945 to the line of the Po. Another unit rendered conspicuous service at Mandalay in 1945. The B. R. is to be amalgamated with the Wilts Regiment by 1959.

Berlage, Hendrik Petrus (1856-1924), Dutch architect, b. Amsterdam, became a leader of the 'Modern Movement' in architecture. After being trained in Switzerland and travelling in Italy, he began practice in Amsterdam c. 1882, where his most important building was the New Exchange or Bourse, 1899-1903, which greatly influenced subsequent architecture throughout W. Europe.

Berlichingen, Götz von (1480-1562), Ger. knight of Swabia, the subject of Goethe's poem bearing his name (trans. by Sir Walter Scott). He went to war with his neighbours, and in 1513 was put under the ban of the empire for attacking Nuremberg; he was besieged by Maximilian the emperor, and d. in defence of his castle.

Berlin, Irving (1888-), Amer. songwriter, b. Russia; his parents migrated to the U.S.A. His songs include 'Alexander's Ragtime Band,' 'White Christmas,' and the scores for *Top Hat*, *Annie Get Your Gun*, *Call Me Madam*, etc.

Berlin, largest city of Germany, former cap. of Prussia (q.v.), and from 1871 until 1945 the cap. of the country. It is in the NE. of the country, on the R. Spree (q.v.), which flows through it SE.-NW. It lies entirely within the ter. of the Ger. Democratic Rep. (see GERMANY). At the end of the Second World War the city came under a 4-power occupation and was divided into 4 sectors: the Brit. sector, in the W., includes the dists. of Tiergarten, Wilmersdorf, Charlottenburg, and Spandau; the Amer. sector, in the S., the dists. of Kreuzberg, Neukölln, Schöneberg, Tempelhof, Zehlendorf, and Steglitz; the Fr. sector, in the NW., the dists. of Wedding and Reinickendorf; and the Russian sector, in the E., the dists. of Mitte, Friedrichshagen, Prenzlauer Berg, Pankow, Weissensee, Lichtenberg, Treptow, and Köpenick. On 30 Nov. 1948 the Russian representatives withdrew from the *Kommandatura*, and a separate municipal gov. was estab. in the Russian sector. The Brit., Amer., and Fr. sectors form an administrative unit called Western B. According to the constitution of the Federal Rep. (see GERMANY) B. in addition to being a city, is also a *Land* of the rep.; it is not yet formally incorporated as such. Western B. is governed by a House of Representatives, with 300 members, and a Senate. Its area is

186 sq. m., and its pop. (estimated 1955) 2,195,200. The area of Eastern B. (i.e. the Russian sector) is 156 sq. m., and its pop. (estimated 1953) 1,248,000.

Industries. The most important industry in Western B. is the electrical industry (in which 92,005 employees were engaged in 1955); steel and engineering, clothing, and chemical industries are also of great importance. There are large-scale manufs. of consumer goods, and of precision and optical instruments.

Education. The Friedrich Wilhelm Univ. of B., though not founded until 1810, came to hold a high place in European scholarship; among the famous names connected with it are Fichte, Hegel, Mommsen, Ranke, and Einstein (qq.v.). This univ. is now in Eastern B. A free univ. was founded in Western B. in 1948 (7635 students in 1955), and in Western B. there is also a technical univ.

Description. Since the end of the Second World War there has been a great deal of reconstruction in the Western sectors of the city; there has been less reconstruction in the Eastern sector, where the war damage was heavier. The most famous street of the pre-war city, the Unter den Linden (so called from its double avenue of lime-trees) is now in Eastern B.; it runs from the site of the old Imperial Palace (severely damaged in the war, and since razed) to the Brandenburg Tor (built 1789, a copy of the Propylaea at Athens), beyond which the Tiergarten and Western B. begin. The Tiergarten, covering 630 ac., is slowly recovering its reputation as one of the finest parks of Europe. Beside it still stands the ruined Reichstag, burned down in 1933 (see GERMANY, *History*). Through the centre of the Tiergarten runs the Charlottenburger Chaussee, on which stands the Stöglensäule, a 151-ft column surmounted by a gilded Victory. The heart of Western B. is the Kurfürstendamm, running W. from the Tiergarten and the ruined Kaiser-Wilhelm-Kirche; it is an important shopping street, and in its neighbourhood there are other streets lined with post-war shops, offices, restaurants, and hotels: the Tauentzienstrasse, the Kautstrasse, the Joachimstalerstrasse, the Mehringdamm, and the Karl-Marx-Strasse. In the Dahlem quarter, towards the SW., is situated the new univ. (see under *Education* above), a botanical garden, and an ethnological museum. Near here is the beautiful forested area called the Grunewald, which is bordered on its W. side by the Havel (q.v.).

History. The nuclei of the city were the 2 small palaces of Kölln and B. on the arms of the Spree. Here another castle was built, which became a court of the Brandenburg (q.v.) Electors. In the time of Frederick William (q.v.), the Great Elector, and his successor these settlements were consolidated under the name of B. After the wars of Napoleon (q.v.) much of the city was rebuilt, mainly under the influence of F. Schinkel, but its rise to the position of a cap. city of the first importance dates from the

formation of the Ger. Empire. The city consequently grew with the expansion of trade and the centralisation of gov., and increased from a pop. of 826,000 in 1871 to 2,000,000 in 1905, and 3,000,000 in 1910. This growth in pop. meant that since 1878 the city was practically rebuilt. Sanitation, water supply, and public hygiene were reorganised, and overcrowding obviated by an extension of the city's boundaries. In 1911 a plan was carried out to bring the city and the tns of Charlottenburg, Lichtenberg, Neukölln,

local affairs was left to the dists. which had been absorbed. The municipal gov. covered schools, poor law, hospitals, water supply, drainage, lighting, etc. The city council consisted of paid and unpaid officials, and the elected common council was presided over by an *Oberbürgermeister* and a *Bürgermeister*. The police authority extended over building, markets, crime, and trade.

The old familiar provincialism of the city, which was dear in the eyes of many Germans, disappeared, and during the

D. McLeish

UNTER DEN LINDEN AND THE BRANDENBURG GATE IN 1939

Schöneberg, Wilmersdorf, with the administrative areas of Teltow and Niederbarnim, under a common authority for the administration of streets, roadways, and the elevated railway. Common police regulations were to be in force in these places. Under the scheme large areas of land suitable for development were to be acquired. The scheme became operative on 1 April 1912, and functioned during the 1914-18 war, but after the armistice it was deemed desirable to effect further co-ordination in the municipal gov. and services. After protracted discussions between the different authorities concerned, a common basis of agreement was reached, and a Bill was passed in the Prussian Constituent Assembly on 27 April 1920, to establish a new municipality of B., which would take under its administrative aegis all the usual services and other matters of general application to the area as a whole; but a large measure of self-control in strictly

second decade of the 20th cent. the city became more European in character and less German. It was a formless city, never having been Germany's natural centre. It lay on the edge of the Reich, not only geographically but also historically and culturally. Under the Nazi regime a programme was laid down to make B. the focus of Ger. pride and the centre of Ger. culture as understood in the Third Reich. By this time B. already covered an area of 340 sq. m.—a larger area than that occupied by any other tn in the world except Los Angeles—and as regards pop. it ranked fourth. The municipal authorities planned in the expectation that in a further 40 years B. would become the cap. of central Europe with a pop. of 10 million inhab. Greater B. was, in fact, almost a country in itself, stretching from Staaken to Schmokwitz, from Buch to Wannsee, and embracing within its area lakes, cornfields, and fir woods. With its fields

and windmills standing between its factories, B. served as a model of what the municipal authorities hoped the whole Reich would become in time.

In 1939 Germany entered upon a war, fully believing that its cap. city would remain invulnerable. Its leaders pledged themselves to this. The city became, however, one of the most heavily bombed of all the cities of Europe. Some of its severest trials under air attack came in 1943. In Jan. of that year it was bombed 4 times, including the first daylight raid,

manned by 5000 airmen, broke through a strong fighter screen and dropped 1700 tons of bombs on B. in 50 minutes, for the loss of 58 bombers and 1 fighter. Large-scale damage was done by this raid, especially to the central parts of the city, including the Mittelstrasse near Unter den Linden, the Wilhelmstrasse, and also the outlying industrial dists. of Siemensstadt and Spandau, while the railway stations, the Potsdamer, Anhalter, and Stettiner were ruined. Terrific damage was again wrought by the R.A.F. in

'The Times'

BERLIN: THE KAISER FRIEDRICH MUSEUM, 1939

which marked the beginning of the offensive of the U.S. Eighth Air Force. In Mar., with an improvement in weather conditions, the R.A.F. returned to the attack, and on 27 Mar. made a concentrated raid with a powerful force of 4-engined bombers carrying 900 tons of high-explosive and incendiary bombs. The sixth attack of the year was on 1 Mar., when a heavy concentric raid was made, lasting 30 minutes. Strong defences were encountered on the outskirts of the city. As a result of these raids various gov. depts were transferred to other cities, including the central offices of the Gestapo (q.v.) which were moved to Prague, and the foreign ministry, which was moved to Vienna, while the majority of the schools were evacuated to Lodz and Poznan. By this time, also, about 500,000 of the inhab. were sent into Poland. On the night of 23 Aug. 1943, a strong R.A.F. force of 700 bombers,

attacks on the nights of 22, 23 Nov. 1943, the destruction being particularly great in the central dists. The whole way from the Potsdamer Platz, through the gov. quarters around Wilhelmstrasse, and towards the Tiergartenstrasse was a sea of fire and smoke. The Columbus Haus skyscraper was burnt out, the landmark Haus Vaterland, and the travel agency, Mitteleuropäisches Reisbüro, in the Leipziger Platz, were destroyed. The only building comparatively undamaged in the Wilhelmstrasse was the Reich Chancellery. The total losses also included the Hotel Kaiserhof in the Wilhelmplatz, and the Ger. Foreign Office. By this time the Luftwaffe had been driven underground, and B. was a wrecked, cold, hungry city, in which food, fuel, and tobacco were bartered for clothing. But the largest force of R.A.F. bombers, chiefly Halifaxes and Lancasters, attacked the cap. on the night of 15 Feb. 1944, when more

than 1000 aircraft dropped 2500 tons in 30 minutes, while Mosquitoes followed them to hamper the work of B.'s fire brigades. The raiders lost 43 aircraft. Another big attack was made in co-ordination with the allied invasion of Europe when, on 21 June 1944, more than 1000 Flying Fortresses and Liberators of the U.S. Air Force, escorted by 1200 Lightnings, Thunderbolts, and Mustangs, bombed various targets in Berlin, for the loss of 43 machines. With the advance of the Soviet army, B. also became threatened from the land. By 21 Feb. 1945, Marshal Zhukov's (q.v.) forces were within 34 m. of the city. Air attack continued, the raid of 18 Mar. by a U.S. force of 1300 Liberators and Fortresses being the largest daylight attack B. had yet sustained. Over 3000 tons of bombs were dropped. On land the Amer. Ninth Army had reached the Elbe, 70 m. from B., on 11 April 1945. The same month the Soviet forces were fighting over the approaches to the city, and on 2 May the city surrendered to Marshal Zhukov. For further details of the Russian military operation against B., see EASTERN FRONT IN SECOND WORLD WAR.

About 75 per cent of the city was literally destroyed; 25 per cent of the buildings remained habitable, though dilapidated and partly damaged. In the central parts most buildings were gutted. Thus the Charlottenburger Chaussee from the Adlon Hotel to the former technical high school was burnt out. This was typical of the main arteries. In the Tiergarten only a few trees survived the bombs, the fires, and the shelling. On 2 May 1945 the city surrendered to Marshal Zhukov and was subsequently divided into 4 sectors (described above).

In 1948 the introduction of the W. Deutsche mark improved the situation for most Berliners. The ensuing Russian ban on rail, road, and canal movements from the W. into B., however, forced the 3 W. powers to supply essentials to the Western sectors by means of the now celebrated 'airlift.' The Russians eventually lifted the blockade late in 1949.

See A. Rutenberg, *Das alte Berlin*, 1913; J. Laforgue, *Berlin and its Environs*, 1923; E. Kaerber, *Berlin im Weltkrieg*, 1921, and *Erfahrungen und Erlebnisse aus dem alten Berlin*, 1917; Baedeker.

Berlin, tn, Coos co., New Hampshire, U.S.A. The falls of the Androscoggin R. provide the power for the large pulp, paper, fibre, and saw-mills. It is a winter sports resort. Pop. 16,615.

Berlin, Congress and Treaty of (June 1878), convention of the representatives of the chief European powers called to reconstruct the Russo-Turkish treaty of San Stefano (1878). The congress met under the presidency of Bismarck at B. Great Britain was represented by Lord Beaconsfield, Lord Salisbury, and Lord Odo Russell. By the treaty Rumania, Serbia, and Montenegro were recognised as independent states. The boundaries of Bulgaria were enlarged, and it became an autonomous Turkish trib. state under an elected prince. Rumelia also became

self-governing, under a Christian minister-in-chief, but was still held by the sultan. The boundaries of Greece were also enlarged. Bosnia and Herzegovina were transferred to the control of Austria. Rumania obtained the Dobruja, and in return ceded to Russia the Bessarabian ter. she took from Russia at the treaty of Paris. Ardahan, Kars, and Batum were ceded to Russia. Turkey agreed to a Brit. occupation of Cyprus.

Berlin, Pact of (1940), alliance between Germany, Italy, and Japan, signed in Berlin on 27 Sept. 1940. Its essential provisions were contained in the third article: after promising mutual respect for the new order (see NEW ORDER) in Europe under Germany and Italy, and the new order in 'Greater East Asia' under Japan, the 3 signatories undertook to 'assist one another with all political, economic, and military means when one of the 3 contracting parties is attacked by a power not at present involved in the European war or the Chinese-Japanese conflict.' Only 2 powers of the first rank came within this definition—Soviet Russia and the U.S.A. But the pact then went on to exempt Russia by the specific statement that the prevailing relations between that state and the contracting parties were not affected. The purpose of the pact was therefore to try to weaken the resistance of Britain by an alliance against the United States, and to limit the scope of the European war by raising a menace which might deter the U.S.A. from either active or even indirect intervention. Yet even if the U.S.A. should intervene in the Pacific, it was not clear how Germany or Italy could put forth any further effort in a form that could be of any real use to Japan; but if the U.S.A. should take positive action in Europe, Japan appeared to be committed to a declaration of war. Japan might reasonably have expected Germany to use her influence over the Vichy Gov. (see EUROPE, History; FRANCE, History) to facilitate her absorption of the whole of Fr. Indo-China, in which Japan already had a foothold. However, Hitler evinced but little concern to promote Jap. ambitions in the E., and Japan's pressure for a base at Saigon met with a rebuff from Vichy. One effect of the pact of Berlin was to decide the Brit. Gov. to reopen the Burma road on 18 Oct., thereby allowing munitions to find their way to the Chinese forces.

Berlin Spirit, potable spirit distilled from comparatively inexpensive material, such as potatoes and beetroot. It contains a large proportion of deleterious by-products, and is used for adulterating brandy and fortifying wines of poor quality.

Berlioz, Hector (1803–69), Fr. composer, b. near Grenoble, the son of a doctor; was trained for that profession, but broke with his family, and after many difficulties entered the Paris Conservatoire. He gained the Prix de Rome in 1830 with a cantata, *Sardanapalus*. His *affaires du cœur* were characteristic of his inborn romanticism and artistic associates, but apart from an idealistic love for a young

girl at home, Estelle Dubouff, nothing of the kind is known before his infatuation for Henrietta Smithson, the Irish Shakespearean actress. Almost crazed by her indifference, he consoled himself by turning to a pianist, Marie Moke, who afterwards achieved distinction as Mme Camille Pleyel. Having lost her, he seems in 1833 to have overcome Henrietta's opposition, but their marriage was unhappy and they separated in 1840, B. having an affair with Marie Recio, a singer with whom he toured Europe. During this period he wrote the dramatic symphonies, *Épisode de la vie d'un artiste*;

BERLIOZ

Harold en Italie; *Symphonic funèbre et triomphale*, which contains a magnificent march for a military band; and *Roméo et Juliette*. From 1838 to 1864 he was musical critic for the *Journal des Débats*. His opera *Benvenuto Cellini* was refused a hearing in Paris, 1837. In 1846 he produced his most popular work, the symphonic cantata *La Damnation de Faust*. His sacred work include the *Requiem Grande Messe des Morts*, 1837, *Te Deum*, 1849, and the oratorio, *L'Enfance du Christ*, 1850-4. His last works were the operas *Beatrice et Benedict*, 1861, and *Les Troyens*, 1863. In 1842 he had first visited Germany, where, owing to Schumann's praise in the *Neue Zeitschrift für Musik*, he was received with enthusiasm by the new school, as he was later in Vienna and St Petersburg. He d. in Paris. B. was one of the prin. exponents of 'programme' music, but his fame will rest chiefly on his original mastery of orchestration, in which his romantic imagination found full scope. A great musician, he is one of the chief representatives of romanticism as well as

one of the originators of such new departures as the symphonic poem of Liszt and the *Leitmotiv* (q.v.) of Wagner. He was, above all, a marvellous inventor of orchestral sonorities. His faults, the results of impatience of discipline, have no doubt turned away many musicians, but these nevertheless not seldom profited from his discoveries. B. had the soul of a poet and his 'fiery romantic periods of genuine creation attained an admirable balance and transferred into the language of sound the harmonies brought to light by Virgil' (Henry Prunières). His *Traité d'instrumentation*, 1844, was ed. with additions by Richard Strauss, 1906. His *Memoirs and Letters* were pub. in 1870 and 1882; see selections, Eng. trans. in Dent's Everyman's Library. See also Alfred Ernst, *L'Œuvre dramatique d'Hector Berlioz*, 1884; J. G. Prod'homme, 'Unpublished Berlioziana' (*Music Quarterly*), April 1918. The standard life is by Adolphe Boschot (3 vols.), 1906-13; others by Adolphe Jullien, 1888; J. G. Prod'homme, 1923; W. J. Turner, 1934; T. S. Wotton, 1935; J. H. Elliot (Dent's Master Musicians series), 1937; G. de Pourfals, 1939; Jacques Barzun, 1950.

Berne, or **Berm** (Ger. *Berne*, edge of a field), technical term of fortification, both temporary and permanent. In the former kind of fortification it is the name given to an earthen mass which separates the parapet from the ditch, and whose function is to uphold the weight of the parapet in order to prevent it from causing the earth of the scarp to fall in. In permanent fortification the B. is a block of freestone which crowns the scarp and, projecting slightly over the ditch, serves the same function as the temporary B. When public works are in course of construction, the narrow passage between the canal or ditch and the earth which is excavated therefrom is called a B.

Bermejo, **Bartolomé** (active 1474-1494), Sp. painter, whose real name was Bartolomé de Cardenas, b. Cordova (it is supposed), worked in Aragon and Barcelona. He is the most outstanding of the early Sp. school and, though clearly influenced by the Flemish painters of his time, has a strong individual character. He painted a fine Pieta, 1490, for Barcelona Cathedral.

Bermejo, Rio, riv. of Argentine Rep., rising on Bolivian frontier and flowing SE. into the R. Paraguay. Much of its course is navigable by shallow-draught vessels. Total length, c. 650 m.

Bermejo Pass, see USPALLATA.

Bermondsey (meaning 'Beormund's island'), parl. and metropolitan bor. of London, on the S. bank of the Thames, opposite the city of London and the bor. of Stepney. A rich Clunian priory, of which there are very scanty remains, existed here from 1089 until the Dissolution. On the riverside in the Middle Ages there were many hostleries and the in houses of the abbots of St Augustine, Canterbury, and of Battle, Sussex, and of the priors of Lewes, Sussex. Many Huguenots settled in B. after the massacre of St Bartholomew (1572), and are

credited with the foundation there of the leather industry. The prin. industries are leather and food manuf. and distribution. Rotherhithe (meaning a 'landing-place where cattle are shipped') was originally a separate vil. to the E. of B. It contains the Surrey Commercial Docks, begun in 1809, the largest timber docks in the world (460 ac.). The bor. has 3 tunnels under the Thames: the Thames Tunnel from Rotherhithe to Wapping, the Rotherhithe Tunnel to Shadwell, and a tunnel emerging near the SW. angle of the Tower of London used for water supply only. B. returns 1 member to parliament. Area 1503 ac.; pop. 58,000.

Bermudas, group of is. in the W. Atlantic Ocean, 32° 15' N. and 64° 51' W., 570 m. off Cape Hatteras, the nearest point on the N. Amer. coast. According to Juan de Bermudez, the Sp. navigator and historian, the B. were discovered at an earlier date than that of his own visit in 1515 but the exact date is unknown. In Peter Martyr's *Legatio Babylonica* there is a map, pub. in 1511, which shows the is. in an approximately accurate position. In 1609, when Admiral Sir George Somers's ship the *Sea Venture* was wrecked on a reef off the is., they were uninhabited. This reef was afterwards known as the Sea Venture Flat. Somers, who had escorted sev. other ships containing a body of settlers, d. the following year, and his companions, ignorant of the prior claims of Bermudez, named the is. after Somers. Reports of the fertility and beauty of the is. induced the Virginia Co. to petition for an extension of their charter so as to embrace the B. James I. granted their petition, but the company soon after sold the is. to a body called The Governor and Co. of the City of London for the Plantation of the Somers Is. In the ensuing two or three decades the is. were prosperous under the administration of this company, but later the settlers became subject to so many grievances and abuses that in 1679 they appealed to the Crown. A writ of *quo warranto* (q.v.) against the Bermuda Co. was successful and the administration was transferred to the Crown. The first General Assembly for the B. was held at St George in 1620, and when the gov. passed to the Crown, the commission to the first royal governor confirmed the grant of representative institutions. Geologically the is. are formed of aeolian limestone deposits and coral reefs, being the N. limit of the coral builders. There are some 300 is., of which all but 20 are small, uninhabited rocks, forming an oval ring lying NE. to SW. The total area is 20.58 sq. m. Great Bermuda, or Main Is., 14 m. long, contains the cap., Hamilton (q.v.); the only other tn is St George, the old cap. on St George Is., which, with Paget, Smith, and other is., encircles Carth Harbour, NE. of Main Is. At St George is the great floating dock. The islets of Ireland, Somerset, and others enclose the Great Sound at the SW. of Main Is. There being no streams or wells the is. are entirely dependent upon rainfall. The vegetation is nevertheless

prolific; the juniper or Bermuda cedar formerly grow in great quantities and is being restored after the blight which destroyed 80 per cent of the trees in the 1940's. The temperate climate, 63°-79° F., makes the B. a popular winter resort for Americans and Canadians, and there is a considerable export trade in early onions, potatoes, green vegetables, spring flowers, and lily bulbs to the U.S.A. Apart from tourism, agriculture is the chief industry, and it is entirely in the hands of small tenants. Arrowroot and bananas are grown, and there are extensive fisheries around the coasts. Locally manuf. essential oils and pharmaceutical products are now important exports; all meat, flour, and such necessities have to be imported. The former naval dockyard and station are being developed as a free port. A railway (21½ m.) connects Hamilton, Somerset, and St George, crossing the sea inlets or bays at a dozen points, but is now out of use; 426 steamships called at the colony in 1954. There are about 105 m. of colonial and 15 m. of military roads. The pop., excludng army and navy, is about 40,450, about 15,400 being white. The is. are a Brit. crown colony, administered by the Governor and Commander-in-Chief, an Executive Council (consisting of 3 official and 4 unofficial members), a nominated Legislative Council, and a House of Assembly (of 36 members, 4 members being elected by each of the 9 par.). The franchise was extended to women in 1944. The B. form an independent diocese under a bishop. Facilities for the setting up of naval and air bases on the E. coast of Bermuda and on the Great Bay were granted in Sept. 1940 to the Gov. of the U.S.A., and in 1944 a training base for ships of the Royal Canadian Navy was estab. Kindley Field is partly available for civil aircraft. There is a modern broadcasting station, transmitting on 2 wavelengths. See A. Hellprich, *Bermuda Islands*, 1889; W. B. Hayward, *Bermuda, Past, and Present*, 1923; H. M. Chapin, *Bermuda Privateers, 1625-1708*, 1925; also official reports, pub. biennially.

Bern (Fr. Berne): 1. Canton of Switzerland; area, 2658 sq. m. The fertile valleys of the Aar and the Emmen divide the mountainous alpine region in the S. from the Jura Mts in the N. Among the peaks of the Oberland are the Jungfrau, the Elger, the Schreckhorn, etc.; among the lakes of the canton are those of Thun, Brienz, and Biemme. The prin. riv. is the Aar (q.v.). The N. part of the canton is hilly; it produces corn, wine, and fruits. The SE. part, the Oberland, produces fruits in its lower valleys, and excellent pasturage higher up. Cows and horses are reared, the horses of Emmentaler specially being noted; the lakes abound in salmon and trout. Quarries of sandstone, granite, and marble are worked, and iron mines, whilst a little gold is also found. The manufs. of the canton, which are not extensive, comprise linen and woollen goods, leather, wood articles, and watches. The canton, which is made up entirely of lands acquired by the city B. at various

times, has a pop. of 838,500 (1955), mainly Protestants.

2. B., the cap. of the canton, and political cap. of the Swiss confederation, is situated on a high sandstone promontory, surrounded on three sides by the R. Aar. It is one of the best-built tns in Europe. There is a magnificent Gothic cathedral, dating from the 15th cent., a univ., the Federal Palace, a museum, and a public library. The streets in the old tn, flanked with arcades, are those of a prosperous 18th-cent. tn; the numerous fountains mostly date from the 16th cent. The chief industries are weaving, spinning,

Swiss National Tourist Office

ARCADES IN BERN, SWITZERLAND

and the manuf. of machinery and chocolate. B. also trades in cheese, wine, coal, and cattle. It has become the seat of sev. international institutions (postal, telegraph, railway, copyright). B. was founded in 1191, and became a free imperial city in 1218, and gradually attained a state of independence. Between 1288 and 1339 it successfully resisted attacks by Rudolf of Hapsburg, Albert his son, and Louis of Bavaria. B. entered the Swiss confederation in 1353 as its 8th member. In 1405 much of the city was destroyed by fire, but was rebuilt. In 1528 B. embraced the cause of the Reformation, and in the ensuing war with the Duke of Savoy added the Pays de Vaud to its dominions. From then till 1798 B. continued to prosper; in the latter year was overrun by the Fr. troops, and lost about half its possessions. In 1848 B. was made the political cap. of Switzerland. The origin

of the name of the tn is said to be from old Swabian *bern*, meaning a bear, and certainly a bear is represented on the first known tn seal, of the date 1224. Ever since 1513 bears have been kept in B. at the public expense, and the bear-pit is one of the sights of the tn. Pop. (1955) 156,100, mainly Protestants.

Bern Convention, *see* COPYRIGHT.

Bernadotte, Jean Baptiste Jules, *see* CHARLES XIV (of Sweden and Norway)

Bernalda, It. tn, in Basilicata (q.v.). 19 m. SSE. of Matera (q.v.). Pop. 5000.

Bernanos, Georges (1888-1948), Fr. novelist and polemic writer, b. Paris, of mixed Lorraine and Sp. descent. He contributed articles to minor periodicals and, at 38, took up literature as a career, his first novel being *Sous le soleil de Satan* (1926). His theme is almost always the struggle for the soul of man between the forces of good and evil, which he portrays with originality and intense conviction. In 1928 appeared *L'Imposture*, the portrait of the inner soul of an unbelieving priest, a masterpiece comparable with Duhamel's *Salavin*. In 1929 came the novel *La Joie*; in 1936 *Journal d'un curé de campagne*, trans. (1937) as *The Diary of a Country Parson*, which won him a European reputation. B., like Mauriac (q.v.), takes his stand upon the Rom. Catholic faith, and is a severe critic of fallen humanity. Other works: *Les Grande Cimetières sous la lune*, 1938, a polemic of remarkable power against Franco and his followers; *Nous autres Français*, 1939. B. went to Brazil in 1939 in voluntary exile, and there wrote *Lettre aux Anglais*, 1942. His last work was *Monsieur Ouine*, 1946, a complex work of fiction on his misgivings about the future of Christian civilisation. *See* A. Béguin, *G. Bernanos*, 1949.

Bernard (fl. 865), It. traveller in Palestine, called Sapiens, who has been confused with a Scottish monk of the same name. He set out from Rome, between 863 and 867, to Palestine, and on his return went to the monastery of Mont St Michael, in Brittany. To him has been attributed a work, *De Ipsa Urbe Hierusalem et de multis adjacentibus Locis*, and also a short tract, of which a MS. exists at Oxford and another in the Brit. Museum. Consult *Early Travels in Palestine* (Bohn's Antiquarian Library, 1847).

Bernard, Claude (1813-78), Fr. physiologist, b. near Villefranche; began the study of medicine in 1834 and worked with Magendie at the Collège de France, becoming deputy prof. in 1847, and succeeding him to the chair, 1855. His prin. researches and discoveries were in the digestive function of the pancreas, the sugar-making (glycogenic) secretion of the liver, and, perhaps his most epoch-making, the discovery of the vaso-motor system. His study of the action of poisonous drugs, chiefly curare, is also of importance. He pub. *Introduction à la médecine expérimentale*, 1866, and *Physiologie générale*, 1872; but his work is best judged by the 17 vols. of his lectures (*Leçons*); *see* his life by Sir M. Foster,

1899, and *Claude Bernard and the Experimental Method*, by J. M. D. and H. Olmsted, 1952.

Bernard, Edward (1838-97), oriental scholar and mathematician, *b.* at Towcester, Northants; 1855, elected scholar of St John's College, Oxford; studied Hebrew, Syriac, Arabic, and Coptic; 1869, Christopher Wren appointed B. his deputy in the Savilian chair of astronomy. B. supervised the reprinting of the old mathematicians. He *d.* at Oxford.

Bernard, Jean Jacques (1888-), Fr. playwright, son of Paul B. (q.v.); *b.* Enghien. His best plays are *L'Ami en peine*, 1921, *Martine*, 1922, and *L'Invitation au voyage*, 1924. In vivid contrast with the mockery and satire of the elder B., the younger's work is notable for penetrating psychology and is often concerned with the secret, almost inarticulate, purgatory of the soul. This is exemplified in *Le Feu qui reprend mal*, 1921, his earliest production.

Bernard, Montagu (1820-82), lawyer, *b.* Tibberton Court, Glos. He studied at Trinity College, Oxford, of which he became a Vinerian scholar and fellow; he was called to the Bar at Lincoln's Inn, 1846. He was influenced by the High Church movement, and became one of the founders of the *Guardian*, 1846. He was appointed the first prof. of international law at Oxford, 1859-74. In 1871 he went to America, and was one of the high commissioners who signed the treaty of Washington.

Bernard, Paul (called Tristan) (1866-1947), Fr. author and dramatist, *b.* Besançon. He graduated in law and took a post first in an aluminium factory (1887-90) and then in the Court of Appeal, Paris. Later he was sports director at the Vélodrome Buffalo (1894-6); then editor successively of various papers, including the *Écho de Paris*, *Gil Blas*, *Journal*, *Auto*, etc. This varied experience of life is reflected in his plays and novels, his earlier work being vaudevilles of irony and mocking humour like *Le Fardeau de la liberté*, 1897, *Le Seul Bandit du village*, 1898, and *L'Anglais tel qu'on le parle*, 1899. The best of his later plays are *Triple Patte* (with André Godfron), 1905, *La Peau de l'ours*, 1907, *M. Codoat*, 1908, *Le Petit Café*, 1911, and *Les Deux Canards*, 1913. His novels, which like his plays satirise human weaknesses, include *Mémoires d'un jeune homme rangé*, 1899, *Un Mari pacifique*, 1901, *Amants et voleurs*, 1906, *Deux amateurs de femmes*, 1907. See L. Trelch, *L'esprit de T. Bernard*, 1925.

Bernard-Beere, Mrs Fanny Mary (née Whitehead) (1856-1915), actress, *b.* Norwich; prepared for the stage by Hermann Veizin; first appeared at the Opéra Comique. In 1877 she joined the St James's company, London, taking the parts of Julia in *The Rivals* and Lady Sneerwell in *The School for Scandal*. She was engaged in 1883 by the Bancrofts for Sardou's *Fédora*, in which she scored a great success. In 1887 she became manager at the Opéra Comique, and produced *As in a Looking-Glass*, *Ariana*, and *Masks and Faces*. She appeared at

Wyndham's in *The End of a Story* in 1902, and at the Coliseum in *The Spy*, in 1905.

Bernard of Clairvaux, St (1090-1153), Cistercian monk, mystic, theologian, and statesman, *b.* of noble parentage near Dijon. He entered the recently estab. monastery of Cîteaux in 1112, and in 1115 was sent to found Clairvaux, of which he remained abbot until his death. B.'s life was one of almost incredible achievement, and he was indeed the embodiment of his age. During his rule no fewer than 68 houses were founded from Clairvaux; and without neglecting the spiritual guidance and temporal administration of his order he made long journeys upon affairs of state, advising popes, kings, and bishops. It was mainly due to his efforts that Pope Innocent II was able to overcome the anti-pope Anacletus and thus avoid a dangerous schism. He it was who inspired and preached the second crusade, and whose intervention brought about the condemnation of Abelard. He combined the most vigorous asceticism with extraordinary gentleness and charm, and even while he moved amid the intrigue and wrangling of courts he was raised to the highest summits of the spiritual life. B. was canonized by Alexander III in 1173; his feast is on 20 Aug. Among his voluminous writings are letters (ed. by B. James, 1955); a long commentary upon the Song of Songs in the form of discourses spoken in chapter at Clairvaux; the *De Consideratione*, a magnificent work addressed to Pope Eugenius III; and many other dogmatic and mystical treatises. See E. Gilson, *La Théologie Mystique de Saint Bernard*, 1934; B. S. James, *St Bernard of Clairvaux*, 1957; and Daniel-Rops, *Cathedral and Crusade* (Ch. III, Eng. trans.), 1957.

Bernard of Morlaix (fl. 1140), Fr. monk belonging to the Benedictine order. He was the author of *De Contemptu Mundi*, a poem which was pub. at Paris in 1843. It was complete in 3 vols., each containing 1000 stanzas, and has been widely read in a trans. by Neale.

Bernardin de Saint-Pierre, Jacques Henri (1737-1814), Fr. writer, *b.* Le Havre. He entered the army as engineer, and in 1765 returned to Paris, having previously visited Malta, St Petersburg, Warsaw, Dresden, and Berlin. From 1768 to 1771 he was gov. engineer in Mauritius. He was greatly influenced by the writings of Rousseau, his *Études de la nature* (3 vols., 1784-9) bearing witness to the fact. Before this he had pub. *Voyage à l'Île de France* (2 vols., 1773), which gained him a reputation for its close portraiture of nature. But his masterpiece was *Paul et Virginie*, contained in the *Études*, a sentimental idyll of love set in Mauritius, followed by *La Chaumière indienne*, 1790. Both had great influence on Romantic literature by the new note of exoticism. See H. d'Almeras, *Paul et Virginie de Bernardin de Saint-Pierre: histoire d'un roman*, 1937.

Bernardines, name commonly applied to Cistercians (q.v.) of the Common Observance, as distinct from the Trappists who

follow the Stricter Observance. The nuns of this order have convents and schools at Slough, Bucks, and Westcliff-on-Sea, Essex. The male branch is not represented in England.

Bernardino of Siena, St (1380-1444), It. Franciscan friar, b. Massa di Carrara. Entered Franciscan order, 1404; appointed vicar-general, 1438. He restored the strictness of the early monastic rule, was famed as a preacher, and wrote sev. mystic works. He founded the *Frates de Observantia*, a branch of the Franciscan order, numbering over 300 monasteries in Italy in his own times. B. was canonised as a saint, 1450. His writings were pub. in Venice c. 1594, again in 1745, and in Paris in 1836. See *Mary Allies, Three Catholic Reformers*, 1870.

Bernau, Ger. tn in the dist. of Frankfurt-on-Oder, 48 m. NW. of Frankfurt (q.v.). It has textile industries, and was once noted for its beer. Pop. 13,000.

Bernauer, Agnes (fl. c. 1432), daughter of a poor barber-surgeon of Augsburg, was married secretly to Albert, eldest son of Ernst, Duke of Bavaria-Munich, in 1432; banned from a tournament by his father for his apparent illegal connection with Agnes, Albert openly acknowledged her as his wife, but in his absence she was charged with witchcraft, condemned, and drowned in the Danube. One of Heibel's prin. tragedies, *Agnes Bernauer*, 1855, is based on the story, and Otto Ludwig left an unfinished play on the same subject.

Bernay, Fr. tn in the dept. of Eure, on the Charentonne, 31 m. from Evreux. The abbey, round which the tn grew, was founded in the 11th cent. The tn was taken by the English sev. times in the 14th cent. A great fair for Normandy horses is held annually in Lent, and there are millinery, leather, metal, and chemical manufs. Pop. 8200.

Bernays, Jakob (1824-81), Ger. philologist and philosopher, b. Hamburg of Jewish parentage; educ. at the univ. of Bonn. He was prof. of classical philology at the Jewish Theological College, Breslau, from 1853 until 1866, in which year he returned to Bonn as extraordinary prof. and librarian. The majority of B.'s works deal with the Gk philosophers.

Bernburg, Ger. tn in the dist. of Halle, on the Saale (q.v.), 23 m. NNW. of Halle (q.v.). It was once the cap. of the Duchy of Anhalt-B. There is a 14th-cent. castle, and there are manufs. of machinery and sugar. In the dist. there are potash and salt-mines. Pop. 54,000.

Berne (Switzerland), see **BERN**.

Berners, Gerald Hugh Tyrwhitt-Wilson, 14th Baron (1883-1950), musical composer and novelist. Educ. at Eton, he was in the diplomatic service from 1909 to 1924. Among his musical works are an opera, *Carrosse du Saint Sacrement*, 1923, and a number of ballets, including *Triumph of Neptune*, 1926, *A Wedding Bouquet*, 1937, *Cupid and Psyche*, 1939, and *Les Sirènes*, 1946. His novels include *The Camel*, 1936, *Far from the Madding War*, 1941, and *The Romance of a Nose*, 1942, and he also pub. two popular

autobiographical works, *First Childhood*, 1934, and *A Distant Prospect*, 1945.

Berners, John Bourschier, 2nd Lord (c. 1469-1533), translator, son of Sir Humphrey B. (a descendant of Edward III), who was killed at the battle of Barnet, fighting for Edward IV. John was sent to Oxford at an early age. Henry VIII made him chancellor of the exchequer for life; he was also made governor of Calais, where he d. At the king's command he trans. the *Chronicles of Froissart*, 1523-5, the work being printed by Pynson. The *Golden Book of Marcus Aurelius*, 1534, *History of Arthur of Lyell Brytaine* (Brittany), and the *Romance of Huon of Bordeaux*. He also wrote a comedy called *Ite in Vineam meam* (Go into my vineyard).

Berners, or **Bernes**, or **Barnes**, Juliana (c. 1388-), writer on sport, was said to be the daughter of Sir James B. and to have become prioress of Sopwell Nunnery near St Albans. The *Boke of St Albans*, 1486, has been attributed to her, but she was probably author only of the treatise on hunting contained in it. See facsimile of the *Boke of St Albans*, ed. W. Blades, 1881.

Bernese Oberland, strictly the upper country or 'highlands' in the S. of the canton of Bern, Switzerland, but often extended to include the range of the Alps from the upper Rhône valley northwards, and from the lake of Geneva to the lake of Luzern, thus lying also in parts of Valais, Vaud, Fribourg, Luzern, Uri, and Unterwalden. It is the most frequented of Alpine dists. by tourists and visitors, both in summer and winter. The chief centres from which expeditions are made are Thun; Interlaken, 17 m. by rail from Thun; Schynige Platte; Lauterbrunnen; Murren; Grindelwald, one of the most frequented resorts in Switzerland; Meiringen, the meeting-place of many routes; and Kandersteg. The prin. peaks of the B. O. are the Finsteraarhorn, 14,025 ft; the Aletschhorn, 13,721; the Jungfrau, 13,670 (the splendid view from Interlaken is famous); Mönch, 13,468; Schreckhorn, 13,386; Gross Vischerhorn, 13,285; Elger, 13,042; the three peaks of the Wetterhorn, 12,166, 12,149, and 12,110. The views from the Sparrhorn, 9928, Eggishorn, 9626, are well known. The highest passes are Lauthor, 12,140, Mönchjoch, 11,680, and Jungfraujoeh, 11,385, leading to the Eggishorn from Lauterbrunnen, Grindelwald, and the Vengern Alp respectively. The Gemmi, 7641, leads from Kandersteg to Leukerbad, the Grimsel, 7100, with a carriage road, from Meiringen to the Rhône glacier, and the Great and Little Scheldeggs, 6434 and 6788, from Grindelwald to Meiringen and Lauterbrunnen. The 3 largest glaciers in the Alps are in the B. O., viz. the Great Aletsch, 12 m., the Unteraar, and the Fischer, 10 m.

Bernesque Poetry (*poesia bernesca*), see **BERNI**, FRANCESCO.

Bernhard of Saxe-Weimar, Duke (1604-1639), Protestant general of the Thirty Years War, youngest son of John, 3rd Duke of Saxe-Weimar. At the beginning

of the war he was present at the defeats of Wiesloch, Wimpfen, and Stadtlohn, 1622-3. He joined Christian IV's Dan. army in 1625, and later rose to high rank in the army of Gustavus Adolphus. His leadership in command at Lützen, 1632, after Gustavus's death, and his successful invasions into Germany and Bavaria, made him the most formidable opponent of the Imperialists. In 1633 he captured Regensburg, but was crushingly defeated by Gallas at Nördlingen in 1634. On the entry of France into the war he took service with her, still being general in command of the Protestant forces. His campaign of 1638 was successful with victories at Rheinfelden, Wittenweiber,

company and made her first marked successes as Zanetta in Coppée's *Le Passant*, 1869, and as the queen in Hugo's *Ruy Blas*. Returning to the Comédie Française after the Franco-Prussian war, great performances in the title role of Racine's *Phèdre*, 1874, the test part of Fr. tragedy, and as Doña Sol in Hugo's *Hernani*, 1877, proclaimed her as the successor to Rachel's vacant place on the Fr. stage. She made her first appearance in London with the Comédie Française at the Gaiety Theatre in 1879. In 1880 she broke with the Comédie Française on the production of Augier's *Les Avenuriers* and had to pay heavy damages. She began her triumphal tours of the world,

Swiss Federal Railways

INTERLAKEN AND THE JUNGFRAU (13,699 ft) FROM THE NORTH

and Thaur, and the capture of one of the strongest fortresses in Europe, Breisach.

Bernhardi, Friedrich von (1849-1930), Ger. soldier and author, b. St Petersburg (Leningrad), where his father was at the Ger. embassy. He entered the army in 1869, and fought in the Franco-Ger. war; later became military attaché at Bern, and was appointed a general of cavalry in 1908. He retired in 1909, and wrote *Germany and the Next War*, 1912, a complete and undisguised exposition of Pan-Germanism and the Ger. ideal of *Weltmacht*. B. may be regarded as a disciple of Nietzsche and Troitschke, but went far beyond them in his frank proposal of the ruthless means for attaining the end of immediate Ger. world dominion.

Bernhardt, Sarah (1845-1923), Fr. actress, b. Paris, 23 Oct., of a Jewish family named Bernard, the 11th of 14 children. She was baptised with the name of Rosine and was brought up in a convent school at Versailles. After gaining prizes for tragedy and comedy at the Conservatoire she appeared in a small part in Racine's *Iphigénie* at the Comédie Française in 1862; in 1867 she joined the Odéon

appearing principally in Scribe's *Adrienne Lecouvreur*, Luras *fil's Dame aux camélias*, and Meilhac and Halévy's *Frou-Frou*. Sardou's plays *Fédora*, *Théodora*, *La Tosca*, and *Cléopâtre* were specially written round her emotional and magnetic personality. These, with Richépin's *Nana*, *Sahib* and Barbier's *Jeanne d'Arc*, were her chief successes during her occupancy of the Porte St Martin theatre (1883-90). During these years, and from 1891 to 1893, she visited not only the chief tns of Europe and the U.S.A., but also Australia and S. America. She moved to the Renaissance Theatre in 1893 with Jules Lemaitre's *Les Rois*, where she also played in Sardou's *Gismonda*, 1894. In the first of Rostand's poetic dramas, *La Princesse lointaine*, 1895, she created the part of Méliande, to be followed by Photine in the same author's religious drama, *La Samaritaine*, 1897. Her appearance in *Magda*, 1895, a Fr. trans. of Sudermann's *Heimat*, marked a new departure, to be followed (1899) by her impersonation of Hamlet, a doubtful though daring experiment. She repeated the impersonation of male character as the hapless

Duke of Reichstadt in Rostand's *L'Aiglon* in 1900 at the Théâtre Sarah Bernhardt. Gifted with a wonderful voice, which could range over every note of human passion, and with a vivid personality, the 'divine Sarah' represented at its highest the emotional as distinct from the intellectual type of actress. To compare her playing with that of Eleonora Duse in such parts as *Magda* or the *Dame aux Camélias* is to realise the creative powers of two actresses of distinct schools of art. She married, in 1882, a member of her company, M. Jacques Damala, a Greek, from whom she separated in the following year. There was one son, Maurice B. As a result of an accident, her right leg—including the thigh—was amputated in Paris, 22 Feb. 1915. Nevertheless she continued to act, and toured in America, 1917. In London, April 1921, she played a man's part in Verneuil's *Daniel*. In 1913 she had received the Cross of the Legion of Honour; she became officer in 1921. Her life has been written by Jules Huret, 1889, Sir G. Arthur, 1923, and M. Baring, 1933. See also her autobiography, *Ma double vie*, 1907 (Eng. trans. 1908).

Bernhardy, Gottfried (1800–75), Ger. philologist, b. Landsberg, Brandenburg; was prof. at Berlin Univ., 1825–9, and afterwards prof. in Halle Univ. and director of the Philological Seminary. His works include *Grundriss der römischen Literatur*, 1830, *Grundriss der griechischen Literatur*, 1836–45, and an ed. of *Suidas* (4 vols.), 1834–53.

Berni, Francesco (1497–1535), It. comic poet. His popularity is evidenced by the fact that since his time burlesque poetry is referred to as *poesia bernesca*. Having held a secretaryship at Rome, he gladly renounced what was to him a drudgery for a canonry in the cathedral of Florence. His fame rests largely on his complete revision of Bolardo's *Orlando Innamorato*, which was the basis of Ariosto's masterpiece, *Orlando Furioso*. His witty, graceful verse forms a pleasant contrast to the unpolished lines of Bolardo.

Bernicia, A.-S. kingdom, from the Tyne to the Forth; the first king was Ida, 547–559, and his cap. Bamburgh. In 605 Ethelfrith united the S. independent kingdom of Deira with B. as one kingdom, Northumbria. The see of the bishopric of B. was at Lindisfarne and later at Hexham. See NORTHUMBRIA.

Bernicle, see BARNACLE.

Bernier, François (1620–88), Fr. traveller, b. Angers in Anjou; took the degree of doctor at Montpellier; he set out on his travels in Palestine and Egypt; left Egypt and went to India, and was physician for 8 years to the Mogul Emperor Aurangzebe. He wrote on his return to France a *History of the Empire of the Great Mogul*, which appeared in 1670, and a continuation of this the next year; they were reprinted under the title of *The Travels of François Bernier*, and have been trans. into all European languages.

Berdina, name of a mt. Piz B., 13,304 ft., and of a pass, 7645 ft., in the Rhaetian

Alps, canton of Grisons, Switzerland. The pass, over which there is a carriage road and a railway line, leads from Pontresina, Upper Engadine, to Tirano in the valley of the Adda, Italy. The B. Alps form a group lying between the Maloja and the Reschen Scheideck passes. The Piz B. was first climbed in 1850. The longest cable railway in Switzerland, covering 2½ m. from B. Häuser on the pass (6720 ft.) to Diavolezza (9770 ft.), was opened in 1957.

Anderson

BERNINI'S 'APOLLO AND DAPHNE'

Bernini, Giovanni Lorenzo (1598–1680), It. architect and sculptor, was, with Borromini (q.v.), the leading exponent of the Baroque style in Rome. As a boy, his skill as a carver had attracted the notice of a cardinal, who introduced him to the papal court; and throughout the remainder of his long life he worked for popes and cardinals in transforming Rome. His chief buildings in Rome were the completion of St Peter's, including the baldacchino over the high altar, and the magnificent colonnaded piazza, 1629–1667; the church of S. Andrea al Quirinale, 1678; and sev. beautiful fountains. Famous among his somewhat theatrical but marvellously competent sculptures,

are the 'Apollo and Daphne' in the Borghese Gallery, and the 'Ecstasy of S. Teresa' in the church of S. Maria della Vittoria, both in Rome. See biographies by M. Raymond, Paris, 1911, and R. Wittkower, 1955.

Bernoulli, or **Bernoulli**, name of a family of mathematicians and scientists. Originally residents of Antwerp, they were driven by the persecution of the Spaniards to find refuge first in Frankfurt, and afterwards in Basel:

Jacques, or **Jacob** (usually called **James** by Eng. writers) **Bernoulli** (1654-1705), *b. Basel*, was esteemed in his own day as a versifier in Latin, German, and French. He taught himself the elements of geometry against his father's wishes, and from 1676 to 1682 travelled in France, England, and Holland. In 1687 he was appointed to the chair of mathematics at Basel, where he remained until his death. He solved Leibnitz's problem of the isochronous curve, and determined the curve formed by a chain hanging between two supports and the curve formed by an elastic rod supported at one extremity and bent by a weight at the other. His *Ars Conjectandi*, dealing with the theory of probabilities, was pub. in 1713.

Jean Bernoulli (1667-1748), *b. Basel*, was aided by his brother **Jacques** in his early mathematical studies, but has achieved a higher reputation as an independent discoverer. He became prof. of mathematics at Groningen, and after holding the position for 10 years, succeeded his brother in 1705 in the chair of mathematics at Basel. His works are numerous and important, and amongst his discoveries was that of the exponential calculus. Three of his sons achieved distinction in mathematics.

Nicholas Bernoulli (1695-1726), son of the preceding, *b. Groningen*, was appointed prof. of mathematics at St Petersburg, but was drowned after holding the office for about 8 months.

Daniel Bernoulli (1700-82), brother of the preceding, *b. Basel*, studied medicine as well as mathematics, and in 1725 was appointed prof. of mathematics at St Petersburg. In 1733, disturbed by the state of his health, he returned to Basel and occupied the chair of anatomy and botany. His work was concerned mainly with the problems of hydro-dynamics and the theory of probability in relation to the practical issues of life.

Jean Bernoulli (1710-90), third son of Jean B., *b. Basel*, studied in France, and became prof. of eloquence in Basel. He succeeded his father in the chair of mathematics in 1748. On three occasions he received the prize of the Academy of Sciences at Paris, his subject being the capstan, the propagation of light, and the magnet.

Jean Bernoulli (1744-1807), son of the preceding, *b. Basel*, became astronomer royal at Berlin at the age of 19, and subsequently held the office of director of mathematical studies at the academy of Berlin.

Jacques Bernoulli (1759-89), brother of the preceding, *b. Basel*, studied law, but

could not be restrained from his natural enthusiasm for geometry and also experimental physics. After acting as a substitute for his uncle **Daniel** at the univ. of Basel for some time, he became prof. of mathematics at St Petersburg in 1788, and was accidentally drowned the following year while bathing in the Neva.

Bernoullian Numbers, series of numbers used in the expansion of a large number of functions; named after **Jacques Bernoulli** (q.v.). They can be obtained by making use of the expansion of the function

$$\frac{x}{e^x - 1} = 1 - x/2 + B_1 x^2/2! - B_2 x^4/4! + B_3 x^6/6!$$

... in which $B_1 = 1/6$, $B_2 = 1/30$, $B_3 = 1/42$, $B_4 = 1/30$, $B_5 = 5/66$, $B_6 = 691/2730$, etc. As an example of their use, $\tan^{-1} x = B_1 x(2^2 - 1) + B_2 x^3(2^4 - 1)/3.4 + x \cot x = 1 - 2^2 B_1 x^2/2! - 2^4 B_2 x^4/4! - 2^6 B_3 x^6/6! - \dots$ The sum S_n of the same power r of the natural numbers from 1 to n can be expressed as follows: $S_n = n^{r+1}/(r+1) + n^r/2 + B_1 n^{r-1}/2! - B_r r(1) (r-2)n^{r-3}/4! + B_r r(r-1)(r-2)(r-3)(r-4)n^{r-5}/6! + \dots$

They appear in many other series.

Bernstein, **Eduard** (1850-1932), Ger. socialist and writer. *b. Berlin*, son of an engine-driver. He became a journalist, and on account of his political views was obliged to leave Germany in 1878; he then went to Switzerland, and with **Bebel** conducted the *Sozialdemokrat* at Zürich, 1881-90—moving to London in 1888, and living there until his return to Germany in 1901. He then became editor of the *Dokumente des Sozialismus* and *Welt am Montag*. He was a member of the Reichstag, 1902-6, 1912-18, and 1920-8. His works were critical of the doctrines of Marx, and he advocated socialist co-operation with other political parties.

Bernstein, **Henry** (1876-1953), Fr. dramatist, *b. Paris*, of Jewish extraction. Was educ. at Cambridge Univ. for 2 years, but took no degree. From the outset B. opposed Socialism; this and his bitter feeling towards the anti-Semites are apparent in his plays, mainly dependent on outer effects. The best of the earlier plays are *Le Délour*, 1902; *La Rafale*, 1906; *Israël*, on an anti-Semitic theme, 1906; *Le Voleur*, the theme being a husband's discovery of his wife's theft, 1907; and *Samson*, 1909. In 1911 B. fought a bloodless duel with **Francis Chevasson**, dramatic critic of the *Figaro*, and there was further trouble on the production of his *Après Moi* at the Comédie Française in the same year. One of his greatest triumphs was *Le Secret*, 1913, and *Judith*, 1922, on the theme of the biblical story. Other plays are *L'Assaut* (Eng. trans., 1912), *The Attack*, produced in 1924), *Félicie*, 1926, and *Mélo*, 1929. See L. le Sidaner, *Henry Bernstein*, 1931.

Bernstein, **Herman** (1876-1935), Amer. writer and diplomat, *b. Russia*, of Jewish parentage. He came to the U.S.A. with his parents in 1893, and finished his education in New York City. He acted as correspondent for the *New York Herald* with the Amer. Expeditionary Force in Siberia. *The Willy-Nicky Correspondence*, pub. in 1918, was sensational

in revealing the secret telegrams exchanged between the ex-Kaiser Wilhelm II and Tsar Nicholas. In 1928 he pub. a biography of Herbert Hoover, who in the same year was elected President.

Bernstorff, Andreas Peter, Count von (1735-97). Dan. statesman, b. Hanover, the nephew of Johann B. As minister of foreign affairs in 1773, he brought about the 'armed neutrality' compact with Russia, and adopted an anti-Swedish policy. His understanding with Great Britain as to the term 'contraband of war' displeased Russia and he was obliged to resign office in 1781. However, he was returned to power in 1784, and during the Fr. wars maintained a neutral policy.

Bernstorff, Christian Günther, Count von (1769-1835). Dan. diplomat, the son of Andreas Peter B., b. Copenhagen, d. in Berlin. He became minister of foreign affairs, 1793-1810, and Dan. plenipotentiary at the Congress of Vienna, 1814. He entered the Prussian service in 1818, and was minister of foreign affairs from 1818 to 1831.

Bernstorff, Johann Hartwig Ernst, Count von (1712-72). Dan. statesman, of an ancient Ger. family, b. Hanover. He entered the Dan. service in 1732; was educ. by his grandfather, minister of George I. Having been for 6 years ambas. at Paris, for 21 years following he controlled the foreign policy of Denmark (1751-72), his adopted country. The settlement of the disputes between Russia and Denmark on the question of Holstein-Gottorp was not the least of his achievements. By the treaty of 1765, Catherine II renounced all pretensions to Holstein.

Bernstorff, Johann Heinrich Andreas Hermann Albrecht, Count von (1862-1939). Ger. diplomat, b. London, his father being the Prussian minister afterwards Ger. ambas. He was educ. at Ratzeburg (Lauenburg). In 1889 he entered the diplomatic service, and was secretary to the embassy in London, 1902-6. Then he was consul-general in Egypt until, in 1908, he was sent as ambas. to Washington. He remained in America until the U.S.A. declared war in April 1917. For the next 3 years he was Ger. ambas. to Turkey. In 1921 he entered the Reichstag as a Liberal, and also became president of the League of Nations Union in Germany. In 1926 he headed the Ger. delegation to the League of Nations Preparatory Commission on Disarmament. When Hitler came to power in 1933, he went into self-imposed exile in Switzerland, and d. in Geneva. His book *Deutschland und Amerika: Erinnerungen aus dem fünfjährigen Kriege*—trans. as *My Three Years in America*—was pub. in 1926.

Beroe, marine organism belonging to the coelenterate order of Ctenophora. It differs from the other genera of Ctenophora in having no tentacles of any kind, and in having a capacious stomodaeum resembling the cavity of a thimble. It is conical or oval in shape, and there is a coelenteric network all over the body,

formed by anastomoses of the meridians and paragastric canals. It is transparent and gelatinous, and shines at night with phosphoric radiance, produced by the 8 bands of fused cilia, by means of which it moves.

Beroea: 1. Anct. name of Veria, or Kara-Feria, tn of Macedonia, Greece, 35 m. SW. of Salonika. It was besieged by the Athenians in 432 BC, occupied by the Romans in 168 BC, and captured by the Turks in AD 1375. St Paul preached there in AD 54.

2. Anct. name of Aleppo (q.v.), cap. of a vilayet of the same name in N. Syria, on R. Kuweik, 70 m. E. of the Mediterranean. The name of B. was given it by Seleucus Nicator, and it is mentioned as Helbon (i.e. Aleppo) in Ezek. xxvii. 18.

Berossus, Babylonian priest, fl. c. 260 BC. Josephus has preserved some fragments of his Babylonian-Chaldaean hist., which he wrote in Greek. They are considered trustworthy because he had access to native documents stored in the temple of Bel at Babylon.

Berosus, genus of coleopterous insects of the family Hydrophilidae. The species inhabit ponds, in which they swim in an inverted position, and they probably feed on vegetable substance. They are nearly oval in shape, and of a dusky yellow hue.

Beroun (Ger. Beraun), Czechoslovak tn in the region of Prague (q.v.), on the Berounka. It has textile, asbestos, and cement manufs., and there are coal and iron mines near by. Pop. 12,400.

Berre, Étang de, salt-water lagoon in France, in the dept of Bouches-du-Rhône, W. of Marseille (q.v.). It is joined to the Mediterranean by the Martigues canal and the Rove tunnel, and has on its banks oil-refineries, oel-fisheries, and salt works. Area 60 sq. m.

Berri, or Berry, Charles Ferdinand, Duc de (1778-1820), b. Versailles, a younger son of the Comte d'Artois, afterwards Charles X. of France. At the revolution he escaped with his father to Italy, fought under Condé (1792-7), and came to England in 1801, where he married a Miss Anna Brown; this marriage was annulled for political reasons in 1814, and in 1816 he married Caroline Ferdinande Louise (1798-1870), daughter of Francis I. of Naples, by whom he had a daughter, later Duchess of Parma, b. in 1819, and a son, Henri, Duc de Bordeaux, better known as the Comte de Chambord (q.v.), b. posthumously, 1820, after his father had been assassinated at the Paris opera house, 13 Feb. of that year.

'Borrow's Worcester Journal', Britain's oldest surviving newspaper (if the specialised *London Gazette* (q.v.) is excepted), founded 1690, and undergoing various changes of title up to 1753 when it was estab. as *B. W. J.* In its early years it pub. only news of war and high politics, and it was a long time before any appreciable space was given to local affairs. H. Borrow acquired the paper in 1748, and his name was finally added to the title. Earlier files of the paper show that it sold not only news and

advertising space, but books and stationery, and even 'elixir for dropsy, powder for the gout, Hypo drops,' and other remedies which the printer kept in his cupboard. After the death in 1894 of Charles Henry Birckbeck, one of its most noted proprietors, a number of local Conservatives formed a private company and purchased it. It is now independent and is owned by Berrow's Newspapers Ltd as one of a group of W. Midlands newspapers. Its chief competitor, the *Worcestershire Advertiser* (founded 1861) has been absorbed in it.

Berruguete, Alonzo (1480-1561), Sp. painter, sculptor, and architect, son of a painter, Pedro B. (q.v.), studied under Michelangelo. Charles V appointed him court painter and sculptor. B. completed the royal palace at Granada, and designed the town hall at Seville and the palace of the Archbishop of Toledo at Alcalá. His finest piece of sculpture is 'The Transfiguration' in the Toledo Cathedral.

Berruguete, Pedro (d. 1503), Sp. painter who lived towards the end of the 15th cent. Most of his paintings were hung in the museum at Madrid. The frescoes in the cathedral at Toledo are thought to be the joint work of B. and another artist. Other works attributed to him are the 'Miracles of the Life of St Peter,' 'St Thomas Aquinas,' and 'St Dominic' (at Avila), and 'Christ in the Garden' and 'The Resurrection' (at Madrid).

Berry, Sir Edward (1768-1831), Eng. naval officer. In 1796 he first came under the notice of Capt. Nelson, and for his services at the siege of Porto Ferrajo B. received promotion to the rank of commander. He distinguished himself for his daring at the battle of Cape St Vincent. B. was captain of Nelson's flagship at the battle of the Nile, of which he later wrote a narrative. B. carried Nelson's dispatches home on the *Leander*, when he was taken prisoner by the French. He also took part in the battle of Trafalgar, 1805. He was knighted 1798; K.C.B., 1815; rear-admiral, 1821.

Berry, James (d. 1855), soldier and parliamentarian, b. Salop. He enlisted under Cromwell, and fought at the battle of Gainsborough, 1643. In 1647, B. was elected president of the council of adjutors in the disputes between Parliament and the Army. In 1655 he was made major-general of Hereford, Salop, and Wales. He sat in Parliament as member for Worcs in 1657, and was made a member of the council of state in 1659. On the Restoration, he was imprisoned in Scarborough Castle.

Berry, Sir John (1635-90), admiral, b. Devonshire. He first went to sea in the merchant service, his first naval appointment being in 1663, when he served as boatswain of the *Swallow* in the W. Indies. In 1667 he commanded a squadron against the combined forces of French and Dutch near St Nevis and St Kitts. In 1672 he distinguished himself at the battle of Sole Bay, and was knighted for his services. His death, at Portsmouth, has been attributed to poisoning.

Consult J. Campbell, *Lives of the British Admirals and Eminent Seamen*, 1779.

Berry, John Bennington (1851-1928), Amer. railway engineer, b. Paterson, New Jersey; educ. at the Polytechnic Institute at Brooklyn. He entered the railway service in 1874, and served successively, as assistant or chief engineer, the Chicago and NW., the Union Pacific, and the Chicago, Rock Island, and Pacific railways. Set up as railway consultant in Chicago in 1914 and wrote authoritatively on railway gradients.

Berry, Mary (1763-1852), authoress, b. Kirkbridge, Yorks. In 1788 she and her younger sister Anne made the acquaintance of Horace Walpole, who held them in great affection, and left them in his will £4000 each and some property at Little Strawberry Hill. Mary B. collected and ed. the *Works of Horace Walpole*, 1798, and also pub. *England and France: a Comparative View of the Social Condition of both Countries*, 1844. See her *Journals and Correspondence* (2nd ed.), 1866, and *The Berry Papers*, ed. L. Melville, 1914.

Berry, William Ewart, see CAMROSE.

Berry, ant. prov. of central France, now the depts of Indre and Cher, and parts of Creuse, Nièvre, and Allier. It came to the crown in 1100, and became a duchy in 1360. Its cap. was Bourges (q.v.).

Berry, name of a baccate or fleshy fruit, which differs from the drupe (e.g. cherry) in having no hard part but the seeds; while the drupe has a strong endocarp. All these fruits are soft and succulent, and have their seeds embedded in the pulp. Many so-called berries have no right to the name, e.g. the holly-berry, which is a drupe; the strawberry, a pseudocarp formed from an eterio of achenes on a fleshy thalamus; while raspberries and blackberries are staerios of drupes. True berries are the gooseberry, tomato, currant, bilberry, and grape, while the orange, melon, and cucumber come under this head, and the banana, in which over-cultivation has destroyed the seeds.

Berryer, Antoine Pierre (1790-1868), Fr. barrister and politician, b. Paris. After the Restoration he defended Ney before the chamber of peers, and successfully defended a number of other Napoleonic generals. Other political trials in which he appeared for the defence were those of Lamennais, 1826, Chateaubriand, 1833, and Montalembert, 1858. Elected to Parliament before the revolution in 1830, he remained the only legitimist deputy till 1851; though a Liberal, he never ceased to advocate the restoration of the Bourbons. He was elected to the Academy in 1854.

Bersaglieri, i.e. sharpshooters, a *corps d'élite* of infantry (riflemen) in the It. army. They were raised in 1836 for the Sardinian-Piedmontese army under King Charles Albert on the suggestion of Capt. Alessandro La Marmora of the Granatieri-Guardia (Grenadier Guards), who was the original commander. They were trained in scouting, rapid marching, and shooting ('bersaglio' = target). Originally consisting

of two companies, the B. before 1914 comprised 12 regiments, and, during the First World War, were expanded to 21 regiments. Their uniform is a dark blue with a red stripe and facings, but their chief distinguishing mark is the wide black slouch hat with heavy drooping plumes of cocks' feathers. They have a distinguished record and are regarded with pride in Italy. They have participated in all It. campaigns. During the Crimean war 5 battalions served with the Allies, but their creator and leading spirit, La Marmora (then a general), d. of cholera. During the First World War their 3rd Regiment was awarded the Gold Medal for Valour, the highest It. distinction, for service on the Piave. In 1895 a cyclist company was added to the B. as an experiment, the success of which led to a general creation of cyclist companies in the army. In 1940 the It. army was reorganised, and provision made to include 12 regiments of B. in the Infantry.

Berseem, or **Bersim** (*Trifolium alexandrinum*), Egyptian name of a species of white clover which thrives well on salt land newly reclaimed from the sea. In the Nile Delta it is grown as fodder for animals, and its cultivation prepares the land for subsequent crops.

Berserker (from the 'sark,' or shirt, of the bear, or the skins of other animals), name given to the 12 sons of the Norse hero, Berserk, by the daughter of King Swafurlam, whom he had killed in battle. Berserk was the grandson of fair Alfhilde and the eight-handed Starkadder. His sons inherited his martial fury, the berserker rage, as well as his courage. They terrified their enemies and were thought to be possessed of an evil spirit. One legend says that they perished all in one combat.

Bersim, see **BERSEEM**.

Berstadt, Ger. tn in Hessen (q.v.), 37 m. N.E. of Wiesbaden (q.v.). Pop. 5000.

Bert, Paul (1833-86), Fr. physiologist and politician, b. Auxerre; first studied engineering, but then under the influence of L. P. Gratiot became a pupil of the great physiologist Claude Bernard. He was prof. of physiology at Bordeaux and the Sorbonne, Paris. His prin. scientific researches and experiments were on the effects of air-pressure (*La Pression barométrique*, 1878, Eng. trans., 1943), of value in the study of caisson disease; on anaesthetics and respiration, and on the effect of light on plant growth. In 1876 he became a deputy, entering politics as a violent anti-clerical; he was minister of education, 1882, in Gambetta's ministry; in 1886 he was appointed resident to Indo-China, and d. there at the end of the same year. Life by H. Depasse, 1883.

Bertani, Agostino (1812-86), It. revolutionary, b. Milan. He practised medicine in Lombardy till the outbreak of the revolution of 1848, in which he was implicated. He organised the ambulance service during the Rom. rep., 1849, and, with Sir James Hudson, worked in Naples for the liberation of political prisoners. Later, he joined Garibaldi's force as a surgeon, and organised 4 Sicilian volunteer

expeditions. When Garibaldi went to Naples B. became his secretary-general. He later had a distinguished parl. career, being a fervent advocate of social reform.

Bertha, name of sev. reigning princesses of the early Middle Ages: 1. Daughter of the Frankish Christian King, Haribert or Charibert, married Ethelbert (560-616), King of Kent. She brought to England her confessor, and was allowed by the king to practise her religion at her oratory, St Martin's, Canterbury, and thus paved the way for the success of Augustine's mission.

2. Mother of Charlemagne, called Bertrada or Bertha Greatfoot. She was the daughter of Charibert, Count of Laon, and married Pepin before 742. Round her have grown many legends set forth in Adenès's 13th-cent. romance *Berte aus grans piés*. Charlemagne married Bertha (or Desiderata), daughter of the Lombard King Desiderius.

3. Daughter of Burkhardt of Thurgau, and wife of Rudolf II, King of Burgundy (912-37). Her deeds of charity and piety gained her the name of the Good.

Bertha, Big, nickname given to the specially prepared long-range Ger. naval gun (or guns) which fired on Paris from the neighbourhood of Coucy, a distance of 75 m., during the First World War. The name was in allusion to the fact that Frau Bertha von Böhlen was one of the proprietors of Krupp's (q.v.), which firm made the gun. Twenty-one shells, of over 200 lb. each, were fired on 23 Mar. 1918, the first day on which the gun was used against Paris, and thereafter there was intermittent fire for sev. months. Fatal casualties caused are variously given at between 100 and 200 for the whole period of firing.

Berthelot, Marcellin Pierre Eugène (1827-1907), Fr. chemist and politician, b. Paris in Oct.; the son of a doctor. He was appointed a member of the staff of the Collège de France in 1851, at which time his long intimacy with Renan began. His paper *Sur les combinaisons de la glycérine avec les acides* made him famous in 1854, and in 1865 he accepted a chair of organic chem. in the Collège de France, an appointment which had been specially created for him. He succeeded Pasteur as permanent secretary to the Academy of Sciences in 1889. In 1895 he was minister of public instruction during the Goblet ministry. His works include many papers and books, among them, *Chimie organique fondée sur la synthèse*, 1860, *Les Carbures d'hydrogène*, 1901, *Science et philosophie*, 1886, and *Science et morale*, 1897.

Berthelot, Philippe Joseph Louis (1866-1934), Fr. diplomat, b. Sèvres; educ. at Lycées Saint Louis and Henri IV. He entered the diplomatic service in 1889, and in 1920 was appointed secretary-general to the Ministry of Foreign Affairs, with rank of ambas. In 1922, as a result of inquiry into the affairs of the Industrial Bank of China, B. was suspended for 10 years. Under the premiership of Herriot in 1925 he was 'amnestied' and re-appointed secretary-general, and he was

instrumental in the creation of the Little Entente.

Berthier, Pierre Alexandre (1753-1815), Fr. general; proclaimed the rep. in Rome in 1798. As chief of the staff he accompanied Napoleon to Egypt, and also in the campaigns of 1812-14. On Louis XVIII's accession he surrendered Neuchâtel, of which he had been created prince in 1806, and submitted to the king. When Napoleon returned from Elba he committed suicide.

Berthierite, dark steel-grey mineral, composed of sulphides of iron and antimony. It occurs in elongated prisms, has a hardness of 2 to 3 and a sp. gr. of 4 to 4.3. B. is found in Auvergne and the Vosges, in Saxony, in Cornwall, and in Lower California. It receives its name from the Fr. chemist, Pierre Berthier (1782-1861).

Berthold von Regensburg (1220-72), Ger. Franciscan preacher, b. Regensburg; educ. in the Franciscan monastery there under David of Augsburg. His teaching was mainly directed against luxury, the abuses of so-called chivalry, and the vices of the clergy. His *Sermons* have been ed. by Pfeiffer and Strebl (2 vols.), 1862-80, and by Göbel (trans. into modern German, 1873). See his life by J. Paul, 1896, and Unkel, 1882.

Berthollet, Claude Louis (1748-1822), Fr. chemist, b. Talloire, in Savoy. He graduated in medicine at Turin, settled in Paris in 1772, and was elected a member of the Academy of Sciences in 1780. Five years later he declared himself a convert to the new theories of combustion propounded by Lavoisier, although previously he had pub. papers in support of the old. He helped Lavoisier to reform chemical nomenclature, and was the first to advocate the use of chlorine as a bleaching agent. As he regarded chlorine as oxygenated muriatic acid, he could not appreciate the nature of the chlorates which he discovered. He also devoted serious attention to the process of smelting and converting iron into steel. Napoleon was his generous patron.

Bertholletia, genus of Lecythidaceae growing in tropical S. America, and having only 2 species of tall trees; *B. excelsa*, yielding the Brazil nuts of commerce; and *B. nobilis*, the source of Para nuts.

Berthon, Edward Lyon (1813-99), inventor, b. London. He studied surgery at Liverpool and Dublin, and lived for some years (1834-40) abroad, where he experimented on screws for propelling ships. His model of a screw propeller was, however, rejected by the Admiralty, though afterwards adopted. In 1841 he went to Cambridge, and took holy orders in 1845. His other mechanical inventions were 'Berthon's log' for measuring the speed of ships, an instrument for discovering the trim of a boat, and collapsible boats, which were first ordered by the Admiralty in 1873. He wrote his reminiscences under the title *Retrospect of Eight Decades*, 1899.

Bertie, Peregrine, Lord Willoughby de Eresby (1565-1601), Eng. soldier, son of Richard and Catherine B., Baroness Willoughby de Eresby. He was b. at

Lower Wesel, Cleves, at the time of the Marian persecution in England. His family returned to England in 1559, when a patent of naturalisation was obtained for him. He married a daughter of John de Vere, Earl of Oxford, and in 1580 succeeded to his mother's title. In 1586 he was made governor of Bergen-op-Zoom, in succession to Sir Philip Sidney. Later, he succeeded the Earl of Leicester as commander of the Eng. forces in the Low Countries. Subsequently he was placed at the head of an army which went to the help of Henry of Navarre at Dieppe, 1589, and was present at the capture of Vendôme, Mons, Alençon, and Falaise.

Bertie, Robert, 1st Earl of Lindsay (1582-1642), admiral, eldest son of Peregrine B. (q.v.), and godson of Queen Elizabeth I. He joined the Sp. expedition of the Earls of Essex and Nottingham, and was knighted in the marketplace of Cadiz, on its capture, 1597. In 1628, after the assassination of Buckingham, he was appointed admiral of the fleet, and headed an expedition (which failed) for the relief of La Rochelle. He became Lord High Admiral in 1636. He supported Charles I during the Civil war, and d. from wounds received at Edgehill. He drained and reclaimed parts of the Lincs. fens.

Bertie, Willoughby, 4th Earl of Abingdon (1740-99), statesman, educ. at Westminster School and at Magdalen College, Oxford. He was a supporter of Wilkes. B. succeeded to the earldom in 1760, and frequently spoke in the House of Lords. He pub. numerous pamphlets, which include *A Letter to Lady Loughborough*, 1798, which is a eulogy of the Fr. Revolution.

Bertillon System. Name given to a system of anthropometry invented by Alphonse Bertillon (1853-1914). It consists of measurement of certain parts of the human body, which he found by research to be practically unchanging after full growth. By these it is claimed that it is possible so to classify any individual as to be able to identify him without fail for the rest of his life. For police purposes this was invaluable, and Bertillon's system was adopted in many countries. The essential measurements included (1) length of head, (2) breadth of ditto, (3) length of middle finger, (4) of left foot, (5) of forearm from elbow to tip of middle finger. Each of these measurements was classified as small, medium, or large, and height, length of little finger, and colour of eyes were also observed. The measurements, however, had to be so extremely accurate, and required such carefully trained observers, that the process of 'Bertillonising' was slow and expensive. As the slightest mistake in one respect might vitiate a whole record, it was necessary to take the mean of at least three measurements. The development of identification by fingerprints (q.v.) led to the latter's replacing the B. S. as the main accepted system of identifying criminals.

Bertin, Louis François (1766-1841), the

'father of Fr. journalism,' b. Paris. He wrote for the *Journal Français* during the Fr. Revolution. He founded the *Journal des Débats* after the 18th Brumaire. In 1801 he was banished for suspected royalist tendencies. Three years later he returned, taking up the management of the paper. Meanwhile Napoleon had altered the title to *Journal de l'Empire*. Gov. censorship and control followed. B. regained possession in 1814, still supporting the royalist cause till his death in 1841.

Bertinoro, It. tn. in Emilia-Romagna (q.v.), 8 m. SE. of Forlì (q.v.). It is a spa, and has a trade in oil and wine. Pop. 9100.

Bertran de Born, Viscount of Hautefort (c. 1170-1200), Provençal troubadour, b. of noble family, near Limoges. He became a vassal of England by the marriage of Eleanor to Henry II of England, and was patronised by Henry Curtmantle, son of Henry II. Dante has placed him (*Inferno*, canto xxviii) among the sowers of discord in hell, where he appears carrying his severed head before him; this referring to the way in which he fostered and took advantage of the ill-feeling existing between the 3 sons of the king. During 1182-3 he joined with the barons of Limoges, Poitou, and Périgord in their revolt against Richard I of England. About 1196 he entered a Cistercian monastery at Dalon, where he d. His poems, of which 45 are still extant, deal with 'arms and men,' and are either in praise of his patrons or depreciation of his enemies. The style is vigorous and bitter, but his love-poems and two *planhs* on the death of Prince Henry, are tender and sincere. They have been ed. by Stimming (1879), Thomas (1888), and C. Appel (1932). See C. Appel, *Bertram von Born*, 1931.

Bertrand, Henri Gratien, Count (1773-1844), Fr. general. He entered the army at the outbreak of the Fr. Revolution. He was made a colonel by Napoleon during the Egyptian expedition, and was afterwards his aide-de-camp at Austerlitz. Napoleon appointed him grand marshal of the court in 1813. In 1814 he accompanied Napoleon to Elba, and returned after Waterloo to St Helena with him. After Napoleon's death he was elected deputy in 1830 in the reign of Louis XVIII, and later brought the remains of Napoleon to France. Hed. at Châteauroux.

Bertrand, Jacques Louis Napoleon (1807-41), Fr. poet, also known as Aloysius, b. Ceva, Piedmont. He spent most of his life in Dijon. His style, both in prose and verse, is marked by purity and rhythm; indeed, the love of language was almost an article of faith with him. His poetry was little in output but excellent in quality. When the Revolution of July broke out, he served it with enthusiasm, contributing to the Dijon pub., *Le Patriote de la Côte d'Or*. He created the form of the prose poem. His most notable work, *Gaspard de la nuit*, was pub. at Angers, posthumously, by his friends, the title being theirs. The best in the collection are *La Barbe pointue* and

Madame de Montbazou. See C. Spritsma, *Aloysius Bertrand*, 1926.

Bertrand, Joseph Louis François (1822-1900), mathematician, b. Paris; educ. at the Polytechnic School. In 1856 he became a member of the Academy of Sciences, in 1874 perpetual secretary of that body, and in 1884 a member of the Fr. Academy. He pub. works on arithmetic, algebra, calculus, thermodynamics, probabilities, and theoretical dynamics.

Bertrand, Louis Marie Emile (1866-1940), Fr. author, b. Spincourt (Meuse). From 1897 until 1900 he was prof. of classics at Aix, Bourg, and Algiers. His first novel, *Le Sang des races*, 1899, was a tale of the Fr. pioneers in Algeria. Other novels which all reveal a great gift of expression, include *Le Rival de don Juan*, 1903, *Mademoiselle de Jessincourt*, 1911, and *L'Infante*, 1920. He has also written: *La Grèce du soleil et des paysages*, 1908; *Le Livre de la Méditerranée*, 1911; *Les Villes d'or*, 1921. In biography: *Saint Augustin*, 1913; *Louis XIV*, 1923; *Sainte Thérèse*, 1927. Later works include: *Carthage*, 1930; *Le Roman de la conquête*, 1931; *Histoire d'Espagne*, 1932.

Beruni, or Al-Beruni (973-1048), Arabian scholar, astronomer, mathematician, and historian. Beside works on mathematics he wrote the *Chronology of Ancient Nations* and, after a visit to India, *India*, the first book by a Muslim which shows an interest in the religion, philosophy, and customs of a non-Muslim people. On his return from India he lived at Ghazni, the cap. of Sultan Mahmud.

Bervie, Charles Clément (1756-1822), Fr. engraver, b. Paris. His full-length engraving of Louis XVI from the portrait by Callet ranks among the finest works of its kind extant.

Bervie, see INVERBERVIE.

Berwick, James Fitz-James, Duke of (1670-1734), soldier, illegitimate son of the Duke of York, afterwards James II, by Arabella Churchill, the sister of the famous general, Marlborough. Educ. in France, on his father's accession he entered the imperial army, serving his apprenticeship as a soldier in Hungary under the Duke of Lorraine. Later he accompanied his father into exile, took part in the battle of the Boyne, and in 1690 was made generalissimo of the Irish forces on the side of James. Later he transferred his services to France. In 1693 he was taken prisoner at the battle of Lindenberg, but was exchanged for the Duke of Ormonde. His attempt in 1696 to stir up an insurrection against William III was a failure. After suppressing the religious revolts in the S. of France, he distinguished himself, during the war of Sp. Succession, by defeating the allied forces under Gen. Stanhope in the battle of Almanza. See lives by Lt.-Col. C. I. Wilson, 1883, and Sir C. Petrie, 1953.

Berwick-upon-Tweed, seaport, municipal bor., and administrative co. of Northumberland, England, situated at the mouth of the R. Tweed on the N. bank. The tn. is connected to the S. bank by 2 bridges. It was one of the first 4 royal bors. of Scotland, and between

1174 and 1406 changed hands between Scots and English 8 times. In 1551 B. was declared a neutral ter. There are ruins of a bell tower which was used to alarm the neighbourhood during border raids. The chief public building is the tn hall (1760). The prin. exports are grain, coal, and fish; among B.'s sea fisheries are those for salmon. The tn has iron works and shipbuilding yards, and small tweed and hosiery mills. A trading estate is being developed by the Corporation. Pop. 12,550.

the Leader, Eden, Leet, and Whiteadder, tribs. of the Tweed. Agriculture is important, and the prin. grain crops are oats and barley, though wheat is also raised. Sheep and cattle are pastured in large numbers. Fishing is the secondary occupation; the chief tns engaged in the fishing industry are Eyemouth, Burnmouth, Coldingham, and Cove. Small quantities of coal, copper-ore, and ironstone are found, and there are large deposits of limestone. Gingham and woollen cloth stuffs are manuf. at

'Sroleman'

FISHERMEN'S COTTAGES AND BOATS AT COVE HARBOUR, BERWICKSHIRE

Berwickshire, co. of Scotland, bounded on the NW. by E. Lothian, on the NE. by the N. Sea, on the SE. by Northumberland, on the S. by Roxburgh, and on the SW. by Midlothian. There are traces of anct Brit. and Rom. settlements in B.; after the Rom. occupation the co. was included in the kingdom of Northumbria, and in 1018 it was finally annexed to Scotland. Fast Castle on the coast N. of St Abbs Head, and Dryburgh Abbey (q.v.) are 2 of the picturesque ruins to be seen in the co. There are 3 natural divs. of B., Lauderdale, the valley of the Leader; Lammermuir, an upland dist. formed by the Lammermuir Hills; and the Merse. The average height of the Lammermuirs is 1000 ft, and Melkie Says Law (1749 ft) is the highest point. The coast of B. is precipitous. St Abbs Head rises to 310 ft and possesses a lighthouse. The riva. of the co. are the Eye, and also

Earlston, while blankets and plaids are produced at Cumledge. Distilling and brewing are other industries. Duns is the co. tn. With E. Lothian, B. returns one member to Parliament. Area 457 sq. m.; pop. 27,000.

Berwyn, city in Illinois, U.S.A., a residential suburb of Chicago with some manufs. Pop. 51,300.

Beryl, mineral consisting of silicates of beryllium and aluminium, represented by the formula $\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{18}$. It crystallises in hexagonal prisms, usually of a greenish colour. The transparent green varieties are known as emerald (q.v.), and those of a bluish-green colour are termed aquamarine (q.v.). Transparent B. is known as precious B., and the opaque varieties are known as common B. B. is widely distributed, being found in Aberdeenshire, the Mourne Mts in Ireland, Siberia, Brazil, Ceylon, and many localities in the U.S.A.

Beryllium, or **Glucinum**, metal of the magnesium group, discovered in the form of oxide in the mineral beryl in 1798. The oxide was first called glucina from the sweet taste of its salts, but was afterwards called beryllia by the Ger. chemists. The metal was first obtained by Wöhler in 1828 by reducing the chloride with potassium, when the metal appears as a dark grey powder. In 1855 Debray prepared it in a compact state by heating B. chloride and metallic sodium in separate receptacles in an atmosphere of hydrogen. The metal thus produced has a sp. gr. of 1.64, is silver-white in colour, melts at a lower temp. than silver, and in the powdered state takes fire when heated in air. B. oxide, or beryllia, is obtained by fusing beryl with twice its weight of potassium carbonate. The molten mass is allowed to cool, and is then treated with sulphuric acid, the excess of acid evaporated off, water added, and the silica filtered out. On cooling, the liquor contains mainly the sulphates of B. and iron. It is poured into a hot and strong solution of ammonium carbonate, allowed to stand for some days, and then filtered. The filtrate contains the B., and on boiling basic B. carbonate is precipitated. The precipitate is redissolved in ammonium carbonate solution and steam blown through the liquid, when the beryllia is precipitated.

Beryllonite, mineral consisting of beryllium sodium phosphate, formula BeNaPO_4 ; discovered in Maine, U.S.A., in the form of ortho-rhombic crystals. It has been used as a gem. It varies from colourless to pale yellow, is vitreous, and transparent.

Berzelius, or **Berzellianite**, silver-white mineral composed of copper selenide (Cu_2Se), occurring at Skrikerum in Sweden and also in the Harz Mts. B., as named by L. A. Necker, is a white translucent mineral found near Albano, and composed of silicates of aluminium, sodium, and calcium.

Berzelite, or **Berzellite**, yellow or yellowish-red mineral occurring as isometric crystals and consisting of orthoarsenate of calcium, magnesium, or manganese. It is found at Långban in Sweden. **Pyrrharsenite**, in which antimony takes the place of part of the arsenic, is lighter in colour and occurs at Örebro in Sweden.

Berzelius, Jöns Jakob (1779-1848), Swedish chemist, b. Värversunda Sörå, Sweden. In 1818 he became perpetual secretary to the Stockholm Academy of Science. His special study was devoted to the significance of atomic and molecular weight, and he pub. a table of results remarkable for their accuracy. He held that the essence of chem. was based upon oxygen. Later he developed an acute interest in electrochemistry. He was the first to adopt the symbol system of alluding to chemical substances. His works include *Lehrbuch der Chemie* and *Jahresbericht*, both works notable for their literary quality besides their scholarship. Of the latter work, which was a yearly record of Stockholm Academy science progress, he issued 27 vols. He

invented many improvements of the blow-pipe and threw much light upon the substances tellurium, selenium, silicon, thorium, titanium.

Berzin, Jan (1881-1938), Latvian Communist. Before 1917 he spent many years in W. Europe and the U.S.A. After 1918 he was chiefly active as a Soviet diplomat (was Minister to Switzerland, Finland, and Austria, worked in the Soviet Embassy in Britain 1921-5). Later he became one of the main organisers of the forced labour camp system in the U.S.S.R., and from 1932 was the head of the Dal'stroy (q.v.) industrial combine and labour camps. B. was shot in the course of the Great Purge. See V. Petrov, *It Happens in Russia*, 1951.

Bēa, popular Egyptian domestic deity, first appearing in the Middle Kingdom in a form suggesting he was originally a cat, destroyer of harmful snakes—the name is connected with African words for 'cat.' He soon became a dwarf dressed in a cat-skin, often with a feather head-dress. Patron of mirth and birth.

Besançon, Fr. city, cap. of the dept of Doubs, on the Doubs. Known to the Romans as Vesontio, it was made a colony by Marcus Aurelius. It has been an archbishopric since the 4th cent. In the Middle Ages it was a free imperial city. It displaced Dôle as cap. of Franche-Comté (q.v.) when that prov. passed to France in 1678. The tn, surrounded by ramparts built by Vauban (q.v.), is in a loop of the riv.; on the open side is a citadel commanding the gap between the Vosges and Jura Mts. It has many splendid old buildings, including a cathedral partly 12th cent. It has a univ. Granvelle, Fourier, Proudhon, Nodier, and Victor Hugo (qq.v.) were b. here. It had a school of watchmaking, and is the prin. Fr. centre of watch manufacturing. Automobiles, paper, artificial silk, and rayon are manuf., and there is brewing. Pop. 73,500.

Besant, Annie, Mrs (née Wood) (1847-1933), socialist and theosophist, b. London. In 1867 she married the Rev. Frank B., vicar of Sibsey, Lincs, but became a free-thinker, and was legally separated from her husband in 1873. In the following year she joined the National Secular Society; she co-ed. with Charles Bradlaugh (q.v.) the *National Reformer*, and took a prominent part in his free thought and radical movement. She joined in various labour movements, became a member of the Fabian Society, and of the London School Board, 1887-90. In 1889 she became a pupil of Mme Blavatsky, and joined the Theosophical Society, of which she was president from 1907. She lectured on theosophy in all parts of the world, and founded at Benares the Central Hindu College, 1898, and the Central Hindu Girls' School, 1904. Later she was associated chiefly with the advocacy of the cause of Indian Nationalism. She pub. her life, under the title *Through Storm to Peace*, 1893. See life by G. M. Williams, 1932.

Besant, Sir Walter (1836-1901), author, b. Portsmouth. He was educ. at King's

College, London, and Christ's College, Cambridge, where he graduated as 18th wrangler. An interest in young and inexperienced authors caused him to found a Society of Authors with the object of protecting the rights of new writers. This was founded in 1884, and Sir Walter filled its chair till 1892. He married in 1895 Mary Foster-Barham of Bridgewater, and shortly afterwards was knighted. Though Sir Walter plunged into many fields of literary art, his greatest success was in writing novels. He collaborated with James Rice (1844-1882) in the production of the first of these works of fiction: *Ready-Money Mortiboy*, 1872, and *The Golden Butterfly*, 1876, are two of the best. The influence of Dickens is apparent, not least in the vigour with which he portrayed social evils. The estab. of the E. End Institute, known as the People's Palace, in the Mile End Road, was one of the direct results of his powerful *All Sorts and Conditions of Men*, 1882, which he wrote alone, James Rice having d. The sweating evil next received his attention, and expression of his indignation was found in *Children of Gibeon*, 1886. Among other novels are *Dorothy Forster*, 1884, *Armored of Lyonesse*, 1890, and *Beyond the Dreams of Avarice*, 1895. Besides fiction, he wrote *The French Humorists*, 1873, *Rabelais*, 1879, and biographies of Whittington, Captain Cook, and Richard Jefferies. His monumental work, *A Survey of London*, on the hist. and archaeology of London, was never completed. See his autobiography, 1902.

Bessant, see ROUNDELS.

Bessler, Hans von, Prussian general (1850-1921). He captured Antwerp in Oct. 1914. In Aug. 1915 he took a distinguished part in the siege of Novogeorgievsk on the E. front, and became Governor-General of Poland until the armistice.

Besler, Rudolf (1878-1942), Brit. playwright, b. Java, of Dutch parentage. Educ. at Elizabeth College, Guernsey, and Heidelberg, he was for sev. years a journalist. His plays include *The Virgin Goddess*, 1906, *Olive Latimer's Husband*, 1909, *Don*, 1909, *Lady Patricia*, 1911, *Kings and Queens*, 1915, *Buzell*, 1916, *Robin's Father* (with Hugh Walpole), 1918, *The Prude's Fall* (with May Edington), 1920, and *The Barretts of Wimpole Street*, 1930. The play last named is about the family of Elizabeth Barrett Browning.

Beskow, Bernhard von, Baron (1796-1868), Swedish poet and dramatist, b. Stockholm. In 1825 he became private secretary to the Crown Prince Oscar. He was director of the Royal Theatre in 1831-2, and in 1834 was elected permanent secretary of the Swedish Academy. His chief works are the poems *Karl XII*, 1819, and *Sveriges Anor*, 1824, and the dramas *Erik XIV*, 1827-8, and *Torkel Knutsson*, 1830. See J. E. Rydqvist, *Bernhard von Beskow*, 1947.

Besnard, Paul Albert (1894-1934), Fr. painter, b. Paris; he entered the studio of Cabanel in 1866, and won the Prix de

Rome in 1874. The impressionist study of light had some effect on his easel pictures but he is mainly known for large-scale mural decorations (École de Pharmacie, Sorbonne, Petit Palais).

Bessarabia, area in SE. Europe, between the R. Dniester and Prut, the Danube delta, and the Black Sea. In antiquity and the Middle Ages it shared the fate of other ters. N. of the Black Sea—recurrent nomadic invasions on one hand, Gk colonies, Rom. rule, Genoese colonies on the other. In 1367 B. was annexed by the newly formed principality of Moldavia which in 1513 was subjugated by Turkey. In 1812 B. was ceded to Russia and became a prov. of Nov Russia (q.v.). By the Paris Treaty of 1856, Russia abandoned S. B. (which was included in Rumania when it was formed in 1859), but regained it by the Berlin Treaty of 1878. After the Bolshevik seizure of power the anti-Bolshevik Land Council of B. declared in 1917-18 first the estab. of the Moldavian People's Rep. as a part of the Russian Federation, then its independence from Russia, and finally its incorporation into Rumania. This was recognised in 1920 by Britain, France, Italy, and Japan, but not by the Soviet Gov., which in 1940, by an ultimatum, forced Rumania to cede B. and N. Bukovina (see BUKOVINA). In 1941-1944 B. again belonged to Rumania, but was finally ceded to the U.S.S.R. by the peace treaty of 1947. The major part of B. forms the Moldavian Rep. (q.v.), while the N. and S., with a predominantly non-Rumanian pop., are included in the Ukraine (see CHERNOVITSY and ODESSA).

Bessarion, John (1395-1472), medieval scholar and ecclesiastic, b. Trebizond. He was appointed Archbishop of Nicaea in 1437, and in the following year attended the Council of Florence when he supported the union of the Gk and Lat. churches. Having joined the Lat. rite, he was made cardinal by Eugenius IV, served as papal legate at Bologna (1450-1455), and was appointed Lat. patriarch of Constantinople in 1463. B. d. at Ravenna, bequeathing his valuable collection of Gk MSS. to the Venetian Senate. He was one of the most learned scholars of that period; his prin. work is a Lat. trans. of Aristotle's *Metaphysics*, Paris, 1515. See L. Mohler, *Kardinal Bessarion als Theologe, Humanist und Staatsmann* (2 vols.), 1923-7.

Bessborough, Vere Brabazon Ponsonby, 9th Earl of (1880-), administrator, educ. at Harrow and Cambridge Univ. He was called to the Bar in 1903; Unionist M.P. for Cheltenham, 1910-13, and for Dover, 1913-20. In 1915 he served in Gallipoli with the Imperial Yeomanry, and, later, on the staff in France. He succeeded to the title in 1920, and from 1931 to 1935 was Governor-General of Canada. The earldom of B. in the Irish peerage dates from 1739; included in the peerage of the U.K. in 1937.

Bessbrook, vill. in co. Armagh, N. Ireland, 3 m. NW. of Newry, an early experiment in tn planning (1846),

founded for spinning, weaving, and bleaching linen. Pop. 2888.

Bessèges, Fr. tn in the dept of Gard, on the Cèze. It has coal-mines and iron-works. Pop. 5500.

Bessel, Friedrich Wilhelm (1784-1846), Ger. astronomer, b. Minden on 22 July. His investigations on Halley's comet, from some old observations going back to 1607, led to recognition by H. W. M. Olbers (q.v.), who pub. his results. Following this, he was installed by the King of Prussia as director of a new observatory at Königsberg. Here he stayed from 1813 till his death. He tabulated a catalogue of 3222 stars, and pub. it under the title *Fundamenta Astronomiae*, 1818. B. is chiefly remembered for his success in determining the parallax of 61 Cygni. See BESSEL'S FUNCTIONS.

Bessels, Emil (1847-88), Ger. scientist and Arctic explorer, b. Heidelberg, and studied natural science and medicine there and at Jena. His first polar journey was made in 1869, and enabled him to demonstrate the presence of the Gulf Stream E. of Spitzbergen. In 1871 the U.S. Gov. appointed him chief of the scientific dept to the expedition under C. F. Hall in the *Polaris*. The vessel was wrecked and all B.'s collections lost in 1873. He pub. an account of the expedition in 1876, and also *Die Amerikanische Nordpolexpedition*, 1878.

Bessel's Functions, in mathematics, indicate certain relationships between two variables. F. W. Bessel (q.v.) introduced them in 1817 in investigating mathematical relationships in connection with planetary orbits. Later they have been employed in calculations concerned with the vibrations of a stretched membrane, thus contributing to the theory of sound; and in calculations connected with almost every branch of mathematical physics. Bessel's function of order m is indicated by the symbol $J_m(\rho)$, and satisfies the differential equation:

$$\frac{d^2\mu}{d\rho^2} + \frac{1}{\rho} \frac{d\mu}{d\rho} + \left(1 - \frac{m^2}{\rho^2}\right)\mu = 0.$$

See A. Gray and G. B. Matthews, *Treatise on Bessel's Functions and Applied Physics* (2nd ed.), 1922.

Bessemer, Sir Henry (1813-98), engineer, b. Charlton, Herts. He was the author of many inventions, particularly the special process of steel manu. called the B. process (q.v.). B. profited to the extent of over a million pounds by his discovery. Among his minor inventions were gold paint and a movable die for embossed stamps.

Bessemer, tn of Jefferson co., Alabama, U.S.A., 16 m. SW. of Birmingham. It has blast furnaces, rolling mills, foundries, machine shops, etc. Pop. 28,450.

Bessemer Process, process for freeing wrought iron and low carbon steel from mechanically entangled cinder. It was first introduced in 1856 by Henry Bessemer (q.v.). By its cheapness and effectiveness, it displaced other methods, and is still widely used in Britain, the U.S.A., and other countries, especially for making rails, ship plates, boiler plates, etc.,

though other processes, such as the Siemens-Martin process, have come into competition with it. The principle of the B. P. is briefly as follows. Molten pig iron is converted into steel by having a large number of fine streams of air forced through it, causing the oxidation of its impurities, such as carbon, silicon, and often its phosphorus and sulphur. The intense heat thus generated, without the use of any other fuel is sufficient not only to melt the iron and keep it in a molten state, but to raise its temp. to above the melting-point of steel, that is, to 1500° C. The Bessemer converter, in which this process is carried on, is an immense retort, made of boiler plates, and lined with some refractory material, such as dolomite, fire-brick, or ganister. It is suspended aloft, and mounted on axes at or near its centre of gravity. It is turned on trunnions, through the right one of which the blast is carried to the gooseneck, which delivers it to the tuyères at the bottom. There are two varieties of converters. The original one is undephosphorising, because it is lined with refractory material, such as silicic acid. The dephosphorising or Thomas Gilchrist process is the name applied when the converter is lined with basic materials. It was patented in 1878, but it is only a modification of the B. P. For further details as to the proportions of carbon, silicon, sulphur, phosphorus, manganese, and copper in the different varieties of Bessemer steel, and the character of the spectrum of the flames, etc., see IRON AND STEEL.

Bessenov, Peter Alexievich (1828-98), Russian philologist, b. Moscow; became prof. of Slavonic literature at the univ. of Cracow in 1879. He pub. many valuable works dealing with the Bulgarian and Serbian languages and literatures, and also ed. collections of popular songs and folklore of the Serbian, Bulgarian, and Russian peoples.

Bessus (d. 328 bc), satrap of Bactria under Darius III. In 331 bc, after the battle of Gaugamela, he captured Darius, and, on being pursued by Alexander, murdered him. He was betrayed to Alexander and put to death by him.

Best, George (d. 1584), Eng. navigator, who accompanied Martin Frobiisher in 1576, 1577, and 1578 on his 3 voyages to discover the NW. Passage. B. pub. an account of these journeys under the title, *A True Discourse of the late Voyages of Discoverie for the Finding of a Passage to Cathaya by the North-weast, under the conduct of Martin Frobiisher, Generall*, 1578. The work was trans. into French, Latin, and Italian. Copies of the *True Discourse* are rare; it was included in Hakluyt's *Voyages*, vol. III (1600). It is probable that B. was killed in a duel by Oliver St John, Viscount Grandison, about 1584.

Best (afterwards Beste), Henry Digby (1768-1836), writer, b. Lincoln and educ. at the grammar school there. In 1791 he took holy orders, but later was received into the Rom. Catholic Church. In 1818 he left England for a time and lived in France and Italy. His works

include *Four Years in France... preceded by some Account of the Conversion of the Author to the Catholic Faith, 1826, The Christian Religion briefly defended against the Philosophers and Republicans of France, 1793, and Italy as it is, 1828.*

Best, Thomas (c. 1570-1638), Eng. naval officer, who went to sea about 1583. In 1612, while in command of the *Red Dragon*, he defeated the Portuguese at Surat, and his victory estab. Eng. trading rights in India as equal to those of the Portuguese. In 1623 B. headed an expedition against the Dutch, who had blockaded a privateer at Aberdeen, and commanded the *Vanguard* in the unfortunate expedition to Ré, 1627.

Bestozobanya, see BAŇSKÁ BYSTRICA.

Bestiary, work in prose or poetry describing the appearance and habits of selected animals and basing an allegory and moral lesson upon them. The original of this type of writing was a Gk work, *Physiologus* (the naturalist), composed in the 2nd cent. AD. There were a great many trans. and imitations of it in both E. and European literature. Among the most popular on the Continent were the *Bestiaires* of Philippe de Thaon and Guillaume le Clerc, written in the 12th cent., and *Le Bestiaire d'Amour* of Richard de Fournival which parodies them. An example in O.E. is the poem of the Panther and the Whale, contained in the Exeter Book. The only complete M.E. B. is of the 13th cent. and is based on an 11th-cent. *Physiologus*. A feature of all these works is an 'unnatural natural history' derived from many sources, including Aristotle and the elder Pliny, and bringing in fabulous animals like the unicorn. The tradition survived till Elizabethan times in the fabulous references in Lyly's *Euphues*. See *The Old English Physiologus*, trans. A. S. Cook, 1922, and T. H. White, *The Book of Beasts* (trans. from a 12th-cent. Lat. B.), 1954.

Beta, 2nd letter of Gk alphabet. See ALPHABET, and B.

Beta, genus of biennial or perennial plants, native to temperate parts of the Old World, family Chenopodiaceae, about 12 species. *B. vulgaris* is the parent species of beetroot, sugar-beet, spinach beet, chard, and mangold. See BEET.

Beta Orionis, see RIGEL.

Beta Particles, high-speed electrons emitted by certain radioactive substances, and often accompanied by gamma-rays (q.v.). Rutherford (1899) found that the radiations emitted by a uranium compound were of two types, which he called alpha-rays and beta-rays (or B. P.). Whereas the former were unable to penetrate more than about 0.002 cm. of aluminium, the B. P. required about 0.2 cm. of aluminium to stop them completely. In 1900 Marie and Pierre Curie confirmed that the particles were negatively charged. In the same year Becquerel showed that they had the same ratio of charge to mass as that of the cathode rays (q.v.) or electrons, and had a velocity about half the velocity of light. Later work

showed that a given beta particle emitter produced a 'continuous spectrum' of electrons with a whole range of energies up to a characteristic maximum value. Other evidence suggested that the emission of each electron was associated with a definite amount of liberated energy. In order to explain the lower energy B. P., Pauli suggested in 1931 that each emitted electron was accompanied by a hitherto unsuspected particle which came to be known as the neutrino (q.v.).

The positive charge of the nucleus is increased by one unit by beta emission and the resulting nucleus is therefore that of a different chemical element. If this resulting nucleus is formed with more energy than it normally possesses, i.e. if it is formed in an 'excited state', the excess energy is given up almost immediately as a photon (q.v.) and gamma-rays are emitted. There is a small but definite probability that the emitted photon will interact with the electrons surrounding the nucleus and cause one of them to be ejected. The process is known as 'internal conversion' and is essentially a photo-electric effect (q.v.). The energy of the photon is characteristic of the excited nucleus and as a result the ejected electron has a definite energy, which is often of the same order as that of the 'continuous spectrum' of B. P. discussed earlier. Therefore a 'line spectrum' due to internal conversion is frequently superimposed on the continuous beta particle spectrum.

The term beta particle is applied to all fast electrons whether they arise from radioactive sources or not. The betatron (q.v.) is a machine designed to produce electrons with energies far in excess of those encountered in radioactivity. High energy electrons are also found as the result of the interactions of cosmic rays (q.v.). High energy positrons (q.v.), i.e. positive electrons, are sometimes called positive B. P. They are emitted by some artificially produced radioactive nuclei, whereas all natural beta-active nuclei emit negative electrons. Positive B. P. are also formed in cosmic ray interactions. See RADIOACTIVITY.

Beta Persel, see ALGOL.

Beta Rays, see BETA PARTICLES and RADIOACTIVITY.

Betaine (Lat. *beta*, beet), chemical formula $C_5H_{11}NO_3$, called also trimethylglycine B., occurs as a natural alkaloid in beetroot, in mangel-wurzel, in the leading branches of *Lycium barbarum*, and in putrefying flesh. It has the constitution trimethylglycine, and can be obtained by the oxidation of choline hydrochloride. Choline occurs in the bile and brain of animals, and also in the white of eggs. B. can be obtained as a hydrochloride synthetically by heating trimethylamine, $(CH_3)_3N$, with monochloroacetic acid, $^1H_2ClCO.OH$. It crystallises from alcohol in shining deliquescent needles containing a molecule of water. It is neutral, has a sweet taste, and is decomposed by boiling alkalis or baryta. It may also be prepared by boiling diluted molasses with baryta, and, in the later stages of the

process, removing the barium from the filtrate by H_2SO_4 , the B. hydrochloride crystallising in evaporation.

Betanzos (anct *Brigantium Flavium*), Sp. tn in the prov. of La Coruña, on a hill between the R.s Mandeo and Mende. It has many fine anct buildings, is the depository of the Galician archives, and was once an important port. Pop. 11,000.

Betatron, machine to produce high-energy electrons, i.e. beta particles (q.v.), first designed and constructed by D. W. Kerst in the U.S.A. in 1940. The basic principle is electro-magnetic induction and its use was proposed by R. Wideröe in Germany in 1928. A changing magnetic field is always accompanied by an electric field which can be used to accelerate electrons—this is the principle underlying the action of an electrical transformer. An electron moving at right angles to a magnetic field is caused to move in a circular path. By careful design the changing magnetic field can be used to make the accelerating electrons travel in a circle of constant radius around which the accompanying electric field is acting. The machine consists of an electro-magnet with specially shaped circular pole pieces which is energised by an alternating current. Between the pole pieces is placed a hollow ring, known as a 'doughnut,' which is highly evacuated. Electrons from a hot cathode are injected at high velocities into this doughnut just after the magnetic field has begun to increase. They are accelerated by the accompanying electric field and travel in circles, making up to 1 million revolutions before the magnetic field reaches its maximum value, at which time they are deflected by a superimposed magnetic field. By this means they can be extracted for experimental purposes or allowed to strike an internal target in order to produce high-energy X-rays, i.e. gamma-rays (q.v.). Electron energies can be obtained equivalent to an acceleration under the action of some 300 million volts. At this energy the electron velocity is over 98.99 per cent of the velocity of light, and the relativistic increase in mass is so great that the electron mass is nearly 600 times the 'rest mass,' i.e. its mass when it is effectively at rest.

Betel-nut Palm (*Areca catechu*), tree indigenous to Malaysia, but cultivated also in S. India, Ceylon, Siam, and the Philippines. It grows about 50 ft high, branchless, but bearing a crown of large fronds. The fruit, nearly the size of a hen's egg, contains the nut used by Asiatics for mastication. Gathered and husked before they are fully ripe, the nuts are then boiled, sliced, and sun-dried. Each piece for chewing is wrapped in a leaf of the betel pepper-vine, with some lime and often an aromatic flavouring. The betel reddens the mouth and blackens the teeth, but preserves them.

Betelgeuse, or **Alpha Orionis**, bright star situated in the E. shoulder of the constellation of Orion. It is a long-period variable of about 196 days during which it declines in magnitude from 1.0 to 1.4.

B. is the brightest star in Secchi's third type, i.e. it is reddish in colour and of a comparatively low temp. The spectro-scope reveals the presence of sodium, magnesium, and iron in its composition, but no hydrogen. B. has a small parallax, 0.012", which means that it is very remote, its distance exceeding 270 light-years. Its brilliancy exceeds that of the sun many hundred times, and it is estimated that it is receding from the solar system at the rate of 15 m. a second. The interferometer (q.v.) has shown that its diameter varies between 210 and 300 times the sun's diameter.

Beth. *see* BETT.

Bethany: 1. Vil. of Jordan 2 m. ESE. of Jerusalem. It is called *Elzariya*, for it was the residence of Lazarus and his sisters. The only object of interest is the supposed tomb of Lazarus. Of the ecclesiastic buildings erected about the 4th cent. little or no trace is existing. It is situated on the Mt of Olives at a height of 2208 ft above sea level. Pop. 200.

2. Vil. in Orange Free State prov., S. Africa, the site of a mission station (altitude 4539 ft), 411 m. from Port Elizabeth.

Bethel, 'house of God,' pile of ruins now called Beitin, situated about 11 m. N. of Jerusalem. It was the scene of Jacob's dream, and was formerly known as Lux. Abraham stayed here, and later the ark of the covenant was deposited in its precincts. Still later it became a royal residence and a centre of heathen worship. Pop. 500.

Bethell, Richard, *see* WESTBURY, 1st BARON.

Bethesda: 'House of Mercy' (the name is uncertain in the texts): 1. A public bath of Jerusalem, where Christ healed the impotent man. Birkit Israel, situated in Jerusalem, has been identified with it since the year 1102. It is in that part of the city near the gate of St Stephen and Omar's Temple. Other sites are suggested by Condor, who claims it to be the spring called Gibon and En Rogel in the Kedron valley; and Schiek who, in 1889, discovered remains of an oblong pool near St Anne's Church, with 4 lateral porches and a fifth central dividing porch.

2. Tn of Caernarvonshire, Wales, 4 m. SE. of Bangor. It derives its name from the local Nonconformist chapel. The Penrhyn quarries near by yield large quantities of slate, which are shipped from Bangor. Pop. 4500.

Beth-horon, Upper and Lower (modern Beit 'Ur et Teahtha and Beit 'Ur el Foka), two vils. of Palestine, 10 m. NW. of Jerusalem, on frontier between Benjamin and Ephraim. Joshua defeated the Amorites in the pass between the two (*see* Joshua x. 1-11), and Judas Maccabaeus defeated the Syrians here in 166 bc.

Bethlehem: 1. The modern Beit Lahm, 5½ m. S. of Jerusalem, 2350 ft above sea level; it is reached by a main road which passes, after 4 m., the tomb of Rachel. B. stands on a high, narrow ridge, and is a typical old Jewish tn of biblical times. Its structure explains many phrases descriptive of it in the Bible; thus

external stairways still lead to the flat roofs, while the roofs are often conjoined so as, in effect, to facilitate flight from one dwelling to another. It has no natural springs, but wheat, olives, etc., grow in its neighbourhood, and its wine is excellent. It was David's home, the scene of Ruth's encounter with Boaz, and above all the bp. of Jesus Christ. Christian pilgrimages began before AD 132. In AD 326 Constantine built a basilica over the grotto stable of the Nativity where, in 1099, the crusaders raised their standard and Baldwin I was crowned King of Jerusalem. In 1244 the Khwarizmians,

historical description; *The Church of the Nativity at Bethlehem*, by W. Harvey, W. R. Lethaby, and others, 1910, an illustrated architectural and descriptive survey; *Bethlehem: le sanctuaire de la Nativité*, by Vincent and Abel, 1914, a fully documented historical and archaeological study, written prior to recent important discoveries, now supplemented by articles in the *Revue biblique*, 1936, 1937; *Structural Survey of the Church of the Nativity, Bethlehem*, by Wm Harvey, 1935, a fully illustrated architectural survey of the then condition of the church, including a record of archaeological dis-

BETHLEHEM

Terraces and the Church of the Nativity.

who had conquered both Christians and Muslims, devastated it, and in 1489 it was again destroyed and became a ruin. It is now a small country town with a pop. largely Christian, and devout and hospitable. The church of the Nativity, the oldest Christian church still in use, is the original basilica built by Constantine, partly restored by Justinian in the 6th cent. The roof was repaired in the 15th cent. with lead sent by Edward IV of England. The church is now shared by sev. communities. The grotto of the Nativity lies beneath the choir; on the E. side is a semicircular recess in which a silver star indicates the spot where Christ was b. with the inscription: 'Hic de Virgine Maria Jesus Christus natus est.' A few m. to the S. of B. the reservoirs, known as the Pools of Solomon, have been brought into use with other anc. sources of supply at Arrub.

Pubs. dealing with the hist., archaeology, and architecture of B.: *Les Eglises de la Terre sainte*, by Count Melchior de Vogüé, 1860, the classic architectural and

coveries; *Excavation in the Atrium of the Church of the Nativity, Bethlehem*, by R. W. Hamilton; *Basilica of the Nativity, Discovery of the Remains of an Earlier Church*, by E. T. Richmond.

2. Post-bor. in Northampton and Lehigh cos., Pennsylvania, U.S.A. It is situated on the R. Lehigh, and is connected by rail with Philadelphia, 55 m. distant. The Moravians founded the town whose inhab. are still mostly of that sect. Clothing, textiles, electrical equipment, metal products, coke, furniture, cement, and chemicals are its chief products. It is joined to S. B. by two bridges across the Lehigh, and to W. B. by Monocacy Creek. Total pop. 66,340. S. B. is a centre of the steel and iron industry. Here are located some of the chief works of the B. Steel Corporation (q.v.). In Nov. 1915 a fire, attributed to Ger. agents, caused a loss of material worth £250,000. B. is the seat of the important Lehigh Univ. and Moravian college. An ann. Bach festival is held.

4. Tn of Orange Free State, S. Africa,

125 m. NE. of Bloemfontein, in an agric. region, with an excellent climate and an important railway junction. Pop.: Whites 7491; Bantu, 11,062; others, 446.

Bethlehem Hospital, *see* BEDLAM.

Bethlehem Steel Corporation, incorporated under perpetual charter in New Jersey in 1904, since when it has acquired control of extensive iron, coal, shipbuilding, and other interests. The corporation has steel and manufacturing plants at Bethlehem, Steelton, Lebanon, Johnston, and Coatesville in Lackawanna, Wilmington, Seattle, and San Francisco. Its chief products are pig-iron, ferro-manganese, spiegeleisen, iron and steel bars, slabs, guns, ammunition, bridges, viaducts, etc. Its shipbuilding and repair plants are at Quincy, Sparrow's Point, Baltimore, Alameda, San Francisco, San Pedro, and Boston.

Bethlehemites, name of various societies as follows: 1. Order of monks who fl. in England during the 13th cent., and who founded a monastery at Cambridge, 1257.

2. Military order founded by Pope Pius II to prevent an attack by the Turks in 1453.

3. Society of Hospitallers of Guatemala, founded in 1659 and patronised by Pope Innocent XI in 1687.

4. Bethlehem Church in Prague gave the name also to its followers who were led by John Huss.

Bethlen, Gabor (1580-1629), Prince of Transylvania, member of an ancient Hungarian Calvinist family. He was chosen prince on the murder of Gabriel Báthory, his former friend, in 1613. When the Thirty Years War began B. invaded Hungary proper as an ally of the Bohemians, and was proclaimed King of Hungary in 1621. Later, on making peace with the Emperor Ferdinand II, B. relinquished the title of King of Hungary, though he gained extensive territories and the title of Prince of the Empire. This did not prevent him from again intervening in the war against the emperor.

Bethlen, Stephan, Count (1874-1947), Hungarian politician, of an old Protestant Transylvanian family. He was educ. at Vienna and Budapest Univs. In 1901 he entered the Hungarian parliament as a Liberal, but refused Tisza's offer of a place in the gov. After the First World War, when Bela Kun (q.v.) headed the Communist revolution, B. was a leader of the successful counter-revolution. In 1921 he became Prime Minister. He settled the W. frontier amicably with Austria, and in 1923 he succeeded in obtaining suspension of the reparations order against Hungary, and a loan from the League of Nations. In 1927 he signed a treaty with Fascist Italy. He was Prime Minister for 10 years from 1921, and, after that, leader of the opposition. He later refused to co-operate with the Nazis.

Bethmann-Hollweg, Theobald Theodor Friedrich Alfred von (1856-1921), Ger. statesman, b. Hohenknorow, Eberswalde. B.-H. studied law from 1875 to 1879, Strasburg, Leipzig, and Berlin,

and then occupied various posts in the civil service. In 1901 he became president of Brandenburg Prov., and vice-president of the Prussian ministry of state, and secretary of state for the interior, 1907. In 1909, on the resignation of von Bülow, B.-H., although he had little experience of foreign affairs, was appointed imperial chancellor. His domestic policy was liberal in tendency; but he is best remembered for his part in the events leading to the beginning of the First World War. It was B.-H. who made the historic speech on 4 Aug. to the Brit. ambas. in Berlin: 'Just for a word, "neutrality"—a word that in wartime has so often been disregarded—just for a scrap of paper, Great Britain is going to make war on a kindred nation, which desires nothing better than to be friends with her.' B.-H. was disliked by the militarists in Germany, and resigned in 1917. He d. at Hohenknorow. His *Betrachtungen zum Weltkriege* were pub. between 1919 and 1921.

Bethnal Green, parl. and metropolitan bor. of E. London. In the Middle Ages the bishops of London had a residence here, demolished in 1845. In the late 17th and early 18th cents. many Huguenots came here from their neighbouring settlement of Spitalfields (q.v.), and encroachment from London began. In the 19th cent. B. G. was London's worst slum area. In 1872 a branch of the Victoria and Albert Museum was opened here. The prin. industry is cabinet-making, but matchbox- and boot-making are also carried on, and there is a street market. The bor. returns one member to Parliament. Area 760 ac.; pop. 55,500.

Bethphage (Kefr et Tur), vil. high on the E. side of the Mt of Olives, between Bethany and the summit, through which the road from Jerusalem to Jericho passed (Matt. xxi. 2).

Bethsaida (modern et-Tell), vil. on the W. shore of Lake Galilee, on the E. bank of Jordan as it enters the lake. It was the bp. of Peter, Andrew, and Philip, and on the plain around it Christ fed the 5000. Nothing now remains save a pile of grass-covered ruins. It was named Julius by Philip the Tetrarch, after a daughter of the Emperor Augustus.

Bethshan, *see* BEISAN.

Beth-shemesh: 1. Ancient city of Palestine, probably the modern Ain Shems, a vil. 15 m. SW. of Jerusalem. Frequently mentioned in the O.T. as a city of N. Judah, between Kirjath-jearim and Timnah, originally a Levite city and later the chief city of Dan. Jehoshaphat, King of Israel, captured Amaziah, King of Judah, here. *See* Joshua xxi. 16, and 2 Kings xiv. 11.

2. City of Naphtali, Upper Galilee. *See* Joshua xix. 38.

3. City of Issachar. *See* Joshua xix. 22.

4. Temple of On (Heliopolis), Lower Egypt. *See* Jer. xliii. 13.

Bethune, Cardinal David, *see* BEATON. Bethune, Edward Cecil (1855-1930), Brit. soldier. He entered the Royal

Artillery in 1874 and a Highland regiment in 1875. He attained the rank of major-general in 1908. He served in the Afghan war, 1878-80, and in the Boer wars of 1881, and 1899-1902; for the last-named war in S. Africa he raised and commanded B.'s horse. After that war he commanded the SE. Sub-Dist., Cape Colony. Promoted to lieutenant-general in 1913. Was director-general of the Territorial Force, 1912-17. Retired 1920.

• Bethune, James, *see* BEATON.

Bethune, Maximilien de, *see* SULLY.

Bethune, Fr. tn, cap. of an arron., in the dept of Pas-de-Calais. It dates from the 11th cent. but did not finally come under Fr. rule until ceded to Louis XIV in 1678 by the treaty of Nijmegen (q.v.). It was severely damaged in both world wars. The church of St Vaast is partly 13th cent., and there is a magnificent 14th-16th-cent. belfry. B. is the centre of a coal-mining area, and manufs. beet sugar and textiles. Pop. 22,100.

Bethylus, in entomology, genus of small hymenopterous insects of the family Proctotrypidae. The species are four-winged flies remarkable for their large depressed heads, and somewhat resemble ants in appearance. They are found chiefly in dry and sandy situations.

Bethylus, in ornithology, genus estab. by Cuvier and placed among the Laniidae, butcher-birds or shrikes (q.v.). The species described by him is a native of Guiana and Brazil, and is particoloured, black and white, like the common magpie.

Betony (*Stachys officinalis*), plant of the Labiateae family. It is found in Great Britain in damp shady places, in hedgerows, woods, etc. The leaves are long, with toothed edges, and the blossoms, which appear in July and Aug., are of a purple colour. It was formerly regarded as a medicinal herb. It can be used to extract a kind of yellow dye.

Betrothal (A.-S. *tréowth*, truth), term signifying pledging oneself to marry, i.e. giving one's troth. It was anciently a more formal ceremony than it is to-day,

having most of the binding force of a marriage. Rom. law (*sponsalia*) imposed the duty on betrothed persons to become husband and wife in a reasonable time, except where death intervened. The custom was practically abolished in the Christian Church by the Council of Trent, because it so frequently led to clandestine marriages; but subsequently B.s became common again on the Continent. Since a B. is a legal contract, it is valid only between parties whose capacity is recognised by law, as, for instance, the persons must be of age. B.s induce a strict obligation to marry, and should either party eventually refuse, the other may obtain damages in an action for breach of promise. B. as a term of art in Eng. law has fallen into disuse, it being rather the mere promise to marry than any formal B. that gives rise to the legal obligation.

Betsileo, S. part of the central plateau of Madagascar, inhabited by the Betsileos, numbering 470,000. Cap. Fianarantsoa.

Betterment, term used to describe the additional value a tenant has caused his landlord's land to possess. *See also* FIXTURES and LANDLORD and TENANT.

Betterton, Thomas (1635-1710), leading actor of his time, b. Westminster, son of an under-cook in Charles I's household, apprenticed to Rhodes, a bookseller of Charing Cross, who had been wardrobe-keeper to the theatre in Blackfriars. In 1659 Rhodes obtained a licence to form a company of players at the Cockpit, Drury Lane, and here B. made his first appearance on the stage. In 1662 Sir Wm Davenant, patron of the new theatre in Lincoln's Inn Fields, engaged B. and all Rhodes's company to play in his *Siege of Rhodes*. B. became so great a favourite of the king that he was sent to France to make improvements in the Fr. theatres. Cibber says that it was after B.'s return that shifting scenes first replaced tapestry on the Eng. stage. In 1670 B. married Mrs Sanderson, a capable actress of the same company. B. left Drury Lane and went to Lincoln's Inn Fields in 1695, playing Valentine in Congreve's *Love for Love*. He lost his money in an unfortunate trading venture and had to continue acting almost up to the day of his death. He was one of the best actors ever seen on the Eng. stage. His performance of Hamlet after this time was especially noteworthy. In 1710 he made his last appearance in his celebrated part of Melantius in *The Maid's Tragedy*. He d. in the same year and was buried in the cloisters of Westminster Abbey. He wrote sev. dramatic works which had a vogue in his day. *See An Apology for the Life of Mr Colley Cibber, Comedian*, 1740, 1879, and R. W. Lowe, *Thomas Betterton*, 1891.

Bettinelli, Saverio (1718-1808), It. historian, critic, and poet. He was a Jesuit, teacher of rhetoric, and admirer of Voltaire. His chief work is the *Risorgimento d'Italia*, 1775, a hist. of It. civilisation in the Middle Ages. He also wrote a tragedy, *Serse*, and a well-known letter attacking Dante, *Lettere di Virgilio*, 1757.

Betting, act of staking money on the result of some future event, usually of a sporting nature, but not necessarily so. The word is supposed to be derived from the Old Fr. *abeter*, to instigate. The origin of the custom is not exactly known, but it dates back to the very earliest days, especially in E. countries. By far the largest part of B. in England takes place over horse-racing, and the men who make a profession of taking bets are known as bookmakers. Up to the early part of the 19th cent. none of these existed, as such, but the first man to take bets in a really scientific and business-like manner was Wm Ogden in 1793, who can be called the first proper bookmaker. B. is illegal except at properly authorised race-meetings, and then it must be in Tattersall's Ring. The B. is of two kinds: post B., when the wagering begins when the numbers of the horses are hoisted on to the board just before the race, and ante-post B., when the wagering takes place weeks before the event. Bets on all big races, such as the Derby, the Oaks, the St Leger, the Cambridgeshire, or the Cesarewitch, often take place nearly a year previous to the race-meeting. Bets are quoted in most newspapers, and as the public take them up so the prices are regulated. The theory of B. is simple, but in practice it is more complicated. The bookmaker will make a book for a certain amount, say £50, £100, or £1000, and his endeavour is to lay an equal amount of his book against every horse in the race. The odds, of course, change with the current quotations of each horse. (For further details see Tattersall's *Rules on Betting* and Rowntree's *Betting and Gambling*.) Bookmakers who wish to carry on their business otherwise than at race-meetings are styled 'commission agents,' and profess only to take money on behalf of others. The Betting Acts of 1853 and 1874 were made to prevent bookmakers having too much power, while the Gaming Act (see GAMING) was designed to check the evils attendant on this custom. The Betting Acts above mentioned enforce that 'no house, office, room, or other place' shall be resorted to for the purpose of B. The word 'place' has been held to mean even an umbrella or stool belonging to a bookmaker at a race-meeting who is outside Tattersall's ring. B. debts cannot be recovered in a court of law. Welshing is the term given to the practice on the part of a dishonest bookmaker of disappearing with the stake-money before a race. The laws on street B. are severe, especially upon those making books with persons under the age of 16. For the first offence any one taking bets in a public place is fined £10; for the second offence, £20; and for the third offence, £50 or six months, and so on, according to the number of convictions. Among some of the famous bets that have taken place may be mentioned that of Lord George Bentinck, who won £20,000 when Crucifix won the Oaks in 1840, and 3 years later the same nobleman stood to win £150,000 if his horse Gaper had won the Derby; the horse lost, but Lord George

won £30,000 on another horse. John Gully and Ridsdale won £100,000 over the Derby and the St Leger in 1832, and Sir Joseph Hawley won £80,000 when Beadaman won the former race in 1858. Lord Glasgow once laid £90,000 to £30,000 with Lord George Bentinck. Capt. Machell gained over £60,000 when Hermit won the Derby, while over the same race the notorious plunger, the Marquess of Hastings, lost the enormous sum of £103,000. The totalisator system of B. is now in operation on many racecourses in England. This system was first used in France, the apparatus being known as the *pari mutuel*. It is a large frame with a pigeon-hole for each horse, into which the stakes are placed; the better obtains a voucher for his money, and the numbers are exhibited after the race. The Fr. municipal authorities deduct a certain percentage from the stake-money, and another percentage is also set aside for the poor before the money is divided up amongst the winners. This system was introduced into France in 1856, and a few years later into England, where, however, it did not find favour, and was soon abolished and declared illegal as being a gaming machine. The difference between the 'tote' and the *pari mutuel* is that the former is operated automatically by electricity. Both the *pari mutuel* and totalisator systems again came into favour in Great Britain and were legalised by the Racecourse Betting Act, 1928. Such B. is controlled, under the Act, by a board of control. The system is also used in the dominions.

Wagers are a form of B. not usually associated with the race course, but are a hazard on any event, sporting or otherwise, sometimes on things of an absurd nature. Lotteries, another method of B., take the form of taking tickets for small or large amounts on the chance of winning big sums of money. The earliest lottery properly estab. was one in Florence in 1530, and in 1571 a special official was appointed in Venice to supervise these affairs. From Italy the lottery passed into France and gradually spread over Europe. The first one known in England was at the end of the 17th cent. Lotteries are, subject to certain exceptions, illegal in England, however, although they still flourish on the Continent, where they are sometimes run by the states, in fact, Austria, Denmark, and Prussia have raised loans by this means. In America, as in England, they are now forbidden by law. The Betting and Lotteries Act 1934, restricts B. by totalisator and bookmaker to 104 days on any racing track; regulates greyhound racing and authorises the estab. of totalisators on dog tracks; bans all lotteries, with the exception of certain small private ones organised by clubs and other institutions; prohibits the pub. of lottery advertisements, 'matter descriptive' of the drawing of lotteries, and lists of prize-winners; and imposes penalties ranging from a fine of £50 to a fine of £750, or 2 months' imprisonment to a year's imprisonment. The pub.

of matter descriptive of the drawing or intended drawing of a lottery is only an offence if it is 'calculated to act as an inducement.' A justice of the peace, before issuing a search warrant, must be satisfied that premises are being used for the sale or distribution of lottery tickets. In connection with trafficking in lottery tickets, and, in particular, in Irish Sweepstake tickets, the gist of the offence is the sale and distribution of tickets in Great Britain. It is not an offence for an individual to send money to Dublin for tickets for himself; but if the individual were to sell the tickets to someone else, or to hand money on to another person for the purpose of purchase, that would be an offence under the Act. (See also LOTTERY.) The gaming-table is also a popular form of B.; this is now also illegal in England, though in 1620 it was licensed in London and was popular in the 18th cent., but in the early part of last cent. the games of faro, hasset, hazard, and roulette were prohibited. Gaming continued, however, to be in vogue at many of the health resorts on the Continent, but only quite small sums are allowed to be staked at one time, generally not exceeding 5 Swiss frs. Ostend has a large kursaal with many tables, and although officially abolished in France in 1838, gaming-tables for the small amounts alluded to above are still to be found at places like Dieppe and Boulogne. Baden-Baden, the famous watering-place, and Homburg, the Prussian spa, were at one time two of the most famous resorts in Europe of gamblers. Since the suppression of the gambling facilities of most of these places, Monaco is the only European state where gambling on a large scale is lawful. See MONTE CARLO; TOTALISATOR; POOL.

Betting Tax, tax on bets laid with book-makers imposed under the Finance Act of 1926 by the Conservative Gov. when Winston Churchill was chancellor of the exchequer. Certain duties were levied on and after 1 Nov. 1926; but they were shortlived, as the tax was abolished by the Labour Gov. in 1930. The Finance (No. 2) Act, 1947, imposes on pool betting promoters a tax on the net proceeds of money staked. See also GAMBLING; HORSE-RACING; LOTTERY.

Bettws-y-coed, urb. dist. of Caernarvonshire, Wales, situated 4 m. from Llanrwst and 16 from Llandudno. Its name signifies house of prayer (from O.E. bede-house) of the wood. Artists and tourists are attracted to the spot. Fishing for trout and salmon yields large results. Among its waterfalls the best known are the Swallow Falls, Conway Falls, and Fairy Glen. Pop. 780.

Betty, William Henry West (1791-1874), actor; popularly known as the 'young Roscius.' He was b. at Shrewsbury, Shropshire, and first appeared on the stage at the age of 12 as Osman in *Zara* by Aaron Hill, which was Voltaire's *Zaire* in English. Spontaneous success led to a journey to Dublin. While there he is said to have memorised the part of Fannet in 3 hours. The House of

Commons was adjourned by Pitt one night to allow members to attend a performance where he was appearing. He made his last appearance as a boy actor in 1808; was a fellow commoner at Christ's College, Cambridge, from 1809 to 1811; returned to the stage in 1813; retired in 1824 to enjoy the fortune he had amassed.

Betula, generic name of the birch (q.v.). **Betulaceae**, family of dicotyledonous trees or shrubs found largely in N. lands. It comprises 6 genera, *Alnus*, *Betula*, *Carpinus*, *Corylus*, *Ostrya*, and *Ostryopsis*. **Betuwe**, dist. of the Netherlands, situated between the R.s Waal and Rhine, in the prov. of Gelderland. It is very fertile and has many orchards.

Beule, Charles Ernest (1826-74), Fr. archaeologist and politician, b. Saumur. He became prof. of archaeology at Athens, where he rediscovered the propylaea of the Acropolis. He was author of numerous works on archaeological subjects, including *L'Acropole d'Athènes* (2 vols.), 1854.

Beurnonville, Pierre de (1752-81), Fr. general under the rep., b. Champignolle.

Beust, Friedrich Ferdinand, Count von (1809-86), Austrian statesman, b. Dresden; descended from a distinguished and noble family who had been connected with the Mark of Brandenburg. Educ. at Leipzig and Göttingen, he entered the public service of Saxony. He was the champion of the minor Ger. states against Prussian hegemony; but is best remembered for his efforts which brought to a successful issue the negotiations for the *Ausgleich* between Austria and Hungary. He was Austrian ambas. in London, 1871; in Paris, 1878.

Beuthen, see BYTOM.

Beuvry, Fr. tn in the dept of Pas-de-Calais. It has coal wharves on the B. canal. Pop. 6300.

Beuzeville, Fr. tn in the dept of Eure. It has distilleries. Pop. 2400.

Bevagna, It. mkt tn, in Umbria (q.v.), 18 m. SE. of Perugia (q.v.). It has a trade in wine. Pop. (com.), 7000.

Bevan, Aneurin (1897-), politician, b. Tredegar, Mon., the son of a miner, and educ. at Serhowy Elementary School and the Central Labour College. At 13 he went to work in the mines and soon became an active and militant trade unionist. He has been Labour Member of Parliament for Ebbw Vale since 1929. His views were always on the left of his own party and he gained public notoriety for his ardent criticisms of the war-time Coalition Gov. of which his own party leaders were members. From 1945 to 1951 he was minister of health. During his term of office the National Health Service was estab. In 1951 he was appointed Minister of Labour, but resigned on a disagreement of policy with the gov.

In Opposition after 1951, B.'s criticisms of his own party's policy caused Labour considerable embarrassment, and at times a split in the party seemed imminent. B.'s more extreme views having wide support among the constituency organisations. In Mar. 1955 the Labour Whip was withdrawn from B.;

it was restored the following month; in June, after Labour's defeat in the general election, B. was re-elected to the Labour 'Shadow Cabinet.' Subsequently, his position within the Labour party has grown considerably more secure: he gained second place in the elections for leadership of the parl. Labour party, held Dec. 1955, and in Oct. 1956 B. was overwhelmingly elected treasurer of the Labour party (having stood, unsuccessfully, on previous occasions. He was re-elected in Oct. 1957. He wrote *In Place of Fear*, 1952.

Camera Press

ANEURIN BEVAN

Beveland, North and South, two is. in the Scheidt estuary, Netherlands. They are of the Zeeland is., of which group S. B. is the largest and most fertile. It has a pop. of 60,500. N. B. is a low marshy tract. Some of the protecting dikes were breached by heavy floods in Feb. 1953.

Beverages, see COOKERY.

Beveren, tn in the prov. of E. Flanders, Belgium; noted for the manuf. of point-lace. It contains a famous church, parts of which date back to the 12th cent. Pop. 13,500.

Beveridge, William (1637-1708), Bishop of St Asaph, studied the classical and Semitic languages as sizar of St John's College, Cambridge. In 1661, having obtained his M.A. degree, he was ordained deacon and priest. Before finally accepting his bishopric in 1704 he refused that of Bath and Wells. Piety and devotion

distinguished him through all his preferences. In 1824 9 vols. of his sermons and other writings were pub. His *Private Thoughts upon Religion* was pub. in 1709.

Beveridge, William Henry, 1st Baron Beveridge of Tuggal (1879-), leading economist, b. Rangpur, Bengal, son of Henry B. of the Indian Civil Service, educ. at Charterhouse and Balliol College, Oxford; Stowell Civil Law Fellow of Univ. College, Oxford, 1902-9. Leader-writer for the *Morning Post*, 1906-8; member of the Central Unemployed Body for London, 1904-8, and first chairman of Employment Exchanges Committee. Entered the Board of Trade in 1908, and was director of labour exchanges, 1909-16; then assistant secretary in charge of Employment Dept. Director of London School of Economics and Political Science, 1919-37, then Master of Univ. College, Oxford, 1937-45. He holds degree of D.Sc.(Econ.), London, 1930, and was a senator of London Univ., 1919-1937, and again, 1944-8, vice-chancellor, 1926-8. From 1941 to 1943 he was president of the Royal Statistical Society. He has served as chairman of various social service committees, notably, since 1934, of the Unemployment Insurance Statutory Committee, and, during 1941-1942, of the Inter-Departmental Committee on Social Insurance and Allied Services. This body was formed as a committee of experts, including the gov. actuaries and representatives of many gov. depts., to undertake a survey of the existing national schemes of social insurance, including workmen's compensation, and to make recommendations. The outcome of these labours was the celebrated report made by B. as chairman, and signed by him alone. It was pub. by the Stationery Office under the title of *Social Insurance and Allied Services* (Cmd. 6404 of 1942). Its main feature was a far-reaching scheme of social insurance against 'interruption and destruction of earning power and for special expenditure arising at birth, marriage, or death.' The plan was intended to cover the whole community, without upper income limit, and embodied 6 fundamental principles: flat rate of subsistence benefit; flat rate of contribution; unification of administrative responsibilities; adequacy of benefit; comprehensiveness; and classification. It provided for the conditions of unemployment and disability benefits, retirement pensions, training benefits, maternity grants, children's allowances, widows' allowances, and recommended a national health service organised under the health depts, while at the same time advocating the creation of a Ministry of Social Security to unify the administrative work of the whole scheme. The report, which was the basis of subsequent legislation, created a widespread interest at the time of its pub., and summaries of it were broadcast to the world. Apart from its merits, it was held to symbolise the stability and confidence of Great Britain by showing that, during the course of a world war, in which its

existence was at stake, the country could nevertheless concern itself with plans for the betterment of social conditions. K.C.B., 1919; raised to the

E.N.A.

LORD BEVERIDGE

peerage in 1946. Other works pub. by B. are: *Unemployment: a Problem of Industry*, 1909 (new ed., 1930); *Insurance for All*, 1924; *British Food Control*, 1929; *Causes and Cures of Unemployment*, 1931; *Planning under Socialism*, 1930; a pamphlet, *The Unemployment Insurance Statutory Committee*, 1937; *Full Employment in a Free Society*, 1944; a book about his father and mother, *India Called Them*; 1948; *Voluntary Action*, 1948; *Power and Influence* (autobiography), 1953.

Beverley, John of (14th cent.), Carmelite friar; he was doctor and prof. of divinity at Oxford and wrote *Quaestiones in Magistrum Sententiarum* and *Disputationes Ordinariae*.

Beverley, St John of (d. 721), ecclesiastic, b. Harpham, Yorks, was for 33 years Archbishop of York, and ordained the Venerable Bede. He founded B. Abbey. After his death he was canonised, and William the Conqueror spared the tn of B. when he ravaged the rest of Yorks. Among his works are *Pro Luca Exponendo*, addressed to Bede, and sev. epistles. His feast is on 7 May.

Beverley, municipal bor. of Yorks, England, cap. of the E. Riding of the co., 8 m. NNW. of Hull city, and connected with the R. Hull by canal. B. Minster (13th cent.) occupies a unique position in Gothic eccles. architecture; it contains the Percy tomb (c. 1350) with its masterly sculpture. St Mary's par. church dates from the 14th cent. The grammar

school is of such antiquity that its date of foundation is unknown. B. is an agric. centre with a flourishing cattle market. Leather tanning, shipbuilding, manuf. of motor-car accessories, and metal plating are the chief industries. Pop. 15,500.

Beverly, tn of Essex co., Massachusetts, U.S.A. It is situated on an inlet of the Atlantic opposite Salem. By rail it is 18 m. NE. of Boston. Its importance is due to its harbour, its fisheries, and large manufs. of shoes, shoe machinery, canvas, and clothing. Pop. 28,900.

Beverwijk, small tn in the prov. of N. Holland, 7 m. N. of Haarlem. It has extensive strawberry growing. Pop. 30,585.

Bevin, Ernest (1881-1951), politician, b. Winsford, Somerset. As a boy he worked as a farm labourer. He was for many years general secretary of the Transport and General Workers' Union, being popularly known as the Dockers' K.O. He was appointed chairman of the General Council of the Trades Union Congress in 1937, and was made M.P. (Labour) for Central Wandsworth from 1940 to 1950, and then, till his death for E. Woolwich. When Winston Churchill formed his coalition gov. in May 1940, B. was asked to be minister of labour, and it fell to him, at a difficult time, to

B.B.O.

ERNEST BEVIN

mobilise the man-power of the country without so straining the principle of industrial conscription as to excite the hostile criticism of the left-wing elements in the country. In this he was outstandingly successful. On Labour's being returned to power in 1945 B. became foreign secretary in Attlee's gov. He

soon became a figure of international importance, his blunt speeches attracting considerable attention. B. was a strong supporter of the U.N.O., and a firm believer in blocking any aggressive Soviet intentions; but he always asserted, with obvious sincerity, that he was in no sense anti-Russian. He was, however, frequently criticised as such by more left-wing members of his own party. In 1946 B. was made an honorary citizen of Missolonghi as a token of gratitude for his services to Greece—an honour which was awarded to Lord Byron in 1824. In 1947-8 he was one of those primarily responsible for the conception of a W. European pact by way of counteracting the gradual westward infiltration of Russian Communist influence. A W. European treaty, valid for 50 years, finally took shape at the Brussels conference in March 1948. (See BRUSSELS TREATY, 1948.) In Sept. 1948 B. made a speech embodying the idealism on which his foreign policy was fundamentally based: 'Let us open up our countries to inspection, all of us: let us open up the world; let light and knowledge come in'—and he looked forward to the day when individuals would be able to travel freely wherever they wanted, without the need of visas or passports. B.'s ill health became increasingly obvious, and he resigned the foreign secretaryship a month before his death, being appointed lord privy seal. See life by T. Evans, 1946. His speeches and broadcast addresses were pub. in 1942 under the title *The Job to be Done*.

Bevis of Hampton, prin. character of an Eng. medieval romance. His father was Sir Guy, Earl of Hamptoun (Southampton). On the murder of his father by the Emperor Divoun of Almayne, his mother sold him to heathen merchants as a slave. Thus he journeyed to Ermony (Armenia), where he won the affection of the King, Ermyon, and the love of his beautiful daughter, Josian. The conquest of Brademond of Damascus, the slaying of a ferocious boar, and of a dragon, and the overthrow of a giant named Ascapart, whose life he spared, are among his achievements. He possessed a celebrated sword called Morglay. His death after 30 years of domestic felicity took place at the same time as that of his wife and his horse, Arundel. The story was retold by Michael Drayton in *Polyolbion*, 1622. Dr Kölbinger ed. the romance for the Early Eng. Text Society in 1886.

Bewcastle, vil. of Cumberland, England, 11 m. from Brampton, with a famous late 7th-cent. Anglian cross carved with a runic inscription. The church is 11th cent. Pop. 540.

Bewdley, bor. of Worcs, England, on the Severn, 14 m. NNW. of Worcester. It has manufs. of leather, combs, brass and iron ware, malt, bricks, and rope. The tn is an ant. one, and its prosperity dates from the 15th cent. Pop. 5000. See also BALDWIN OF BEWDLEY, EARL.

Bewick, Thomas (1753-1828), wood-engraver, was the son of the lessee of a small colliery. Showing small aptitude

for learning, but decided talent for art, he was apprenticed, in 1767, to Ralph Beilby, a Newcastle engraver, with whom he afterwards entered into partnership. Having pub. many woodcuts in his *Select Fables*, 1784, he estab. his reputation as an artist and engraver by the vignettes and tail-pieces of his *History of Quadrupeds*, 1790. His observation, virile humour, and technical mastery are most conspicuous in his *History of British Birds*, 1797-1804. See monograph by M. Weekley, 1953.

Bewsher, Samuel (1852-1915), school-master, and once bursar at St Paul's School. He was the founder (1881) of the preparatory school of Colet Court which prepares boys for St Paul's School.

Bex, vil. of Switzerland, in the Rhône Valley, canton of Vaud, about 30 m. SE. of Lausanne, with which it is connected by rail. There are salt mines and sulphur springs. Pop. 5000.

Bexhill-on-Sea, residential and holiday resort on the coast of Sussex, England, 62 m. from London and 5 m. from Hastings. B. is mentioned in Domesday Book; the church of St Peter in the old tn dates back to 1070, and houses the B. Slab, a Saxon tomb slab. Here is the De La Warr Pavilion (1937), a well-known example of contemporary architecture. Pop. 25,700.

Bexley, Nicholas Vansittart, 1st Baron (1766-1851), politician, b. in London, son of Henry Vansittart, governor of Bengal, and educ. at Christ Church, Oxford. He became M.P. for Hastings in 1796, and sat for various constituencies, without a break, for 25 years, until he was raised to the peerage. He was joint secretary to the Treasury in 1801, and again, under Sidmouth, in 1806, and estab. a reputation as a financial expert which has not stood up to subsequent examination. After Waterloo when a reduction of taxation was generally anticipated, he declined to abolish the property or income tax and instituted further complicated schemes for effecting economies in the National Debt services. He was now highly unpopular and, eventually, in 1822, resigned.

Bexley, residential bor. of NW. Kent, England, 11 m. SE. of London. Pop. 89,000.

Bev, see BEG.

Bevers, Christian Frederik (1869-1914), S. African soldier, b. Cape Colony, practised as lawyer at Witwatersrand. On Boer side in the war, 1899-1902, he became a general. Under Brit. rule, he was Speaker of Transvaal House of Assembly, 1906. Commandant-General of Defence Force of S. Africa, 1910; visited England, 1912. At the outbreak of First World War, he resigned, and joined in Maritz's rebellion. Caught trying to cross Vaal at Greyling, 7 Dec. 1914, he was shot at and fell into the riv., where he was drowned.

Beyle, Marie Henri (1783-1842), Fr. author, known by his pen-name of Stendhal, b. Grenoble. He was in turn soldier, shopman, and diplomatist. After some years spent in the commissariat, he accompanied Napoleon on the Russian

campaign, and was present during the retreat from Moscow. After the fall of Napoleon, he took up his residence in Milan. In 1821 he was compelled to leave this city, and returned to Paris, where he soon became known in literary circles. In 1830 he was appointed consul at Trieste and then at Civita Vecchia, and in this post he continued till his death. His works are numerous, chiefly falling into the divs. of critical works and novels, and they are all remarkable for fineness of observation and for the extraordinary abundance of their ideas. Of the first div. are *Histoire de la peinture en Italie*, 1817, *Rome, Naples, et Florence*, 1817, *Racine et Shakespeare*, 1823, 1825, and *Promenades dans Rome*, 1829. His chief novels are *Armance*, 1827, *Le Rouge et le Noir*, 1831, and *La Chartreuse de Parme*, 1839. Amongst a variety of miscellaneous works the following are interesting: *Essai sur l'amour*, 1822, and *Mémoires d'un touriste*, 1838. *Correspondance*, 1855, *Journal de Stendhal*, 1888, *Vie de Henri Brulard*, 1890, *Souvenirs d'égoïsme*, 1892, and *Lettres à sa sœur*, 1892, all pub. posthumously, are valuable as autobiography. He had the gift of psychological analysis, and it is for this, rather than for continuity and arrangement of plot, that his novels are so outstanding. Although he shared many of the literary ideas of the romantics, he remained fiercely independent. His masterpiece, *Le Rouge et le Noir*, had an enormous influence on European literature, and with Julien Sorel he created a new type of hero. B.'s stock has risen appreciably in recent times, and it has been justly said that he was a century before his true era. See F. C. Green, *Stendhal*, 1939; L. Blum, *Stendhal et le Béalisme*, 1941; A. Caracciolo, *Stendhal, L'Homme et l'œuvre*, 1951.

Beylerbey, see BEGLERBEK.

Beyrich, Heinrich Ernst (1815-96), Ger. geologist and palaeontologist, b. Berlin. In 1856 he became prof. of geology and palaeontology at Berlin Univ., and in 1873 director of the geological dept.

Beyschlag, Willibald (1823-1900), Ger. Protestant theologian and writer, b. Frankfurt-on-Main. His works include *Die Christologie des Neuen Testaments*, 1866, *Leben Jesu* (2 vols.), 1855 (3rd ed.) 1893, *Neutestamentliche Theologie* (2 vols.), 1891-2, *Christenlehre auf Grund des kleinen lutheranischen Catechismus*, 1900, and *Aus meinem Leben*, 1896-8.

Beza, or de Béze, Theodore (1519-1605), Fr. theologian, b. Vézelay in Burgundy; studied at Orléans, under Melchior Volmar, who taught him Greek and inspired him with his first leanings towards Protestantism. He studied law, but gave himself largely to polite society and literature, and wrote *Poemata juvenilia*, a vol. of loose verse, 1548, which later he regretted. In 1548 a severe illness brought about his conversion. He had already decided not to become a Catholic priest, and now, after marrying his mistress, Claudine Denosse, he joined Calvin (q.v.) at Geneva, and became prof. of Greek at Lausanne. In

1550 he pub. a drama on *The Sacrifice of Abraham*, and began a series of lectures on parts of the N.T., which ultimately led him to trans. all of it into Latin. In 1559 he became prof. of theology at Geneva with Calvin. In 1561 he represented the Protestants at the Conference of Poissy, returning to Geneva in 1563. Next year Calvin d., and B. took his place as head of the reformed churches of France and Geneva. In 1571 he presided over the synod of La Rochelle. His best-known works are an ed. of the Gk Testament, *De Haereticis a civili magistratu puniendis*, and the doubtful *Histoire ecclésiastique des églises réformées du royaume de France*; his *Confessio and Tractatus Theologici* are still of value to theologians. B.'s Codex, the Codex Bezae, or Codex D, is a Gk MS. of the N.T. in uncial characters, dating from about the 6th cent. B. presented it to the univ. of Cambridge in 1581, with a rather untrustworthy account of its hist. See lives by Heppé, 1861, Baird, 1899.

Bezant, or Byzantine, name of a coin of the Byzantine empire. The value of the gold B. varied from 10s. to a sovereign, that of the silver B. from 1s. to 2s. The gold B. was for cents, the chief gold coin of the world and was widely imitated. Owing to the commercial relations which the Byzantine empire then had they were distributed throughout the known world. They were in use in England and India until the reign of Edward III. The fact of their being brought home by crusaders led to their use in Eng. heraldry.

Bezant (heraldry), see ROUNDELS.

Bezhitza (1935-43 Ordzhonikidzgrad), former tn in the Bryansk Oblast of Russia, the main centre of heavy industry in the Bryansk industrial area. Pop. (1956) 74,000 (1939, 82,000). It was fused with Bryansk (q.v.) in 1956.

Béziers (Rom. Julia Septimana Biterrea), Fr. tn, cap. of an arron., in the dept of Hérault. It is on the edge of a plateau overlooking the R. Orb. There are pre-Rom. and Rom. remains. In 1209 there was a massacre of the townspeople by Simon IV de Montfort (see under MONTFORT) during the crusade against the Albigenses (q.v.). In the 16th and 17th cents. the tn was a Huguenot (q.v.) centre. There is a fine Gothic church, formerly a cathedral, and many anct buildings. Textiles, chemicals, and confectionery are manuf., and the tn is a commercial centre for wines and spirits. Pop. 64,950.

Bézique (corruption of Fr. *bésigue*, origin uncertain), game at cards which, under varying rules, may be played by 2, 3, or 4 persons, the number of packs being the same as the number of players, usually played by 2 players. The piquet pack of 32 cards is used, but in duplicate, the 2 packs being shuffled together. The dealer then deals 8 cards to each player, dealing 3, 2, 3, and the cards that remain are laid on the table between the players, forming the 'stock'. Trumps are fixed either by turning up the top card of the stock or by the suit of the first marriage

or sequence (*see* below) which occurs during the game. The non-dealer then plays the first card, and the second player is not compelled either to win the trick (which he can do by trumping or by playing a higher card of the same suit) or to follow suit. Unless he has something to declare, he will probably avoid winning the trick. After each trick, each player takes a card from the stock and places it in his hand, the winner taking the top card. This continues until only 2 cards remain in the stock. The trick that follows is called the 'last trick,' and after the stock is exhausted the last 3 tricks are played under different rules. The aim in B. is not to gain tricks. It is (1) to secure certain combinations of cards in the hand, which, when declared, add to the score; (2) to gain in play brisques, i.e. as many aces and tens as possible; (3) to win the 'last trick,' which, as explained above, is not the last trick of the game. Scores are gained as follows: *Marriage* (king and queen of any suit), 20; *Royal Marriage* (king and queen of trumps), 40; *Sequence* (ace, ten, king, queen, and knave of trumps), 250; *B.* (queen of spades and knave of diamonds), 40; *Double B.* (all the B. cards), 500; four aces (of any suit, whether duplicates or not), 100; four kings, 80; four queens, 60; four knaves, 40. These are all gained by declaration. Winning of last trick, 10. In addition to this, if the dealer turns up the seven when turning up for trumps, he counts 10. If the seven of trumps is in the hand, the player may either exchange it for the card turned up, or declare it and count 10. Lastly, at the end of play, each player counts up the number of aces and tens in the tricks he has won, and registers 10 for each.

The deal goes on alternately until one of the players has scored 1000. This closes the game. If the loser has scored less than 500 points, the game counts double. Three and four-handed B. are played under almost the same rule. In four-handed B. the players may form partners, declarations may be made after a win by either partner, and B.s may be from either hand. Other forms of the game are Polish (or open) and Rubicon B.

Bezoar, or **Bezoar Stone**, concretion or hardened mass occasionally found in the stomach or intestines of ruminating animals, as goats, llamas, antelopes, cows, etc. The name is of Persian origin, and means antidote to poison, the stones obtained from the Persian wild goats being at one time much esteemed in that connection. They appear to be formed through the presence of some irritating substance in the alimentary tract. Balls of hair are found in the intestines of Brit. cattle, but these have little or no accretion. The term is sometimes applied to the fossilised dung of extinct animals found in the Lias beds of Glos. *See* CAPRA.

Bezawada, now called Vijaywada, tn in Andhra State, India. Situated on the l. b. of the R. Krishna (Kistna) B. has long been an important centre of communications by land and by canal and was once an important Buddhist religious

centre. In the local museum there is a colossal figure of Buddha in black granite found in one of the striking hills which hem the town in. There is also a fine Hindu cave-temple of great antiquity at Undavalli close by.

Bhagavad-Gītā (the song of the blessed), religious and philosophical poem of India which is inserted as an episode in the 6th book of the *Mahābhārata*. It begins by describing the state of war between the 2 tribes of the Pāndus and the Kurus. The 2 tribes are closely united in blood, and this renders Arjuna, Chief of the Pāndus, unwilling to slaughter his adversaries. But Krishna is with him in the form of his charioteer, and now recalls him to his duty, and instructs him in the work of a warrior. As the instruction continues it becomes more elevated and mystical, until at last Krishna reveals himself as the supreme lord of creation. The work is the greatest ethical product of Indian philosophy, but there is much confusion of elements caused by the various alterations it has undergone. Pantheistic and monotheistic ideas are mingled with high ethical teaching. The main aim of the book is to teach the way of mystic souls to the Yoga or absorption in the Deity, which it proposes as the highest aim of humanity. The later recension of the work shows traces of the influence of Buddhist and possibly even of Christian thought. *The Song Celestial* is a trans. or paraphrase of the B.-G. done into blank verse by Sir Edwin Arnold. *See* N. Macnicol (ed.), *Hindu Scriptures* (Everyman's Library), and S. Radhakrishnan, *The Bhagavad-Gītā*, 1948.

Bhagirathi: 1. One of the chief head-streams of the Ganges, rising on the W. slopes of the Himalayas in the neighbourhood of Kedarnath (22,770 ft.). It is regarded as sacred by the Hindus.

2. Branch of the Ganges which flows past Murshidabad, and later becomes the Hugli, one of its prin. outlets.

Bhamo, tn of Burma, on Upper Irrawadi, 40 m. W. of the Chinese frontier. B., the second largest tn in the Kachin state, has been a trading centre on the trade route to Yunnan, in China, since the 12th cent. An Anglo-Chinese convention in 1893 gave special trading rights with Yunnan to Britain. Its chief industry is the transit of goods. During the military operations in Burma in 1944, B. fell to Chinese forces on 16 Dec. Pop. 10,000.

Bhandarkar, Sir Ramkrishna (1837-1925), Indian orientalist, son of a Brahman civil servant. Was recognised as one of India's most distinguished orientalists, and represented the Bombay Presidency at the Vienna Congress of orientalists. He was the founder of the *Indian Antiquary* (1872); pub. *The Early History of the Deccan*, in 1884.

Bhang (Hindu word), name for Indian hemp (*Cannabis sativa*), but applied to a narcotic drug formed from its dried leaves. It is used sometimes for smoking, either alone or with tobacco, sometimes it is strained in water to produce an intoxicating drink, sometimes it is used for

chewing. It is in common use among the Indian races, and also among the Arabians and Egyptians. In addition to intoxicating effects, it produces hallucinations, as opium does.

Bharata Natyam, classical dance art of India, originating in the dances of the deva-dasis, the temple dancing-girls. Though the practice of dedicating girls to this service has been abolished, the art has been preserved, in its most pure form in S. India, and is studied by amateurs and professionals. Its development envisaged performance by women dancers alone. It can take the form of pure dance with the accent on the rhythmic element or of expressionistic dance, illustrating a story with the help of mime and of *mudras* or symbolic gestures. Since temple companies have ceased to exist, dances for *ensembles* are not often performed.

Bharatpur, former Indian State now included in Rajasthan state, India. The cap. of the state is the tn of B., whose immense mud walls still remain. It successfully resisted a siege by the British in 1804, but was captured by storm by them in 1826. See INDIAN PRINCELY STATES.

Bhartihari, Indian poet who is supposed to have lived during the 1st cent. BC, but sometimes identified with a writer who lived c. 650 AD. The best-known work attributed to him is a collection of apophthegms, arranged in 3 centuries or groups of 100. It is possible that they are the work of various hands. The first century deals with love, the second with ethics and morality, the third with asceticism, and devotion to the Divine Being. A critical ed. by Böhlen appeared at Berlin in 1833.

Bhatkal, tn in the S. of Bombay, India, 80 m. N. by W. of Mangalore. Was a prosperous mart from 1300 to 1600 when it was the port for Vijayanagar (q.v.).

Bhattacharya, see KUMARILA BHATTĀ.

Bhau Daji, or Ramkrishna Vital (1822-1874), Indian physician, a Sarasvat Gond Brahmin, b. Mandra, Goa; educ. in Bombay, and became a teacher in the Elphinstone School; studied medicine at the Grant Medical College, 1845-50. He did valuable research work in connection with the treatment of leprosy.

Bhavabhūti, Indian dramatic poet who fl. at the beginning of the 8th cent. of our era. He came of an illustrious Brahman family, and is the author of 3 Sanskrit dramas which raise him to the level of Kālidāsa and Harsha. The 3 are the *Mahāvīra-charita*, *Uttara-rāma-charita*, and *Mālātī-Mādhava*, the story of the two first being drawn from the legend of Rama. All three have been trans. into English separately.

Bhavnagar, or Bhaunagar, formerly a princely state of India, then merged in Saurashtra state, now itself merged into Bombay. The cap. is a port on the Gulf of Cambay, 60 m. NW. of Surat, and is an important centre for the export of Kathiawar cotton. See INDIAN PRINCELY STATES.

Bhils, aboriginal, pre-Aryan people of Central India, found scattered over the hilly dists. there, but especially in the Khandesh dist. of Bombay and the Vindhya Hills. They were driven out of the fertile dists. by the Aryan invaders, and thenceforth led the wild, nomadic life of outlaws. An unsuccessful attempt having been made to subdue them, the Bhil Corps was formed in 1825 to utilise their fighting instinct, and this corps secured some order in their dists. The Bhil is short dark, active, and a great woodman; he is brave but superstitious. They number about a million.

Bhilai, tn of Rajasthan, India, on the Betwa R., 26 m. NE. of Bhopal (q.v.), and 16 m. NW. of the famous Sanchi (q.v.). B. itself is a place of Hindu pilgrimage, and has taken the place of a very ancient Hindu city, Vidisa.

Bhopal: 1. Former Indian princely state (q.v.), since 1956 merged into Madhya Pradesh state. It was founded in 1723 by Dost Mohamed Khan and concluded a treaty with Britain in 1818.

2. The former cap. of B. state, now the cap. of Madhya Pradesh, 325 m. SW. of Allahabad. It has an aerodrome and is watered by 2 large artificial lakes. The Taj-ul-Masjid is said to be the largest mosque in India. Pop. 102,000.

Bhowanagore, Sir Manoharjee Merwanjee (1851-1933), b. Bombay, the son of a Parsee merchant; educ. at Elphinstone College and Bombay Univ.; became sub-editor of the *Statesman* in 1871. In 1873 he came to England as state agent for the maharaja of Bhavnagar. In 1895 he entered Parliament as Conservative member for Bethnal Green. He was knighted in 1897. He pub. *History of the Constitution of the East India Company*, 1871, and a Gujarati trans. of Queen Victoria's *Life in the Highlands and Loyalty of India*, 1916.

Bhubaneswar, city of Orissa state, India (see BHUVANESHWAR).

Bhutan, independent state in the E. Himalayas, bounded on the N. and E. by Tibet and India, on the S. by India, on the W. by the independent state of Sikkim. The surface is extremely varied, and B. presents a series of lofty, forest-clad mt ranges, alternating with deep-out valleys. Through these valleys swift rivers run in a southerly direction, ultimately joining the Brahmaputra. During Brit. rule in India relations with B. were governed by various treaties from 1774 onwards, the substance of all of which was to guarantee B.'s internal independence, to provide that external relations should be subject to Brit. guidance, and to fix an ann. subsidy. In 1942 this was fixed at Rs. 200,000. In Aug. 1949 the Indian Gov. negotiated a similar treaty, with a subsidy of Rs. 500,000. The maharajah has an agent at Kalimpong (India); the Gov. of India are represented in B. by the political officer, Sikkim. There were formerly 3 supreme chiefs of the state, the Dharma Raja, head in spiritual matters, and the Deb Raja, head in temporal affairs; but in 1907 the

governor of E. B. was elected hereditary maharajah by the Buddhist ecclesiastics and people. His grandson became maharajah in 1952. The religion is Buddhism. The area of the state is estimated at 18,000 sq. m., and the pop. at 600,000. Chief tns are Tashi-Cho-Dzong and Punakha (the cap.). The huge feudal castles of B. and the Buddhist temples in inaccessible situations, such as Tak Tsang, the Tiger's Nest, are described by the Earl of Ronaldshay in *Lands of the Thunderbolt*, 1923.

Bhuvaneshwar, cap. of the Indian state of Orissa, 30 m. N. of Puri. B. is a very anct city, the earliest record of which dates back to about AD 500. It once had reputedly 7000 temples and was a great centre of pilgrimage, though it had little modern importance when chosen for the site of a new cap. lately. It still has 500-600 temples; the Great Temple is said to be one of the finest purely Hindu temples in India. Near B. are the wonderful carved cave temples (Buddhist and Jain) of Udayagiri and Khandagiri. Since 1948 B. is being developed as a model administrative centre.

Biaka, see **BIELSKO**.

Biakra, Bight of, bay on the W. coast of Africa, on that part of the Gulf of Guinea lying between Cape Formosa on the N. and Cape Lopez on the S. It contains the is. of Fernando Po (Sp.), Prince's and St Thomas (both Portuguese). Into it flow various important rvs., the Niger, New Calabar, Old Calabar, Rio del Rey, Cameroen, and Gaboon.

Bialik, Chaim Nachman (1873-1934), Heb. poet, b. in the Ukraine. Opposed the Bolshevik regime, mainly because of its suppression of the Heb. language, and went to Palestine where he became a national hero. He is indeed looked upon as the best modern Heb. poet and numerous streets in Jerusalem and other Zionist cities are named after him. He d. in Vienna.

Bialogard (Ger. Belgard), tn of Poland, in Kozalin prov., on the R. Prosnica, 15 m. SW. of Kozalin (q.v.). It has a Gothic church and an anct castle, and is in a dist. producing live-stock, sugar-beet, and fruit. Pop. 15,000.

Bialystok (Russien Byelostok, Belostok: 1. Prov. (województwo) of NE. Poland, bordered on the N. and E. by Russia. The greater part of its ter. was annexed to Belorussian S.S.R. (see **BELO-RUSSIA**) 1940-5. The prov. is low-lying, is mainly agric., and is watered by the Bug (q.v.) and the Narew. Area 8696 sq. m.; pop. 918,000.

2. City of Poland, cap. of B. prov., 107 m. NE. of Warsaw (q.v.). It was founded in the 14th cent., and belonged to Prussia from 1795 until ceded to Russia by the treaty of Tilsit (q.v.) in 1807. During the First World War B. was the scene of one of the final battles in the Ger. campaign against the Russians in 1915; at the end of the war it went to Poland. During the Second World War the Germans made a thrust towards the B.-Brest-Litovsk railway during the invasion of Russia in 1941, and there were

fierce battles in the B. area (see **EASTERN FRONT IN SECOND WORLD WAR**). By the end of the war a large part of the tn had been destroyed, but reconstruction started almost immediately. There is an important textile industry, and metallurgical, chemical, and engineering manufs. Pop. 66,000.

Blancavilla, tn in Sicily (q.v.), on the SW. slope of Mt. Etna (q.v.), 16 m. NW. of Catania (q.v.). It has a trade in citrus fruits, wine, and grain. Pop. 21,000.

Blanchina, Francesco (1662-1729), It. astronomer, b. Verona. He was a favourite of Pope Alexander VIII, whose librarian he had been, and continued in favour under Clement XI, who made him secretary of the committee for the reformation of the calendar. In 1726 he made observations of a bright spot on Venus and concluded that its period of rotation was 24 days 8 hrs. There is no consensus even now on this period.

Blandrata, Giorgio, see **BLANDRATA**.

Blard, Auguste François (1798-1882), Fr. genre painter, b. Lyons. He visited the Levant, Greenland, and Brazil. Some of his pictures show the influence of these varied travels, but he is mainly remembered as one of the few Fr. painters of humorous anecdote.

Blarritz, Fr. watering-place in the dept of Basses-Pyrénées, on the Bay of Biscay. Under the patronage of the Empress Eugénie (q.v.) B. rose from a small fishing vil. to a fashionable resort. It has a mild climate, splendid beaches, casinos, and luxurious villas and hotels. Pop. 22,000.

Bias (c. 550 BC), son of Tentames, b. at Priene, in Ionia, was one of the Seven Sages of Greece. He became a distinguished citizen of his native tn, and many of his apophthegms have been preserved. The stories associated with his name, such as his persuasion of the Ionians to settle in Sardinia, are probably unauthentic.

Bib, Whiting-pout, or Brassy, popular names of *Gadus luscus*, a fish belonging to the family Gadidae and of the same genus as the cod, whiting, and haddock. It is about a foot long and less than 5 lb. in weight. It occurs in the N. Sea and Arctic Ocean.

Biban-el-Muluk, valley of Upper Egypt, on l. b. opposite Thebes, in which are the tombs of the kings of the 18th, 19th, and 20th dynasties.

Bibbiena, Bernardo Dovizi da (1470-1520), It. cardinal, was the son of poor parents. Having entered the service of Cardinal Giovanni de' Medici, he followed him to Rome after the death of Alexander VI and was there entrusted by Pope Julius II with sev. important commissions. When his patron became pope in his turn as Leo X, he presented B. with his cardinal's hat in the year 1513. He had a lively interest in the progress of literature, and himself wrote plays in the manner of Terence. His best play, *La Calandria*, was performed in Urbino in 1513.

Bibbiena, It. tn, in Tuscany (q.v.), 17

m. N. of Arezzo (q.v.). The church has 2 terra-cottas by Luca della Robbia. Pop. 9000.

Bibby Line Ltd., steamship line founded by John Bibby in 1807. It has traded with the Far E. for a cent. and a half. The fleet now consists of 6 motor vessels (Diesel), and 3 steamers built on the Clyde by Fairfield. The 6 liners carry cargo, mail, and first-class passengers and run principally to Ceylon and Burma. In addition the company has 2 troopships of 10,000 tons and 1 of 20,000 tons. The line is operated by the firm of Bibby Brothers & Co., Bankers and Ship-owners of Liverpool.

Biberach, Ger. tn in the *Land* of Baden-Württemberg (q.v.), on the Riss, 53 m. SE. of Stuttgart (q.v.). It is a former free city of the empire. The Austrians were defeated here in 1796 by Gen. Moreau (q.v.), and in 1800 by St Cyr. It has medieval towers and gates, fine old mansions, and a splendid 13th-18th-cent. church, as well as a museum and an art gallery. There are mineral springs. Pop. 17,000.

Bibiens, family of It. architects (17th and 18th cents.); notable designers of theatres and theatrical scenery in Italy, France, Austria, and the small princely court towns of Germany. The prin. members of the family were Francesco B. (1659-1739), who built theatres at Verona and Nancy, and his nephews—Antonio B. (1700-74), who built theatres at Rome, Bologna, Siena, Mantua, Pistoia, Livorno, and Giuseppe Galli B. (1696-1756), who pub. many magnificent engravings of theatrical designs.

Bibiru, see GREENHEART.

Bible, The (Gk *ta biblia*, 'the books'; Lat. *Biblia* (singular); in N.T. referred to as *hai graphai*, 'the writings, scriptures'). The B. contains in 1 vol. the sacred books of the anc. Israelites and of Christianity. It falls into 2 parts, the Old Testament (O.T.) and the New Testament (N.T.), testament really meaning covenant. The relations of the Israelites with God were governed by a covenant, ratified with Moses on Mt Sinai (see ISRAEL). This made them a Church, the Elect or Chosen People of God. Jesus Christ (fulfilling prophecy, cf. Jer. xxxi. 31ff.) replaced the old Mosaic covenant with a New Covenant in His blood, at the Last Supper and on the Cross. This covenant, rejected by all but a small remnant of the Jews, was not racial or national, like the Old, but universal (Catholic), and open to all mankind, and under it was estab. the Christian Church as God's new Israel, inheriting all the promises of the Old. The Hebrew for covenant, trans. into Greek by the ambiguous *diathēkē*, became the misleading Latin *Testamentum*. The O.T. and the N.T. are the record of God's revelation of Himself to mankind, under the 2 dispensations, of the Old Covenant and the New.

(a) *Its historical value*. For Jews and Christians the truth of their B. is in a special sense guaranteed by its divine inspiration (see (b) below). Its immense religious importance, however, with the

growth of rationalism since the Reformation and the development of scientific historical method and research, has led to a minute and sceptical scrutiny and testing of its trustworthiness and authenticity since the 18th cent., an ordeal from which the Scriptures have now emerged with their value as first-class and reliable historical documents triumphantly vindicated. As a mere record of antiquity, intimate and continuous over an immense period of time, and covering almost every field of human life, the B. is of unique historical importance. At times the most damaging theories were put forward concerning the authorship, the date, and the trustworthiness of the biblical documents (e.g. by the 19th-cent. Tübingen school of criticism, q.v.). But always with the growth of knowledge, and the great advances made by archaeology and philology, sceptical theories have been refuted, and the B. justified. 'In the light of such evidence, it is a far cry from the time when adventurous European savants could seriously date the composition of a considerable part of the Heb. B. in early Rom. times...' and suggest 'equal absurdities in dating parts of the N.T. ... It is sheer hypercriticism to deny the substantially Mosaic character of the Pentateuchal tradition. Abraham, Isaac, and Jacob no longer seem isolated figures, much less reflections of later Israelite hist. ... the patriarchal narratives have a historical nucleus throughout,' recast in a way 'emphasising its religious and pedagogical values. Our gain is thus far greater than any possible loss [by omission of details]. There is no longer the slightest reason for dating the song of Miriam (Exod. xv) after the 14th cent. BC.' (W. F. Albright, *The Archaeology of Palestine*). The same scholar, describing the historical books that follow the Pentateuch, speaks of them as compilations of 'priceless documents copied or abridged with the greatest care, and some ... reproduced verbatim,' and of 'painstaking care and accurate reproduction of the compiler's material,' including 'older written documents and oral tradition.' As for the poetic books of the O.T., he says 'archaeology tends to modify ... extreme positions' as to their dating. 'There is no longer any reason to refuse a Davidic date for such psalms ... it has become improbable that any of them descend below the 4th cent. BC. We find a similar position with Proverbs ... (and) there is now less reason than ever to date Job and Ecclesiastes after the 6th, 5th, and the 3rd cents. respectively. ... The facts brought to light by Palestinian archaeology agree with specific points in biblical hist. ... Biblical historical data are accurate to an extent far surpassing the ideas of any modern critical students, who have consistently tended to err on the side of hypercriticism' (op. cit.).

As Prof. Albright says, it is far more difficult to apply archaeology to the N.T. than to the O.T.: the latter spans a period of over a millennium and a half,

whereas the N.T., from the opening of Christ's public ministry to the death of Sts Peter and Paul, covers only about a third of a cent. Yet wherever historical research and discovery have shed any light it has always confirmed in an astonishing way the truth and meticulous accuracy of the N.T. writers. This is particularly so with St Luke, in his Gospel and in Acts. (Cf. E. Power, 'Archaeology and the Bible,' in *Catholic Commentary on Holy Scripture*, 1953; W. F. Albright, Director, Amer. School of Oriental Research, Jerusalem, 1919-36, *op. cit.*; F. G. Kenyon, *The Reading of the Bible*; and all modern commentaries on Luke.)

This scrupulous historical truthfulness on the part of the biblical authors is a natural consequence of their religious faith, quite apart from any question of divine inspiration. They worshipped the God of Truth, and also the Living God, a God manifesting Himself actively in hist. Judaism and Christianity are unique in being specifically historical religions: their teachings are bound up inextricably with the truth of a certain series of historical events as such. Their scriptures therefore consist very largely, not of myths and legends, but of historical records, and unless these are true the religion itself loses its credentials.

(b) *Inspiration.* Jews (see JUDAISM) and Christians alike regard their scriptures as the inspired Word of God. But since the Reformation Christians have been divided as to what inspiration implies. All agree that the human authors were inspired by the Holy Spirit, and that the B. is both a record of God's self-revelation to His people and also, in a real sense, God's Word, speaking to us to-day. But widely varying views are held about (i) the doctrinal sufficiency of scripture, and (ii) the nature and extent of inspiration, especially with reference to the inerrancy of scripture. (i) It was a cardinal tenet of the Protestant reformers, in rejecting eccles. authority, that the B. and the B. only, was the source of Christian doctrine, and that its meaning is evident enough to any man who reads it with the help of the Holy Spirit. Previously, however, it had been universally accepted that there were 2 founts of revealed truth, the B. and the tradition of the Church, and the former was to be interpreted in the light of the latter. Christianity for over a cent. had no N.T. The apostolic B. was the O.T. only, and Christ gave His Apostles authority to teach all nations, which they did, explaining the O.T. in accordance with their oral Gospel. The N.T. is the written deposit of that primitive oral teaching; but does it contain it all, and without ambiguity? And when the N.T. was finally completed and assembled, did the oral tradition of the Church lose its authority? Protestants said yes; Catholics said no. The Council of Trent (Session IV) affirmed that revelation 'is contained in written books and in traditions without writing, traditions which were received from the

mouth of Christ Himself, and from the Apostles under dictation of the Holy Spirit, and have come down to us, delivered, as it were, from hand to hand.' The Church of England, taking a middle course, accepted both scriptures and eccles. tradition, but declared that the function of the latter is only to explain the former ('the Church to teach, the B. to prove') and that 'Holy Scripture containeth all things necessary to salvation, so that whatsoever is not read therein, nor may be proved thereby, is not to be required of any man that it should be believed as an article of the Faith or be thought requisite or necessary to salvation' (Article vi). (ii) Until a cent. or two ago Christians had from the earliest times believed the B. to be verbally inspired: God was its primary author and dictated to the human writer the words he wrote, so that, since God cannot lie, be deceived, or be ignorant of any matter, the Scriptures were utterly free from error of any kind. So Augustine, writing to Jerome (c. 406): 'I have been taught to view the canonical Scriptures (and only them) with such reverence and respect as will show my unshakable belief that none of their authors has made any error in his writings.' But with the rise of sceptical rationalism, and the great development of natural and historical science, the old belief in the verbal inspiration and inerrancy of the B. was badly shaken. Outside the Rom. Catholic Church, roughly speaking three types of opinion now prevail. The extreme Protestant *Fundamentalists* (q.v.) cling to an absolute belief in the verbal inspiration and inerrancy of the B. and, in some cases, even of the A.V. They reject any finding of science or hist. that conflicts with a biblical statement, refusing to concede to modern science and the critical scholar an authority over God's Word that they have denied to the Church. Their obscurantism often leads them to quote biblical texts piecemeal, without reference to their context or the modifying light cast on them by the B. as a whole. At the other extreme the *Modernists* regard biblical inspiration as differing in degree, perhaps, but not in kind, from ordinary artistic and literary inspiration, and conferring no guarantee of truth or inerrancy whatever. The B. for them is the record of man's evolving faith, as God has led him nearer and nearer to the truth. There are practically no facts stated in the B. that they are not ready to jettison or explain away, allowing them perhaps a symbolic or pedagogic value. Miracles never happened. Christ was only a supreme prophet. The Gospel is reduced to morality, and even that has to be modified to suit modern needs, conditions, and knowledge. Between, are the *Conservatives*, believing the B. to be inspired in a unique sense, but not verbally nor in a way that conferred inerrancy except within the field of theology, though even there the B. has to be viewed as a whole, and the help of science and sound scholarship is needed for its interpretation. They are inclined

also to regard inspiration as a fluctuating influence, so that some parts of scripture may be viewed as more inspired than others. *The Rom. Catholic Church*, on the other hand, maintains strictly the plenary inspiration and inerrancy of scripture in every part alike, but welcomes all the certain findings of science and historical research. Leo XIII taught that the Holy Spirit roused the human author to write, and so assisted him in the work of composition that those things only and wholly which He wished should be written down; furthermore he declared that divine inspiration not only excluded all error, but did so of absolute necessity, inasmuch as God, the absolute Truth, cannot be the author of any error whatsoever (*Providentissimus Deus*). How then account for the contradictions and discrepancies that have been found in the B., and apparent contradictions between science and scripture? In the first place, inspiration and inerrancy belong to the original MS., as it left the author's hand, only. Copyists errors and alterations of the text have to be allowed for. Then, 'no error whatever exists where the sacred writer, treating of physical matters, followed sensible appearances, expressing himself metaphorically, or in the manner current at the time... the Holy Spirit did not intend to teach men these matters, which are in no way profitable to salvation' (*op. cit.*). And, more recently, Pius XII in his encyclical *Divino Afflante Spiritu* has declared that ancient documents must be interpreted strictly in accordance with the norms proper to the particular literary genres to which they belong, in which respects they differ very greatly from modern writings.

(c) (i) *The canon of scripture* (Gk *kandn*, a rod, or rule) is the list of those writings which conform to the rule of divine inspiration, and so form the B. *The O.T. canon* came to be recognised in 3 main stages, corresponding to its Jewish div. into 3 sections: the Law (Torah), the Prophets, and the Haglographa (Sacred Writings). The Law consisted of the Pentateuch (see PENTATEUCH) or Five Books of Moses (cf. (a) above). It reached its final form about the time of Ezra or soon after (c. 400 BC). The B. of the Samaritans, whose breach with Jewry became irremediable during this time, contains the Pentateuch only. The other sections of the B., however, were already formed (or forming) and venerated at that time. The corpus of the *Prophetic Writings* had certainly acquired canonical status, alongside the Torah, and been closed by about 200 BC, as we can see by references to it in Ecclesiastical (written about 185 BC). It contains the Former Prophets, i.e. the historical books of Joshua, Judges, Samuel, and Kings, compiled by the early prophetic schools, and the Latter Prophets, i.e. the 3 Major Prophets (Isaiah, Jeremiah, and Ezekiel) and the 12 Minor Prophets (Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, and

Malachi). The rest of the B., the *Haglographa*, though it included much that was very ancient (e.g. Psalms and Proverbs), and though its accumulating contents were viewed as sacred and scriptural much earlier (being referred to as such in the prologue to Ecclesiastical which was written in 130 BC), did not reach its final definition for the Jews until the Christian era had well begun. The canon of the Jewish B. was defined and closed by the rabbis at the Synod of Jamnia, in AD 90-100, in their eagerness to preserve and protect what was left to them of their religious inheritance after the destruction of Jerusalem and the temple. This decision was ultimately accepted by Jewry, and it also had a disturbing effect on Christendom, though of course the Synod itself had no authority whatever in the Christian Church. In practice the Church had already given approval and recognition to the Gk version of the O.T., known as the Septuagint (LXX), which is the source of most of the quotations from the O.T. in the N.T. and in the early Fathers. The LXX, which had originated at Alexandria among the Jews of the Dispersion, contained a number of books and passages that were not part of the O.T. canon recognised by the rabbis at Jamnia. Some of these writings (e.g. Wisdom) had been composed in Greek at Alexandria. Nevertheless they were accepted by the Church as part of the inspired Scripture, though their absence from the recognised Heb. canon gave rise to some controversy later. Jerome, the great Hebraist, again and again rejected their canonicity (e.g. in the *Prologus Galeatus*), though in later writings he accepted them (cf. *Ap. contra Ruf.* ii. 33). Even Gregory the Great described them as 'books which, though not canonical, are received for the edification of the Church' (*Lib. Mor.* 19, 21). The controversy continued throughout the Middle Ages, though the traditional acceptance of the disputed writings as part of scripture continued, and was endorsed at the Council of Florence, in the decree for the Jacobites. At the Reformation Protestants generally accepted the view of the Synod of Jamnia, and repudiated the disputed writings absolutely. The Church of England reverted to the view of Jerome and of Gregory, accepting them as part of the B. but to be 'read for example of life and instruction of manners, not... to establish any doctrine' (Article vi), and printing them as a separate section of the B. between the O.T. and the N.T., entitled *The Apocrypha*. For Rom. Catholics, however, the Council of Trent finally decided that the disputed writings, though Deuterocanonical, were as fully inspired a part of scripture as the other, or protocanonical, parts, and they are therefore printed among the latter in the order of the Latin Vulgate. (There is some confusion of terminology between Anglicans and Rom. Catholics. The Anglican 'Apocryphal' = the Rom. Catholic 'Deuterocanonical', and the Rom. Catholic 'Apocryphal' = the Anglican

'Pseudepigraphical.') The Anglican canonical Apocrypha still contains the books of Esdras and the Prayer of Mannaseh, which Trent finally excluded from the inspired scriptures.

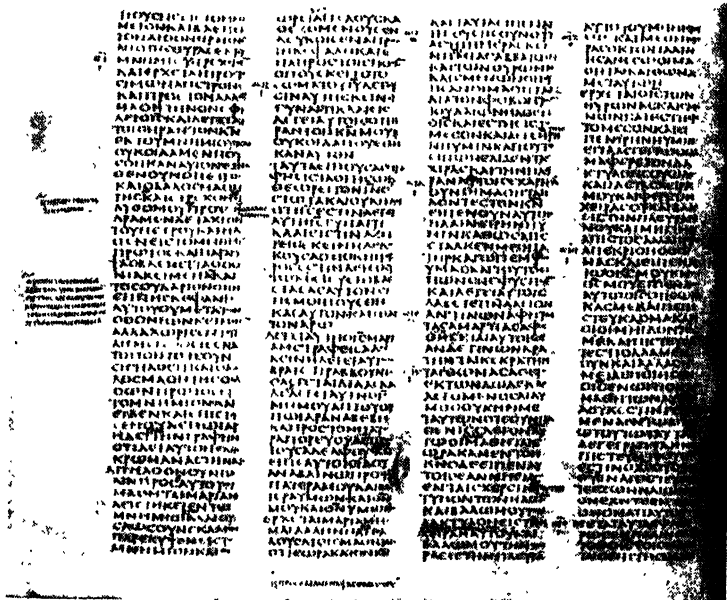

(ii) *The canon of the New Testament.* The N.T., like the O.T., took shape gradually. The Apostles did not set out to write a book but to teach by word of mouth, as they had been told. But as the Church spread preachers and catechists multiplied, and the need for written records of their teaching and witness was felt. This need intensified as the Apostles began to pass away from the scene. Written accounts of the life and teaching of Christ, at least in fragmentary form, were current quite early, as St Luke testifies in the prologue to his Gospel, and the canonical four were selected by the unerring judgment of the Church from a number of unsatisfactory if not completely spurious rivals. The essential criterion must have been immediate, or at least proximate, apostolic origin, a test that was later explicitly recognised to control the admission of any writing to the N.T. canon. This, however, was in the time of Tertullian and of Clement of Alexandria, the second half of the 2nd cent. Until then there had been perhaps some uncertainty in the matter owing to the existence of Christian prophecy, and to the claim of certain non-apostolic works to be authoritative as inspired by the Spirit, like the prophetic books of the O.T. The Christian dispensation, however, differs from the old, in that it begins with a revelation, in Christ, which is recognised as final and complete, so that the work and testimony of the Spirit in the Church and her writings is directed to the preservation and unfolding of that revelation as delivered to her by the Apostles. The O.T. on the contrary is a record of a growing incomplete revelation to which the prophets and other writers have an inspired contribution to make. The 4 canonical Gospels at any rate were recognised almost immediately as uniquely authoritative, and their dissemination throughout the Church was extraordinarily rapid. A papyrus fragment (P 52 Rylands 457, Manchester) of John xviii. 31-2, 37-8, discovered in Egypt and dating early in the 2nd cent., proves that the fourth Gospel (written in the last decade of the 1st cent.) was already circulating in Egypt within 20 or 30 years. Similarly a somewhat larger papyrus in the Brit. Museum contains the fragment of a life of Christ built out of quotations from all 4 canonical Gospels, dating again from early in the 2nd cent. Almost at once the four must have been treated as scripture among Christians, and equated with the O.T. In the 'Epistle of Barnabas' iv (c. AD 100), Matt. xxii. 14 is quoted with the biblical formula 'as it is written.' When we compare the N.T. Gospels with the kind of writing with which they had to compete (cf. M. R. James, *The Apocryphal New Testament*) we cannot but endorse the inspired wisdom of the Church in making her

choice. St Luke's 2nd vol., the Acts of the Apostles, naturally was received with the same veneration, from the first, as his Gospel. But in addition to these historical writings, a new form of inspired literature was being produced by the Apostles (and especially by St Paul) in the shape of letters to the churches and individuals whom they had established in Christ, and for whose welfare and problems they properly felt responsible. These letters were naturally treasured not only by their recipients, but by all the Christian communities who received copies of them (in some cases by direct apostolic command). That a collection of the Pauline Epistles was already being made and venerated as scripture in the earliest times is evidenced by the N.T. itself (2 Peter iii. 15); by Clement of Rome, in his Epistle to the Corinthians xlvii. 1, in c. AD 96; by Ignatius in his Epistle to the Ephesians, xii. 1, in c. AD 117; and by Polycarp (c. AD 70-156) in his Epistle to the Philippians. The 2nd cent. saw the rapid completion of the local collections of copies of the N.T. writings throughout the Christian communities. Our evidence, which is indirect, and consists of the presence of quotations from the various books in documents of the period, shows that at first, here and there, this or that book had not yet been received, or at any rate not received with confidence as apostolic. The early Church was not credulous, and writings of the kind were scrutinised with caution. However, the N.T. books that were seriously disputed were few, and universal agreement about the contents of the Christian B. gradually crystallised. The process was hastened by the activities of the gnostic heretics, with their claim to possess a secret apostolic tradition of their own: of Marcion in particular (c. 150), who, to support his denial of the O.T. revelation, not only repudiated it but also expurgated Luke and rejected all but 10 of the Pauline epistles; and also of the Montanists, who claimed for Christian prophecy the power to add new revelations of the Spirit to the original apostolic deposit. So Christian lists, i.e. canons of the N.T., began to be drawn up, the earliest that is still extant being the Muratorian fragment, discovered by Muratori in the Ambrosian Library, Milan, in 1740. This canon dates from late 2nd-cent. Rome. It omits a number of canonical books, but its fragmentary nature makes it impossible to say for certain that it did not include them originally. From the beginning of the 3rd cent. the evidence (especially that of the Chester Beatty papyri) shows that the N.T. consisted essentially of its present books, though there were some that were still disputed in different parts of the Church. These Antilegomena, or Deuterocanonical elements of the N.T., are Hebrews, James, Jude, 2 Peter, 2 and 3 John, and Revelation. Of these, Hebrews and Revelation remained longest in doubt, Hebrews in the W. (chiefly because its Pauline authorship was contested, and perhaps too because it

might seem to assert that deliberate apostasy even under persecution was beyond repentance) and Revelation in the E., because it was quoted in support of the Millenarian heresy. The decrees of Diocletian (303), directed specifically against the Christian Scriptures, shows that not only Christians but pagans were increasingly conscious of the unique importance of these books and probably helped to further their definition. Constantine had 50 copies of the complete

of its emphasis on the importance of works as indicative of faith. The Council of Trent (Session IV) in 1546 was the first council claiming oecumenical authority to deal with the canon, and it reaffirmed the N.T. in its traditional and complete form. See also under titles of the individual books.

(d) *Texts and versions.* The earliest extant MS. of the Heb. B. (apart from fragments) dates from AD 1010. The sanctity of the rolls caused the Jews to

PORTION OF CODEX SINAITICUS

British Museum

Christian B. made for his churches in Constantinople, under the direction of Eusebius (Eus. *Vii. Const.* iv. 36), which provided a standard for the E., and Eusebius recognised the N.T. as we have it, though he still expressed some hesitation over Revelation. The authority of Athanasius, however, finally extinguished that doubt. The local councils of Laodicea (363), of Hippo (393), and of Carthage (397) dealt with the canon, and we possess the list drawn up by the latter, which is identical with our canon to-day. From that time onwards disputes about the N.T. canon disappear, until the time of the Reformation when Erasmus, Cajetan, and Luther revived doubts concerning the Epistle of James, called by Luther the 'Epistle of Straw,' because

destroy them when they were too worn for use in worship, to avoid desecration. There is, however, practically no disagreement between the thousands of MSS. that we do possess, after that date, and they bear witness to the thoroughness of the work of the Massoretic scribes who set themselves to preserve the sacred text uncorrupted, by means of textual annotations (the Massorah, or tradition), in the form which it was given early in the 2nd cent. after the fixing of the canon at Jamnia. To the Massoretes we also owe the insertion of vowel points: not Hebrew (and the revived Hebrew of modern Palestine) was written only by its consonants; and they were also responsible for the div. of the text into verses (the chapter div. was a Christian

innovation of the 13th cent. later adopted by the Jews, though not in liturgical scripts). The script used in these Heb. texts is the square Aramaic alphabet, which superseded the original Phoenician-Canaanite writing at the time of the exile, when Hebrew itself also began to become a dead language and to be replaced by Aramaic in popular use. In addition to the Massoretic text (M.T.), however, we possess a papyrus fragment witnessing to the O.T. text independently, and dating back to the late Maccabean and pre-Herodian age (the Nash papyrus containing the decalogue and the *Shema* — 'Hear, O Israel,' etc.). Of similar date is the complete text of Isaiah, found in 1947 (see *SCROLLS OF THE LAW*), sealed in jars and hidden in a cave by the Dead Sea. They apparently formed part of the library of a neighbouring Essene community. This text, written in the old Canaanite script, is remarkable for its witness to the accuracy, except in minor details, of the M.T. There is also the independent witness of the Samaritan B., containing the Pentateuch only and written also in the older script. This provides an independent tradition of the text from about 400 B.C., though the oldest extant MS. is of the 12th cent. A.D. Further witness to the O.T. text is provided by the versions, of which the most important is the LXX or Septuagint (q.v.) (see above (c)), preserved and copied in a large number of MSS. by the Christian Church. The earliest almost complete texts of the LXX are contained in Codex Vaticanus (4th cent.), and in the 2 codices now in the Brit. Museum, Sinaiticus (4th-5th cent.) and Alexandrinus (5th cent.). But brief fragments of the Maccabean age have been found among the Chester Beatty papyri, and in Rylands papyrus 458. All other versions are derived either from M.T. or LXX. MSS. of the N.T. are extraordinarily numerous and early, and in fact the N.T. is far better attested than any classical author. There are no less than 53 codices containing the whole N.T., the earliest of which are the Uncials (written in capitals), Vaticanus, Sinaiticus, and Alexandrinus mentioned above. Others of great importance are Codex Ephraemi rescriptus (5th cent.) and Codex Claromontanus (6th cent.), both in the Paris National Library, and Codex Bezae (6th cent.) at Cambridge; these, however, do not contain the whole N.T. Evidence for the N.T. is also derived from the versions, chiefly from the Syriac B. (the Peshitta) which exists in texts of the 4th and 5th cents., and contains a much earlier trans. of the O.T. and N.T. We also possess the Syriac Diatessaron or Harmony of the Four Gospels made by Tatian (which existed also in Greek) in an Arabic version of the 11th cent. Coptic versions, in various dialects, also exist and we possess fragments from the 3rd and 4th cents. (Chester Beatty, and Brit. Mus. Or. 7594). Fragmentary remains survive of the Old Lat. version, going back to the 2nd cent., on which Jerome improved in his Vulgate at the

end of the 4th cent. Mention has already been made of early papyrus fragments that have been found in Egypt, and of quotations from the N.T. found in the Fathers. In all there are no less than 210 uncials, 2400 minuscules (small letter), 50 papyri, and 1610 lectionaries, from which our direct knowledge of the N.T. text is derived (F. Power, 'Languages, Texts, and Versions of the Bible,' *Catholic Commentary* 1953). Scholars have distinguished 4 families of texts, the Western, Eastern, Antiochene, and (less certainly) the Caesarean. (c) *The English Bible*. The eagerness of the Church that the B. should be widely read and understood is shown by the number of vernacular versions produced from the first. In the W. the Teutonic languages throughout the Dark Ages had not become literary, and all who could read, read Latin. It was in England that a B. in the native tongue first began to appear, with Caedmon's partial paraphrase (c. 670), Bede's St John (735), and Aelfric's partial O.T. (990). The Norman Conquest then put an end to the growth of an A.-S. B., and the language used for literary purposes in England for some cents. was Norman-French, in addition of course to Latin. A Norman-Fr. version was produced and gained currency in due course. It was unfortunate that when an Eng. version of the whole B. did appear (an Eng. psalter preceded it) it was associated with heretical and revolutionary views, expressed in its prologue by John Wycliffe (q.v.). This made Eng. versions suspect by eccles. and civil authority for many years. Nevertheless the trans. itself was excellent and sound, and as such was not objected to. In fact it was widely used by kings, nobles, and religious once suspicion had died down. The early Wycliffe version was issued probably about 1382, and the later version in 1388, 4 years after Wycliffe's death. What part Wycliffe himself actually took in the trans. is uncertain; it is, however, supposed on fair evidence that he trans. the Gospels. The work began by the trans. of the Gospels, and this part was probably finished some 20 years before the B. was pub. The O.T. portion of the early version was probably the work of Nicholas of Hereford; the later version, probably the work of Wycliffe's successor, John Pusey, is certainly idiomatic English, a great improvement on the early version. It was also popular, and many copies survive despite the persecution of the Lollards (q.v.). These versions were the last of the MS. B.s of England. In the 15th cent. Caxton (q.v.) had introduced the art of printing into this country. The printing of an Eng. B. did not, however, immediately follow. No complete Eng. B. was printed in England before 1538. A printed ed. of the N.T. by Tyndale (q.v.) appeared in 1535, having been trans. into the vernacular and printed under difficulties. During the 10 years which followed, Tyndale also trans. and printed various other portions

of the B. The characteristic of Tyndale's trans. is his independence of the work of any other translator. The first full trans. of the Eng. B. is the work of Miles Coverdale (q.v.), who, although contemporary with Tyndale, is independent of him. Coverdale probably used in his trans. Luther's B., the Vulgate, and, from some evidence, Tyndale's. The first Eng. B. printed in England was the work of one Thomas Matthew (alias John Rogers, q.v.), the greater part of whose work is a reproduction of Tyndale and Coverdale. This B. was printed by the king's licence, and from it we get all our subsequent eds., this being taken as the standard work. The next ed. of the Eng. B. was the 'Great' B. undertaken under the patronage of Thomas Cromwell. Its title-page showed Henry VIII presenting the B. to Crammer and Cromwell, who in turn presented it to the clergy and laity. This B., printed under the supervision of Coverdale, was begun in Paris, but finished in London after an attempt to stop the printing in Paris. In 1560 appeared the Genevan or 'Breeches' B. (q.v.), at the expense of the congregation at Geneva. It was a thorough revision of the 'Great' B. The Bishops' B., printed about 1568, was undertaken as an A.V. of the 'Great' B. and was intended to drive out the Genevan B. It never succeeded in its object. There next appeared a N.T. and an O.T. trans. into English by Catholics (see MARTIN, GREGORY). The N.T. was printed at Rheims and the O.T. at Douai in 1582 and 1609-10 respectively. They had a fair amount of influence on the A.V. of the B. which appeared in 1611, and was one of the results of the Hampton Court Conference, called by James I in 1604. He suggested the revision of the Eng. B., a work to be done by the best scholars in the kingdom. The version was to be without notes, since the notes of the Genevan B. seemed to the king to be seditious and dangerous. The revisers were divided up into 6 committees, each with a special section of the B. to work upon. The whole of their work was revised by a general committee. Over 2 years were spent in that revision, and altogether the work took about 7 years. This version, in spite of the R.V., continues in general use in this country. The R.V. was the work of Convocation, which determined in 1870 that 2 committees should be formed to revise the Scriptures of the O.T. and the N.T. respectively, and with power to invite the co-operation of any eminent scholar, whatever his nationality or creed. The work ultimately became the work of Eng.-speaking non-Rom. Christians throughout the world, and was completed by 1881.

Many new versions of the B. have been produced by individual enterprise in the 20th cent., notably those of J. Moffatt (1934), R. Weymouth (1926), and of the Rom. Catholic scholars, C. Lattey (the Westminster Version) and R. Knox. In America the Standard Version and the Revised Standard have been co-operatively produced by the non-Rom.

Churches, and in Britain a new R.V. is contemplated by the Church of England.

Bible Christians, society founded in 1815 by Wm O'Bryan, or Bryant, who was a Methodist lay preacher. The name B. C. was given to the sect because they appealed only to the Bible for the doctrines which they taught. The society was founded at Shebbear, in N. Devon, and the ministrations of the Wesleyans undoubtedly had great influence on the development of this sect. The B. C. in 1907 joined with 2 other Methodist communities, the Methodist New Connexion and the United Methodist Free Churches, to form the United Methodists. An Act of Parliament sanctioning the fusion received the royal assent in 1907. Outstanding names in their denomination are those of O'Bryan, Thorne, and Billy Bray. In 1932 the United Methodist Church, having over 2200 churches, with a total membership of over 150,000, joined with the Wesleyan Methodist Church and the Primitive Methodist Church, and became 'The Methodist Church.'

Bible Communists, founded 1848 by J. H. Noyes, and known as the Oneida Community. Their primary object was

essentially religious. They practised not only community of property and life, but by means of a system called complex marriages, community of wives also. In 1879 this system was discontinued, and 2 years later the movement became a joint stock company. It has been successful financially, but with the abolition of the complex marriage system its only really distinct feature was banished.

Bible Societies, name given to various associations which have as their chief work the trans. and propagation of the Scriptures among all nations. Such societies became prominent about 200 years after the Reformation; but previous to the Reformation, and during the period immediately following it, we find the Scriptures being trans. and to a certain extent disseminated throughout Europe. Before or during the 18th cent. the following societies were formed: The Society for the Propagation of the Gospel in Wales, 1662; the Society for Promoting Christian Knowledge, 1698; the Dan. Society for Sending Missionaries to India, 1705; the Society for the Propagation of the Gospel in Foreign Parts, 1709; the Society for Promoting Christian Knowledge Amongst the Poor, 1750; the Naval and Military Bible Society, 1780. All these had the same object in view—the spreading of Christian knowledge and the trans. and propagation of the Gospels. In Germany various bodies had been formed with the same object, and the society formed in 1792 for the Propagation of the Gospel in France was brought to an end by the Revolution. The evangelical revival of the 18th cent. naturally had a great influence on these societies in England, and led to the estab. of many new ones.

The *British and Foreign Bible Society* was founded in 1804. It had its origin in the difficulty which the Rev. Thomas Charles of Bala found in propagating the Gospel in Wales, owing to the lack of Welsh Bibles. The Society was formed to send out copies of the Gospels trans. into the languages of those countries which felt need of them. The versions were to be neutral as far as doctrine was concerned, and 'without note or comment.' Like all non-Anglican B. S. its Bibles never contain the Apocryphal or Deuterocanonical books of the O.T. The original society, founded in London in the year already mentioned, consisted of a committee of 36, 6 of whom were to be distinguished foreigners resident in or near London, and the remaining 30 equally divided representatives of the Church of England and of nonconformity. The society found support and developed rapidly, having at the present day 6000 auxiliary societies in England and Wales, and over 5000 abroad. It issues over 1,000,000 copies of the Bible every year, and the same number of N.T.s, besides over 10,000,000 portions of Scripture, large numbers of them among the peoples of Asia. The Bible, or parts of it, have been trans. into over 1000 languages. The society has met with many difficulties, especially from its principle of

distributing the Scriptures without note or comment, but it has in most cases been able to surmount all obstacles. One such trouble arose in 1831, when the society proposed to demand a belief in the Trinity as a condition of membership. Arising out of this the Trinitarian Bible Society was created.

Other Brit. B. S. which may be noticed briefly here are the Edinburgh Bible Society (1809) and the Glasgow Bible Society (1812). Difficulties as to the form in which the Scriptures should be pub. by the Brit. and Foreign Bible Society, led these to disassociate themselves from that body, and form in 1861 the Scottish National Bible Society. The Dublin Bible Society was founded in 1806, and afterwards, by amalgamation with kindred societies throughout Ireland, became the Hibernian Bible Society. It is associated with the Brit. and Foreign Bible Society, and contributes annually to the funds of that society. Among the more important of the European B. S. may be mentioned the Prussian Protestant Bible Society (1814), originally started as the Berlin Bible Society in 1806; the Russian Bible Society (Revel) (1807); the Swedish Bible Society (1814); and the Finnish Bible Society (1813). Most of these found considerable support in the early days from the Brit. and Foreign Bible Society. In America the Philadelphia Bible Society was founded in 1808, and gradually a number of societies grew up which by 1839 had all amalgamated into the Amer. Bible Society. The American is one of the most active of all B. S., distributing over 12,000,000 copies of the Scriptures every year, and translating these into nearly 300 different languages. The Gideons, or Christian Commercial Men's Association of America, formed at Janesville, Wisconsin, in 1899, which claims to be the oldest interdenominational laymen's evangelistic association in the world, began, in 1908, to place bibles in every hotel guest-room; and this work was followed in later years by distributions to hospitals, prisons, and the armed forces.

Biblia Pauperum, Lat. for 'poor men's Bible,' is the name given in modern times to a series of MSS. and printed books which contain crude biblical illustrations, with a short explanatory text to each picture. Very often these pictures represented events in the life of Christ, together with the corresponding O.T. prefigurations or types; the text was in rhyming Lat. verse. On an antependium or altar-front of 1181 in the Leopold Chapel of Klosterneuburg in Austria 15 scenes from the life of Christ were executed in enamels. Each scene was accompanied by 2 O.T. types. An early 14th-cent. MS. at St Florian, in Austria, is the first known to contain a similar triple arrangement. The books which contain such pictures belong to the class of block-books (q.v.).

Bibliography is derived from the post-classical Gk word *bibliographia*, which, when first used, meant the writing of

books, and was so used in France (*bibliographie*) till the 18th cent., and in England till the 19th cent. It was mainly owing to T. F. Dibdin that the change was then made in England. The usual definition of the science of B. is the systematic description and hist. of books, their authorship, printing, pub., eds., etc. B. also means any book containing these details, and its more widely used meaning is a catalogue of books by a particular author, or of the literature of a subject. B. as the science of books as such comprehends the subject and class of the work, the size, the pagination, the type, the plates, the rarity, etc. It will thus be seen that the ideal of bibliographic work is the provision in an accessible form of a comprehensive description of a copy of any book, possessing any typographical, historical, or literary interest, in its original form as first pub., and of any different issues of it. The standard description of a book generally consists of the following sections: (a) a transcript of the title-page, the colophon (if any—i.e. the note of pub. at the end of a book), and any other distinguishing headings. (b) Collation, or description of the number of leaves in the book, the measurements of such leaves, and the different kinds of type employed, etc. (c) A description of the literary contents of the book, and any other detail providing some distinctive or necessary information about the particular book being described. When a bibliographer wishes to describe a book, he examines it first of all to discover its origin, and to see if it is in perfect condition. Ultra-violet rays and chemical analysis are among the scientific aids used in establishing whether a book is what it purports to be. The type also must correspond to the alleged date of the work, and a search must be made in case any leaves have been inserted from another copy in order to supply omissions. This can be discovered by observing whether the 'signatures' of the folios run on consecutively, at the foot of the eighth, twelfth, etc., page, depending on whether the book is 8vo, 12mo., etc. The 'size' of a book is the relation of the size of the separate pages to the original sheets of paper of which they formed a part. Thus when a sheet is simply folded in two the book is in folio, when in four it is in quarto, when in eight octavo, or 8vo, etc.

Of the many bibliographical catalogues already compiled by notable bibliographers, the following general ones are in most constant use to-day for establishing the identity of a book: the *Short Title Catalogue*, 1475-1640, of Pollard and Redgrave, and the continuation vols. by Wing, covering the pub. of 1641-1700; Robert Watt's *Bibliotheca Britannica*, 1824; the *Bibliographer's Manual* of Wm Thomas Lowndes (q.v.); Hain's *Repertorium Bibliographicum*, 1826-38, and Dr Copinger's *Supplement to Hain*, 1902; the *General Catalogue of the British Museum*; the *Cambridge Bibliography of English Literature*, 1940, ed. by F. W. Bateson.

Outstanding B.s of authors are Jagard's *Shakespeare*, 1911, Michael Sadleir's *Trollope*, 1928, and Gallup's *T. S. Eliot*, 1952. Then there are B.s of books pub. during a certain period, as W. W. Greg's *Bibliography of the English Printed Drama to the Restoration*, 1939-51, or concerning a particular country, as John Ferguson's *Bibliography of Australia*, 1st vol. in 1941, or about a special subject, such as Raymond Irwin's *British Bird Books*, 1951. In this connection it should be mentioned that the catalogues of the libraries of great book collectors, and also the sale catalogues of booksellers and auctioneers, are of great value as B.s—e.g. the Harmsworth collection of Americana sold by Sotheby's, 1948-53, Michael Sadleir's *Nineteenth Century Fiction*, 1951, Lord Rothschild's Library of 18th-cent. books, and Maggs catalogue of *Sports and Pastimes*, 1950. Catalogues of libraries which serve as bibliographies of a subject include the Royal Empire Society, and the catalogues of exhibitions serve a similar purpose, such as those of the National Book League exhibitions *A Thousand Years of French Books*, 1948, *Flower Books*, 1950, and *Waller de la Mare*, 1956. Book lists and Readers' Guides are also pub. by the National Book League (q.v.) as well as other organisations, and these, as well as the reading lists at the end of books, or even chapters of books, are often called B.s, but are not strictly so as they rarely give more details than author, title, publisher, and date of a book, and sometimes price or number of pages. Other notable bibliographers than those mentioned above are T. F. Dibdin (q.v.), Sir Samuel Egerton Brydges (q.v.), R. B. McKerrow, author of the standard work on B., Fredson Bowers of the Univ. of Virginia, and Theodore Besterman, compiler of, among other things, *A World Bibliography of Bibliographies* (3rd ed.), 1955 (4 vols.).

See R. B. McKerrow, *Introduction to Bibliography for Literary Students*, 1927; J. D. Cowley, *Bibliographical Description and Cataloguing*, 1939; Arundell Esdaile, *A Student's Manual of Bibliography*, (revised ed.), 1954; and 2 pamphlets, *Bibliographical References*, Brit. Standard 1629, 1950; David Foxon, *The Technique of Bibliography*, 1955. See also the transactions of the Bibliographical Societies of London (*The Library*), Oxford, Cambridge, and Edinburgh, and the B. Society of America and of the Univ. of Virginia (*Studies in Bibliography*). See also CATALOGUING AND CLASSIFICATION.

Bibliomancy (Gk *biblion*, book; *mantia*, prophecy), name given to a method of obtaining prognostics of the future. The procedure is as follows: The person wishing to obtain information opens the book at random, and then endeavours to apply the passage displayed to the particular case. The book usually chosen now for the purpose is the Bible; the ancients used Homer or Virgil, the process being then termed *sortes Homericæ* or *sortes Virgilianæ*.

Bibliothèque Nationale, Fr. national library in Paris. There is mention of a collection of MSS. by Charlemagne, but the most famous of the early collections is that of Charles V. The library has had many homes, as, for example, at Fontainebleau under Francis I and later in Mazarin's palace. The Hôtel Tuboeuf No. 8, destined with adjoining mansions to become the B. N., was, it is said, staked at the gambling table and won by Mazarin. The vast mansion he built on the site was divided among his heirs and in its different parts was put to various uses till, in 1721, it was bought by the Crown. The king's library was then taken there from the Rue Vivienne, where it had been placed in 1666, and opened to the public. The modern part of the building, dating from 1854, has been reconstructed in recent times and enlarged. The chief entrance to the library is in the Rue de Richelieu.

The Petite Librairie of Louis XI was the true embryo of the actual B. N., or what has been successively the Bibliothèque Royale, Bibliothèque Impériale, and now the B. N.; but the B. N. owed its first real impetus to Napoleon, who increased the gov. grant; and in the opening years of the 19th cent. it had 500,000 printed vols. and 80,000 MSS., besides a great many engravings which Napoleon had taken from conquered cities. Numbers of these acquired treasures, however, were returned after the fall of Napoleon.

Acquisitions, gifts, sometimes confiscations, state seizure of the estates of *émigrés* or of the clergy during the Revolution, and, finally, the *dépôt légal* or regulation by which Francis I compelled every printer to deposit a copy of every book issuing from the press, swelled the royal library enormously, so that from a few hundreds of vols. it has to-day grown to nearly 8 million printed books, 123,000 MSS., 3,500,000 stamps, maps, periodicals, music, engravings, and works of art of various kinds connected with letters, and a considerable number of coins, tokens, and medals. From last cent. the importance of the collections determined their div. into 5 depts: Printed Books; MSS.; Stamps; Music; Medals. The Dept of Printed Books is the one that occupies the most space. In the time of the second empire it was found necessary, in order to house so large a collection, to instruct the architect, Labrousse, to transform the old premises of the library, comprising at that time a part of the Mazarin palace, the hotel de Névers, and those of Clivry and Tuboeuf; and it was then that Labrousse built his reading hall, one of the earliest metallic architectural works to be produced in France, and one of the most successful. The ceiling of the Galerie Mazarin is covered with splendid frescoes by Romanelli. The heart of Voltaire is said to be encased in the statue to be seen there. The following are among the rarest items in the Dept of Printed Books or Département des Imprimés: A Gutenberg Bible dated by the binder; a Theophrastus with *ex-libris* autographed by François Rabelais;

a copy of Pascal's *Pensées* anterior by one year to the first ed., and not carrying the corrections authorised for that ed.; a book, which belonged to Racine, adorned with sev. portraits of the great writer drawn in crayon by his son Louis; numerous prints on vellum with illuminations (see ILLUMINATION OF MANUSCRIPTS) and miniatures in the style of medieval MSS.; luxury works reserved for monarchs, one of which is adorned with a portrait of Charles VIII; and also, rare curiosity indeed, the sole copy of the book *Christianisme restitué* by Michel Servet, snatched from the stake to which he and his work had been condemned by Calvin.

After the First World War, with the fall of the franc, the library was faced with economic difficulties, but by amalgamating with other Parisian libraries under a council of management, and securing legislative action in the matter of holding funds and acquiring books, the situation was restored.

Since 1950 current books have been listed in a Supplement to *Bibliographie de France*.

Elbra, Baron Ernst von (1806-78), Ger. writer, travelled in Brazil, Chile, and Peru, and brought home good natural hist. and ethnological collections. He pub. the results of his explorations in *Reisen in Südamerika*, 1854, and also wrote works on chem. and novels remarkable for their excellence of description.

Bibulus, Marcus Calpurnius, consul with Julius Caesar in 59 bc. His efforts to oppose Caesar's agrarian law and other democratic measures being futile, he excited ridicule by spending 8 months of his consulate shut up in his own house. Appointed praefectus of Syria in 51 bc, he was afterwards (49) given command of Pompey's fleet in the Ionian Sea. In this capacity he once more proved his futility, and d. in the following year of fatigue and mortification (Caesar, *Bell. Civ.* iii. 5-18; Dio Cassius, xii. 48).

Bibury, picturesque old vil. in Glos., England, in the Cotswold Hills, about 7 m. N. of Cirencester. Pop. 600.

Bicarbonate, old name for acid carbonate. The gas carbon dioxide (CO₂) when dissolved in water is looked upon as carbonic acid, which may be represented as H₂CO₃. If both hydrogen atoms are replaced by a metal, the resulting compound is called a carbonate, as sodium carbonate, Na₂CO₃; but when one hydrogen atom only is replaced, the result is a B., as sodium B., NaHCO₃, the name being due to the fact that the proportion of the carbonic acid group to the amount of sodium is doubled. The term B. usually refers to B. of soda which is useful medicinally as a gastric sedative and antacid. See SODIUM and SODA.

Bice, name of 2 pigments, blue and green. In the natural B., formed with clay mixed with yellow ochre, the blue and green colours are due to the carbonate of copper in the B. The artificially manuf. B. is not so durable as the natural. B. is known to artists under various names, but its use is dying out.

The etymological origin of the name is obscure. See PIGMENTS.

Biceps (Lat., from *b*, two; *caput*, head), anatomical term meaning two-headed. It is used to denote 2 muscles of the human body, one of the arm, the other of the leg. Each has 2 'heads' or points of origin. The former, the B. flexor cubiti, is the muscle on the upper arm, which serves to flex the shoulder, to flex the elbow, and supinate the forearm. The B. flexor crucis extends along the whole of the back of the thigh and flexes the knee. In popular use biceps generally denotes the muscle of the arm.

Bicester, mkt tn and urb. dist. of Oxon, England, 13 m. NNE. of Oxford. The ruins of the Rom. settlement of Alchester lie 1½ m. SW. of B., and there are remains of an Augustinian priory. There are manufs. of rope, clothing, and pale ale, and fairs are held annually in the tn. B. is in the Henley parl. div. Pop. 4220.

Biêtre, noted hospital of Paris, situated on an eminence on the S. side of the city. Founded by Louis IX as a Carthusian monastery, it was in the possession of John, Bishop of Winchester, in 1290, hence the name of B., a corruption of Winchester. Destroyed in 1632, it was rebuilt, and, after having been a hospital and a prison, became a home for indigent old men and the incurably insane.

Bichat, Marie François Xavier (1771-1802), Fr. anatomist and physiologist. *b*. Tholrette, Jura. Studied at Montpellier, Lyons, and Paris. In 1797 he was appointed lecturer in anatomy, surgery, and experimental physiology at the Hôtel-Dieu, and in 1800 he was made physician. His chief works are *Traité des membranes*, 1800, *Recherches physiologiques sur la vie et la mort*, 1800, and *Anatomie générale, appliquée à la physiologie et à la médecine*, 1801.

Bichromate Cell, see CELL, VOLTAIC.

Bickerdyke, John, pseudonym of Charles Henry Cook (1858-1933), writer. *b*. London; educ. at Baden-Baden and Cambridge Univ. In 1880 he became a barrister of the Inner Temple. His works were mainly on sporting subjects, and include *Sea Fishing*, in the Badminton Library, 1895, *Wild Sports in Ireland*, 1897, and *The Book of the All-round Angler*, 1923.

Bickerstaff, Isaac, see SWIFT, JONATHAN.

Bickerstaffe, Isaac (c. 1735-c. 1812), Brit. dramatic writer, in early life a page to Lord Chesterfield when Lord Lieutenant of Ireland. He produced, between 1756 and 1771, many dramatic pieces, which had considerable popularity, the best known being *Love in a Village*, 1762, *The Maid of the Mill*, 1765, and *Lionel and Clarissa*, 1768. Owing to misconduct he was dismissed from his post as an officer in the Marines, and had to flee the country. The remainder of his life seems to have been passed in penury.

Bickersteth, Edward (1786-1850), Anglican clergyman. *b*. Kirkby-Lonsdale, Westmorland. He was a solicitor at Norwich from 1812 to 1815, but later took holy orders, and became a secretary of the

Church Missionary Society, and in 1830 rector of Watton, Herts. His *Christian Psalms*, 1833, comprising 700 hymns, ran to over 50 eds. and was the basis of the *Hymnal Companion* compiled by his son, the Bishop of Exeter.

Bickersteth, Edward (1850-97), Anglican missionary, grandson of above, *b*. Banningham, Norfolk. He went to Delhi in 1877 to be the first head of the Cambridge Mission there, which he founded. He returned to England in 1882, and was made rector of Framlingham, Suffolk, where he remained till 1886. In the latter year he went to Japan, and was made Bishop of S. Tokyo. He worked in Japan till 1896.

Bickerton, Sir Richard Hussey (1759-1832), Eng. admiral. He took part in 1781 in the action between Hood and de Graesse off Martinique. In 1799 he was made rear-admiral, and from 1804 to 1805 was with Nelson in the Mediterranean before Trafalgar. Later he was Commander-in-Chief at Portsmouth.

Bickley, residential dist. of Bromley (q.v.).

Bicycles, see CYCLES.

Bida, tn in Niger prov. of W. central Nigeria. The Niger flows 20 m. S. Elevation, 450 ft. B. was taken by Col. F. S. Lugard (see LUGARD, LORD) in 1903 in his campaign against the N. B. is connected with Lagos by railway. Pop. 25,231.

Bidar, tn in Hyderabad state, India, which was the home of the Bahmani kings from 1428 to 1492. There are numerous fine Muslim tombs in and near the tn. It is well-known for the manuf. of Bidari ware, a traditional craft now flourishing, which consists of fine silver and gold inlay on iron.

Bidasoa, Sp. riv. which rises in the Baztán valley (q.v.) and flows into the Bay of Biscay at Fuenterrabia (q.v.). For a short distance near its mouth it forms the boundary between Spain and France, and its course was the site of sev. battles during the Peninsular War (q.v.). Length 37 m.

Bidauld, Georges (1900-), Fr. politician, educ. at Paris Univ. He became a univ. prof. and leader-writer for the Catholic *L'Aube*. He had served in the First World War; in the Second he was taken prisoner, but later released and subsequently took part in resistance to the Germans. He became prominent in post-war Fr. politics as leader of the M.R.P. (Mouvement républicain populaire), and was Prime Minister in 1946 and 1949-50. As Premier, and as Foreign Minister (1944; 1947; 1953-4), he exercised considerable influence in European politics, strongly upholding Fr. national interests, while advocating a European defensive alliance and supporting projects for inter-European economic unions.

Biddeford, city in York co., Maine, U.S.A. It has large cotton manufs. and also makes textiles, textile machinery, lumber products, and shoes. It stands on the Saco, which supplies power for factories. Pop. 20,836.

Bidder, George Parker (1806-78),

engineer, was carried round the country as a 'calculating phenomenon,' until someone, interested in his extraordinary powers, educ. him at a Camberwell school and Edinburgh Univ. He was the inventor of the swing bridge for railways, and the founder of the Electric Telegraph Co., which was the first of its kind. Victoria Docks was his greatest engineering achievement, but his claim to renown rests rather on his faculty for rapid, accurate, and elaborate calculation.

Bidding-prayer (O.E. *biddan*, to pray), an exhortation to prayer often said in England in cathedrals, at univ. sermons, in the Inns of Court, and elsewhere on special occasions. Such prayers are to be found in anct. Greek liturgies, in Gallican and pre-Reformation liturgies of England, and in the Rom. Missal's Liturgy of Good Friday. The main characteristic of the Eng. B. is that it informs the congregation of the object for which they are to pray. It ends with the Lord's Prayer. The B. is commanded to be used before every sermon, lecture, or homily in the canons of the Church of England of 1603; save in the places above mentioned, it is now obsolete. Forms of B. which have been used at various times, from the 11th to the 15th cents., were collected in the *Manuale Rituale*, 1874, of the Surtees Society.

Biddulph, urb. dist. of Staffs, England, with mining, engineering, textile, and ribbon industries. Pop. 10,890.

Bideford, seaport of N. Devon, England, 8 m. SW. of Barnstaple, lying on both banks of the R. Torridge, 3½ m. above its confluence with the estuary of the Taw. An old bridge of 24 arches unites the 2 parts of the tn. Vessels of 500 tons burden can reach the quay. B. had formerly an extensive trade; it is known as the starting-place of Sir Richard Grenville's last voyage, and it also figures prominently in Kingsley's *Westward Ho!* The playing-fields were opened by the Duke of Edinburgh in 1952; there is a newly constructed art gallery, while the par. church of St Mary has many historic documents and monuments. Industries are the making of fabric gloves, sails, boat building, and leather. Pop. 10,200.

Bidens, genus of Compositae, of which 2 species, *B. cernuus*, the Nodding Bur-Marigold, and *B. tripartita*, Tripartite Bur-Marigold, are locally common in Britain. *B. diversifolia*, from the Argentine, and *B. striata*, Mexico, are grown in gardens.

Biddle, John (1616-62), 'the father of Eng. Unitarianism,' b. Wotton-under-Edge, Glos. In 1647 he pub. his *Twelve Arguments, etc.*, against the deity of the Holy Spirit. He was imprisoned, but next year pub. his *Confession of Faith touching the Holy Trinity, etc.*, and he followed this by a tract bringing the fathers of the Church to support him. In 1656 B. was banished to the Scilly Is., where he stayed for 3 years. After the Restoration he was again brought to trial, and fined heavily. He was unable to pay, and so was sent to prison, where

he d. See his life by J. Toumin, London, 1791.

Bidpai, or **Pilpay**, legendary Indian philosopher, to whom a famous collection of E. apologues known as *The Fables of Bidpai* was once attributed. According to tradition, this B. (the title, derived from the Sanskrit, means master of knowledge) lived under a king called Dabshelim, by whom he was imprisoned, because of his free condemnation of the royal tyranny. He was later released to discuss the affairs of the kingdom, and was then commanded to write down his advice in Sanskrit in fable form. The fables early became popular, and the news of them having reached Persia the King Khosrū Anushirvan (6th cent. AD) sent Barzoi, his court physician, into India to make a collection of them, and to translate them into Pahlavi. The physician made this trans. under the title *Katilah and Dimnah*, from the names of 2 jaokals in the Sanskrit version. From the Pahlavi a trans. into old Syriac was made, and the same version was again made the basis of a more important trans. about AD 750. Then Abdullah-ibn-al-Mokaffah turned it into Arabic, and it was from this version that the fables were trans. into most of the European languages. The chief sources of the *Fables of Bidpai* are the *Pancha Tantra* and the *Hilopadesa*. The stories, which made animals speak and reason as human beings, are didactic in aim, their purpose being to infuse Buddhist doctrine, in the same way as do the *Jatakas*, or birth stories, of the Buddha, with which the fables have much in common. The fables were trans. into Hebrew by the Rabbi Joel, and from this work was trans. the *Directorium Vitae Humanae* of John of Capua, a converted Jew. This was trans. into Italian, and from the Italian into English by Sir Thomas North, 1570. There have been about 20 Eng. trans. during the last cent. See J. G. N. Keith-Falconer's *Katilah and Dimnah*, Cambridge, 1895.

Biedermann, Friedrich Karl (1812-1901), Ger. historian and politician, b. Leipzig. He was one of those who went to Berlin from the Frankfurt assembly of 1848 to urge the King of Prussia to constitute himself Ger. Emperor. He took a leading part in Saxony in the movement in favour of the unification of Germany, and was a member of the Reichstag, 1871-4.

Biel (Fr. *Bienna*), important industrial tn in the canton of Bern, Switzerland, 20 m. NW. of that city. Overlooked by the Jura, it is pleasantly situated on the lake of B. Gardens and villas enfold the tn, which is composed of an old and a modern quarter, the one semi-medieval in its irregularity, the other modern in its regular elegance. From 1362 to 1352, B. belonged to the Bishops of Basel; in 1552 it was allied to Bern, and was a free and independent city until 1798, when France seized it, but in 1815 it was again united to Bern. Its industries are watch-making, the manuf. of machines, cotton-spinning, cigar-making, tanning, and dyeing. Pop. (1955), 52,300.

Biela, Wilhelm, Baron von (1782-1856), Austrian army officer, and amateur astronomer, b. Rossau. On 27 Feb. 1826 he discovered a faint comet when he was at Josephstadt, Bohemia; and it was not known at this time that this comet had been seen on 2 previous occasions, in 1773 and 1805. It became known as B.'s comet. According to prediction from its computed orbit it returned in 1832, and it was seen again in 1845 when it split into 2 parts; on the return of the double comet in 1852 these parts had separated further. In 1872, when it was expected to return, there was a wonderful display of meteors on 27 Nov., and this shower has been repeated each year about the same date. These meteors are the debris of B.'s comet which has been spread along its track; the earth encounters this debris each Nov.

Bielaya, see BELAYA.

Bielfeld, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), at the foot of the Teutoburger Wald (q.v.), 93 m. NE. of Düsseldorf (q.v.). It belonged to the Hanseatic League (q.v.), and it has been a centre of the linen industry since shortly after the Thirty Years War (q.v.). During the Second World War it was severely bombed in 1941 and 1945. There is an ancient castle and a fine 14th-cent. church. The *Anstalt Bethel*, a remarkable charitable institution founded in the tn at the end of the 19th cent., takes in people of many different kinds who are in need of care; it has had as many as 6000 inmates at one time. In addition to the linen industry there are motor-cycle, sewing-machine, cash-register, and paper industries, and the tn is a publishing centre. Horst Wessel (see HORST WESSEL LIED) was b. here. Pop. 171,150.

Belgorod, see BELGOROD.

Belitz, see BIELITZ.

Biella, It. tn, in Piedmont (q.v.), on the Cervo. It has many ancient buildings, including a 10th-cent. baptistry and a 15th-cent. cathedral. There are important woollen manufs. Pop. (tn) 27,200; (com.) 43,000.

Bielostok, see BIALOSTOK.

Bielsk (-Podlaski; Russian Belisk), tn of Poland, in Białystok prov., 25 m. S. of Białystok (q.v.). It has an agric. trade, and cement and textile industries. Pop. 6300.

Bielski, Martin (c. 1495-1576), Polish chronicler. His *Kronika Polska* was the first book of chronicles written in the Polish language, and is the first important hist. of Poland, still having some historical value.

Bielsko (-Biala; Ger. Bielitz), tn. of Poland, in Stallinograd prov., on the R. Biala, 29 m. S. of Stallinograd (q.v.). It has an ancient textile industry, and chemical and engineering manufs. Pop. 26,000.

Bien-hoa, cap. tn of the prov. of the same name and situated on the l. b. of the Dong-nai riv. (q.v.), 20 m. NE. of Saigon (q.v.) in Cochinchina (q.v.). There is a Vietnamese school of art and sculpture, the remains of an old citadel, and a temple containing a 15th-cent. gilded

stone statue of Vishnu (4 arms) of Cham workmanship. B. produces rubber, rice, vegetables, and fish. It is connected by road and rail to Saigon and has a small airfield.

Bienna (Switzerland), see BIEL.

Biennials, plants which require 2 seasons of growth from the seedling to the production of ripe seed. In the first year they produce only vegetative shoots, in the second, flowers, fruits, and seeds, after which they perish. See GARDENING.

Bienteveo, see BENTIVI.

Bienville, Jean Baptiste le Moyné, Sieur de (1680-1768), Fr. governor of Louisiana, b. Montreal, Canada. He founded New Orleans in 1718, and estab. there the seat of the gov. He was obliged to return to France (1725) to answer accusations made against him; but he returned (1733) as lieutenant-general. He failed in a number of expeditions against the Indians and asked to be relieved of his duties. He d. in France.

Bierbaum, Otto Julius (1865-1910), Ger. poet, novelist, and critic, b. Grünberg, Silesia. He studied philosophy, law, and Chinese, but took up journalism in Munich. In 1899 he founded the literary jour. *Die Insel*, out of which grew the famous *Insel-Verlag*. He gained an outstanding success with his poems *Der Irrtum der Liebe*, 1901 (revised ed. 1906), combining traditional themes with modern impressionistic verse technique. His prose works are mainly humorous, or grotesquely satirical, notably *Prins Kuckuck* (3 vols.), 1906-7. See G. Conrad, *O. J. Bierbaum zum Gedächtnis*, 1912.

Bierce, Ambrose Gwinett (1842-c. 1914), Amer. author, b. Ohio, son of a farmer, and the youngest of 12. He enlisted in the Union Army at the outbreak of the Civil war, 1861. After distinguished service he was invalided out in 1865. He then joined his brother Albert in San Francisco, and found his way into journalism. In 1872 he came to London, and was on the staff of *Pan* for 4 years. Under the pseudonym 'Dod Grile' he collected 3 vols. of his journalistic ventures. From 1876 to 1897 he was a journalist in San Francisco. In 1891 his first book of stories, *Tales of Soldiers and Civilians*, was pub., notable for his capacity to see war in all its horrors. In 1897 he went to Washington as newspaper correspondent, remaining there until 1913, when he disappeared into Mexico, then in the throes of civil war. A last letter was received from him in Dec., saying he was attached to Villa's army. Nothing is known beyond that date. One story states that he was shot by Villa himself. His books include *Cobwebs from an Empty Skull*, 1874, *Tales of Soldiers and Civilians*, 1891, *Can Such Things Be?*, 1893, *Fantastic Fables*, 1899, *The Cynic's Word Book*, 1906, and *The Shadow on the Dial*, 1909. A self-edited collected ed. was pub. 1908-12. See J. McWilliams, *Ambrose Pierce*, 1929, and J. H. Grattan, *Bitter Pierce: A Mystery of American Letters*, 1929.

BIG BEN'S CLOCK TOWER

The sculptured horse is part of the Boudicca statue group at the north end of Westminster Bridge.

Bier's Congestion Treatment, method of dealing with certain diseases by inducing an increased supply of blood in the part affected, whether arterial or venous. His general name for the former treatment is the artificial production of active hyperaemia, as opposed to passive hyperaemia artificially produced, which includes all methods of hindering the departure of the venous blood from the part affected. Both treatments are based on the principle of assisting nature by increasing the supply of the blood, and consequently of those agencies whose function it is to resist and overcome the disease producing elements in the particular part of the body affected. The prin. method of producing active or arterial hyperaemia is the application of heat. (See also AEROTHERAPEUTICS.) The apparatus used by Dr Bier (A. V. Bier, Ger. surgeon, 1861-1949) and his assistants for this purpose consisted of hot-air boxes adapted to enclose the different extremities, the openings being well packed with fireproof asbestos cotton. The source of heat was a Bunsen burner or a spirit lamp which could be regulated. A thermometer was fitted to the box so that the temp. could be continually under observation. The usual effect of the treatment was to produce a copious perspiration. In the case of the passive hyperaemia treatment, Dr Bier achieved his object by carefully applying a bandage ('Bier's bandage') to the limb in such a way as to slow up the venous return without seriously interfering with the main arterial flow.

Bierstadt Albert (1830-1902), Amer. artist, b. Solingen, near Düsseldorf, who at the age of 2 was taken to America by his parents. He went back to Europe to study at the academy of Düsseldorf, 1853-7. Returning to America he took part in General Lander's expedition across the Rocky Mts. As a result of this trip his picture of 'Lander's Peak' attracted attention at the Paris Exposition of 1863. 'The Discovery of the Hudson River' and 'The Settlement of California' are in the Capitol, Washington.

Big Ben, great bell in the clock tower of the Houses of Parliament, Westminster. It was so named after Sir Benjamin Hall, who was first commissioner of works in 1858 when it was cast. It cost some £40,000 and weighs 13½ tons. A light is displayed from this tower when Parliament is sitting.

Big-bud, swelling of the buds of plants, particularly of black-currents and nuts, caused by infestation by gall mites.

Big Game. The pursuit of the larger fauna has had a fascination for men in all ages; anct cave-dwellers, Assyrian kings, and modern sportsmen have all taken pleasure in hunting and in recording their adventures. But to-day, instead of finding the bear, elk, or aurochs close at hand, the European hunter must go far afield if he desires to pursue B. G.

Africa. Formerly game, large and small, was abundant in N. Africa; now, except in national parks and reserves, only a few small buck remain. The best African hunting-grounds of the present day are in Kenya and Tanganyika, but a fair amount of game is to be had in N. Rhodesia, Uganda, and the Sudan. In most of the above territories elephant, rhino, and buffalo are still plentiful, and lion can be got (but not so easily, for lions receive special protection in areas where they do no harm). The picturesque days of native porters are past and their place has been taken by the safari lorry and ubiquitous Land Rover or jeep. The expenses of a modern hunting trip are in any case considerable, and, if the sportsman desires a full-dress safari with a first-class white hunter and all the latest luxuries, can run up to £1000 a month. Specimens of the animals already mentioned should be obtained on a month's trip, together with hippopotamus, eland, and a large variety of the smaller antelopes. Most safaris outfit in Nairobi, get licences and permits, and then go by road to the area chosen for shooting. The cost of a visitor's licence varies according to the different territories but is usually in the neighbourhood of £50. An additional special licence is necessary to shoot elephant or rhino. If a sportsman wants a particular trophy, such as white rhino, giant sable, or nyala, a special journey will be necessary. Careful inquiries should be made before setting out, for certain animals may suddenly be subject to special legislation prohibiting all hunting on account of their rarity. There are, however, less expensive ways of seeing B. G. in its natural surroundings, and most African countries have estab.

National Parks where wild animals can be seen, studied, and photographed. The majority of National Parks have camps from which a system of tracks covers most of the country. All game quickly loses its fear of motors and it is not uncommon for lions to scratch themselves on the bumper bars of onlookers' cars. The days are past when an attack of fever was almost certain, and provided the sportsman remembers to take one of the modern antimalarial prophylactics regularly, he should run no risk.

India has always been famous for its wild animals, but enjoying the best sport is expensive. There is an immense variety of game, tiger, leopard (or panther), lion, wild boar, rhinoceros, and buffalo, besides deer and gazelles, from the lordly sambar downwards. The tigers are unmatched elsewhere; one was shot which measured 10 ft 2 in. in length, including tail, and weighed 540 lb. Tigers are to be found in many parts of India, but especially in the Terai jungles (along the foot of the Himalaya), and in the Sundarbans. They are generally shot when sitting up over a kill, from elephants, but sometimes from trees, towards which they are driven by beaters. Lions are preserved in the W. and are sometimes of great size. Leopard (or panther) are numerous: the snow leopard of the Himalaya is one of the finest prizes a sportsman can secure. Rhinoceros are found in the Terai and Assam, and the gaur, or Indian bison, in the Sâtpurâ and other mt ranges. One of the most noted sports of India is 'pig-sticking,' or hog-hunting (q.v.). The Indian buffalo, living in swampy dists. overgrown with tall reeds, has to be hunted on elephants, and may be taken on the fresh grass which comes up after burning, though dense, dry patches of grass may be burned off to bolt a wounded animal. Up in the Himalaya those who enjoy mountaineering may stalk the markhor, ibex, and wild goat; brown and Himalayan bears, and snow leopards, are sometimes met with. At a great altitude (10,000-17,000 ft), the bharal, or blue wild sheep, needs expert stalking, and furnishes excellent mutton. Burma also affords plenty of sport, its fauna including the elephant, rhinoceros, tiger, and leopard, besides innumerable deer. Elephant-shooting, however, is strictly prohibited both here and in India, though proscribed rogue elephants, for which a reward is offered, are the sportsman's usual, and legitimate, quarry.

Europe. Good shooting may be had in some parts of Europe, especially Russia, Scandinavia, and the Alps. In Russia, wolves and bears are plentiful, and their skins are prized. Further S., in the Caucasus, wild boars abound on the lower slopes, and bears and bison are also found. Higher up there are chamois, ibex, and other mt game; but though sport is plentiful it is expensive, and involves much difficult mountaineering. Bison are now being reintroduced into various parts of the European continent. Chamois and ibex are stalked also in

Switzerland, the Tyrol, the Carpathians, and the Pyrenees. In Scandinavia the brown bear is hunted, though bears in Norway are now scarce.

America. In N. America the hunter may find abundant sport, and the great herds of bison have been re-established in Canada and the U.S.A. The black bear is becoming scarce, having been killed for his fur, but in the Rockies grizzlies and other bears are still to be found. Canada is rich in game, moose and caribou being the largest; these are also found in parts of the United States. Newfoundland also became noted as a shooting ground, but in E. Canada as a whole B. G. is becoming scarce. The 'bighorn,' rare elsewhere, is now preserved in Brit. Columbia and Kootenay; it is difficult to stalk. Musk-oxen are found in the N., and some bison, and the Alaskan bears are almost as large as the grizzly. There is good shooting in S. America, but the country is difficult. The chief animals are the jaguar, puma, many kinds of smaller game, including wild pig, and on the plains there are herds of wild cattle. See F. C. Selous, *A Hunter's Wanderings in Africa*, 1881; F. Nansen, *Farthest North*, 1893-6; Sir A. E. Peace, *The Book of the Lion*, 1913; C. Phillips-Wolley, *Big Game Shooting*, 1913; H. F. Wallace, *Big Game of Central and Western China*, 1913; J. H. Patterson, *Maneaters of Tsavo*, 1914; W. D. M. Bell, *The Wanderings of an Elephant Hunter*, 1923; D. D. Lyell, *Memoirs of an African Hunter*, 1923; V. Stefansson, *Hunters of the Great North*, 1923; Lord Baden-Powell, *Pig Sticking or Hog Hunting*, 1924; R. Lydekker and J. G. Dollmann, *Game Animals of India, Burma, Malaya, and Tibet*, 1924; J. Ross and H. Gunn, *The Book of the Red Deer and Big Empire Game*, 1926; A. R. Dugmore, *African Jungle Life*, 1928; M. Johnson, *Safari*, 1928; K. Kittenberger, *Big Game Hunting and Collecting in East Africa*, 1929; Dunbar Brander, *Wild Animals of Central India*, 1931; R. G. Burton, *Sport and Wild Life in the Deccan*, 1932; J. W. Best, *Forest Life in India*, 1935; E. Hemingway, *Green Hills of Africa*, 1936; K. Gandar Dower, *The Spotted Lion*, 1937; J. Corbett, *Maneaters of Kumaon*, 1946; A. Locke, *Tigers of Trengganu*, 1954.

Big Horn: 1. Co. in the NW. part of Wyoming, U.S.A., drained by the Bighorn R. and its tribs. On the E. are the Bighorn Mts, on the W. the Shoshone Mts. Stock-raising and agric. pursuits are carried on, and a system of irrigation is generally practised. The cap. is Basin. The dist. has an area of 3176 sq. m. Pop. 13,176.

2. Co. in S. Montana, U.S.A., drained by Bighorn and Little Bighorn R.s. It is the site of the Custer Battlefield National Monument.

Big Horn Mountains, see BIGHORN MOUNTAINS.

Big Horn River, see BIGHORN.

Big Horn Sheep (*Ovis canadensis*), species of large N. Amer. sheep with a brown

coat, which turns to bluish grey in winter; so named from the size of the horns of the ram, which often measure over 40 in. round the curve. The sheep are also named Rocky Mountain sheep.

Big Sandy River: 1. In Arizona, U.S.A., formed by confluence of 3 forks at Hualpía Peak; it flows c. 80 m. to join Santa Maria R. and form Bill Williams R. 2. In NE. Kentucky and W. West Virginia, U.S.A., formed at Louisa, Kentucky, by junction of Tug Fork and Levisa Fork; it flows 27 m. N. to the Ohio R. at Catlettsburg, Kentucky.

3. In W. Tennessee, U.S.A., rises N. of Lexington in Henderson co. and flows 65 m. N. to Kentucky Reservoir.

Bigamy. In Eng. law, by the Offences against the Person Act, 1866, sec. 57, 'Whoever, being married, shall marry any other person, during the life of the former husband or wife, whether the second marriage shall have taken place in England or Ireland or elsewhere, shall be guilty of felony, and being convicted thereof, shall be liable to be kept in penal servitude for any term not exceeding 7 years'; but no offence is committed: (1) if the second marriage is contracted by a person not a Brit. subject outside England and Ireland; (2) if the former husband or wife has been continually absent for 7 years, and is not known to be living by the person marrying a second time; (3) if the first marriage has been dissolved by a divorce or a decree of nullity; (4) if there was a *bona fide* belief based on reasonable grounds that the former husband or wife was dead. To support a charge of B. a valid first marriage must be proved; thus if a man marries a woman while his first wife is alive and after the first wife's death marries a third, the last marriage is not bigamous, for his second marriage was a nullity. In Scotland, by the statute of 1551, the offence is one of perjury; at common law B. is punishable as an offence with imprisonment.

In U.S.A. law the statutory provisions of the various state criminal codes against B. or polygamy (q.v. as to Utah) are for the most part copied from the statute of 1803 (replaced by the Criminal Law Consolidation Act, 1861). The various exceptions to this statute are likewise practically the same in the Amer. Acts, e.g. continuous absence of former spouse for a space of 5 years, without being heard of; dissolution of former marriage by decree of a competent court, etc. Punishment for the offence differs in different states. In cases where the prior marriage was made abroad, the prosecution must show that such marriage was valid by the law of the country where it was made. The second marriage must be within the jurisdiction; if in a foreign state it is not B. Again, the second marriage need not be a valid one. Even though the first marriage be contracted under any of those disabilities or impediments which render it *voidable*, yet a second marriage, whilst the former is in fact subsisting, comes within the criminal law, for the first is a marriage in legal

theory until it is avoided. But if the first marriage were contracted under disabilities or incapacities which rendered it void *ab initio*, the case is otherwise. In Maine, Pennsylvania, and other states, the defendant's admissions as to a former marriage may be given in evidence against him, but apparently this is not so in Massachusetts, Connecticut, and a few other states. Consummation is not necessary to the validity of either marriage. The fact, if so, that polygamy is allowed by any religious creed is not, even in Utah, a defence in law to a charge of B. As in England, so in U.S.A., a woman who, having a husband living, marries another person is guilty of B., even though her husband has voluntarily withdrawn from her and remained both absent and unheard of for any period less than 7 years, and even though she honestly believed him to be dead at the time of her second marriage.

Bigelow, Erastus Brigham (1814-79), Amer. inventor, contrived, whilst still a boy, a loom for weaving suspender webbing and piping cord. His other inventions were a machine for making knotted counterpanes and a power-loom for the carpet weaver, which reduced the cost of carpet manuf.

Bigelow, Jacob (1787-1879), Amer. physician and botanist, graduated in 1806 at Harvard Univ., where he was afterwards prof. in more than one capacity. For more than 40 years he practised medicine in Boston. His title to renown rests on his original research in botany, as well as on his introduction of single-word nomenclature in the *U.S. Pharmacopoeia*, 1820. His best work was *American Medical Botany* (3 vols.), 1817-20.

Bigelow, John (1817-1911), Amer. journalist and statesman, b. Malden, New York. From 1849 to 1861 he was managing editor and, with Wm Cullen Bryant, joint owner of the *New York Evening Post*. Amongst the offices which he filled in his political career were United States consul at Paris, 1861-4, minister to France in 1865-6, and secretary of state for the state of New York, 1875-7. His best work is his ed. of Franklin's *Autobiography and Complete Works*, to which he added notes based on personal knowledge. See Margaret Clapp, *Forgotten First Citizen: John Bigelow*, 1947.

Biggar, burgh of Lanarkshire, Scotland, 27 m. SW. of Edinburgh. It consists mainly of one lengthy street, and has a cruciform church with a tower in the middle. Pop. 1435.

Biggarsberg, range of mts in S. Africa, which are an easterly extension of the Drakensberg Mts, separating the N. part of Natal and the dist. of Newcastle from the rest of the colony. The area is rich in coal and iron ore.

Biggers, Earl Derr (1884-1933), Amer. novelist, b. Warren, Ohio. After studying at Harvard he worked as a journalist in Boston. He scored a great success with his mystery novel, *Seven Keys to Baldpate*, 1919, and later broke from

tradition in the detective story by introducing a Chinese investigator, Charlie Chan, who figured in sev. novels, *The House Without a Key*, 1925, *The Chinese Parrot*, 1926, *Behind that Curtain*, 1928, *The Black Camel*, 1929, *Charlie Chan Carries On*, 1930, and *The Keeper of the Keys*, 1932. Others of his novels were *Love Insurance*, 1914, *The Agony Columna*, 1916, and *Fifty Candles*, 1926.

Biggleswade, urb. dist. and mkt tn in Beds, England, on the r. b. of the Ivel. It has a large weekly corn market, and there are many market gardens in the neighbourhood, which send their produce to London. It manufs. agric. implements, hosiery, caravans, and machine tools, and has a large brewery, and bookbinders. Pop. 7421.

Bigham, John C., see MENSEY, BARON. Bighorn, riv. of the U.S.A., formed at Riverton, central Wyoming, by the confluence of the Popo Agie and Wind rvs.; it flows 460 m. N. to Yellowstone L., of which it is the largest affluent. Tribes are the Shoshone and Greybull rvs., Wyoming, and the Little B., Montana. Plans for development of Missouri R. Basin include 2 projects on B. R.: Boysen project, including Boysen Dam (now under construction), and Hardin project, with Kane and Yellowtail dams.

Bighorn Mountains, range of Rocky Mts lying principally in the N. part of Wyoming, U.S.A., on the E. of the Bighorn R. They are composed of anct sedimentary rocks with a granite nucleus. The range runs in a NW. and SE. direction for nearly 120 m., and has a number of summits over 10,500 ft covered by perpetual snow. There are live-stock grazing and irrigated agriculture in the foot-hills. Bighorn National Forest, in the Wyoming part of the range, contains large stands of pine, spruce, and fir. The Sioux, the most belligerent of the Amer. Indians, had their fastnesses in these regions for a long time. In this dist., 15 m. to the S. of Fort Custer, occurred the famous massacre of the Little Bighorn in 1876, when a United States Army detachment under Gen. Custer was annihilated.

Biglow Papers, The, see LOWELL, JAMES RUSSELL.

Bignonia (named in honour of Abbé Bignon, librarian to Louis XIV, 1662-1743), family Bignoniaceae; a genus of which *B. unguis-cati*, a Brazilian tendrill climber, with bell-like, yellow flowers, is now the chief species for stove-houses.

Bignoniaceae, family of dicotyledonous, tropical or sub-tropical trees, shrubs, or herbs, of which typical genera are *Bignonia*, *Campsis*, *Catalpa*, *Colea*, *Eccremocarpus*, *Incarvillea*, *Jacaranda*, *Pandorea*, *Spalhodea*, *Stereospermum*, and *Tecoma*.

Bignor, vil. of Sussex, England, 5 m. from Petworth. The extensive remains of a Rom. villa, occupied during the 2nd to 4th cents. AD, and discovered in 1811 by an ancestor of the present owner, are still in excellent condition and contain some of the finest mosaics in the country. Pop. 130.

Bigod, Sir Francis (1508-37), Eng. knight, educ. at Oxford. He served Cardinal Wolsey, and later Thomas Cromwell, but later joined the Pilgrimage of Grace (q.v.). He was hanged at Tyburn after leading the ineffectual rising at Beverley. Some of his letters may be seen at the Public Record Office.

Bigod, Hugh and Roger, see NORFOLK, EARLS OF.

Bigorre, Fr. dist. formerly in the prov. of Gascony. It now forms part of the dept. Hautes-Pyrénées. The cap. is Tarbes.

Bihac, tn in Bosnia-Herzegovina, Yugoslavia, on the Una. Frequently under siege in the Turkish wars, it has many anct buildings, including a Gothic church which has been converted into a mosque. Pop. 9000.

Bihar: 1. State of India, embracing some of the most fertile land in the lower and middle Ganges Valley above Bengal. It extends from the Himalayas to about 100 m. from the Bay of Bengal and is bounded on the N. by Nepal, on the W. by Uttar Pradesh and Madhya Pradesh, on the S. by Orissa and on the E. by W. Bengal. Most of the area is very thickly populated plain, with heavy rainfall and varied temp. and vegetation.

History. B. figures prominently in the most notable eras of Indian hist., being the scene of Buddha's enlightenment and mission; later, it was the Magadha of the Mauryas, the Sungas and Guptas; and Patna (as Pataliputra) was the cap. At Pataliputra court lived and worked men like Kalidasa, the playwright, and Aryabhata, the mathematician, and from here Indians went forth to preach Buddhism while Chinese and other pilgrims came to study at Nalanda Univ. B. came under the Delhi sultans in the medieval period and later under the Moguls. In the mid-18th cent., the Mogul emperor gave the E. India Co. the *diwani* or revenue administration of Bengal and B. From 1912 to 1936, B. and Orissa were one prov., Orissa being separated in 1936. In Aug. 1942 B. was the scene of widespread disturbances after the 'Quit India' resolution of the Indian National Congress, and for a time sabotage cut B. off from the rest of India by rail, road, and telegraph. The army had to take drastic action to reopen lines of communication with the Burma front. Again, in 1946, the communal riots from Bengal spread to B., and for a fortnight there was wholesale bloodshed in sev. cities in retaliation for Muslim excesses in Bengal.

Development. B. grows rice, wheat, maize, barley, gram, sugar, jute, chilies. It possesses some remarkable industrial enterprises—Tata's iron, steel, and allied enterprises at Jamshedpur (q.v.); the fertiliser factory at Sindri; many coal-fields, Jharia being the chief; deposits of iron ore and many other minerals, B. providing much of the world's mica; a big cigarette factory; sugar factories, etc. Multi-purpose riv. schemes in the Damodar and Kosi valleys will no doubt lead to further development in the future.

Culture. Bihari is the language of B., but Hindi is universally understood. Many people speak Bengali and Oriya. Holding many of the holiest Hindu and Buddhist sites, the state is overwhelmingly Hindu in pop. Both the state's univs., those of Patna and of Bihar, have their H.Q. at Patna.

Government. The governor acts through ministers responsible to an elected assembly of 330. B. has 21 representatives in the Upper and 53 in the Lower House of India's Parliament.

The cap. is Patna (pop. 283,000). Other big tns are Jamshedpur (pop. 218,000), Gaya (pop. 134,000), Bhagalpur (pop. 115,000), and Ranchi (pop. 107,000). Area 67,830 sq. m.; pop. 38,930,000.

2. City of B. state, India, a transport centre in the dist. of Patna, 35 m. SE. of Patna. There is a trade in rice, corn, and oil seeds. Silica is mined locally, and textiles are manuf. Near by are the ruins of Hindu, Buddhist, and Mogul buildings. Pop. 55,000.

Bihari, Alexander (1856-1906), Hungarian painter, b. Grosswarden. His most famous pictures are 'Gypsies with the Broken Violin before the Country Justice,' 'A Pleasure Trip on the Zagryva,' 'Peasants at Supper on the Pusztá,' and 'A Rumanian Funeral.'

Bihe, dist. in Portuguese W. Africa, situated about 12° 40' S. and 17° E. It lies at an altitude of 5300 ft above the level of the sea, and has a sufficiently mild climate to allow of the cultivation of corn and other crops. The Benguela-Katanga railway connects B. with the coast.

Biak, see BIRSK.

Bijapur, Bombay state, India. It was at B. in AD 1490 that Yusuf Khan estab. the Adil Shah dynasty of B. kings which survived till 1686 when the city was taken by Aurangzeb. B. contains one of the finest collections of Muslim ruins in India. In particular the great hall, the mausoleum of Mohammed Adil Shah, 7th king (1626-56), is reputed to be the largest domed space in the world.

Bika, see COLE-SYRIA.

Bikaner, formerly a leading Indian princely state (q.v.), now part of Rajasthan. It lies in the less inhabited area of Rajputana to the N. of Jodhpur. The city was founded in AD 1488 by the ancestors of the present princely family; it is surrounded by a battlemented wall and is the fourth largest city in Rajputana. The fort to the NE. of the city was begun in the period 1571-1611, and contains a fine library of Sanskrit and Persian books. Maharaja Sir Ganga Singh, who himself commanded the famous Camel Corps in China in 1900, ruled from 1887 to 1943 and was one of the best-known Indian princes in Europe. He attended the Imperial War Conference in 1917 and 1919 as a representative of India, was a member of the War Cabinet, and a delegate to the peace conference. He was also the first chancellor of the Chamber of Princes from 1921 till 1926. He was the first Indian prince to be made a full general in the Brit. Army. Ganga Singh

was succeeded by his son, Sri Sadul Singhji Bahadur.

Bikelas, Demetrius (1835-1908), Gk poet. He drew his inspiration chiefly from the Klephtic songs, and used the Epirotic dialect. His poems are characterised by grace of style and imagination.

Bikh, Bish, or Vish (Hindu, 'poison'), name given to the herbaceous perennial *Aconitum ferox*, which grows in the Himalaya; or, more specifically, to the fatal poison extracted from this plant. *

Bikrampur, anct tn of Dacca, Pakistan, formerly the seat of gov. of the Hindu kings of Bengal, and now an educational centre.

Bilhao (anct Belvao; Eng., obsolete, *Bilboa*), Sp. port, cap. of the prov. of Vizcaya, on the Nervion. It is on an inlet of the Bay of Biscay, and is surrounded by mts. B. was founded in the 13th cent., and became prosperous with the growth of the Sp. empire. It suffered in the Peninsular war and in the Carlist wars. At the outbreak of the Civil war in 1936 it was held by the gov. forces, and was taken by the insurgents in 1937 after severe fighting. The picturesque old tn, with its churches and monasteries, is on the r. b. of the riv., and is united by fine bridges to the new tn, with its broad business streets, parks, and squares. There is a (non-State) univ., and there are museums and learned societies. B. is a great commercial centre, and one of the chief ports in Spain; it has, actually, two ports, one on the riv. estuary and one a deep-water port used by transatlantic liners. It owes much of its prosperity to the rich iron deposits in its vicinity. In the Middle Ages it was famous for sword blades, and it still has important iron and steel works. Among its other industries are shipbuilding, and the manuf. of chemicals, glass, and paper. Pop. 238,800.

BILBERRY

Bilberry (*Vaccinium myrtillus*), plant belonging to the Ericaceae, which is found on moors and hilly woodland dists. It has deciduous leaves and edible blue berries. Other names for it are whortleberry, huckleberry, and blaeberry.

Bilbilis, anot tn of Spain, remains of which still exist near Calatuyud (q.v.). In Rom. times it was famous for weapons, and had baths called Aquae Bilbilianae. Martialis (q.v.) was b. here.

Bilboa, see **BILBAO**.

Bilboes, fetters formerly used for offenders on board ship. This word and bilbo, a sword (both Shakespearean), were derived from the Sp. tn Bilbao, or Bilboa, noted for its iron and steel.

Bilderdijk, Willem (1756-1831), Dutch poet and scholar, b. Amsterdam. He studied at Leyden, and after taking his doctorate in law, he started practice at The Hague. When, in 1795, the French invaded Holland, he quitted the country. After a visit to Germany, he took up his residence in London. Here he had a love affair with one of his pupils, Katharina Schweickhardt, whom he married in 1802, having divorced his first wife. In 1806 he returned to Holland, where he was well received by Louis Napoleon, who made him his librarian. On the abdication of Louis he fell into poverty, in which he d. B. was a follower of Gk and Fr. classicism. He wrote nearly a hundred works, conspicuous for their command of language. His chief poetical works are *Het Buitenleven*, 1803, *De Ziekte der geleerden*, 1807, and the unfinished epic *De Ondergang der eerste wereld*, 1820. See J. Smit, *Bilderdijk et la Franc*, 1929, and A. Heyting, *W. Bilderdijk als Dichter*, 1931-40.

Bile, fluid secreted by the liver. Human B. is yellowish-brown or green in colour, is of a viscous nature, has a sp. gr. of 1010 (water=1000), a bitter taste, an alkaline reaction, and a sickly odour. The quantity secreted by the liver averages 500-600 grains per 24 hrs, but may amount to as much as 2400 grains. B. consists mainly of B. salts and B. pigments, with small quantities of fats, cholesterol, and leucithin. The most important B. salts are sodium glycocholate and sodium taurocholate. The pigments are biliverdin, which is green in colour, and bilirubin, which is reddish. The former is most abundant in herbivorous animals, the latter in flesh-eaters, and the colour of the B. is determined by the relative proportions of these pigments. Both are waste products of the used-up haemoglobin in the blood, the iron from which is, however, retained for further use. B. is secreted from the blood by the liver; some of it is temporarily stored in the gall-bladder (q.v.), while the remainder passes through the common B.-duct to the duodenum, the first part of the small intestine. B. in itself is not a digestive juice, but certain of its salts promote greater activity in the pancreatic juices, and aid in the absorption of fats and fatty acids. The production of B. is practically continuous, but is stimulated by the processes of digestion. If by any means it is prevented from entering the intestine, digestion may proceed without much disturbance to health. If, however, excess of B. in the liver leads to its being reabsorbed by the blood, the condition known as jaundice (q.v.) is produced: the tissues are

coloured yellowish by the B. pigments, and there is general derangement of the system. A *bilious attack* is only indirectly connected with B.; catarrh is set up by the ingestion of unsuitable or too abundant food, and sickness, headache, and giddiness result, with vomiting of food and bilious matter. Purified ox bile has been used as an aperient and antiseptic. The B. of oxen which have d. of rinderpest has been injected in cattle in S. Africa for the prevention of that disease, and the B. of serpents is looked upon as a partial antidote to their poisons.

Bilge, see **SHIPS** and **SHIPBUILDING**.

Bilharziasis (**Bilharziosis**, or **Schistosomiasis**), disease common in tropical and subtropical countries where unsanitary conditions prevail. Different forms occur, but all are due to a genus of flat worms, *Bilharzia*, named after Bilharz, who first discovered a species in 1851, in Cairo, and named it *Distomum haematobium* (later *Schistosoma* or *Bilharzia haematobium*). Another species (*S. japonica*) was found in China and Japan early in the 20th cent. B. was so prevalent in Africa and Asia that the Colonial Office appointed a commission (1913) to investigate the disease. The investigation was interrupted by the outbreak of war in 1914, but the infection of troops in Egypt stimulated research, and Leiper and other workers were able to trace the life hist. of the *Schistosoma*. In water the eggs of the *Schistosoma* develop into minute free-swimming larvae which infect snails. The infection is specific; each species of *Schistosoma* parasitises a particular species of snail, in which it forms spores. These develop into other free-swimming forms, cercariae, which enter man either in drinking water or by getting on his skin during bathing, and boring their way in. They then bore through tissues until they reach the pelvic veins, where they remain until adult. The male coils round the female, and they migrate through the pelvic veins until they reach the wall of the bladder. This the female *S. haematobium* pierces, causing the symptom haematuria, and lays her eggs which are evacuated with the urine. (Cercariae can live for only 2 days, so water enclosed for this period may subsequently be used without danger of infection.) The eggs of *B. mansoni* are laid near the anus, and are expelled with the faeces. In the early stages B. may be cured by the injection of tartar emetic into the veins. A synthetic compound 'nilodin' has recently been tried, with promising results. The late stages of the disease are incurable. Recent research on the prevention of B. includes attempts to eliminate the snail, and to destroy cercariae by the addition of compounds such as chloramine to contaminated water. See R. T. Leiper, *Researches on Egyptian Bilharziasis*, 1918; A. H. Hall, 'Bilharziasis in Iraq' (*Journal of the Royal Army Medical Corps*, vol. xlv, 1925); Manson, *Tropical Diseases* (14th ed.), 1954.

Biliary Calculi, see **GALL-STONES**.

Bilmbi, see **AVERRHOA**.

Bilin, riv. in Burma. Its course lies

between the Salween and the Sittang, for more than 280 m. It enters the Gulf of Martaban. In the Second World War the inadequate Brit. defence force at Thaton fell back on the B. to escape piecemeal destruction at the hands of the Japanese on the Salween R. (Feb. 1942). After fierce and costly fighting the Brit. units fell back on the Sittang. See BURMA, SECOND WORLD WAR CAMPAIGNS IN.

Bilin, see **BILINA**.

Bilina (Ger. Bilin), Czechoslovak tn in the region of Ústí nad Labem (q.v.). It is a health resort, and has mineral springs the waters of which are exported. Pop. 8600.

Biliousness, popular name for a condition characterised by loss of appetite, headache, lassitude, coated tongue, nausea, and constipation. This chain of symptoms, though not exclusively belonging to biliary disorders, is associated with conditions in which the flow of bile is interfered with. B. is a symptom of catarrhal jaundice (see JAUNDICE).

Bill, or **Beak**, in natural hist., the term applied to the horny toothless jaws of birds. The foremost bones of the skull are elongated, and covered with a horny sheath or rhamphotheca; the same with the lower jaw, or mandible. No living birds have any teeth, but the earliest forms of birds, such as *Archaeopteryx*, undoubtedly possessed some. The Tertiary Period appears to be the time when birds ceased to have teeth; traces can still be found in certain species. The B. is not usually sensitive, though in some aquatic birds, and in the woodpecker, it is much more sensitive than usual. The chief uses of the B. of a bird are for dividing food, for fighting, preening, nest-building, etc. It varies in shape in different species of birds, its conformation being adapted to the nature of its food and habits. Among peculiar beaks may be noticed the raptorial beak of birds of prey, the fissirostral beak of swallows, etc., the tenuirostral beak of sunbirds, etc. See also **BIRDS**.

Bill-broker, name applied to one who deals with bills of exchange, receiving bills from merchants, foreign or other banks, etc., and disposing of them for the best terms, and receives a commission on the transaction. But now the B. usually buys bills outright and sells them to banks and other buyers. He is financed by the banks by loans at call and short notice. He acts as principal and not agent, and the name of broker (who does not buy and sell but acts as an intermediary between buyer and seller) does not strictly apply to him.

Bill Chamber was a dept of the Court of Session in Scotland which dealt with business of a summary nature, such as applications for interdict, etc. It was so called because in former times summonses and executions were generally begun by a writ, called a bill. It was abolished in 1933 and its functions transferred mainly to the Petition Dept.

Bill in Equity, or **Bill of Chancery**, formerly a statement in writing of a

plaintiff's case, setting forth the grounds on which he claimed relief. It is now an obsolete form of pleading, and its place is taken by a writ and statement of claim.

Bill of Adventure, in maritime law, a writing signed by a shipmaster, merchant, or owner, declaring that merchandise shipped in his name is 'at the venture' of another, and his responsibility is limited to their safe delivery.

Bill of Costs, itemised account setting forth in detail the work done and the charges and expenses paid by a solicitor on behalf of his client. By statute a solicitor must deliver a signed B. of C. to his client.

Bill of Exchange, form of credit instrument of practically universal commercial use, and governed by laws and regulations which, with certain differences, are identical in all countries. In the U.K. the law, founded on mercantile custom, judicial decisions, and separate statutes, was codified in the Bills of Exchange Act, 1882, which has been adopted by Brit. overseas dominions and colonies and agrees in the main with the law of the U.S.A. The original form from which the B. of E. developed was a simple system by which money could be paid in a distant place without sending cash; thus A living at X owes money to C living at Y; D, also living at Y, owes a debt to A; therefore A sends to C an order to D to pay the money to C; or suppose A sells to D goods on credit, but his business requires ready money; if he can get D's acknowledgment, and his credit is good, he can raise money now on D's promise to pay cash later for a consideration from a third party; thus arises the discounting of bills; D is going to pay A in 3 months, for goods shipped, £100; C will lend A the money now at 4 per cent; he therefore will give £99 and collect £100 from D when the time expires. Various forms of such means of transacting commercial business were no doubt in use in early times, but the B. of E., as a negotiable instrument, was evolved, it is said, by the Florentine Jews in the 13th cent., and was in use generally in commercial Europe by the 14th cent. There are 2 classes of bills: 'inland' bills, covering transactions in one country only, and 'foreign' bills, which are drawn in one country and payable in another. Bills may also be classified as good 'trade bills' where the transaction is based on produce or goods sold and coming into the market; such bills are said to pay themselves, and form the best kind of security for advances made on them; other bills, which are drawn on securities or on credit, are called 'finance' bills; lastly, there are 'accommodation' bills, or 'kites', where no valuable consideration passes between the parties to the bill. By the Bills of Exchange Act, sec. 3, a B. of E. is defined as 'an unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a certain sum in money to, or to the order of, a specified person, or to bearer.' Thus

a cheque (q.v.) is a B. of E. drawn on a bank payable on demand. (It may be noted here that bills payable on demand, i.e. cheques, must have a twopenny stamp on them; other bills must be stamped *ad valorem*; the rates can be found in any almanac, postal guide, etc.) An example of a simple inland B. of E. will elucidate the definition:

£100

LONDON, 1st Nov. 1958.

Three months after date pay to the order of Mr S. Robinson the sum of one hundred pounds, for value received.

SMITH & Co.

To Messrs JONES & Co., Glasgow.

The last words, 'for value received,' are not legally necessary, as the law presumes that the bill was given for valuable consideration. Here Smith & Co. are the 'drawers,' Jones & Co. the 'drawees,' who on signing their name across the front of the bill become 'acceptors.' Robinson is the 'payee.' By accepting the bill Jones & Co. become the persons primarily liable on the bill. The acceptor may qualify the bill by attaching conditions, e.g. delivery of bills of lading, or making it payable at a certain place, such as his bank. When the bill falls due, that is, on 1 Feb. 1959, with 3 days' grace, it is presented to the acceptors for payment; if it is not accepted or not met by payment at maturity the bill is 'dishonoured,' and the holder must give notice at once to the drawer and any other persons who have endorsed the bill, from whom he can then claim payment. If the bill is a 'foreign' bill it must be 'protested' by a notary public on the day of dishonour. A bill dishonoured by non-acceptance can be accepted by another 'for honour *supra protest*'; if by non-payment, it can be paid *supra protest*; the new acceptor or payee having rights against the party for whose honour he has accepted or paid. A B. of E. is a negotiable instrument, the property in which passes, like money, by delivery; if the bill is made payable to bearer; if payable to order then it must be endorsed. In the example given above, the bill is made payable to the order of S. Robinson; if he wishes to transfer the bill he writes his name on the back. An endorsement in blank makes the bill payable to bearer; a special endorsement makes it payable to a specially named person's order, who to transfer the bill must again endorse it, and so on. A bill can, and often does, pass through a number of hands before it is discharged by presentation to the acceptor and payment by him, and the greater part of the law relates to the rights and liabilities between the various parties through whom it has passed. The person to whom a negotiable instrument is transferred by endorsement or delivery can sue in his own name, and if he is a 'holder in due course' takes the bill free from all defects of title. To be a 'holder in due course' he must have given value for the bill, the bill must not be overdue or known to be dishonoured, and he must take the bill honestly and without notice of a defect

in title, such as fraud, etc. See M. D. Chalmers, *Digest of the Law of Bills of Exchange*, and Byles, *Bills of Exchange*; also J. A. Slater, *Bills, Cheques, and Notes* (for general readers).

Bill of Exchange, or Exchequer Bill, form of security on which the Brit. Gov. borrows money for the public service, under parl. authority. They were first issued in 1696. They used to be issued annually, and bore daily interest till 1861. They were current for 5 years, and renewable, and the rate of interest, fixed half-yearly, varied with the money market. They became extinct in 1897, and have been superseded by treasury bills, issued for a maximum period of 12 months, and exchequer bonds, issued for a specific period, and with a fixed rate of interest.

Bill of Health, document given to the master of a ship, when clearing from a port, by the consul or other port authority; it shows the sanitary condition and health of the port; where there is no infectious or contagious disease existing, it is a 'clean bill'; if disease is thought possible, it is a 'suspected' or 'touched'; if it actually exists, it is a 'foul bill.' B.s of H. are necessary when the next port of call is one where the ship may be quarantined if there be no clean bill.

Bill of Indictment, see INDICTMENT.

Bill of Lading, document signed by the master of a ship or an agent of the owner, acknowledging that goods have been received on board, and stating the terms on which they are to be carried. The B. of L. serves as a receipt for the goods shipped on board, as the memorandum of a contract between the owner of the ship and the shipper of the goods, and as a document of title to the goods; and if, as is usual, the goods are deliverable to the consignee's order or assigns, the B. of L. becomes a negotiable instrument, transferring by endorsement the rights to the goods and the various liabilities and rights of the contract. There are various forms of B.s of L., but they all contain the names of the shipper, of the ship, the port where the goods are loaded and the destination, the description of the goods, place of delivery, name of consignee, freight, the excepted perils, and shipowner's lien. With regard to the more important of these items, it should be noted that it is implied that there should be no deviation from the route of the voyage, and the shipowner is liable for loss or damage due to such deviation, except to save life (but not property). It is usual, however, to insert in the B. of L. specified 'liberties'; the quantities and condition of the goods at the time of shipment must be described, as the contract is to deliver that quantity in the same condition. A 'clean bill' is one where the goods are not described with qualifying words, such as 'cases one or three in damaged condition,' or the like. The contract is to deliver at a certain place; the shipowner is liable if he does not do so, unless his failure is due to one of the perils excepted, or, for example, war has closed the port. The B. of L. generally contains the name of

the consignee to whom the goods are to be delivered, and usually adds to his 'order or assigns.' He can then transfer his rights and liabilities to a third person by endorsing his name and delivering the document. The bill thus becomes a negotiable instrument, and can be re-endorsed. On payment of freight the endorsee receives delivery of the goods. The amount of freight is either stated in the B. of L., or reference is made to the terms of the charter-party. The 'excepted perils' are those causes of loss or damage which exempt the shipowner from liability. The common law exemptions are 'act of God,' i.e. every act in which man has no part, and the act of the 'king's enemies,' i.e. war. The shipowner is presumed to undertake absolutely that the ship is seaworthy, and that all reasonable care will be taken by his servants and agents. It may be noted that by Eng. law a shipowner may make any exceptions, but in the U.S.A. an Act of 1893 forbids the insertion of terms exempting the owner from liability for loss through his servants' negligence. Finally, the shipowner has a lien on the goods for freight by common law, and, by the terms of the B. of L., usually for demurrage. See Scrutton, *Charter Parties and Bills of Lading*, 1925, and T. G. Carver, *Carriage of Goods by Sea*, 1925.

Bill of Mortality, weekly statement, formerly issued by the par. clerks, showing the number of deaths (and the causes) that had occurred in each par. based on the reports of 'searchers.' They are said to date from 1538, when par. registers were estab. They were regularised in 1603, and continued till the Births and Deaths Registration Act, 1836, was passed. The age of the persons dying was not inserted till 1728, from which year dates the science of life insurance.

Bill of Rights, name commonly given to the Act declaring the rights and liberties of the subject, and settling the succession of the crown, 1689, which embodied the Declaration of Right drawn up by a committee of the Commons and presented to William, Prince of Orange, and his wife, afterwards William III and Queen Mary. The B. of R. is the nearest approach to a written constitution which the U.K. possesses. Its provisions, so far as applicable, were embodied in the U.S.A. constitution.

Bill of Sale, form of legal document by which the grantor transfers to another (the grantee) the ownership, while retaining the actual possession, of personal chattels, such as goods, furniture, and other articles capable of transfer by delivery, including fixtures and growing crops, when assigned and charged separately from the building or land to which they are attached. The law on B.s of S. is to be found chiefly in the prin. Act of 1878 and the amending Act of 1882. The objects of these Acts are widely different. The enactments prior to 1882 were designed to protect creditors and to prevent their rights being affected by secret assurances of goods which were permitted to remain in the ostensible possession of a

person who had parted with the property in them. The B.s of S. were therefore made void only as against creditors or their representatives, but as between the parties to them they were perfectly valid. The Act of 1882 was designed for the altogether different purpose of preventing needy persons being induced to sign complicated documents which they might be unable to understand, and being subjected by their creditors to the enforcement of harsh and unreasonable terms; hence, a form was presented to which the B.s of S. were to conform. B.s of S. may be *absolute*, where the chattels are sold absolutely; they must be attested by a solicitor; the regulations as to such B.s of S. are laid down in the Bills of Sale Act, 1878; non-compliance does not void the B. of S. as between the parties, but only as against the trustee in bankruptcy and execution creditors of the grantor. More important are the second class, B.s of S. *by way of security for the payment of money*; they must be made in accordance with the form given in the Bills of Sale Act, 1882, which can only be departed from in verbal differences. The bill must be by deed, must contain the names and addresses of the borrower and the lender of the money for which it is security, the amount lent, and the interest; the assignment as security of the chattels, of which an inventory must be attached; the time when the money lent, and interest, will be repaid; a covenant to insure goods and pay all rent, rates, and taxes due on the premises where they are. The lender stipulates that the goods will not be seized except for the reasons set out in section 7, viz.: (1) default in payment and covenants; (2) bankruptcy or distress for rates, rent, or taxes; (3) fraudulent removal of the goods; (4) unreasonable refusal to produce last receipts for rates, etc.; (5) execution under a judgment. A B. of S. must be witnessed and stamped in accordance with the scale, and registered within 7 days of its execution. As trade protection societies pub. all such registrations, a B. of S. damages a grantor's credit. All B.s of S. not complying with the regulations of the Act are void. There are no B.s of S. in Scotland. See H. Reed, *Bills of Sale Acts* (14th ed.), 1926, and Pitman's *Bankruptcy and Bills of Sale* (ed. W. V. Ball), 1921.

Bill of Lading, document given by an importer of goods to a customs officer, containing as good a description as possible of the goods, when a full description cannot be given. The goods can then be landed, but the full description must be given within 3 days.

Bill of Store, permit granted by the customs house to reimport Brit. goods without payment of duty such as would have been imposed had they been foreign goods. It must be within 5 years of exportation.

Bill of Victualling, or **Victualling Bill**, order to the master of a vessel by a custom-house officer for the withdrawal from bond or for drawback of such stores as are necessary for the crew and passengers. Stores not on the bill, or landed

in the U.K. without authority, are liable to be forfeited and destroyed.

Billancourt, see BOULOGNE-BILLANCOURT.

Billardiera, or Appleberry, genus of Australian evergreen climbers, family Pittosporaceae. Some species, such as *B. scandens*, are cultivated in Eng. glasshouses, bearing a fruit which, when ripe, is generally bluish in colour, and possesses a strong resinous flavour. The Tasmanian *B. longiflora* is grown out of doors in the mildest parts for the decorative value of its fruits.

Billaud-Varenne, Jean-Nicolas (1756-1819), Fr. revolutionary, the son of a lawyer, b. La Rochelle. His early home influences were bad, his parents being both of weak character. He joined a religious society when he was 19, but subsequently left it. In 1785 he went to Paris, and shortly afterwards married and became an advocate in the parlement. Political matters soon absorbed all his attention, and in 1789 he pub. a 3-vol. work on the subject, *Despotisme des ministres de la France*. This estab. his reputation as a prominent revolutionary. A leading member of the Jacobin Club, he was a close associate of Danton and Robespierre (qq.v.) and worked hard for the abolition of monarchy. When the trial of Louis XVI took place, he voted for 'death within twenty-four hours.' He was prominent in the overthrow of the Girondists in 1795, and in the same year he was made president of the Convention and member of the Committee of Public Safety. Later he helped to overthrow Robespierre, but soon after this he was himself arrested and banished to Fr. Guiana. He refused the pardon offered him by Bonaparte and d. in Haiti.

Billbergia, genus of perennial plants, family Bromeliaceae. They are chiefly found in Brazil and Mexico, and have stiff channelled leaves and tubular flowers of various colours. *B. nutans* and *B. portiana* make fine greenhouse plants.

Bille, Steen Andersen (1797-1883), Dan. admiral. He served in the Fr. marine during the campaign of 1823, was made rear-admiral and minister of the marine in Denmark, commanded an expedition round the world, and wrote an account of it.

Billericay, tn of Essex, England, 5 m. E. of Brentwood. Its old church has a tower which is considered one of the finest examples of brick architecture extant. B. is part of Baisdon (q.v.) urb. dist. Pop. 9000.

Billet, in Romanesque architecture, an ornamental moulding formed of short cylindrical blocks, suggesting miniature wooden 'billets,' and set in a concave moulding.

Billet, in heraldry, a bearing of the shape of a rectangle placed on end. Although B.s are common in armorial bearings, their representation is uncertain. Some suppose them to represent bricks or blocks of wood. 'Billety' signifies that the charge is uniformly covered with B.s. See also HRALDRY.

Billeting, or Cantoning, as it is also

called, means of lodging officers and soldiers among the inhab. of a dist. The system of B. has been in vogue from the earliest times, when the monasteries afforded hospitality to soldiers. Natural and cordial resentment has invariably been aroused by these arbitrary proceedings, and the third article of the Petition of Right, passed in 1628, bound the king 'not to billet soldiers on private individuals.' Since the Army Act of 1881 B. is limited to the extent that only public-house proprietors, inn- and hotel-keepers are liable to have soldiers quartered on them, and keepers of livery stables to tend their horses. If the keeper of the house is unable to provide room, he is obliged to obtain accommodation in the vicinity. In 1909 'public buildings, dwelling-houses, warehouses, barns, and stables' were included in the official list of possible billets, but this extension was limited to times of emergency. During the 2 world wars B. became an obvious necessity, both in home tns near the training centres and also in the tns and vils. in the war area. The amount which is to be refunded to a householder to defray the cost of feeding one or more soldiers is laid down in army regulations. B., however, may consist only of board without food, and in this event no compensation is allowed. The householder is compelled to afford shelter, but not necessarily to supply beds.

Billfish, see BONY PIKE.

Billiards (probably from O.F. *billard*, stick with a curved end), an indoor game of skill. It is not definitely known whether B. originated in France or England, and it is more than doubtful if the game seen by Anacharsis in his travels through Greece in 400 bc really had any analogy to even the most primitive form of the modern pastime. Among Eng. writers it is mentioned by Spenser in *Mother Hubbard's Tale*, 1591, and Shakespeare in *Antony and Cleopatra*, 1607. Ben Jonson draws a simile from the game in praise of Chloris; Looke uses it to illustrate a passage in his famous *Essay Concerning Human Understanding*; Gayton in his notes to the 1654 ed. of *Don Quixote* refers to B. as being played in taverns; and Charles Cotton in *The Compleat Gamester*, 1674, states that in England 'there are few towns of note . . . which hath not a public billiard table,' and proceeds to a description of the game and the rules then in force. Louis XIV was an enthusiastic player, and in Louis XV's time the game had become popular with both the male and female members of the Fr. court. Early in the 19th cent. the introduction of the cue (a flat-headed mace had previously been used), to which later a leathern tip was affixed, and the use of chalk which made possible the use of 'side,' that is, striking the cue ball on its right or left side, midway between its centre and edge, to impart lateral deviation, caused a revolution in the science of B. These were followed some years after by the substitution of slate beds for the former ones of oak and marble; and in 1835 indiarubber cushions for those of

flock and list; these were later improved by being constructed of a composition manuf. for the purpose, which is impervious to variations in temp. Under these conditions professionals like John Roberts, jun., Cook, Peall, Diggie, Reece, Dawson, Stevenson, Inman, and also the subsequent champions, T. Newman, J. Davis, W. Smith, C. McConachy, and W. Lindrum, brought the game to such a pitch of accuracy that the B. authorities have had to impose, from time to time, restrictions on certain strokes, to prevent their repetition from destroying the spectacular element in the game. Up to 1919 B. was governed by the B. Association (founded 1885) and by the B. Control Club (founded 1908), but there was confusion between the rules formulated by each body. In 1919 an amalgamation took place under the title of the B. Association and Control Council, with the Earl of Lonsdale as president. Since that time a great number of associations in all parts of the world have become affiliated to the Control Council. The first business of the council was to draw up a single code of rules, which has remained in force with only 2 revisions. In 1926 the council introduced a rule limiting consecutive hazards to 25 in order to prevent undue exploitation of the red-ball game. In the 1926 championship Reece first discovered the 'pendulum' stroke, and he was able to run up a record break of 1151, made mostly from 568 consecutive cannons. To avoid the future exploitation of the cannon sequence, an amendment to the rules was made limiting consecutive direct cannons to 35. A direct cannon is defined as being any cannon other than that made by the cue ball striking the cushion after making contact with the first ball, and before making contact with the second. One of the most popular moves of the Control Council was to institute a Brit. Empire amateur B. championship in 1926. In 1929 interest in B. centred on C. McConachy, New Zealand champion, and the brothers Lindrum, who came on a tour of England. They were, however, not allowed to enter for the Eng. championship, but with the exception of F. Lindrum, the Australian champion, who was indisposed in England, they gave some remarkable performances. W. Lindrum scored 32 four-figure breaks during the tour, one being the record break of 3262. In 1932 he estab. a new record with a break of 4137. In 1933 he met Joe Davis, the Eng. champion, for the world title, defeating him by 21,815 points to 21,121. He repeated the feat in 1934, when he won by 23,553 to 22,678. After 1934 he never visited England again, to the disappointment of Eng. enthusiasts, for he remains, by common consent, the greatest billiard player in the hist. of the game. The world title was not again contested till 1951, when C. McConachy (New Zealand) beat J. Barrie (England) in London by 9,294 to 6,691 points. No contest has taken place since. Davis maintained his position as Eng. champion, defeating Newman in 1938 and again in

1939, with a walk-over in 1946. In that year he retired from championship play of any kind.

B. proper is divided into 2 distinct kinds: the Eng. game, as played, on a table with 6 pockets, in Great Britain and in most of the Commonwealth countries; and the Fr. form, played, on a pocketless table, in the prin. European cities and in America.

English billiards. The table consists of a mahogany or other hard wood frame standing upon 8 legs sufficiently strong to support the massive weight of 5 slate slabs each measuring 2 ft by 6 ft 1½ in., which, when proved by the aid of a spirit-level to be absolutely true all over, are covered with a green cloth of fine texture, and form the bed, at a height of 2 ft 9½ in. to 2 ft 10½ in. from the floor. The playing surface is bounded by cushions, covered with the same material, with openings at each corner and in the centre of its 2 sides (making 6 in all) to allow of the balls dropping into the hanging pockets. The surface of the table is marked out as follows: a baulk line is drawn 29 in. from the face of the bottom cushion and parallel to it; the intervening space being termed the baulk. A semicircle, called the D, is described in baulk, striking from the baulk line with a radius of 11½ in. Spots, of black court plaster, are placed (on an imaginary line down the centre of the table) at 12½ in. from the face of the top cushion (the spot), another half way between the middle pockets (centre spot), and a third, the pyramid spot, midway between the centre spot and the top cushion. Also spots are commonly placed on the baulk line, at its exact centre, and at the intersecting ends of the D. Cues are made of old and seasoned wood, ash being generally used. They vary in weight from 14 oz. to 18 oz. or more. The striking end, on which is the leather tip, is from ¾ to 1 in. in diameter. The average length is about 4 ft 10 in., but it varies according to the build and fancy of the user. The butt end is about 1½ in. in diameter and is often spliced with some heavier wood to give balance. Three balls are used, a red and 2 white, one of the latter being distinguished by 2 spots at opposite extremities for easy identification throughout a game; hence one player is 'spot' and the other 'plain.' They should measure 2⅞ in. to 2⅝ in. in diameter, and nowadays are made from compositions known respectively as bone-zoline and crystalate. Formerly ivory balls were used, but were superseded in the late 20's. Two other implements are sometimes in requisition, the half-butt and the butt, for playing a ball when at an inconvenient distance from the striker. Points are scored either by the cannon, the cue (striker's) ball touching both object balls in its course, or by the losing and winning hazard.

The losing hazard is made by the cue ball striking one of the object balls and going off into a pocket; the winning hazard consists in pocketing one of the object balls by striking the cue ball against it. The cannon counts 2; going

in off, or pocketing, the white ball, 2; the red, 3. It is also possible to make combinations of these scores from one shot. Friendly games between good amateurs may be of 250, 500, or more 'up.' In championships sessions of 2 hours are played. The amateur championship final consists of 6 sessions (3 days). A game is most frequently contested by 2 persons, but 4 sometimes

in the order indicated. Pyramids consists of 15 red balls placed at the top end of the table in the form of a triangle, and is played by 2 players using the same white cue ball alternately. He who pots the most balls wins the game. It is usual to receive so much for each ball potted, double on the last one, and a stake on the game. When more than 2 persons compete it is designated 'shell-out.' Other

THE BILLIARD TABLE

Left, spots and markings for billiards; right, arrangement of balls for snooker.

play. A player continues until he fails to score, when he makes way for his opponent, and his 'break' is ended.

English pool and pyramids. The ordinary pool game consists of 2 or more players, each playing with a different coloured ball in the following order: white, red, yellow, green, brown, blue, pink, spot-white, spot-red, spot-yellow, spot-green, and spot-brown. Each participant in the pool endeavours to 'pot' or pocket his opponent's ball, the one 'potted' losing a 'life' which usually possesses a monetary value, generally one-third that of the entrance to the pool. The game is commenced by a white going on the top spot, red playing upon it from baulk, the others playing upon each of the

varieties of pool are Snooker, Russian, Black, Skittle, Pin, Cork, and Indian Pool. Russian and Indian Pool are the only Eng. varieties into which cannon play enters.

Snooker is played by 2 players, or 4 players in 2 partnerships, with 15 red and 6 coloured balls and the striking ball, white. The red is first potted, and this entitles the player to pot any coloured ball, which is returned to its specific spot on the table. Potted reds stay down, i.e. in the pocket(s). This procedure is followed, red and coloured alternately, until all reds are potted, leaving on the table only the coloured balls which are then potted in the following order, and with the scoring values shown: yellow (2),

green (3), brown (4), blue (5), pink (6), black (7). The same values count for colours potted in the first part of the game, reds gaining 1 point each. The word 'snooker' applies to the act of 'laying a snooker,' an integral feature of the game. A player is said to be snookered with regard to any ball when a direct stroke to the ball he should play at is obstructed by one which he should avoid. An amateur championship of snooker was inaugurated by the B. Association in 1916 and a professional championship by the Control Council in 1927. The rules of snooker were revised in 1920 and again in 1926.

French and American Billiards. This form of B. is played upon a pocketless table, 9 ft by 4½ ft, or for championship games 10 ft by 5 ft, and is confined strictly to cannon-play, or, as it is usually termed, carom, from the Fr. name, *carambolage*. Three balls are used, 1 red and 2 white, which are larger and heavier than those used in Eng. B., and the cues more powerful. The somewhat coarser nap of the cloth causes the balls to run more slowly, and since they are larger and heavier more 'work' can be got upon them. Every type of game played on the pocketless table is commenced by placing the red ball upon a spot near the top cushion, and the 2 whites occupy parallel positions at stated points spotted within the lower half. The cue ball, in opening a game, must be played at the red, the endeavour of the striker being to bring the balls together so as to control them in a sequence of cannons. Each cannon counts 1, and the player continues his break until he fails to score. The proficiency acquired by professionals like Vignaux on the Continent and Slosson and Frank Ives in America caused the authorities controlling Fr. B., especially in America, to devise restrictions in order to keep down the enormous sequences of cannons. Thus the game has become divided into 3 varieties: the plain cannon game, the corners lined off and the push stroke barred, and the baulk-line game, which latter can be varied according to the fancy of the players. An offshoot of the game proper is the three-cushion-cannon type, the cue ball having to strike 3 or more cushions before it can cannon on to the second object ball.

American pool. Amer. or 15-ball pool is played upon the ordinary 6-pocket table, and the 15 balls, each bearing a number, are set after the manner in Eng. pyramids; a deep red ball (the one marked with the highest number—15) is placed upon the pyramid spot and forms the apex of the triangle pointing towards the baulk end of the table. The player endeavours to pocket as many of the object balls as possible with the white cue ball. The figures marked on each ball count towards the score, so it is a most important point to know the exact situation of the balls bearing the highest numbers. The player with the highest aggregate, after the last ball is potted, wins. Another form of this game is known as Continuous Pool—the one who first reaches 100 being the winner. Each time the whole of the

balls are potted they are reset upon the table as for a fresh game, and play continues until one of the participants has scored the desired 100. Other varieties played in the U.S.A. are Chicago and Bottle Pool.

Leading professional exponents of snooker to-day are Joe and Fred Davis, W. Donaldson, H. Lindrum, S. Smith, J. Pulman, J. Rea, R. Williams, K. Kennerley, Alec Brown, and Albert Brown. J. Davis has compiled 670 breaks of 100 or over.

The amateur standard at snooker has improved immensely since the war, and the difference between the amateur's play and that of the professional is one of degree and not of kind, as formerly. The skill of professional play, and in its turn of amateur snooker, is the result of the intensive study of the game made by Joe Davis prior to and after the last world war. See J. P. Mannock, *Billiards Expounded*, 1904; Riso Levi, *Strokes of the Game* (3 vols.), 1920; A. F. Peall, *All about Billiards*, 1925; Joe Davis, *Billiards up to Date*, 1928, *How I play Snooker*, 1950, and *Advanced Snooker*, 1954.

Billingham, urb. dist. of Durham, England, on the N. bank of the mouth of the R. Tees. B. has grown from a small vil. to a tn in 30 years. Partly agric, but principally industrial, it contains large chemical works, shipyards, and other metal and engineering works. Pop. 24,000.

Billings, Josh, see SHAW, HENRY WHEELER.

Billings, city, cap. of Yellowstone co., Montana, U.S.A., on the N. Pacific railroad. The third largest city in the state, it is the trade and shipping point of wool, live-stock, alfalfa, and dairy products, beet, sugar, flour, meat products, and vegetables. It has an oil refinery and manufs. electrical equipment and farm machinery. The E. Montana College of Education and Rocky Mt. College are here, and there is also an airport. Pop. 31,834.

Billingsgate, prin. fish market in London, situated just E. of London Bridge. It is the most anct market belonging to the Corporation of London. The original site was one of the two gates in the Rom. wall along the riv., and the name appears to derive from a person. Here was one of the havens where royal tolls and customs were collected as early as the reign of Ethelred (979-1016), and probably earlier. It became a general market for corn, wine, salt, fish, pottery, coal, etc., and apparently did not become mainly a fish market until some time in the 16th cent. (the main fish market for cents. had been at Queenhithe and Fish Wharf). In 1699 an Act of Parliament estab. it as a free and open fish market. The present building was completed in 1876. B. as a synonym for vituperative language goes back at least 400 years.

Billington (née Weichsel), Elizabeth (c. 1765-1818), Eng. singer, b. in London. She was the daughter of a Ger. musician, from whom she received her first musical

training. She was a child of 8 when she made her first appearance as a pianist at the Haymarket Theatre. Her singing career began when she was 17, and in 1783 she secretly married her singing-master, a Mr B. The couple went to live in Dublin, and it was there that she made her debut in opera. In 1786 she returned to London and accepted an engagement at Covent Garden, at a salary unheard of at that time. She was reigning favourite in London (1786-94), and on the Continent (1794-6), and in London again (1796-1811).

Billion Dollar Congress, the 51st Congress of the U.S.A., which came into power immediately after the passing of the McKinley Tariff Act of 1890 and was popularly so called because it appropriated roughly a total amount of a billion (thousand million) dollars during its 2 sessions to meet the excessive increase in national expenditure consequent on Republican legislation.

Biliton, **Belitung**, or **Belitoeng**, Indonesian is. situated between Borneo and Banca. It is about 5 m. long, 44 m. broad, and in area 1800 sq. m. Its coast is fringed with coral reefs and rocks, which render it difficult of access. It is marshy and sandy, but the interior is somewhat hilly, being at an altitude of nearly 3000 ft. The is. is noted for its tin mines. The exports are rice, sago, nuts, gum, tortoise-shell, etc. The port of Tanjung-pandan is the chief tn. Pop. 75,000, of whom a quarter are Chinese immigrants.

Billon, Ger. coin-alloy of copper and silver in which the base metal greatly predominates. Usually one part of gold or silver to three of copper.

Billot, Jean Baptiste (1828-1907), Fr. general. He served with great distinction in Algeria until he was recalled to take command of the 18th Corps d'Armée on the outbreak of the Franco-Prussian war. He was elected a life senator in 1875, and was minister of war in the de Freycinet Cabinet.

Billroth, Christian Albert Theodor (1829-94), Ger. surgeon, b. Ruegen. He studied medicine and graduated at Berlin, 1852. In 1860 he became prof. of surgery at Zurich, and 7 years later at Vienna, where he did his best work. He was a pioneer in the surgery of the stomach and intestines and an advocate of Lister's antiseptic method. He made valuable contributions to the study of wound infection. During the Franco-German war he served voluntarily with military hospitals and his work there, together with a famous speech on the war budget, was instrumental in securing sev. reforms in the transport and treatment of the wounded. His book *Allgemeine chirurgische Pathologie und Therapie*, 1863, reached 11 editions and was trans. into 10 languages.

Bilma, oasis in Sahara on the route from Tripoli to Kuka. It is noted for its salt mines.

Bilney, Thomas (c. 1495-1531), Eng. heretical preacher, b. probably near Norwich. Educ. at Trinity College, Cambridge, he was ordained in 1519. He

preached against formalism, and the veneration of saints and relics. In 1527 he was tried by Wolsey as a heretic, and was imprisoned for a year in the Tower. He then resumed preaching, but was once more condemned, and sentenced to be burned at the stake in Norwich.

Biloculina, name given by d'Orbigny to a genus of minute protozoans of the family Milicididae and order Testacea. They are marine animals. B., in geology, are a genus of Foraminifera which are found in the tertiary deposits of the N. Sea.

Biloxi, city in Harrison co., Mississippi, U.S.A. It is on a branch line of the Louisville and Nashville railroad, and is a summer and winter resort for the residents of Mobile and New Orleans. It does a trade in packing and shipping fruit, vegetables, and oysters. Pop. 37,400.

Bilthorpe, agric. vil. of Notts, England, in Sherwood Forest, with waterworks for various parts of the co., now one of the new coal-mining vils. Pop. 2200.

Bilston, tn of Staffs, England, 4 m. from Wolverhampton, and is one of the iron-smelting centres. There are considerable manufs., which consist of heavy iron goods—bars, machinery, engines, bedsteads, iron and brass castings, wire, etc.—tin, enamelled goods, japanned ware, and pottery. A hard stone is found in the neighbourhood which is utilised for grindstones, and also a fine sand for casting, is obtained. Pop. 33,464.

Biltong, sun-dried salted meat; an Afrikaans (q.v.) word commonly used throughout S. and E. Africa. Formerly made entirely from game, but beef, mutton, and ostrich are now used. B. is valued for its nutritional and keeping qualities and lightness of weight.

Bima, seaport, and cap. of the is. of Sumbawa, Indonesia. The is. is specially renowned for its teak forests and tamarinds. The exports are timber and horses.

Bimba, riv. of W. Africa, which enters the Bight of Biafra, to the W. of the Kamerun R. It is known in its upper course as the Mungo R.

Bimetallism, the employment of both silver and gold coins as standard money or legal tender, widely operated in the 19th cent. because of the fear that one metal alone would fail to satisfy the demand for money and so produce deflation. But it worked smoothly only as long as the ratio between the values at which the two metals could be freely minted into coins approximated to their relative values in international markets. Otherwise the metal with the higher international value would tend to be sent abroad and be replaced by the other. Hence the instability of the system, and the periodic but not always successful efforts to achieve international agreement on relative values. It was hoped that if all the commercially important countries agreed to fix the ratio of the values of gold and silver at 15½ to 1, it would be possible to maintain that ratio by regulating the demand, i.e. by increasing or decreasing the coinage of gold or silver, and so stimulating or discouraging supply. The

advantages claimed for a fixed ratio are greater stability in value of commodities generally, since there is likely to be a compensatory supply of one metal if the production of the other diminishes; the avoidance of depending on one metal, the supply of which may not be equal to the work required to be done; and the possibility of establishing a world currency, with consequent advantages to commerce universally. The great weakness of the case for B. was the conflicting interests of different countries in adjusting the supply of and the demand for the 2 metals. This is well illustrated by the conditions which led to the bimetallic controversy. Between 1848 and 1860 great discoveries of gold took place in California and Australia. France, America, and the prin. European countries except Britain had a double coinage standard, and gold was minted in large quantities, a large amount of silver being exported to India and other countries having a silver standard only. After 1870 the production of gold diminished, and that of silver increased enormously. The consequence was a general rush to mint silver and the operation of Gresham's law in causing the exportation of gold. An attempt to restrict the coinage of silver threw it on the market as metal, and caused a further fall in price. The Indian Gov., as large holders of silver, and the silver producers of America, thus suffered considerable loss. A great agitation now sprang up, chiefly in America, to bring about an international agreement to fix a ratio and make a double standard universal. Money conferences were held in Paris in 1878 and 1881, but without effect. Through the efforts of the U.S.A., another conference was held at Brussels in 1892, but the opposition of Britain and Germany again prevented the estab. of a silver standard. An attempt was then made in America to establish a bimetallic standard for that country independently of Europe, and the presidential elections of 1896 and 1900 were fought mainly on that issue. The Gold Standard Act of 1900, however, placed the country on a monometallic gold standard. By 1914 a gold standard was universal in all countries except China, which maintained a silver standard. The general adoption of gold dates back to the depreciation of silver after 1873. In this year Germany

the first half of the 19th cent., when B. was confined to France and a few other countries, a ratio of 1 to 15½ was maintained between gold and silver. This ratio successfully withstood the gold discoveries of 1850 and the increased ann. output, but Germany's demand for fifty millions in gold after the Franco-Prussian war decided the fate of B. At the Genoa Conference in April 1922 it was decided that all countries must stabilise their currencies on a gold basis. The idea of B. was revived during the economic crisis of 1931-2. Its introduction would greatly increase the value of silver; but the idea was not seriously entertained. Shortage of the precious metals was not feared, as paper currencies spread when the Gold Standard broke down in the 1930's. The bimetallic controversy may be studied from the point of view of the bimetalist in *International Bimetallism*, 1896, by F. A. Walker; the opposing side is represented by Giffen in *The Case against Bimetallism*, 1892; whilst an impartial view is adopted by Leonard Darwin in *Bimetallism*, 1897. See also W. S. Jevons, *Investigations in Currency and Finance*, 1884, and D. Barbour, *Theory of Bimetallism*, 1885.

Binan, or Vinan, tn of Laguna prov., Luzon, Philippine Is., on Laguna de Bay. It grows coconuts, rice, and sugar. Pop. 20,794.

Binary Theory, generalisation in chem. which is now of historical interest only. It assumed that every chemical compound consisted of 2 parts which might be elements, or groups acting as elements, 1 element or group being electro-positive and the other electro-negative. The theory has been discarded.

Binehe, industrial tn in the prov. of Hainaut, Belgium, 10 m. ESE. of Mons. Pop. 10,100.

Binsk, or Bink, Jacob (c. 1500-c. 1568), Ger. painter and engraver, b. Cologne. He studied under Dürer and worked in Denmark. His engraving is unequal; among his best productions may be named the 'Divinities of the Fable' and his various portraits.

Bindusara (297-272 bc), 2nd Mauryan Emperor of India; son of the conqueror Chandragupta, and father of Asoka, who succeeded him.

Bindweed, name given to sev. plants of the family Convolvulaceae, which climb by means of twining stems and are natives of Britain. The name is most often applied to the sweet-scented *Convolvulus arvensis*, or Cornbine. The larger B. or Bellbine is *Calyptegia sepium*, a perennial of the hedges; and the Sea B. is *Calyptegia soldanella*, found on sandy or shingly shores. The name black B. is given to *Polygonum convolvulus*, an ann. species of Polygonaceae.

Binet-Simon Test, method of testing the intelligence of persons by putting to them a series of questions and getting them to perform a number of simple exercises, such as drawing, which can normally be performed by children of various ages. The test is named after Alfred Binet (1857-1911), Fr. psychologist, director of the

countries of the Lat. Union that they suspended the free coinage of silver in order to protect their stock of gold. They were thus forced into a regime of incomplete or 'limping' B., which hardly differs in practice from the monometallic gold standard. The 2 systems could not exist side by side, for the bimetallic country lost alternately the metal, of which the monometallic countries were most in need, and received in exchange the unwanted metal. The theoretic bimetallics had hoped for an international agreement establishing the free coinage of both gold and silver in all civilised countries. In

laboratory of psychology at the Sorbonne, and his collaborator Dr Simon. Originally designed to detect mental deficiency, the test was found to be useful to detect differences of intelligence at all except very high levels of ability. This test is now rarely used in its original form, the revision by Terman at Leland Stanford Univ., called the Revised Stanford (1937), being generally preferred. See INTELLIGENCE TESTS.

●Bingen, Ger. tn in the Land of Rhineland-Palatinate (q.v.), on the Rhine (q.v.), 17 m. W. of Mainz (q.v.). Behind the tn is the *Rochsburg* on which is a chapel with fine sculptures and paintings. Near by is the *Bingerloch*, a whirlpool most dangerous to navigate until the channel was widened in 1834. The *Mauseurm* (Mouse tower) is situated on a rock in mid-stream, the scene of the legend of Bishop Hatto II (q.v.) related in Southey's ballad. B. is a tourist centre, and has an ancient wine trade. Pop. 17,000.

Binger, Louis Gustav, Fr. officer and explorer, b. Straßburg in 1856. He studied the language of the Bambara in the Niger states, and pub. a work on the Niger. In 1887 he commenced his expedition from Senegal up to the Niger, and 2 years later he arrived at Grand Bassam. He described this journey in his work *Du Niger au golfe de Guinée par le pays de Kong et le Mossi*, pub. in 1891. In 1892 he again visited the Guinea Coast for the purpose of superintending the forming of the Eng. and Fr. boundaries. Appointed governor of the Ivory Coast, 1893. See Henri Mouézy, *Asinie et le royaume de Krinjabo* (Paris), 1942.

BINDWEED

Bingerville, tn of W. Central Africa, situated a little to the NW. of Grand Bassam. Named after Louis Binger (q.v.).

Bingham, Joseph (1668-1732), divine, b. Wakefield, Yorks. He was educ. at Oxford, and was made fellow of his college in 1689, and tutor in 1691. After

some time he was forced to resign his fellowship, and leave the univ. because of an accusation brought against him of heresy. This originated from a sermon which he preached upon the terms 'Person' and 'Substance' as applied to the Trinity. Shortly after, a living was given him at Headborough, close to Winchester, and it was here that he wrote his great work, entitled *Origines Ecclesiasticae, or Antiquities of the Christian Church*, in 10 vols., 1708-22.

Bingham, small tn of Notts, England, 8 m. from Nottingham. Pop. 1800.

Bingley, urb. dist. and mkt tn in W. Riding, Yorks, England, on the Aire, 6 m. from Bradford. Its manufs. are woollen goods, worsted, cotton, paper; there are extensive iron works in the neighbourhood. It possesses sev. fine buildings; among them are technical schools, a free library, a hospital, etc. Pop. 21,566.

Bingo, see DOMINOES.

Binh-Dinh, tn of S. Annam (q.v.), 11 m. from the coast and 205 m. S.E. of Hue (q.v.). It is a centre of silk production and cloth weaving, and its port is Qui-nhon.

Binh Xuxen, brigand group in Cochinchina (q.v.) led by Le Van Vien. This group maintained an army and controlled a strip of territory adjoining Cholon (q.v.). It derived a large income from levying 'protection money' from Cholon business men and by organising gambling and other vice in Cholon. In time it became a political force having its representatives in the gov. and, in 1954, assuming responsibility for Viet Nam's (q.v.) security services. Removed from the gov. by President Ngo Dinh Diem (q.v.), the Binh Xuxen clashed with the national army and was finally defeated and disbanded in 1955. Le Van Vien now lives in France. See E. Hammer, *The Struggle for Indo-China*, 1954, and the supplement, *The Struggle for Indo-China Continues*, 1955.

Bink, Jacob, see BINCK.

Binmaley, tn in the prov. of Pangasinan, Luzon, Philippine Is., E. of Lingayen. It produces copra, corn, and rice. Pop. 26,501.

Binnacle, framework or case or box in which is kept the nautical compass. It is fitted with lighting apparatus, so that the compass can be seen at night. It is as a rule placed on the deck of a ship, in front of the steersman. A double B. is occasionally carried, one on each side of the steering wheel. On board a man-of-war, one B. is for the use of the officer on watch, while the man at the wheel has the other. At one time the B. was just a locker with sev. compartments, to contain the compass lights, watch-glasses, etc. In the middle div. was placed the small lamp, and as the sides were of glass a light could be thrown on the compass all the time at night. The modern B. has been improved, for it is so constructed that the compass needle is made proof against vibration or shocks.

Binney, Edward William (1812-81), geologist, b. Morton, Notts. He practised as a lawyer, and became expert on the

geology of Manchester coal-fields. He was concerned with the founding of Manchester Geological Society, of which he became president twice (1857-9; 1865-7). F.R.S. 1853.

Binnie, Sir Alexander Richardson (1839-1917) engineer, b. London, educ. at private schools and under J. F. Bateman, F.R.S., president of the Institute of Civil Engineers; was engaged on Welsh railways, 1862-6; in Indian Public Works Dept, 1868-74; was appointed engineer to the city of Bradford, 1875; and chief engineer to the L.C.C., 1890-1901; his engineering feats include the Blackwall Tunnel, Bradford Waterworks, and Barking Road Bridge.

Binocular, see VISION.

Binoculus, term formerly used instead of *Apus* for a genus of phyllopodous crustacea of the family Apodidae. They inhabit fresh-water ditches, pools, and stagnant waters, and are gregarious. Males are seldom produced; the females carry their eggs about on specially modified appendages, and these eggs preserve the living principle for a long time in a dry state.

Binomial (Lat. *bis*, twice; *nomen*, a name), the name given in algebra to an expression consisting of 2 terms, as $a+b$, $a-b$. The *binomial theorem* is a method of expanding any power of a B. expression into a series. It is given in the following formula, where n may be any power integral or fractional, positive or negative.

$$(x+y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{1.2}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{1.2.3}x^{n-3}y^3 + \dots + y^n.$$

Thus, the expansion of

$$(x+y)^5 \text{ is } x^5 + 5x^4y + \frac{5.4}{1.2}x^3y^2 + \frac{5.4.3}{1.2.3}x^2y^3 + \frac{5.4.3.2}{1.2.3.4}xy^4 + \frac{5.4.3.2.1}{1.2.3.4.5}y^5 \text{ or } x^5 + 5x^4y + 10x^3y^2 + 10x^2y^3 + 5xy^4 + y^5.$$

The theorem owes its origin to Sir Isaac Newton, who first pub. it in 1676.

Bintan, chief is. of the Riuw archipelago, Indonesia. It is situated on the S. of the strait of Singapore. The coast is beset with rocks and small is., while the interior is low and marshy. Pepper, gambier, rubber, and rice are exported. There is also a trade in timber and tin. The chief port is Tanjongpinang. Pop. 18,500.

Binturong, or 'black bear cat' (*Arctictis binturong*), small black carnivorous mammal, found in India, Sumatra, Java, etc. It possesses a large head, and a thick long tail, prehensile at the tip. Its habits are nocturnal and solitary, slow and crouching. It feeds upon birds and insects. Its howl is very loud. It is easily tamed.

Binyon, Laurence (1869-1943), poet and orientalist, b. Lancaster, son of a clergyman. He was educ. at St Paul's School and Trinity College, Oxford, where he won the Newdigate Prize for Poetry. In 1898 he joined the staff of the Brit. Museum, and from 1913 to 1933 was

Keeper of the Oriental Prints and Drawings. His first book of verse was *Lyric Poems*, 1894, and just after the First World War he pub. *The Four Years*, containing the well-known poem 'For the Fallen' which has been quoted innumerable times in war memorial services. In 1924 he compiled *The Golden Treasury of Modern Lyrics*, and he also added a fifth book to Palgrave's famous anthology. His last vol. of verse was *The Burning of the Leaves*, 1944. He also trans. Dante's *Inferno* into Eng. verse, 1933, and pub. sev. plays. He was widely celebrated as an authority on oriental art. He compiled official catalogues of the Jap. colour prints in the Brit. Museum, as well as of Eng. drawings, and during his 20 years in charge of the oriental dept he made it the most representative in Europe. His books on art include *Painting in the Far East*, 1908, *Court Painters of the Grand Mogul*, 1921, *Drawings and Engravings of W. Blake*, 1922, and *English Water Colours*, 1933. In 1932 he was created a Companion of Honour.

Biobío, one of the largest rivs. in Chilo, S. America. It is 240 m. long. Its source is in the volcano of Antuco, on the Argentine border, and it takes a NW. direction to Concepción, a port on the Pacific coast. It is more than 2 m. wide at its mouth, but is navigable only for shallow boats above Concepción. B. is also the name of a prov. of S. Chile. It has an area of 4343 sq. m., and is divided into 3 depts. The chief products are timber and agric. products. The cap. is Los Angeles. Pop. 129,300.

Biochemistry is that section of chem. which investigates the chemical changes and products evolved in the life processes of plants and animals. It includes the investigation of the nature of living matter and the chemical processes of life and death. Not only is it concerned with the composition of the substances found in the organism, but also with their method of manuf. In this inquiry into the chemical activity of the organism, B. is intimately connected with the origin of life, and some biochemists think that one day it may be possible to synthesise living organisms.

The role of B. in medicine (q.v.) is becoming increasingly important. The earlier concept of diseases as possessing, as Sydenham (q.v.) put it, 'certain distinguishing signs which Nature has particularly affixed to every species,' has given way to the concept of disease as a disorder of function. Since the basis of all physiological function is chemical change it can be seen why the biochemist is playing an ever greater part in the diagnosis, control, and cure of disease and in the understanding of normal function. At the beginning of the cent., chemical pathology, which may be said to be the application of biochemical methods in the investigation of disease, had reached the stage of qualitative tests for urinary abnormalities, chemical examination of the stools, and some crude tests of gastric function. The technique of

gastric analysis was perfected in the early 1920's. At about the same time, with the advent of the practice of venepuncture as a commonplace procedure, the blood chem. began to be investigated and correlated with the chem. of the excretions. Hugh MacLean and de Wesselow invented a test for the quantitative estimation of the sugar in blood which was a landmark in the investigation of carbohydrate metabolism. The test became of great importance in the diagnosis of diabetes (q.v.) and in the stabilisation of diabetic patients treated with insulin. Van Slyke's method of estimating the amount of urea in the blood was equally important in estimating renal function (see KIDNEY and UREMIA) and led to the use of what is known as the urea-clearance test, a test which measures the amount of urea which the kidneys can excrete in a given time. Meanwhile, in 1918, Francis Benedict had pub. the first practical method for estimating the basal metabolism (see THYROID GLAND, *Basal Metabolic Rate*). Investigations of liver function and fat metabolism soon followed. The discovery by Bayliss and Starling in 1902 of secretin (see HORMONES) opened up the science of endocrinology as we know it to-day. Something was known before of the clinical manifestations of glandular deficiencies, and Grave's disease, Addison's disease, myxoedema, and acromegaly (q.v.) had been described. But the essential nature of the secretions of the ductless glands, the hormones or 'chemical messengers', which exerted a humoral as against a nervous control in the body, was unknown. The discovery of secretin introduced a new field of discovery to the biochemist. Gradually all the known hormones have yielded up their chemical secrets, and by the ingenuity of the biochemist some of the most complex have been synthesised. Others have defied synthesis. The function of the ductless glands and the hormones are described elsewhere under their separate headings. Recently the biochemist has enlisted the aid of radioactive isotopes. The development of the discovery by Curie and Joliot in 1934 that ordinary elements which are found in nature in the stable state can be induced to become radioactive has put in the hands of investigators a wide variety of elements of biological interest, which by means of special recording instruments can be traced in their progress through the body by their radioactivity. 'Labelled' atoms are followed in the myriads of complicated reactions which occur in the body in health and disease. Radioactive iodine has been used to study the physiology of the thyroid gland (q.v.). Radioactive phosphorus has been used in the study of the blood and its disorders, in the investigation of the metabolism of nucleic-proteins and in tracing the fate of labelled antigens and the rate of antibody production. Radioactive calcium has contributed to the knowledge of bone growth, and radioactive sulphur to that of the role of sulphur-containing amino-acids

in protein metabolism. The biochemist is intimately connected with the story of the vitamins (q.v.), and recently has scored a triumph in completely elucidating the chemical structure of the anti-anaemia factor, vitamin B₁₂, or folic acid (see LIVER). Much has yet to be learnt of the B. of allergy, but the liberation of histamines has already been estab. as an essential link in the allergic reaction. Enzymes occur in all the digestive juices and are able to convert certain foods into digestible form. The conversion of proteins, fats, and starches into soluble compounds in both plants and animals is brought about by various enzymes, which resemble catalysts in that they remain unchanged at the end of the reaction. Bacteria and yeast secrete enzymes of industrial importance and the action of many of these has been very extensively investigated. The discovery by Pasteur (q.v.) that alcoholic fermentation was due to an active substance in the yeast cell, later known to be an enzyme, was the forerunner of the discovery by biochemists of a whole series of enzymes occurring in animal and plant life (see ENZYMES; FERMENTATION; DIGESTION). The nature and action of many enzymes has still to be elucidated and the existence is assumed of many others as yet unknown. For instance, decomposition is known to be due to enzymes liberated by bacteria, and it is thought that the morbid effects of infection in man may be similarly due to bacterial enzymes, and that antibodies and antitoxins formed in reactions of immunity may be in the nature of anti-enzymes.

The biochemist is also concerned with therapeutics, and the advances made since 1934 in chemotherapy and antibiotic therapy is a story in itself. More and more is the biochemist exploring within the confines of the cell and its nucleus and trying to elucidate the chemical mysteries of the protein synthesis which goes on there—a synthesis which is the basis of cell div. The key to the problem seems to be a protein substance called deoxyribonucleic acid which is situated in the chromosomes (q.v.) and may make up as much as 64 per cent of the weight of the nucleus. The presence of deoxyribonucleic acid in this situation strongly suggests that it is the functional part of the genetic apparatus. It is thought that it has a double function—first to produce a substance, the primary gene product, which can be dispatched to the cytoplasm of the cell to control its activity, and, secondly, to produce a replica of itself at cell div. How it does this is a complicated story which is still partly a matter of supposition. There is strong evidence, however, for the theory that deoxyribonucleic acid is the master substance which decides all the activities of the cell and that another somewhat similar substance, ribonucleic acid, is the servant which translates the decisions into action. The evidence indicates that deoxyribonucleic acid makes ribonucleic acid

which, in its turn, makes the specific proteins which are necessary for cell activity.

The B. of the brain and central nervous system, which, beside the hormones, is the other master controller of body function, is yet in its infancy (see PSYCHOPATHOLOGY). Greater knowledge of the chemical reactions of brain function will lead to greater knowledge of the nature of brain diseases, of which little is known at the moment. This brief sketch of the field of B. is sufficient to show that there is no aspect of the body's function with which the biochemist is not directly concerned. In fact, B. may be said to hold the key to the mystery of life itself. See J. S. Kleiner, *Human Biochemistry* (2nd ed.), 1951, and E. S. West and W. R. Todd, *Textbook of Biochemistry* (2nd ed.), 1955.

Biogenesis, term used to express the theory that all forms of life owe their origin to antecedent life ('omne vivum ex vivo'), as opposed to abiogenesis (q.v.), which maintains that it may be possible to produce life from inorganic matter. The terms are used in connection with a biological controversy which recurs from time to time, though Pasteur's refutation of abiogenesis is now usually regarded as conclusive, except perhaps in the case of viruses (q.v.). B. is also expressed by homogenesis, which means that the living organism produces by sexual reproduction, spore formation, or partition, organisms resembling the parent, though the resemblance to the immediate parent may not, of course, be exact. See BIOLOGY.

Biography (Gk *bios*, life; *graphē*, writing), that branch of literature which deals with the hist. of the lives of individual men. The first known instance of the use of the word *biographia* is in the work of Damascius, a Gk writer of the early 6th cent. The word does not appear to have been used in England until the 17th cent. Fuller, in his *Worthies*, 1662, referred to the 'biographists of these saints', and in 1683 Dryden defined *biographia* as the 'history of particular men's lives,' in all parts of which 'Plutarch equally excelled.' B., in its most rudimentary form, exists in the early literature of all nations. The hist. of the lives of national heroes, coloured by popular imagination, may be traced in the myths of gods and giants and insuperable warriors. Jewish literature abounds in B., as it affects the hist. of the race. The O.T. is full of the lives of patriarchs, kings, prophets, and great women who left their work on the religious and social hist. of the Jews. The earliest examples of B. written with a conscious effort to narrate the true hist. of particular men, are probably to be found in Gk literature. In Gk and Rom. literature B. is generally a mere account, in strict historical sequence, of the chief events of his hero's life. It often took the form of a funeral panegyric, and the aim of the writer was strictly a moral one. His hero must either be an example or a warning. Every noble action is emphasised with grave eulogy; the consequence

of every deed pointed out and if necessary censured. Xenophon's memoir of his master Socrates is one of the earliest B.s that have come down to us from the Greeks. By far the most interesting is the *Parallel Lives* of Plutarch (AD 46-120). The lives number 46, and the Gk and Rom. heroes are arranged alternately as a parallel to each other. Plutarch excels all anc. writers of lives. His rare gift of sympathy with his subject, and his powers of selection and of seeing what is interesting, are only equalled by the best of modern biographers. North's trans. appeared in 1679, and had a remarkable influence on the Elizabethan dramatists. Other B.s of note, belonging to Gk literature, are Philostratus's *Life of Apollonius of Tyana*, the Neo-Pythagorean saint, and his *Lives of the Sophists*; Diogenes Laertius's *Lives of the Philosophers* (3rd cent.); Eunapius's *Lives of the Sophists* (4th cent.); and the *Life of Plato*, by Olympiodorus of Alexandria. The Augustan age of Rom. literature contains many fine specimens of B. *De Viris Illustribus* of Cornelius Nepos (c. 99-24 BC) is frequently historically inaccurate, but is of great interest. *The Life of Alexander the Great*, by Q. Curtius Rufus, is not so much biographical as historical, and is over-weighted with general reflections and rhetorical speeches. Tacitus's life of his father-in-law (*De vita et moribus Julii Agricola*), written c. AD 98, is a stately work, and contributes to our knowledge of the hist. of the times. The *Lives of the Twelve Emperors*, from Caesar to Domitian, written by Suetonius Tranquillus about AD 120, are rhetorical studies. Suetonius shows indifference to chronological exactness, and is by no means an impartial historian. Another B. of note is the monograph by Sallust (80-c. 34 BC) on the conspiracy of Catiline. St Jerome's *Lives of the Fathers* belongs to a later period.

The B.s of the Middle Ages were frequently written in the cloister or the cell; and the subjects chosen were saints, martyrs, abbots, bishops, and the like. In England many B.s of this kind were written in Lat. Bede (673-735) wrote lives of St Cuthbert (one a metrical version of considerable length, and one in prose), and also *Lives of the Abbots of Wearmouth and Jarrow*, the material for which he found in certain anonymous lives of these saints. Aldhelm, Bishop of Sherborne (d. 709), composed a prose treatise in praise of virginity, which he illustrated by the lives of a number of men and women—scriptural characters, hermits, monks, and saints—examples of chastity. Other lives of interest to the student of Early Eng. literature are *The Life of St Columba*, by St Adamnan (625-704); *Vita Caroli Magni*, a life of Charlemagne, written about 820 by Eginhard; *Lives of the Saints*, by Aelfric; *Wulfstan*, by Wm. of Malmesbury; *Wulfred of York*, by Radus Stephanus; and *St Guthlac*, by Felix. *The Life of Alfred*, by Asser, Bishop of Sherborne, has the distinction of being the earliest B. of an Eng. layman. During the 16th

and 16th cents. there was a fair output of this species of writing, but the form and the scope of B. did not develop to any great extent. Latin was frequently chosen as the medium of expression, and the style and form modelled on that of Livy and Sallust. The chief B.s to be noted here are *Illustrium Majoris Britanniae Scriptorum Summarium*, 1584, by John Bale (1495-1563); *Commentarii de Scriptoribus Britannicis*, by John Leland (d. 1552); a *Life of Sir Thomas More*, by his son-in-law, Wm Roper (1496-1578); a graceful *Life of Cardinal Wolsey*, by George Cavendish (1500-c. 1561), which remained in MS. till the 17th cent.; and *History of the Life and Death of King Edward V and the Usurpation of Richard III*, by Sir Thomas More, written between 1513 and 1514, and printed in 1657. Bacon's *History of Henry VII* appeared in 1621. In this an effort is made to analyse the motives and purposes of the chief actor, and everything is subordinated to or explained by his actions. In this analytic handling of his subject Bacon made a clear advance on the methods of his predecessors. All modern B.s, which aim at giving an artistic and truthful presentation of the life and character of an individual, must acknowledge their debt to the admirable *Lives of Isaac Walton*, written between 1640 and 1678. Walton had a sympathetic understanding, and his pleasing style and the revelations of his own pious and kindly personality combine to make the *Lives* attractive to modern readers.

So far it will have been noticed that the men chosen as subjects of B. are those whose lives bear directly upon the hist. of the Church and State. Men of letters were not considered to be of such influence and importance as to warrant a B. Even Walton's heroes were not wholly scholars. Drummond of Hawthornden's *Notes on Conversations with Ben Jonson*, 1619, though not strictly speaking a B., revealed the character of a man of letters in conversation, and proved that a man's character may be revealed in his trivial as well as in his serious remarks. From this time the scope of B. began to expand. Anthony a Wood (1629-95) chose the writs of Oxford for the subject of his *Athenae Oxonienses*; John Aubrey (1629-97) pleasantly sketched the lives of his immediate predecessors and his contemporaries in his *Brief Lives*; Thomas Fuller (1608-1661) wrote extensively, with numerous digressions, of the notable men of each co. in his *Worthies of England*, 1661. Thomas Sprat, Bishop of Rochester (1636-1713), reverted to the old classic models in his *Life of Cowley*, 1668, where he expounded that all familiar anecdote was out of place in a B., and that moral effect was the thing to be aimed at. Before the end of the 17th cent. 2 lives of Milton were in print, one by Edward Phillips, pub. in 1694, and one by Toland, in 1699. Lord Herbert of Cherbury (1583-1633), and Anne Harrison, Lady Fanshawe (1625-80), were the earliest to write lives of themselves. Another early autobiography (1656) is that of Margaret

Lucas, Duchess of Newcastle, who also wrote a life of her husband in 1667. With these autobiographies must be noted certain diaries, which were, after all, autobiographies not intended for pub. The most important of these is the famous *Diary of Pepys* (1633-1703), written between 1660 and 1669. Its value was unrecognised till the 19th cent., and an incomplete ed. was first pub. in 1825 by Lord Braybrooke. Notice must also be paid to the *Diary of Evelyn*, written between 1641 and 1697.

B. attained its most perfect form at the end of the 18th cent. in James Boswell's *Life of Dr Johnson*. The qualifications required of a good biographical writer are numerous. He must, of course, have a knowledge of the facts and access to authentic documents relating to the life of his hero. This is by no means all. The ideal modern biographer should not merely be in touch, through his own technical knowledge, with the work and ambitions of his hero; he should have a sympathetic understanding of his hero's character. He should be able so to present his hero that the reader is left with the feeling that he himself has known the man. Everything must be subordinated to the central figure; no incident, no person that does not influence the life or the character of the hero, should be introduced. The biographer must possess a knowledge of psychology; he must be able to analyse motives, and to arrange his material and group his characters to the best effect. In fact, in order to reveal the personality of his portrait he must create as well as reproduce. The *Life of Dr Johnson* is thought by many to have no rival in the whole realm of the world's literature. Boswell had an unbounded admiration for his hero; an intimate knowledge that would be hard to surpass; and the happy knack of an artist in selecting and grouping his material. Among the most prominent B.s written by men almost as great as their heroes are Boccaccio's *Life of Dante*, Dean Stanley's *Life of Dr Arnold*, and Lord Morley's *Life of Gladstone*. Excellent B.s were written in great number during the 19th cent. The great modern classics in this branch of literature are Southey's *Life of Nelson* and *Life of Wesley*; Lockhart's *Life of Scott*; Forster's *Life of Dickens*; Trevelyan's *Life of Macaulay*, and his *Life of Charles James Fox*; Carlyle's *Lives of John Sterling, Frederick the Great, Schiller, Oliver Cromwell*; Moore's *Life of Byron*; Mrs Gaskell's *Life of Charlotte Brontë*; Sir Theodore Martin's *Life of the Prince Consort*; and Dowden's *Life of Shelley*. Cross deviated from the ordinary form of B. in his *Life of George Eliot*, 1884. He arranged her letters in chronological order, headed by brief introductions or explanations, allowing her character to reveal itself in her correspondence. Cross's method has by many writers been adapted and combined with a B. Mason, in his *Life of Gray*, 1744, was the first to insert familiar letters, written to intimate friends, for the purpose of illustrating the

character of his hero. A great fault of some B.s is the lack of the power of selection in the author. A great amount of industrious research and scholarship is put into the work, but the biographer fails to present a living portrait of his subject. An example of this kind of work is Masson's *Life of Milton*. Masson gives a great amount of information about the politics and lives of Milton's contemporaries, and introduces in detail many people and incidents which only indirectly bear upon the life and character of the poet. During the 19th cent. all manner of men had their interest quickened in different branches of art and science; and numerous B.s, autobiographies, and memoirs have been pub. These have dealt with leading men in all walks of life. Autobiographies have been written in great number by all manner of men and women, such as Gibbon, Hume, Franklin, Talleyrand, Harriet Martineau, Oliver Wendell Holmes, Leigh Hunt, Scott (in his *Journal*), Ruskin (*Praeterita*), Carlyle (*Reminiscences*), Goethe (*Dichtung und Wahrheit*), Sir Henry Taylor, Edmund Gosse (*Father and Son*), etc. Sometimes an autobiography has almost taken the form of fiction, as in Borrow's *Lavengro*. Halliwell-Phillips has said with truth that the writing of modern B.s has been 'carried to a wasteful and ridiculous excess.'

In the 20th cent. one of the most remarkable B.s is Monypenny's and Buckle's *Benjamin Disraeli, Earl of Beaconsfield*, which appeared in 6 vols., 1910-20; and as a reference book on its subject, Morley's *Gladstone* suffers by comparison. Smaller B.s, however, became the fashion. B. in general has also on the whole been rendered more sincere and more readable by abolition of the conventional frontier between matters to be put in a life and those that should be glossed over. Two Brit. monarchs have been subjected to candid treatment: in Lytton Strachey's 1-vol. *Queen Victoria*, 1921, and in Sir Sidney Lee's *Edward VII* (in 2 vols.), 1925-6. Lytton Strachey's *Eminent Victorians*, 1918, is probably the most remarkable biographical work of its size; it is 1 small vol. dealing with 4 lives—Cardinal Manning, Florence Nightingale, Arnold of Rugby, and Gen. Gordon. Bernard M. Allen's *Gordon and the Sudan*, 1931, disposes of the malicious picture of Gordon presented by Lytton Strachey, whose conception of Gordon was based on a hasty generalisation from unreliable material. Indeed much of Strachey's work is marred by its straining after effect, e.g. in his sketches of Mme du Deffand, Horace Walpole, and Frederick the Great, and above all in the cloying study of *Elizabeth and Essex*. It may be said that Lytton Strachey has been the main influence in 20th-cent. B., particularly in reaction against the formal official 'Life' of the preceding cent., and the writing of B. has been one of the outstanding features of Eng. and Amer. authorship since the First World War. The growth of interest in psychology is one explanation of this, but the

pervasive irony of Strachey, the wish to revalue (or 'debunk') the 'great' in the light of modern interpretative psychology cannot alone account for the popularity of B. Writers appear to be attracted to B., also perhaps because the central life story of an individual may well serve other interests, such as historical research, literary criticism, social study, and in some instances, no less legitimately, creative and imaginative works of art. B. has therefore gained these interests as ballast against its use for motives of social satire, and the full-length study as against the short and biting pen-portrait came into its own again by the third decade of the cent. Of the many modern authors of biographical works, it is possible to name only a few. A high reputation in popular esteem was won by Philip Guedalla, particularly for his life of Wellington. Harold Nicolson, Hugh Kingsmill, Hilaire Belloc, Hesketh Pearson, Osbert Burdett, John Fortescue should be mentioned in Eng. literature; Gamaille Bradford, Van Wyck Brooks, Katherine Anthony, Joseph Krutch, and Matthew Josephson in Amer., and among continental writers with international reputation André Maurois, Stefan Zweig (d. 1942), Emil Ludwig (d. 1948), and Salvador de Madariaga. Special mention may be made of the monumental life of the Duke of Marlborough, *Marlborough, his Life and Times*, written by Winston Churchill, and pub. in 4 vols., 1933-8. The 20th cent. has above all been the flourishing period of autobiography. There is hardly a writer of note who has not written his own life or reminiscences, and many of them have extended such work to sev. vols.; examples of this are Sean O'Casey's 6-vol. autobiography, beginning with *I Knock at the Door*, 1939, and ending with *Sunset and Evening Star*, 1954; with it may be grouped the series of family memoirs by Sir Osbert Sitwell and Siegfried Sassoon's series of reminiscences.

The biographical dictionary dates from the 16th cent., and first made its appearance at Zürich in Switzerland with the pub., in 1545, of *Bibliotheca Universalis* of Konrad Gesner. It is in effect a catalogue (in Greek, Latin, and Hebrew) of past writers with the titles of their works. A second part, *Pandectarium*, was pub. in 1548-9. Other early works of this sort are *Prosopographia* of Verdia de Vauprivas (Lyons), 1573, the Bollandists' *Acta Sanctorum*, 1643-1788, and Pierre Bayle's *Dictionnaire historique et critique*, 1696. A dictionary of national B. was pub. in Sweden in 23 vols., 1835-1857. Other nations followed; and such dictionaries have appeared in Dutch (1852-78), Austrian (1856-91), and German (1875-1900). The Brit. *Dictionary of National Biography* was begun in 1882, under the editorship of Leslie Stephen, who was succeeded by Sidney Lee. It was issued in 63 vols., with 2 supplements forming 5 vols. more to bring it down to the end of 1911. Under new auspices and on a less comprehensive plan it had a 'Twentieth Century' vol. (1912-21) added

in 1927, and since then 2 other vols. have been issued covering the periods 1922-30 and 1931-40. A comprehensive work which supplies references to the main Eng. biographical dictionaries is Abert M. Hyamson's *Dictionary of Universal Biography* (2nd ed.), 1951. A *Dictionary of American Biography*, resembling the D.N.B., was begun in 1928, and completed in 21 vols. in 1937, with a supplementary vol. pub. in 1944. Other biographical dictionaries have been brought out in different countries. Nearly every country has now a *Who's Who*, which gives a brief outline of the life and work of living men who have distinguished themselves in various ways. Cyclopaedic biographical dictionaries include *Biographia Ecclesiastica*, 1704; *Biographia Britannica*, 1747-60; *Biographica Classica*, 1778; Michaud's *Biographie universelle*, 1811-28 (new ed., 45 vols., 1842-65); *The English Cyclopaedia*, with biographical section, 1856-7; *Nouvelle Biographie générale*, 1857-66; Chalmers's *Biographical Dictionary*, 1812-17; Sparks's *Library of American Biography* (10 vols.), 1834-8; Vapereau's *Dictionnaire universel des contemporains*; *Dizionario Biografico* of Gubernatis, 1880; Rose's *New General Biographical Dictionary*, 1829-47; Hammerton's *Concise Universal Biography*, 1935; Webster's *Biographical Dictionary* (latest ed.), 1943; Chambers's *Biographical Dictionary* (latest ed.), 1946; and D. C. Browning's *Dictionary of Literary Biography* (English and American), 1958.

See H. Nicolson, *The Development of English Biography*, 1928, and A. Maurois, *Aspects of Biography*, 1929.

Biology (Gk *bios*, life; *logos*, discourse), science of life. It attempts to survey all the phenomena manifested by living matter, and includes the sciences of morphology, physiology, genetics, embryology, and ecology. Besides treating generally of the life and origin of animals and plants, it includes the bacteria, viruses, and other organisms which do not fall readily into the sub-sciences of botany and zoology.

B. is also used in a more restricted sense within the science of life to indicate the way in which an animal or plant lives in its natural environment.

Two main aspects of biology. From the beginning of its hist., B. discovers 2 main types of investigator at work: the observer of living things, who records accurately what he sees; the theoretical worker who attempts to systematise the accounts he receives from observers. New forms of life and new species are still being discovered, while a detailed investigation of known forms is constantly being applied to them. B. has thus developed along the parallel lines of increasingly intensive and extensive observation, and of increasingly comprehensive generalisation. But observation is the fundamental basis of the science, and no finality can be claimed for B. until the whole field of living matter has been exhaustively surveyed.

History of the rise of biology. Men,

however primitive their mode of life, are dependent for their sustenance upon a limited number of plants and animals. As hunters and herders, it is essential that they distinguish a number of animals from one another, and that they do not confuse useful with harmful plants. The div. of living things into the 2 great categories of plants and animals was achieved by primitive peoples; further, animals were classified into birds, beasts, and fishes, and plants into trees, shrubs, and herbs. To some extent, then, primitive man had already made the distinctions which latterly categorise the 2 great groups of naturalists. The empirical folk knowledge thus accumulated in the course of many hundreds of years through the observation of nature becomes classified even whilst it is being collected, and is to be regarded as the foundation of the early stages of the science. The Babylonians possessed knowledge of higher animal forms and of human anatomy, and had developed theories of the functions of the visceral organs. In Egypt, also, the sacred animals were studied with minute care. The development of the scarab was known, the metamorphoses of the frog and the fly had been observed, and observations of various parasitic worms had been made. The Egyptian custom of embalming the dead led to a knowledge of the structure of the human body. However, in spite of the accumulation of facts in Egypt and Babylonia, it is to Greece that we must turn for the earliest attempts to organise such knowledge in systematic form. Hippocrates (460-377 bc) discarded magical theories of disease; Aristotle (384-322 bc) originated scientific classification. He was acquainted with over 500 forms classified by modern zoologists, all Greek and mainly marine. He was the founder of comparative anatomy, and his chief interests were anatomical and morphological. His disciple, Theophrastus, paid special attention to the botanical side of biology, doing for botany what Aristotle had done for zoology. The influence of Aristotle and his immediate successors led to the development of the school of medical study in Alexandria under the Ptolemies, where B. was studied, with anatomy and physiology, in relation to medicine. In the 1st cent. of the Christian era, the Roman, Pliny, compiled his *Natural History* from a number of sources: a work which made him, after Aristotle, the most influential of the biologists of classical antiquity. Galen (b. AD 131) stood on the borderland between antiquity and the Middle Ages. He began the study of the component parts of the living organism. He recognised the difference between sensory and motor nerves, he described the heart and blood-vessels in detail, and studied the process of respiration. Throughout the Middle Ages little or no progress was made with the study of B., and Galen's work remained unquestioned until the 16th cent., when fresh work was begun. Vesalius (b. 1514 or 1515 at Brussels) became prof. at Padua, and carried out investigations into anatomy by means of

dissections of the human body. In theory he followed Aristotle and Galen, but he corrected a great many false beliefs and made many new discoveries. Gesner (b. 1516 at Zürich) wrote the *Historia Animalium*. Aldrovandi (b. 1522 at Bologna) was also a zoologist, but in connection with his work in Bologna planted a botanical garden. Rondelet (b. 1507 at Montpellier) wrote *De piscibus marinis*, a work which groups together not merely fishes, but also crustaceans, worms, molluscs, echinoderms, and other aquatic animals. Caesalpinus developed the work of classifying plants which Gesner had begun, using, for the first time, their seeds as a basis. Generally

WILLIAM HARVEY

speaking, these pioneers of the Renaissance specialised in their researches so that botany, zoology, and human anatomy developed as distinct sub-sciences of B. Progress was made more rapidly in the 17th cent. Fabricius ab Aquapendente (1537-1619) discovered valves in the veins, and Harvey (b. 1578 at Folkestone) made the discovery of the mechanism of the circulation of the blood, and the means by which it is supplied with nutritive materials. Harvey's work was a great incentive to further research and discovery, particularly in the case of morphology and physiology of animals; from this time onwards morphology—the analysis of living structures into component parts—and physiology—the functioning of living structures—become the prin. sub-sciences of B. By asserting that all animals are produced from an ovum, Harvey also laid the foundations of embryology. Just before this time, Gasparo Aselli (1581-1626) had discovered the lacteal vessels, in the course of a vivisection experiment on a fully fed dog, and Bartholin (b. 1616 in Copenhagen), following up this work, discovered the

nature of the lymphatic ducts. Rudbeck (b. 1630 at Vasterås) had made this discovery independently somewhat earlier, but Bartholin's account was pub. first. Robert Hooke (b. 1635) described in 1665 the cellular structure of thin slices of cork; Malpighi (b. 1628 at Crevalcore) discovered the capillaries of animal blood systems and the stomata in leaves, while Nehemiah Grew (b. 1628) independently worked on the fine structure of plants. Grew and Malpighi freely exchanged their ideas, and besides founding microscopical anatomy, formulated the idea that the structure of organised living matter is something unique. This view remained at this stage until the development of the cell theory nearly 200 years later. Leeuwenhoek (b. 1632 at Delft) applied himself to improving the microscope, and studied animal spermatazoa. He discovered the Infusoria and Rotifera and is credited with drawing bacteria for the first time; the 3 main shapes are shown in figures of scrapings taken from his teeth. In the botanical field he showed the difference of structure between the stems of monocotyledons and dicotyledons. Most important, he first questioned the view that any living creatures could be generated spontaneously by putrefaction, insisting that they are produced by reproductive processes. Swammerdam (b. 1637 at Amsterdam), combining fine dissection with microscopical technique, investigated the anatomy of invertebrate animals, and laid the foundations of modern entomology. He explained the development of the frog and of insects on rational principles, and also made observations on the physiology of muscle; he showed that there is no change in volume when a muscle contracts. Another Dutchman, de Graaf (b. 1641), by his study of the sexual organs, overthrew the Aristotelian doctrine that the embryo is the product of the male semen alone, and gave an account of the true character of fertilisation. John Ray (b. 1627, near Braintree; d. 1705) and Francis Willughby (q.v., 1635-72) applied themselves to the problem of classification; Ray applying himself at first especially to botany, and Willughby to zoology. Ray's important pub. was the *Historia plantarum generalis*, in which he summarises all the botanical knowledge of his time, and lays the foundations of an anatomical classification of plants, which prepared the way for the work of Linnaeus in the following cent. Hermann Boerhaave (b. 1668, near Leyden) made a close study of the general structure and functions of the human body, and presented the results of his survey in terms which more closely resemble the conclusions of modern B. than the work of his contemporaries. He sought to explain many biological phenomena in terms of chem. and physics. Albrecht von Haller (b. Bern, 1708; d. 1777) laid out a botanical garden at the univ. of Göttingen, and sought to set up a natural system of plant classification; in physiology he investigated muscular irritability, extended knowledge of the

circulation of the blood, and in comparative anatomy. Charles Bonnet (b. 1720 at Geneva; d. 1793) studied insect B., but, compelled to give this up through failing sight, applied himself to speculative B. His discovery of parthenogenesis, his observations of the metamorphoses of insects, and contemporary studies of regeneration and reproduction by fission, led him to work out in detail theories of development. He originated the catastrophic theory of creation, according to which the earth has undergone a series of developments, each of which has been cut short by a great natural catastrophe, which has destroyed the forms of life, though leaving intact the germs from which life was to develop

COMTE DE BUFFON

when the catastrophe has ended. Bonnet was impelled to consider together botany, zoology, anatomy, morphology, physiology, and comparative anatomy, thus unifying those sub-sciences which had been developed independently. De Buffon (b. 1707 at Montbard; d. 1788) pub., in 1749, the first part of his *Histoire naturelle*, which engaged him for the rest of his life. He attempted the task of unifying the study of the earth with the study of living forms by regarding the hist. of the earth as related to the development of living creatures. With him the geographical distribution of animals and plants on the surface of the earth becomes significant. Linnaeus (1707-78) pub. the *Systema naturae*, in which he expounds his system of classification. This system laid the basis of classification as we know it to-day; and, through it, the biologist has been able to handle the material which has accumulated as the result of the labours of those engaged in observations and descriptive work. But Linnaeus committed himself to the view that species were immutable, and would ever remain so, each having

originated as such through a special act of creation. Meanwhile the sub-science of palaeontology had been founded by Paley the potter, who correctly asserted that fossils are the authentic traces of extinct life; and by John Hutton (1726-97), who taught that present processes are adequate to explain the formation of stratified rocks and the existence of fossils. Bichat (b. 1771 at Thoirette (Jura); d. 1802) carried out investigations of tissues by means of the microscope, which entitle him to be regarded as the founder of modern histology. Sprengel (b. 1750 in Brandenburg; d. 1816) pub. in 1793 a general theory of fertilisation in the vegetable kingdom, which in essentials still holds good. Robert Brown (1773-1858) first discovered the cell nucleus, and his early work on the flora of Australia was a pioneer piece of plant geography. Lamarck (b. 1744 in Picardy; d. 1829) challenged the fixity of species, arranging animals in series on the basis of the presence or absence of certain organs. The development of these organs, and their presence or absence, he ascribed to habits. He is thus the propounder, not merely of a theory of evolution, but of a theory of the evolutionary process. In a modified form, his views were held by one of the 2 great groups of protagonists over evolution, namely the Neo-Lamarckians. Von Baer (1792-1876) made important contributions in the field of embryology. His discovery of the actual mammalian ovum enabled him to follow the successive stages of embryological development. He showed the affinities of vertebrates through study of comparative embryology, and enunciated the principle that the development of the individual is a recapitulation of the development of the group of which it is a member, an idea which was later elaborated by Ernst Haeckel (1824-1919). Schleiden (b. at Hamburg; d. 1881) first regarded the plant as a community of separate cells. Schwann (1810-82) took up Schleiden's theory, and showed that it applied to animals, arguing that the whole plant or animal organism is composed of cells and the products of cells. Dujardin (1801-60) first used the term 'sarcode,' later supplanted by 'protoplasm,' to denote the living material of which simple organisms consist. Hugo von Mohl (b. 1805 at Stuttgart; d. 1872) carried this work farther, and is regarded as the founder of modern plant cytology. Virchow (b. in Pomerania; d. 1902) applied the results of the cell theory to pathology, and Max Schultze (1825-74) estab. the fact that protoplasm is the fundamental substance of the cell, and that the structures formerly supposed to be essential were products of the living protoplasm. Claude Bernard (b. 1813 at Saint-Julien; d. 1878) was a pioneer in the field of experimental biology. To him is due much of our knowledge of the digestive processes in the alimentary canal. He also showed that sugar, formed as a product of digestion, is temporarily stored in the liver as glycogen. In the second half of the 19th cent. Charles Darwin (1809-82) and

Alfred Russel Wallace (1823-1913) simultaneously propounded the theory that species originate as a consequence of 'natural selection' or the 'survival of the fittest.' This theory was based on the observation that individuals of a species vary in small but significant details from each other; it does not attempt to explain how these variations originate, but shows that, since some are advantageous and some disadvantageous, their possession assists or handicaps animals in their struggle for life. Francis Galton (1822-1911) developed a theory of eugenics which seeks to elucidate all those agencies which affect racial qualities. In connection with the development of the theory of evolution by means of natural selection, the names of Thomas Henry Huxley (1825-95), Ernst Haeckel (1834-1919), and Herbert Spencer (1820-1903) must be mentioned. Carl Gegenbaur (b. 1826 at Würzburg; d. 1903) worked to confirm Darwin's hypothesis by means of comparative anatomy, showing by means of anatomical comparisons the relationships, due to descent, between the various forms of animals. Like Haeckel, Gegenbaur sought to establish genealogical trees for existing species of animals, and gaps in the line of descent were filled with 'missing links.' The discovery of fresh facts has done away with many of these. Under the influence of Darwinism a great deal of specialised work in the various sub-sciences into which B. is subdivided has since been accomplished in the last fifty years. In anatomy the names of Wiedersheim (1848-1923) and Arnold Lang (1855-1916) must be mentioned; in embryology, Kowalewsky (1844-1901), Oscar Hertwig (1849-1922), Richard Hertwig (1850-1937), Sir Edwin Ray Lankester (1847-1929), Wilhelm His (1831-1904), and Francis Maitland Balfour (1851-82). In cytology, Strasburger (1844-1912) elucidated the problems of nuclear div. in vegetable cells, whilst Flemming (1843-1905), Fol (1845-92), Bütschli (1848-1920), van Beneden (1845-1910) and Boveri (1862-1915) made many advances in cytological technique; in the specialised field of the cytology of nervous structure the names of Golgi (1844-1926), Ramón y Cajal (1852), Ehrlich (1852-1915), Ranvier (1835-1922), and Nissl (d. 1919) are all connected with important discoveries. The advances in technique made by these workers in the cytological field have made possible the researches which have revealed the details of the process of fertilisation, and thus opened up possibilities of studying experimentally the mechanism of heredity. Meanwhile controversies arose regarding a number of issues, such as the question of the origin of variations, and the transmissibility of 'acquired' characters. Weismann (1834-1914) worked out a theory of inheritance based upon cell structure. His theory of the structure of the germinal cell and its material ('germ plasma') is partly speculative and partly based upon contemporary research, and denies the possibility of any transmission of the effect of habit or practice.

Semon (1859-1919) elaborated the 'mneme' theory for the purpose of accounting for the transmission of acquired characters: modifications in the soma of an organism leave impressions ('engrams') on the germ cells in the same sort of way as impressions are formed in the brain by outside stimuli. Hugo de Vries (b. 1848 Haarlem; d. 1935) pioneered in the field of modern genetic research, and discovered 'mutations,' i.e. sudden large variations. Mendel (b. 1822* at Helzendorf; d. 1884) carried out a series of experiments on the hybridisation of peas, which remained almost unknown till after his death. The rediscovery of his work was practically the beginning of a period of brilliant investigations of the problems of heredity and the transmission of characters, which is still being carried on and developed. The names of Bateson and Punnett (in England), Baur and Correns (Germany), Czermak (Austria), Lang (Switzerland), Cuénot (France), E. B. Wilson and T. H. Morgan (U.S.A.), are outstanding in this field. Another development in modern B. is that of biochemistry (q.v.), arising in the first instance from the modern chem. of solutions and of ferments and the study of the composition of the various products of animal glands. Cytology, the study of the cell, and particularly its nucleus and chromosomes, is yet another branch of B. which has made tremendous progress in recent years, as a result of work by Strasburger, Darlington, Ruggles Gates, and many others. The chromosomes have been shown to be the carriers of hereditary qualities; many observations on the chromosomal number and behaviour in the cells of an organism have been brought into line with its genetical make-up. Experimental embryology, in the capable hands of Spemann, Vogt, de Beer, and C. H. Waddington, has shown the presence of chemical organisers which are responsible for the differentiation of the parts of the embryo from the segmenting egg.

Logical development of biology. This brief survey of the hist. of B. makes it clear that, on the whole, this hist. has followed a logical order of development. If a perfect logical sequence were possible, we should first seek a complete enumeration of all the forms of life and their natural classification into families. We should seek to know the distribution of the various plants and animals over the earth at the present time and in the past. Analysis of the separate forms would give rise to anatomy, and comparisons of these analyses to comparative anatomy. The attempt to discover underlying unities leads to the generalisations included under morphology, and the analysis of the organism into organ, tissue, cell, and protoplasm; the attempt to study morphology through observation of the development of the organism from the fertilised ovum leads us to embryology. Meanwhile the study of the functioning of the organism has given rise to physiology, which must be studied in terms of the organism as a whole, and also in

terms of organ, tissue, cell, and protoplasm. This, in turn, will involve studies of the effect of environment, heredity, disease. Variation and reproduction, too, must be studied. In every instance results must be arranged under the categories of organism, organ, tissue, cell, and protoplasm. Final generalisations are only possible as these various studies attain completion, and none has yet reached this stage. When, in the past, it has seemed that some finality has been attained, and B. has become dogmatic, the discovery of fresh facts or of a new technique has rendered many of the current generalisations untenable. But any partial generalisation is a gain, provided it subsumes the available facts,

CHARLES DARWIN

since invariably it leads, sooner or later, to fresh investigations and to the further development of one or more of the special sub-sciences which compose B. The most comprehensive generalisation is the new theory of evolution.

Evolution and the Darwinian revolution. A generalisation as comprehensive as that of Darwin, to be fully justifiable on strictly scientific grounds, needed to be the assimilation and reformation by one mind of the results of many years of work by a large number of investigators. As it was, Darwin owed a great deal to the work of both theoreticians and specialists on the one hand and practical breeders on the other. One invaluable result of his work was that specialists could no longer work in isolation in their own chosen field but had to take the whole of organic nature into account. His work gives no explanation of the origin of variation but points out that variations do occur. Neither does it give any account of the mechanism or the laws of heredity, though it assumes that traits are transmitted. Nor does it attempt to explain the problem of the origin of life, though

it suggests that the multifarious species of plants and animals have developed from a smaller number of species and these again, in all probability, from a still smaller number. Regardless of his suggestions and speculations regarding some of the problems, what is called Darwinism is the doctrine of the origin of species through the operation of natural selection. As such, it called imperatively for work in all the sub-sciences of B. to provide exact information, particularly in regard to (a) the occurrence of variations; (b) the heritability of variations; (c) the role of variations in the struggle for existence.

One of the immediate sources of controversy was the question whether 'acquired' variations (resulting from habit, accident, disease, or education in the lifetime of the individual) could be transmitted—the Lamarckian view. To this question Weismann made an important contribution in his celebrated theory of the germ plasma, which he developed mainly on the basis of work done by him in embryology and cytology. According to him the cells of an embryo are already segregated at a very early stage of its development into 2 kinds—those destined to form the germ cells and those (the remainder) destined to give rise to all other bodily tissues of the germ cells, organised for the purpose of transmitting the germ plasma from one generation to the next. It follows, therefore, that habits acquired by the organism during its life, and hence subsequent to the segregation of the germ plasma, cannot be transmitted. Using the newly described events of cell div., Weismann proposed that the chromosomes in every cell nucleus were composed of minute ultimate elements, each corresponding to a unit character of the eventual developed organism. In the process of producing ovum and spermatozoon, 'reduction divisions' take place, whence half of these unit characters are eliminated, and replaced during fertilisation by the fusion of 2 half-sets of characters. While these theories provided an explanation of variation, they were of course beyond confirmation by microscopic observation. However, in further developments of his theory, it was suggested that, for instance, if a particular organ was not used, its determinants within the germ plasma were weakened and ultimately perished as a result of competition for survival within the organism; this admission that the germ plasma could be modified as a result of a mode of life of the individual organism is of course tantamount to accepting the inheritance of an acquired character. It is also difficult to apply these rigid ideas to plants, where the clear-cut distinction into somatoplasm and germ plasma is often entirely absent.

But research stimulated by Weismann's theory confirmed many of his speculations as to the character of the chromosomes in the nucleus of the germ cells. Modern theories of heredity conceive of invisible elements termed genes, and justify the assumption by means of numerical and quantitative data. Statistical methods

of determining chromosome structure and mapping the component genes are now extremely advanced, but techniques such as the electron microscope offer hope of confirmation of many of these formulations by more direct means. The assessment of these inheritance factors arises from the development of a technique originated by Gregor Mendel, who worked chiefly with peas. Mendel observed that the hybrids produced by crossing tall with dwarf plants were all tall. But by self-fertilising these, he obtained a generation which contained 3 times as many tall as short ones. He explained these results by assuming that the pollen and ovules of the pure dwarf plants contained only a factor 'shortness'

Cambridge University Press

GREGOR MENDEL

while the pure tall plants produced reproductive bodies with only a factor 'tallness.' When crossing the 2 varieties, all the offspring, regardless of which contributed the pollen and which the ovule, contain one 'short' and one 'tall' factor; all are tall, because 'tallness' dominates 'shortness.' But as the germ cells, when mature, contain only one of each pair of factors present, the hybrids will produce equal numbers of 'tall' and 'short' pollen and of ovules. Hence self-fertilisation must bring these elements together as SS:ST:TS:TT. The three-quarters which contain a 'T' will be tall, and the remaining 'SS' quarter are short. Mendel's work, which was lost for nearly fifty years, led to an enormous programme of research after 1900, chiefly under Bateson and Punnett in Great Britain, which extended and confirmed his ideas, and founded the modern science of genetics. In this, and similar work in America led by T. H. Morgan, it is now clear that many of the inheritance units or genes are not so free as Mendel had supposed but often function as groups, as if they were linked in some way.

Darwin had suggested that variation was progressive, starting as slight deviations from the normal, and tending to increase in successive generations. But the Dutch botanist, de Vries, claimed that offspring could very occasionally—as exemplified by the evening primrose (*Oenothera lamarckiana*)—differ so markedly from their parents as to constitute a new species in one generation. His theory of evolution by sudden 'mutation' of this kind is still considered an essential part of the mechanism, while his insistence on the necessity of studying the relation of variation to the inheritance mechanism was of great importance.

The eventual charge against natural selection was that it stressed too strongly the influence of the environment, rather than what went on inside the organism. The all important factor which was overlooked was the way in which the mechanism in the organism reacted to environmental influence. And it is now clear that such experiments as those by which Weismann sought to disprove that acquired characters could be transmitted (by cutting off the tails of many generations of new-born mice without diminishing the tails of their offspring) are irrelevant. The essence of Neo-Darwinism is that the environment selects from the inherent potential of the organism what is most suitable to survive; the Neo-Lamarckians suggest that things acquired by the organism in reaction to the environment can subsequently be passed to the progeny. For this there is some evidence that such things as temp. acclimatisation might be transmitted; the more extravagant claims of Lysenko (q.v.) have recently been severely criticised. The most startling example of Darwinian selection has been revealed very recently in the resistant strains of insect under the environmental influence of insecticides. Many of these are shown to have been inherent in the animals, and to be simple Mendelian characters.

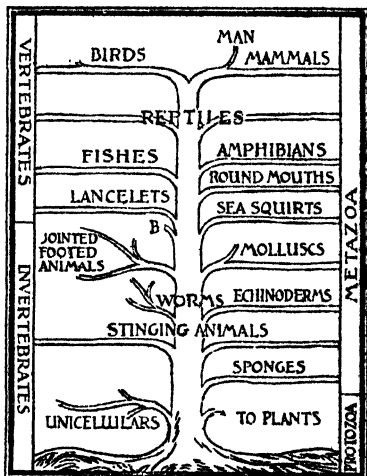

Morphology. As seen in the historical sketch already given, this sub-science was in a rudimentary state when, in the 17th cent., Ray and Willughby set about and succeeded in bringing real order to it. The value of Buffon's great work in natural hist., which includes the accurate morphological description of virtually all that was known in the old world, was still further enhanced by Linnaeus's system of nomenclature. Morphology then becomes a process of subdivision to finer and more microscopic limits. Bichat analysed organs into tissues, Schleiden and Schwann resolved the tissues into cells and Dujardin and von Mohl the cells into protoplasm. To-day ultra-microscopic techniques are resolving the finest structures of cell contents and revealing how remarkably the gross structure reflects the finest constituents. At this level of course, B. is inextricably mingled with biochemistry and physics. As a result of von Baer's study of the development of the complete organism from a single-celled egg, the step-by-step process of elaboration of cells into tissues and

tissues into organs was made clearly known. This process, which reveals much of the story of evolution, constitutes the natural synthesis of which morphology is the analysis.

Physiology. Unlike the observational side of B. covered by morphology, physiology deals with the functioning of organisms, and depends so much on other sciences that it is not surprising to find its development in the ancients was practically nil. The great value of Harvey's demonstration of blood circulation was to reveal the operation of

of its evolution, and is an essential supplement to the study of form or function because they have resulted from evolutionary processes.

Phylogeny is the special study of organisms with a view to establishing their relationships. The earlier problem of classification, before Darwinism, was that of reducing a vast accumulation of material to order for convenience of reference and manipulation. But the Darwinian theory of descent implied that there were relationships existing between the various species of living

THE CLASSIFICATION OF ANIMALS, EXPRESSED AS A GENEALOGICAL TREE

B, *Balanoglossus* (*Enteropneusta*), an important connecting link between vertebrates and invertebrates.

definite organs in essential life processes. Following the pattern of morphology, Bichat and then Virchow revealed successively the functioning of tissues and then cells. To-day comparative physiology reveals a remarkably similar pattern of basic mechanisms and patterns of activity throughout the animal and plant kingdoms, and can often help substantially in establishing relationships between animals. Again, at its finest limits, it merges into chem. and physics.

Embryology and evolution. The special position of embryology is not only in revealing the continuous process of development in which form and function are elaborated side by side. The parallels between the facts of embryology and of palaeontology forced the realisation that the hist. of the individual organism closely resembles that chronologically increasing complexity of all higher organisms. A study of the embryology of an individual is thus an actual study

organisms. With the help of morphology, comparative anatomy, embryology, and palaeontology, it should be possible to discover lines of descent connecting the various branches of the genealogical tree. Two interesting facts stand out clearly, viz. degeneration and convergence. Forms which differ widely in their adult forms are found to be closely allied in embryonic stages. Fishes in caves lose their eyes, parasites lose their locomotive organs. This return from the complex to the simple by the loss of highly specialised structures is known as degeneration. All along the evolutionary path are found organs which were once required, but are now useless or are adapted to some new function, one which they did not in the first instance serve. These organs are called vestigial, and tend to disappear. Degeneration is evidence in support of the evolutionary theory, according to which variation may be either progressive or regressive, a

regressive variation being as likely to be a factor favouring survival in some environments as a progressive one. On the other hand, adult organisms show characters which would lead us to group them with others, were it not that the hist. of their embryonic development shows the two to be quite unrelated. In the process of adaptation to environment they have evolved structures comparable to those of unrelated organisms which have been compelled to adapt themselves to similar environmental conditions. The facts of convergence and degeneration make clear the need of the phylogenetist for evidence gathered from every available source before he is in a position to say definitely in what relationship an organism stands to other organisms. The cases of the worm-like *Balanoglossus* and the lancelet (*Amphioxus*) (q.v.) may be cited. Only a full knowledge of their development would lead anyone to realise that the place of these organisms is not with the worms, and that they have vertebrate affinities.

Nature and Origin of Life. Until recently, though the mass of mankind believed that life owed its origin to an act of creation by a divine being, men were nevertheless ready to believe that living organisms could be spontaneously generated from dead or inorganic matter. Vinegar, left alone, might generate eels. Flies and lice might develop from dust. Bees, or rather 2-winged flies mimicking bees very closely, might be formed inside the carcass of an animal. Men who hesitated to believe in these alleged phenomena might nevertheless believe that micro-organisms might spontaneously be generated in various infusions—in infusoria (as their name implies) from infusions of hay, etc. But, though these beliefs are no longer held, and though it is not seriously doubted that existing organisms are the products of previously existing organisms, 2 questions constantly arise. The first of these is the question of the origin of the first living matter, from which we may assume all living forms to have been derived. The second is the question of the possibility of making living matter from inorganic materials in our laboratories. The latter query has been raised anew recently, partly as a consequence of the success of biochemists in synthesising complex compounds hitherto known only in association with living organisms, and partly as a consequence of experiments in the growing of living tissues, severed from the living organism, over long periods of time in appropriate chemical solutions. It may be urged that the consideration of these problems does not properly fall within the prov. of the biologist, but their results, if not their investigation, are strictly relevant to the study of living matter. It has been estab. that living matter always consists of a complex substance or substances composed of carbon, nitrogen, hydrogen, and oxygen, with traces of other elements and about 70 per cent of water: the components of that primary form of living matter known as protoplasm. Further, living matter is

always in a state of physico-chemical change, i.e. it is constantly changing its chemical composition and at the same time liberating or storing energy. One type of change is the elaboration of chemical substances of more complex character with absorption of energy; whilst the complementary type of change involves the breaking down of complex into simpler substances with liberation of energy. The respiration of oxygen from air causes oxidation of complex substances with production of carbon dioxide, water, and other compounds and liberation of energy, with waste of tissues: whilst the utilisation of food results in reconstruction and storage of energy. The one process (katabolism) is waste and decay; the other (anabolism) is repair, renewal, growth, and storage. The two are included in the single term metabolism. The food taken in by most animal organisms consists of the protoplasm of plants and animals, whilst green plants have the power of building up from carbon dioxide, water, and mineral salts a number of substances, and ultimately protoplasm itself. The condition upon which life depends would seem to be the quantitative relation of anabolism to katabolism. If katabolism is in excess of anabolism, the organism is wasting and decaying; if the reverse, the organism is growing. Should the two exactly balance one another, then the organism is stable. Nothing comparable with this occurs in non-living matter. A crystal will grow if it be suspended in a saturated solution of matter similar to itself in structure, but there are striking differences between the growth of crystals and that of organisms. In the first place, the crystal will grow only at the expense of matter similar to itself, whilst plants grow through the utilisation of materials widely different from themselves, and even animals absorb materials different from that of which they are made up. Again, crystals grow only by accretion at the surface, while the growth of living matter is always a process of inter-susception between existing molecules in the cells. Further, all living matter decays and dies by resolving itself into products of oxidation, and the life processes can take place only under certain restricted conditions of moisture and temp. All living matter reveals, under the microscope, that its various parts differ chemically and physically; and in most living things these different parts are organised into organs and tissues visibly different. Even the simplest forms of life have the power of reacting to stimuli, which is termed *irritability*. Again, in its mode of propagation, living matter stands in sharp contradistinction to non-living matter; for all living matter is believed to derive from pre-existent living matter (biogenesis), a portion of which is detached and develops the same power of reproduction by means of div. Nothing is known in the realm of non-living matter which resembles these properties of living matter. These facts seem to imply a div. between the two,

but it is nevertheless by no means easy to distinguish simple forms of living matter with certainty from non-living matter, a difficulty well illustrated by the virus particles which cause such diseases as smallpox and measles, and which are still widely believed to lie on the boundary between the living and the non-living. The criterion may be, after all, not chemical composition, but power of adaptation and functioning. Although a great deal of progressing has lately been made in the direction of the synthesis of very complex compounds, chemists are still a long way from the synthesis of anything like protoplasm itself. The actual manuf. of protoplasm, were it achieved, would not necessarily mean that the problem had been solved—since some speculations proceed on the assumption that life is an entity, distinct from, though associated with, living matter, whilst others assume that once the organisation of matter assumes particular types of complexity, the matter is living. It has been suggested, for instance, that in the earth's earlier phases, under different temp. conditions, other forms of life existed, associated with chemical substances, perhaps as complex as protoplasm, but composed of different elements and with different physical properties—but nevertheless irritable, capable of adaptation, of reproduction, and of metabolism. Such speculations are based on the view that life and living matter are the same thing. On the other hand, all the 'creation' theories have held that life is something put into matter which, animated by this new principle, becomes living. Some modern vitalists hold what is, in essentials, a similar view, regarding life as an irreducible entity—something unique, which cannot be expressed or explained in terms of anything other than itself. It has a vital spark, Bergson's *élan vital*, which can never be imitated. Others—non-vitalists, materialists, etc.—hold that the entities which the chemist and the physicist consider are adequate to explain life, which is not a separate entity. All that can be said with certainty is that up to the present no success has been achieved as a result of attempts to produce living matter in the laboratories, and that we know of no way in which life is produced except as the result of the reproduction of pre-existing living beings.

Belief in spontaneous generation died hard. As early as 1660 Francesco Redi, of Florence, found that the maggots in decaying meat arose, not from the putrefaction, but from eggs laid on the meat by flies; and that if the meat were covered with a thin cloth, no maggots were found. Nevertheless he believed that gall-flies and intestinal worms were produced spontaneously. Buffon, Needham, and Lamarck (q.v.) believed that minute life-units were scattered through the universe, and that these spontaneously organised themselves into forms of life. Spallanzani showed that by boiling organic substances and enclosing them in air-tight vessels it was possible to prevent living

creatures from forming in them. But the greatest blow to the theories of a biogenesis, renewed by Pouchet (1800-72), was the series of experiments carried out by Louis Pasteur (1822-95) (q.v.). Charlton Bastian (1837-1915) was the only man of scientific eminence at that time who seriously questioned biogenesis.

Lord Kelvin (q.v.) suggested that life was brought to the earth by meteorites. Very recent evidence that bacteria can survive the high vacuum, tem., and radiation within an electron microscope strongly supports the suggestion that one part of the universe could 'seed' another. But, essentially, this merely alters a little the form of the question, from 'How did life originate on the earth?' to 'How

LORD KELVIN

did life originate in the universe?' Ray Lankester (q.v.) took the view that living matter was evolved from non-living matter by gradual stages, and that the first protoplasms fed upon their ancestors. This view fits in well with the general theory of evolution. It assumes that at some time in the earth's hist. the conditions of temp., moisture, etc., were such as to allow the formation of highly complex chemical compounds. Some would break down immediately, whilst perhaps others would—owing to their capacity of being able to use other substances—tend to re-form as fast as they were disintegrated. The theory of the survival of the fittest is applied here. Those compounds best fitted to survive, on account of their metabolism—their capacity for maintaining a balance between growth and waste—would live on and gradually evolve into protoplasm. Huxley and Spencer were inclined to believe that biogenesis is now the rule, and that, in all probability, the actual conditions under which life was evolved in the past have disappeared, with no likelihood of re-appearance. It may be, of course, that

the conditions demanded for the development of life from inorganic materials are so complex, involving so many precisely adjusted factors, that the possibility of the situation occurring twice over on the earth is an incredibly remote one. Nevertheless the view is widely held that some form of vegetation, even if not of animal life, occurs on the planet Mars. At least one other star besides the sun has recently been shown to possess a solar system, so that on the ground of probability alone it is unlikely that our own planet is the only one where life is in existence. Perhaps, in so unique a situation, life began. In any case, however, the facts are little further advanced now than they were some years back, in spite of real advances in the field of biochemistry, and we can only say that the origin of life remains a mystery—all forms proceeding, as far as we know, from previous forms; and that we have no evidence that any form of life is being evolved from non-living material.

Embryology and reproduction. The simplest organisms never consist of more than 1 cell, which, after a time, divides into 2 parts, each containing a share of the cell substance, the nucleus and the nuclear contents. There has been a great deal of speculation why this should happen. In a single cell the power of responding to external stimuli and of taking in food are functions of the external surface, whilst the total needs of the organism are to be regarded as a function of the total bulk, i.e. of the volume. We may say that, generally speaking, anabolism is dependent upon the extent of surface, and katabolism upon volume; i.e. the one varies as the square of the radius and the other as the cube. There is thus, for every cell, an optimum bulk beyond which growth is difficult, and at this point, it is assumed, the cell safeguards itself by dividing into 2 smaller ones. Although, when such division has once occurred, the original cell no longer exists, its actual material is part of the new cells. In the simple forms of organisms, consisting of single cells, it is possible to say, therefore, that death never occurs; and that the cells, though not everlasting, are nevertheless immortal. In such forms of life there is no distinction between body and organs. All the functions of a living organism are performed by the one body, and though we speak of the unicellular organism as a simple form of life, physiologically it is very complex, since it performs all the varied functions of nutrition, reproduction, response to external stimuli, excretion, etc., itself. The form of reproduction which has been mentioned in connection with these organisms is known as asexual reproduction, or reproduction by simple fission. A slightly higher, though really hardly different method is that shown by some single cells, such as yeast, which bud off tiny portions of themselves which eventually become separate and grow approximately to the size of the parent cell. Another form of reproduction which can be observed with some unicellular animals results from

conjugation. Here 2 apparently similar cells unite into 1, and then divide to give rise to new individuals; as some nuclear material is exchanged, we have here the rudiments of the sexual process which reaches its highest development in the reproduction of the flowering plants and the mammals.

A higher stage of life is reached when a number of similar cells combine together to form a body. We thus have an organism made up of a number of cells (multicellular), and here we see differentiation, certain cells assuming one function preponderantly, and some another. Some cells take on the function of digestion and nutrition, some movement and some reproduction. At a still higher stage groups of cells become organised, for the purpose of carrying out in common a single function, into aggregates—the tissues; and eventually, in higher forms, tissue aggregates occur—the organs. In these higher forms of life the cell has split up into aggregates of cells of specialised structure, carrying out different functions, but nevertheless all have originated in a single cell, and unitedly they may be termed the organism or body. In the course of the development of the organism, differentiation is constantly going on, and 2 main directions may be distinguished. Some of the cells are differentiated into those which are destined to form the bodily tissues and to be concerned with the functions of nutrition, movement, and response; others are differentiated into the germ cells, which will undertake the function of reproduction. It is clear that for the persistence of the race the function of reproduction is of paramount importance. The reproductive cells are of 2 types, known as ova and sperms (sometimes called spermatozooids in plants and spermatozoa in animals). In dioecious plants and animals the sperms are carried by certain individuals called males, and the ova by others, termed females. Sometimes a single individual—hermaphrodite—carries both sperms and ova, but in such cases there are, frequently, elaborate mechanisms which ensure the impossibility of union occurring between ova and sperms derived from the same organism. Ova and sperms differ in structure and in function. Ova are normally quiescent and provisioned with nutriment for the nourishment of the embryo in the early stages of development, whilst sperms are smaller and more active, being provided, in many cases, with structures which enable them to swim about and make their way to the ovum. Sperms which do not unite with an ovum die; and so, in all but exceptional cases, do ova which fail to unite with a sperm. For reproduction to occur a sperm must penetrate an ovum. The nuclei of the two fuse, and the cell material of the sperm is absorbed into the cell material of the ovum. The resulting cell is known as a fertilised ovum, which begins to divide, forming first 2, then 4, 8, 16, etc., cells. In suitable conditions the fertilised ovum will give rise to millions of cells by

repeated division and subdivision. The cells produced by the fertilised ovum have, in very many cases, been observed to be differentiated, very early in div., into germ cells and somatic cells. No other cells, excepting the germ cells which are embedded in the reproductive organs till they take their part in reproduction, ever *unite* to produce a new organism. Somatic cells may increase their number by div., and it is possible for missing parts of organs to be renewed; they may also form new individuals by budding.

It should be remarked, in passing, that exceptionally it appears to be possible to fertilise an ovum without the aid of a sperm. The eggs laid by the virgin queen bee hatch into drones, and the green fly (*Aphis*) produces large numbers of young from unfertilised eggs. These are cases of parthenogenesis (virgin birth). Still more remarkable is the fact that the unfertilised ova of the sea-urchin may be made to commence development merely by immersing them in inorganic chemical solutions, and that the unfertilised ovum of the frog commences to develop when the egg is merely pricked. Recently a similar claim has been made for eggs of the rabbit (i.e. a mammal), which have been caused to develop as far as the adult stage without any process of natural fertilisation. Apart from the implication of parthenogenesis concerning the birth of Christ and other religious leaders, Spurway has recently calculated the chances of this phenomenon in humans as one in sev. millions, and has investigated one possible case. It has been urged that the function of the sperm is purely chemical or mechanical, and that it is not indispensable. But this statement is too sweeping. Geneticists have shown beyond doubt that the sperm carries half of the unit characters which will determine the attributes of the offspring. In some cases of parthenogenesis, observers have seen a part of the ovum, which is normally rejected before fertilisation, returning to the ovum and functioning as a sperm. Again, ova which have been stimulated to development by means of physical or chemical stimuli may not develop normally; even the carefully worked-out methods of Loeb (1859-1924) produced larvae which were not quite normal.

Closely related to the problems of fertilisation is the problem of death. Weismann regarded the mature organism as the mere guardian of germ cells destined for reproduction, and death as the nemesis of reproductive acts: once the germ cells had been brought to maturity and released in sufficient quantity to ensure the perpetuity of the race, the body was of no further use. Death, therefore, appeared to him inevitable. But it is clear that the matter cannot be allowed to rest at this point. If the germ cell is immortal, and the somatic cell is destined to perish, in what ultimate differences of structure or material does this difference lie? Unicellular organisms, as has already been said, are potentially immortal, and this quality is shared by germ cells. The

somatic cells are formed by the germ cells; by specialisation they lose their power of reproducing new individuals, though they may divide to produce other cells of their own specialised type. Death seems, then, to be involved in differentiation—the germ cell *may* die as a result of violence or disease or unfavourable conditions, but the body cell apparently *must* die in any event.

Perhaps the greatest generalisation in the field of embryology is the recapitulation theory. The embryologists of the earlier half of the 19th cent. had observed that there were interesting resemblances between the early embryonic forms of animals markedly different from each other at maturity. For example, the resemblances between the embryos of sharks and birds and dogs were obvious, in spite of the great differences between adult sharks and birds and dogs. Further, there were resemblances between the very young embryonic forms of creatures so widely different as worms, sea-urohins, frogs, and mammals. Development, that is to say, proceeds on parallel lines up to a point at which divergences begin to occur. These phenomena were not intelligible until the theory of evolution had been announced. Individual development then became intelligible as a recapitulation of the stages through which the race had passed in its evolution from a simple to a complex organism. Von Baer first enunciated this principle, which is generally named after him, though Haeckel later enunciated it in the form: ontogeny (the development of the individual) recapitulates phylogeny (the evolutionary hist. of the species to which that individual belongs). Further research has shown that often a great deal of omission occurs, and that other complications interfere with the accuracy of the detailed reproduction of the past; but nevertheless the general truth of von Baer's law is admitted. It has, however, been criticised recently by de Beer; the stages in development of the individual are held by him to recapitulate similar stages in the *embryo* of the ancestors, not in the adult form of their ancestors. The principle of Baer's law has been widely used in the fields of sociology, anthropology, etc., and, provided the application is not strained too far, it is capable of illuminating a great many problems. In B. it has been used in the effort to construct genealogical trees of existing species of animals and plants, and demonstrating their historical relationships. But it must be remembered that the evolutionary hist. of a single species extends over many millions of years, whilst the process of individual development is a matter of days or weeks, of months at most. Consequently it is impossible that the development of the embryo from the ovum can do more than retrace the main outlines of the development of the hist. of the race; details must necessarily be omitted, and short cuts often taken. There has been speculation why the ovum must develop into the mature adult by means of an often circuitous route, when

greater economy would be secured by more direct means. For example, in the developing human embryo gill slits appear as they do in the embryo of the shark and the chick. In the shark they are the basis of gills, but in the chick and the human being they simply close again. It has been suggested, however, that such structures provide the necessary stimuli for the development of the structures which subsequently replace them; and this view seems to be borne out by recent work dealing with the hormones, chemical substances generated within the organism and passed into the blood-stream to activate other parts of the body. It seems likely that structures arising in the course of development and disappearing before development is complete may function in this particular way, giving rise to substances necessary for the development of other parts. It has been found that the total removal of embryonic structures interferes very definitely with proper development, whilst their transplantation to other parts of the embryo has quite other effects. Work in this particular field of research is still being carried on at present. In fact, biologists are coming more to appreciate that purely embryonic structures are essential in promoting their successors, and may have vital secretory functions where they survive, apparently uselessly into adult life.

Darwinism and humanity. The simplicity of the Darwinian formula proved misleading to a great many people. It was conceived that the Darwinian theory implied that human beings were mere creatures of environment, and that, through modification of the environment, the aims of philanthropists and social reformers might be achieved. The expression of these ideas has again been found in very recent pubs, of biologists in Soviet Russia (see Lyseuko). It is not necessary to deal with the literature which grew up from confusing the 'fittest to survive' with the morally best, or with ideas based on the unjustified simplification of a theory which was already oversimplified. The real issue is that the relationship between the organism and its environment is excessively complex and that the two together make a totality in which the environment can present a vast array of variable factors to the organism, while the organism can react in a great many ways. The analysis of this situation, which is the modern science of ethnology or 'animal behaviour,' is in its infancy, and stands very close indeed to psychology. Since Malthus (1766-1834) first pointed out that the pop. increases at a faster rate than the means of subsistence, nothing in the way of the improvement of agriculture, the opening up of new lands or the discovery of new supplies of food has refuted Darwin's observation that far more individuals of every species, including humans, are born than can survive.

The experimental studies of heredity and variation belong, in the main, to the 20th cent. Galton (1822-1911) realised

that the question of the tendency of parents to transmit their characteristics to their offspring must be investigated, in part, at least, by a statistical method. Mendel, it will be remembered, working earlier and independently, had arrived at the same conclusion. The difficulties of individual investigation of human heredity were largely caused by the fact that there was no precise knowledge of the hist. of the feature the inheritance of which was being investigated no matter how thoroughly that feature was known in the individual. Galton's contribution to biological knowledge lies not so much in his actual theories of heredity, as in his discovery of a method which Morgan, Blakeslee, and Kiddell have since used successfully.

Evolution and behaviour. If environment is regarded as the means of making explicit what is implicit in the individual (e.g. the capacity to eat is expressed as behaviour only in the presence of an edible object), variations may be looked upon as being partly inherited and partly acquired. Structures which may be used in certain ways are inherited, but modes of using them are acquired. The environment, though it may stimulate certain organisms to act in certain ways, cannot possibly do so in the case of others. Tempting food at the top of a tree may cause a monkey to climb the tree or a bird to fly to it, may stimulate a dog to frantic and futile efforts: it cannot, however, make the dog, whose limbs are unfitted for climbing, climb. The cause of the effort, in all these cases, is a relation between the animal and the food. If the animal were indifferent to the food, the possession of suitable climbing structures would not induce it to climb the tree. Some such line of criticism as this must be applied to the experiments of Weismann and his followers to show by the mutilation of successive generations of rats and mice that acquired characters were not transmitted. There was no innate tendency towards taillessness in these animals, and Weismann's attempts to stimulate something which did not exist came to nothing. From results of experiments made by Kammerer, Sumner, and other workers, Neo-Lamarckians believe there is no longer any room for doubt that some acquired characters are transmitted, and the question to be solved has thus become that of which characters are so transmitted, in what ways and to what extent. It has been pointed out that the results of education are not transmitted in human beings; on the other hand, men vary in their capacity to be educ., so that we may postulate a hypothetical variation, 'educability.' It is not possible to define and measure it in men, and, further, the interval between successive generations makes man an unsuitable subject for experiment of this kind. Wm McDougall, however, conceived the possibility of educating rats, by training them to learn how to interpret signals which lead them to food, failure to follow the proper signals resulting in punishment

by means of a mild electric shock. It is possible here to estimate the speed at which the rats learn by counting the number of trials necessary before the rat has learnt how to reach the food without making mistakes. If the same experiment is repeated through a number of generations, evidence will have been accumulated which will indicate whether the results of training are transmitted to later generations in the form of an increased facility to learn. McDougall (1931) pub. an interim report in which he claimed he had evidence that this was the case, but which has not so far been confirmed.

Basis of genetical change. One of the conclusions from the experiments of Mendel and his successors is that no individual possesses characters which have not been transmitted to him, even though in his individual existence he may develop and use them in ways which are different from those in which his parents made use of them. Thus, if we believe that the Alsatian sheepdog, the bulldog, and the spaniel are descended from a single race of dogs, we must believe that the members of that race possessed the characters which we find, in exaggerated form, perhaps, in their descendants. The origin of all the domestic races of plants and animals is accounted for by the view that selective breeding has resulted in the weakening or loss of factors which were present in the ancestors; and the view is confirmed by such experiments as those of Darwin, who succeeded in breeding the wild rock-pigeon by crossing extreme domestic varieties, or the reproduction of the colour of the wild rabbit by the crossing of a yellow rabbit with a Himalayan variety. In such ways we bring together the factors which have been segregated in the domestic strains. It is not possible to say what these factors are, but they seem not to be corpuscles of living matter, as Darwin and Weismann held. They may be definite chemical compounds which, entering the cell, influence metabolism, and so determine development. Of mutations and their origin little is known except that they occur, and to say that they are 'spontaneous' is merely to admit ignorance of their cause. Darwin held that great and sudden changes in environment increase variability. This appears to be true of *Drosophila* when kept under laboratory conditions; the rate of mutation has been greatly increased by subjecting this insect to X-rays. Consequent on the exposure of animals to various forms of radiation produced in atomic research, and the discovery that the mutants so produced may actually have broken or malformed chromosomes, it is now believed that the cosmic rays (q.v.) constantly falling on the earth, may be a primary cause of 'spontaneous' change and hence of evolutionary mechanism. Similar effects are produced by a group of chemical compounds, the mustard oils. At the same time it must be pointed out that remarkable differences in the form of the adult can be produced by varying the conditions of, for example,

temp. or illumination, during the larval life of animals such as insects. The subsequent transmission of these characters to the offspring raises the question as to whether the environment has merely released selectively a potential in the organism, or whether it has produced a permanent change in the inheritance mechanism. Very recent research indicates that some characters of this kind can be transmitted directly from mother to offspring by a chemical mechanism (somatic inheritance) particularly where, for example, the environment to which one generation is subjected appears to determine whether or not its offspring shall be hibernating and over-wintering forms.

Place of Biology among the sciences. It is evident that B. considers all matters which throw light on the relationship of life to matter. It touches very closely, at its higher stages, the physical and the mental sciences. The study of morphology or physiology in the light of the cell theory leads to consideration of protoplasm, and it is the endeavour of some biologists to reduce this to chemical and physical formulae. Whether this be possible or not, it is clear that living matter responds in a variety of important ways to physical and chemical stimuli, and the relation of B. to chem. and physics has resulted in the development of special branches of investigation under the names of biochemistry and biophysics. Again, the statistical methods of certain branches of biological research depend upon mathematics. Psychology, too, stands in close relation to B.: if the psychologist turns to B. for definitions of environment, organism, instinct, and the like, it is no less true that the biologist uses terms borrowed from the psychologist in his descriptions of animal behaviour. The science of sociology, too, though it is the study of social aggregates, and must study the individual for the purpose of accumulating data, has to make use of concepts borrowed from B. The studies of social and physical anthropology, also, are related to B.

Applications of Biology. Although B. is pursued purely as a branch of science, as a contemplation of, and an effort to comprehend the world of life and man's place in it, it is proving itself of utilitarian value. From the first it has stood in definite relation to medicine, the earliest botany being connected with the gathering and cultivation of plants of medicinal value. At the present day pharmaceutical research is directed towards the discovery of new remedial agents in plants and methods of extraction. The discovery and preparation of vaccines, anti-toxins, and medicinal preparations from the glands of animals is a definite application of B. to medicine. Again, the study of many diseases showed that they owed their origin to the presence of living organisms which lived either within the body (parasitic worms, protozoa, germs of various kinds, etc.) or upon it (various blood-sucking insects, etc.). The development of successful procedures

against the disease demanded study by competent biologists of the hist. of the organism causing the disease. Studies of this kind have made it possible to banish certain diseases—malaria, yellow fever, sleeping sickness, relapsing fever—from areas in which they had formerly been prevalent. Despite the production of insecticides, and of plant hormones, both to promote growth and to eradicate weeds, which have virtually become biological industries, it is certain that a study of the entire B. of pests, including their natural enemies, food requirements, and other environmental relationships, is essential. This is instanced in the classical work of Ross, who showed by detailed investigation of the mosquito in the field, exactly what changes in the environment would cause the disappearance of malaria which the insect carries. See APPLIED BIOLOGY.

While the production of new strains of animals and plants by selective breeding has increased the yields obtained, and extended the ranges of climate in which they can be raised, and while agric. stock has been improved by the introduction of artificial insemination (q.v.), making the best strains of animal available to all classes of breeder, the direct application of genetics to agriculture is still a remote possibility, and workers now are effectively operating as selectors of the fittest, just as agriculturalists have for hundreds of years. The lessons learned by the introduction of a foreign animal or plant into new terr. as instanced by the rabbit and prickly pear in Australia, and the changes in a complex pop. caused by the indiscriminate use of insecticides, favouring the appearance of other and often more harmful pests, has led to an entirely new aspect of applied B. It is now a recognised part of agric. research, pest control, etc., that a team of botanists, entomologists, who are ecologists (i.e. studying the relationships of animals and plants in the field), backed up by purer morphologists, physiologists, and statisticians in laboratories, is essential to any operation which might lead to unforeseen disturbances of the balance of nature with perhaps disastrous results. Modern surgery likewise owes much to work originating as physiology in B., where much of the pioneer work and development is carried out on animals other than man (see BACTERIOLOGY AND ANTISEPTICS).

In conclusion one could speculate on the application of B. and in particular genetics to the field of eugenics. The possibilities of, for example, preventing the reproduction of human beings with undesirable variations which are likely to transmit to offspring, e.g. feeble-mindedness, is of great interest, and likewise the alarming tendency in highly civilised communities for the birth-rate to be lowest amongst the best types, and highest amongst the poorest. But the ethical and political problems involved must mean that the application of B. towards the improvement of the race must remain a theoretical consideration at least in the sense that the application of biological knowledge in agriculture,

hygiene, and medicine favours survival, the broad principle of Darwinism, and the high ideals of eugenics may yet combine with rich results. See ANTHROPOLOGY; APPLIED BIOLOGY; EVOLUTION; MAN.

Biology, Marine, see MARINE.

Biometry, literally, the science of measurement as applied to living things. B. concerns itself with the analysis, particularly by statistical methods, of the variation (q.v.) in living material, of pop. problems, and of the frequency with which phenomena occur in living material.

Bion, Gk scientist, belonged to the family of Democritus. He lived at Abdera, and was famous as a mathematician. It was said that he taught the existence of countries where the year is composed of a day and a night.

Bion, Gk bucolic poet, of whose life no record is known to exist. He was b. Smyrna, or near by, and he lived perhaps c. 100 BC, probably in Sicily or Magna Græcia. A few only of his poems have been preserved, among which the *Lament for Adonis* is the best known. According to Moschus's *Lament for Bion*, B. d. by poison. See U. von Wilamowitz-Moellendorf, *Bucolici Græci*, 1910.

Bion of Borysthènes (c. 274–c. 241 BC), Gk philosopher and moralist. As a youth

B. was sold into slavery, but was afterwards freed and made the heir of his master, a rhetorician. He studied at Athens, subsequently taught philosophy at Rhodes, and d. at Chalcis in Euboea. A typical product of his age, half philosopher and half *littérateur*, B. was a member of the literary *salon* at the court of Antigonus Gonatas. Fragments of his work have survived; but his influence may be traced in the Satires of Menippus. Cf. Horace, *Epistles*, II. 2. 60. His life was written by Diogenes Laërtius.

Biondi, Giovanni Francesco (1572-1644), It. writer, b. Lesina, one of the Dalmatian is. Introduced to the court of James I, he won the king's confidence, and later a title. He wrote a *History of the Wars of the Roses* in Italian, and d. in Bern. He was noted for the elegance of his prose.

Bionomics, or laws of life, that branch of biological research which deals with the relations of organisms amongst themselves and to their environment. It thus includes the study of heredity (q.v.), or the tendency of growing organisms to develop a symmetrical arrangement of parts which is characteristic of the species. How this tendency is transmitted is an old and still unsolved problem, though the researches of the followers of Mendel (q.v.) are suggestive. The development of parental characteristics is dependent upon the maintenance of certain conditions in the earliest or pre-natal stages of growth, and these conditions are investigated and generalised in the study of embryology (q.v.). Finally, the species being looked upon as one link in the whole chain of organic life, it is necessary to study how certain structures are affected by the laws of variation (q.v.), which have been directed by the tendencies studied under the name of evolution (q.v.).

Biophysics, investigation of the properties of living material and its products, by the techniques of physical science. Though considerably less advanced than its sister science, biochemistry (q.v.), B. is producing information of great theoretical and practical value. Biology analyses organisms into organs, tissues, and eventually cells (q.v.), but further sub-div. produces portions of material not independently capable of life. This is the boundary at which B. begins.

Amongst knowledge obtained through B. we have information on the molecular structure of muscle, skeletal tissues, and the crystalline viruses by X-ray and electron diffraction techniques; the interpretation of electrical phenomena associated with nerves (q.v.) and with membranes through which the differential transport of chemicals takes place; the causes of the unique physical properties of protoplasm, such as its surface tension, viscosity, and permeability.

Biot, Jean Baptiste (1774-1862), physicist, b. Paris. He was educ. in the polytechnic school, after which he entered the artillery service. The latter he soon left in order to study natural science and mathematics. He taught physics for some years at Beauvais, after which he

became prof. of the same subject in the Collège de France. In 1803 he was elected a member of the Academy of Sciences, and a year later he was appointed to the Observatory of Paris. In 1806 he was made a member of the Bureau des Longitudes, and in 1809 became also prof. of physical astronomy in the univ. of Paris. His pub. sev. excellent textbooks; among them he mentioned *Essai de géométrie analytique* and *Traité élémentaire de physique expérimentale*, etc. He also wrote books on the astronomy of the ancients, Egyptians, Chinese, and Indians. Nearly all branches of physics were advanced by his labours, and he was specially celebrated for his discovery of the circular polarisation of light; he invented a polariscope to show polarisation by reflection. He was one of the more eminent physicists and mathematicians of his time. He d. in Paris.

Biotite, mineral of the mica group. It is a silicate of aluminium and iron with magnesium and potassium. It crystallises into hexagonal prisms. It is often called magnesia mica, as distinct from muscovite or potash mica. The most important variety of B. is meroxene, which is found in volcanic deposits. It was from fine crystals of this variety, found near Vesuvius, that mineralogists were able to determine the crystalline form of mica, which was formerly thought to belong to the hexagonal or orthorhombic systems. Other varieties of B. are rubellene, found in many volcanic rocks, voigtite, found in gravel rocks, phlogopite, which has a large proportion of silica, and lepidomelane, which is rich in ferrous and ferric oxides. When ferrous oxide quite replaces magnesia, iron mica results. B. mica is more readily decomposed than muscovite.

Biplanaria (Lat. *bis*, twice; *penna*, a feather), name given to the larva of a starfish. Its shape is peculiar, and has a tendency to develop long 'arms.' The two ciliated bands, which at first encircle the larva, gradually extend themselves till they enclose nearly the whole of the upper and lower halves of the body.

Biquadratic (Lat. *biquadratus*, twice squared), an equation which involves the fourth power of the unknown quantity, e.g. $x^4 + ax^3 + bx^2 + cx + d = 0$, where x is unknown.

Bira, see BEEROTH.

Birch, Charles Bell (1832-93), sculptor, b. London, the son of Jonathan B. (1783-1847), the translator of *Faust* and the *Nibelungenlied*. He was a pupil at the school of design, Somerset House, afterwards studied in Berlin and at the Royal Academy and was assistant to Foley (q.v.). He won £600 in 1864 from the Art Union of London by his life-sized group 'A Wood Nymph.' He became an A.R.A. in 1880, and in that year his most conspicuous work the Griffin, on the Temple Bar memorial in Fleet Street, was accomplished.

Birch, Samuel (1757-1841), dramatist, b. London. He was the son of a pastrycook in Cornhill. He himself was a pastrycook, the proprietor of 'Birch's,'

the oldest shop of the kind in London. In 1815 he became lord mayor. He wrote numerous musical dramas and poems, including *The Adopted Child*, *The Smugglers*, *The Manners*, *East Asleep*, and *A Victim of Romance*.

Birch, Samuel (1813-85), antiquary and Egyptologist, b. London. He was educ. at Merchant Taylors' School. In 1861 he was appointed to the keepership of the antiquities dept. of the Brit. Museum. In 1874 he became president of the London Congress of Orientalists. He trans. many hieroglyphical works, and compiled Egyptian grammars.

Birch, Thomas (1705-66), historical writer, b. of Quaker parents in London. He qualified himself for the ministry, and entered the Church of England. In 1734 he became chaplain to the Earl of Kilmarnock, and rector of St Margaret Patten in 1746. In 1735 he became a fellow of the Society of Antiquaries and of the Royal Society. He did a considerable amount of literary work, compiling and editing. He also transcribed a great number of works in the library at Lambeth Palace.

Birch (*Betula*), tree or shrub belonging to the family Betulaceae. There are about 40 species of B., and while the majority are trees of medium size, some are shrubs. B. trees are to be found in nearly every country of the N. temperate regions, and in the Arctic. The trunks are round, with slim branches, and the bark is generally in fine, soft, membranous layers. The common B. (*B. pendula*) is a graceful tree, silvery white in colour. It grows quickly, but does not live long. It is found in the forests throughout the greater part of Europe, particularly in Russia, and also in Asia Minor and N. America. The prin. use for B. in Scandinavia, Russia, and Canada is for cutting into veneers for the manuf. of plywood. Thousands of spoons, used in Russia, are made from it. The bark and also the leaves are utilised medicinally, and for dyeing and tanning; the Russian leather is noticeable for the odour caused by the B. tanning. In N. America the B. tree is as useful. The wood is tough and durable, and is made into canoes, snowshoes, platters, and also used for house roofing. There are sev. kinds of B. in N. America; the white is used in the last-mentioned ways. The black B. (*B. nigra*) and the red B. (*B. lenta*) are other varieties of which the wood is exceptionally hard; hence their value. The leaves may be used for making tea, which has an agreeable flavour. The yellow B. (*B. lutea*) of Nova Scotia is another species, and the paper B. (*B. papyrifera*) is so called because the bark can be thinly peeled into sheets and used in the place of paper. B. oil is manuf. from the outer layers of the bark, and mixed with a fine meal it forms food for pigs. In early spring, when the sap is just beginning to rise, it is drawn from the trunk, and on account of its sugary nature is manuf. into a kind of vinegar. The weeping B. (*B. pendula* var. *youngii*) is another variety. The dwarf B., a very low shrub, is found almost every-

where in the N. part of the world. The Laplanders used it in stuffing their beds, for fuel, and the seeds for food. See FORESTRY and TIMBER.

Birch-Pfeiffer, Charlotte (1800-68), Ger. actress and dramatist, b. Stuttgart. She began to act at Munich at the age of 13, and from that time she played at Berlin, Hamburg, and other places. In 1825 she married Dr Christian Birch of Copenhagen. She played afterwards in Amsterdam, St Petersburg, and Pest. From 1837 to 1843 she was sole manageress of the Zürich theatre, and took to writing plays. She won more popularity for her play-writing than for her acting, though her works reached no very high standard. She dramatised *Jane Eyre*, and her works, mostly adaptations of novels, were pub. in 23 vols. at Leipzig.

Birchington, seaside resort in the Isle of Thanet, Kent, England, 2 m. from Margate and 71 m. from London by rail. Dante Gabriel Rossetti (q.v.) d. and was buried here. There is a good golf-course; the beach is of tide-washed sand. Pop. 4000.

Bird, Edward (1772-1819), genre painter, b. Wolverhampton, where for some years he was engaged in designing for japanware. In 1809 his 'Good News' was accepted by the Academy, and his reputation became estab. He came under the patronage of Princess Charlotte, and in 1815 was elected R.A. Well-known paintings of his are 'The Country Auction,' 'Village Politicians,' 'Blacksmith's Shop,' 'The Field of Chevy Chase.'

Bird, John (c. 1709-76), mathematical instrument maker and mechanician of London. He pub. a work entitled *The Method of dividing Astronomical Instruments*. See HOROLOGY.

Bird, Robert Montgomery (1804-54), Amer. author, b. Newcastle, Delaware. He began his career as a dramatist, achieving his greatest success with *The Gladiator*, 1831. This was followed by *Oralloossa*, 1832, and *The Broker of Bogota*.

Turning to fiction, he pub. *Calavar*, 1834, and its sequel *The Infidel*, 1835. The best of his novels was *Nick of the Woods*, 1837. See life by C. E. Foust, 1919.

Bird, warm-blooded, feather-bearing, egg-laying, amniotic (see AMNION) vertebrate, with the fore-limbs modified into wings. Metacarpus and fingers carrying feathers or quills. With an intertarsal joint. Not more than 4 toes, of which the first is a hallux. This transformation of the fore-limbs of B.s into feathered wings is of the greatest importance, and the modification of the internal structure arising from it forms the basis of classification of this group of animals known as Aves. The wing consists of the typical parts of a fore-limb, the humerus, radius, and ulna, carpus, metacarpus, and digits. The first digit is the *pollex*, or thumb, to which some feathers, known as *ala spuria*, or bastard wing, are attached; the second digit is the *index*, which bears the large feathers known as the *primaries* or *manuels*, usually 10 in number. The primary feathers, with the *secondaries* or *cubitals*, which are attached to the ulna, form the large wing-quills, called *remiges*, which are used in flight. The sternum, or breast-bone, of B.s is affected by their powers of flight: those B.s which are able to fly have a carina, or keel, projecting from the sternum, and serving as the basis of attachment of the great pectoral muscles used in flight. When the B.s are incapable of flight the keel is absent or greatly reduced. The vertebral column is completed in the caudal region by a flat plate known as the pygostyle, which forms a support for the rectrices, or steering tail-feathers, and for the uropygial gland (see below). The legs are composed of a femur, tibia, and fibula, and the bones of the foot; the feet have often 4 toes, but in many cases there are only 3. The proximal tarsal bones are fused with the tibia, and the distal tarsals are joined to the metatarsals; between the 2 sets is the intertarsal joint already mentioned. In swimming-birds the legs are placed well back, while in those which have an upright carriage the balance of the body is preserved by the forward position of the legs. No existing species of B.s possesses teeth. The uropygial gland borne on the pygostyle is an oil-gland used by B.s in preening their feathers, for their skin is unprovided with sebaceous glands. The eyes are furnished not only with an upper and a lower eyelid, but also with a nictitating membrane, semi-transparent, and covering the eye at the volition of the owner. The vascular system contains warm blood, which is kept usually at a higher temp. than that of mammals; death from cold is rare unless allied with torpidity and starvation. The aortic arch is on the right side of a B., whereas in a mammal it is on the left. The respiratory system is curious, as the lungs themselves are small and are prolonged into air-sacs with which are connected a number of air-spaces in the bones. These air-spaces are found in the species which are powerful flyers and require the lessening of bodily weight, but in young B.s, small B.s,

aquatic and terrestria B.s they are not so highly developed; in addition they increase the efficiency of the respiratory system. The organ of voice is not the larynx, but usually the *syrix*, a peculiarity of this class formed at the bifurcation of the trachea, and the modulations are effected by adjoining muscles. The heart of a B. is enclosed by pericardium, and consists of a right and a left half; there is no diaphragm between the thoracic and abdominal regions. Digestion takes place in the oesophagus, stomach, and intestines, but it is a highly specialised function. The tongue is the first organ to aid in digestion, then comes the oesophagus, and this has frequently a dilatation known as the crop in which the food is softened; the food then passes into the stomach, in the front part of which, the *proventriculus*, the process is carried on further; then follows the gizzard, or *ventriculus*, which contains small stones and gritty matter for the grinding of the food, especially noticeable in such B.s as feed on seeds and grain. The duties of building a nest and hatching the young cannot be definitely assigned to either the male or the female B. It is customary for the male to provide the material and for his partner to perform the architectural work, but in many cases the female provides her own material. It usually falls to her lot also to do the sitting, but there are cases in which the pair takes this in turn, and other cases in which it is performed by the male alone. The cuckoo neither builds a nest nor rears its own young, but places the eggs in the nest of another bird and leaves the foster-mother to care for them. The position which Aves hold in the animal kingdom is higher than that of Reptilia, and lower than that of Mammalia; with the former class they have great affinity, but few links have been discovered to trace the transition from one to the other. The discovery of the oldest B. known, the fossil *Archaeopteryx*, has been of great value in such research. There is a resemblance in the generative organs and oviparous condition of both classes, but B.s are never viviparous. The scales of reptiles may be compared with the feathers of B.s, but the blood of the Reptilia is cold while the blood of Aves is warm. In the development of brain, memory, and sight the lower class compares unfavourably with the higher, but the chief difference between the two lies in the adaptation of the B.s fore-limbs to flight. This adaptation, as well as a keeled sternum, is to be found in the reptilian Pterodactyl, but in the absence of feathers and in the general structure of the skeleton this fossil differs greatly from a B. Among mammals the bat is also able to fly, but the specialised structures by which it accomplishes this feat are entirely different from those found in Aves.

The main reptilian features of *Archaeopteryx* are the presence of teeth, the well-marked tail, with many separate vertebrae, and the claws on the wing-digits (claws also occur in the embryo ostrich). This bird is found fossilised in sandstone

of the Upper Jurassic period at Solenhofen (Bavaria).

In the classification of B.s. zoologists are agreed in dividing them into two unequal orders, the Archaeornithes, or primitive B.s., which includes the single genus *Archaeopteryx*, and Neornithes or modern B.s., which is sev. times subdivided, at first into 3 sub-orders known as Ratitae, Odontolcae, and Carinatae. The Ratitae receive their name from the resemblance of their breastbone to a flat-bottomed boat; they are flightless B.s., with reduced wings, and include, in addition to extinct species, e.g. the moa, living B.s., such as the ostrich, rheas, cassowary, emu, and kiwi, or apteryx. The Odontolcae are extinct marine flightless B.s. with teeth in grooves in the jaws and no keeled breastbone; an example is the genus *Hesperornis*. The Carinatae is much the largest sub-order of B.s., comprising thousands of species. It receives its name from the resemblance of the sternum to a keel, but in sev. flightless forms, as the extinct dodo and the living parrot, genus *Strigops*, this keel is absent or greatly reduced. The main orders are as follows. The Colymbiformes, or swimmers, consists of divers and grebes, all of which are water B.s. with webbed or lobed feet, upright bodies, and short tail-feathers. The Sphenisciformes, or penguins, are flightless marine B.s. covered with feathers, having the wings without large quill-feathers and using them as paddles when in the water; they are confined to the Antarctic. The Procellariiformes, or petrels, are marine B.s. with webbed feet and capable of powerful flight; the albatross and Mother Carey's chicken belong to this group. The Ciconiiformes, or stork-like B.s., have feet adapted for wading, and inhabit marshes as well as the sea, and inland ponds, e.g. the gannet, tropic B., cormorant, heron, bittern, stork, ibis, spoonbill, and flamingo. The Anseriformes, or goose-like B.s., are aquatic and include all geese, swans, ducks, and screamers. The Falconiformes are B.s. of prey with strongly clawed toes and curved beaks, as the hawk, vulture, eagle, kite, buzzard, falcon, and osprey. The Galliformes, or fowl-like B.s., run along the ground, e.g. the brush turkey, curassow, peacock, pheasant, domestic fowl, turkey, grouse, partridge, and quail. The Gruiformes, or crane-like B.s., include the water hen, rail, coot, trumpeter, and bustard. Five groups are placed in the Charadriiformes, or plover-like B.s., which vary in habit; some can both fly and wade, as the plover, oyster-catcher, avocet, curlew, and snipe; some can swim as well as fly, e.g. the gull, tern, auk, and puffin; others, as the sand grouse, inhabit deserts; while others again are land B.s. feeding on grain and seeds, e.g. the pigeon, dove, and dodo. The Cuculiformes, or cuckoo-like B.s., are arboreal. The parrots are placed in a separate order, Psittaciformes. Representatives of the Coraciiformes, or raven-like B.s., are the kingfisher, hoopoe, bee-eater, roller, hornbill, etc. The last, and largest, tribe is that

SOME TYPICAL HEADS OF BIRDS

A, Seed-eating bird. B, One which seeks food in soft mud. C, Eagle. D, d. Duck. E, Bird with wide gape which catches insects on wing, e.g. Swallow, Nightjar. F, Heron.

of the Passeriformes, or sparrow-like B.s., all of which are perchers and have few variations of internal structure. To them belong the broadbill, cock of the rock, lyre B., bush-shrike, lark, wagtail, flycatcher, thrush, wren, swallow, butcher-B., tit, B. of paradise, rook, starling, weaver-B., Amer. oriole, crossbill, and finch.

In most countries to-day official protection is given to B.s., but more particularly to B.s. useful in agriculture, such as those that counteract the too rapid spread of injurious insects, slugs, snails, mice, and voles. Again, cruelty to captive or domestic B.s. is an offence punishable by fine or imprisonment, and cruelty to wild B.s. is also punishable. There is a Wild Birds Protection Act which prohibits shooting or snaring certain B.s. during close seasons. Bird sanctuaries exist in most countries of Europe and in the U.S.A. These are places set apart for wild B.s. and, in England, the best known is that in Hyde Park. There are others in the royal parks and on the N. coast of Norfolk at Blakeney and Cley next the Sea.

Birds of various countries. Countries especially rich in B. life are Australia and New Guinea; Brazil and other parts of S. America, including the Falkland Is.; Mexico; tropical and sub-tropical Africa; and India. Australia's B. life is particularly rich in song B.s., and not a few Australian B.s. have aroused curiosity in the past, if not in the present day. There are wonderful cockatoos, brilliant-plumaged honey-eaters, emus, lyre-B.s., master mocking-B.s., etc. Notable, too,

SOME TYPICAL FEET OF BIRDS

A, Bird that passes much of its life on the ground, e.g. Fowl. B, Percher. C, Hawk, Eagle. D, Duck. E, Coot. F, Woodpecker.

are the mound-builders or mallee hens and scrub turkeys, of which the former are remarkable for the fact that they do not brood on their eggs, but construct natural incubators filled with decomposing vegetation, which generates the heat necessary for hatching. Other Australian B.s are the wedge-tailed eagle, the fish-hawk of N. Australia (see OSPREY), numerous species of pigeons—bronzewing, wonga, topknot, and crested being among the most beautiful; the blue wren, the masked wood swallow, and the 'summer bird' or black-faced cuckoo. In the Amazon valley the numerous varieties of B.s provide many of the most brilliant plumage; but it is a very rare thing in a Brazilian forest to hear B.s singing, and nature's artistic energies would seem to have been concentrated in the production of beauty for its own sake. In the place of melodious songsters of more temperate climates are harsh-shrieking parrots and toucans; dry chatters such as the jay, and black and yellow hangnest; melancholy wallers, like doves and goat-suckers. There are, however, some little songsters known as 'dancers' which are the size of tom-tits, with blue plumage, red topknots, and black 'points'. The jacutinga, found in enormous numbers in the middle part of the Ivahy valley, is a species of penelope, in size and appearance something between the turkey and the pheasant. A B. of a different kind is the

suruquá, which is the size of a thrush, and with the exception of some of the humming B.s, by far the loveliest Brazilian forest B. The plumage of the male B. is resplendent purple and gold on the head, throat, and back, the breast a lovely bullfinch red, and the wings dark slate, varied with delicate white bars. Peru is also rich in B. life, notably in guano-producing species, such as the palmpeps, gaviots, and alcatraz, which at times are to be seen flying in myriads like a darkening cloud low down on the waters. Millions of cormorants, too, haunt these silent expanses of coast; scarlet-feathered flamingoes inhabit the upland lakes, and other wild fowl, some of edible value. Of the other S. Amer. countries, Venezuela boasts the scarlet ibis, eagles, and herons; Chile has but few B.s, and nearly all of sombre plumage, such as hawks, a species of turkey-buzzard, and also the condor. The wild turkey of Mexico was the progenitor of the domestic B. which that country gave to Europe; the zensontli or mocking-B., the humming B., the scops owl or buzzard—known as the scavenger of the plains and cities—the mournful tecolote or night-owl, and the quetzal, of rare and wonderful plumage, are among the best known of the other B.s of Mexico. The Falkland Is. are a rare haunt of B.s. Frequent violent gales at migration time add to the numbers of the occasional B. visitors, and these numbers are enhanced during the severe droughts that periodically recur in S. America. Among the most frequent visitors and indigenous species are the violet-eared dove; red-gartered and other kinds of coot; various kinds of grebe; the crane; the penguin—including the king, gentoo, ringed, or Antarctic, jackdaw, macaroni, and rock-hopper. The ringed penguin is very common in the S. Orkneys and S. Shetlands. These and the mollymauks are characteristic features. Also there are innumerable species of petrel—notably Wilson's storm petrel—one of the most numerous species of B. in the whole world, the water here being at times literally black with them. Other B.s of these waters are the wandering, the black-browed, the yellow-nosed, and the sooty albatross; terns; gull; sandpiper; plover; Chilean flamingo; spoonbill; heron; teal; pintail; vulture; snipe; and geese of various kinds. The S. Atlantic penguin differs slightly from the Antarctic. The 'emperor' of the cold regions is the most beautiful of the whole penguin tribe; the 'adelle' is much smaller. The African penguin, sometimes called by the natives the laughing jackass, is a very useful B. commercially—a fact which would not be true of the Antarctic varieties. Another notable African B. is the gannet of the Malagasy, or, as the natives name these birds, the Malagases, so called because the B.s congregate in thousands on these Is. It may be observed here that in most B.s the nostrils are on each side of the beak; but in the gannet there is no nostril on the outside, but immediately under the skin on each side of the head close to the eye

there is a system of air-cells, and as the B. breathes inwards the cells on each side of the head are inflated with the air which the B. can exhale at will. There is a much smaller species of gannet, the solan goose, *Sula bassana*, which nests in various places round the coasts of Britain.

The African continent, particularly W. Africa, possesses a very varied B. life. There are the great crested grebe; storm petrels and shearwaters; tropic B.s—not unlike large terns but for their long central tail feathers, 15–26 in. long; red-footed and brown boobies; cormorant;

SKELETON OF A BIRD (PIGEON)

1, radius of wing, with the ulna below and alongside it. 2, humerus. 3, pelvic girdle. 4, the pygostyle or ploughshare bone, supporting the tail feathers. 5, femur of hind limb. 6, tibia. 7, tarso-metatarsus. 8, the keel of the sternum, to which are attached the pectoral muscles moving the wings. 9, bones (phalanges) of second and third digits of wing. 10, clavicle. 11, bone (phalanx) of first digit, to which is attached the bastard wing.

shag or reed duiker; darter or snake-B.—somewhat like the Brit. or African white-headed cormorant; frigate-B.s which wander from Boa Vista, Cape Verde Is., to the W. African coast; pelicans—white, pink-backed, etc.; heron—W. African reef, black-headed, purple, Goliath; squacco; white-crested bittern, etc.; stork—hammerhead, bishop or African woolly-headed, jabiru, marabout—an immense B. weighing as much as 13 lb., and entirely devoid of any charm in appearance; ibis—spotted-breasted, Upper Guinea olive, Bocage's olive, glossy, and many other kinds; spoonbills and flamingo; geese and duck—one remarkable variety is the pigmy or dwarf goose, which is to be found in the swamps and is an expert diver; secretary B.—this B. is restricted to Africa, where the two races into which it is divided have

a wide but local range. It is protected in Cape Colony and Kenya, for it is becoming rare. There is probably no other large B. so graceful in movement when landing or about to fly, for it resembles a miniature aeroplane most realistically, and curiously enough has never been seen to land otherwise than right into the wind. Also in Africa are found the vulture, falcon and eagle, kite, buzzard, hawk, harrier, francolin—notably the Cameroonian mountain francolin discovered in 1909; partridge and quail—the African blue quail is the smallest member of the Phasianidae, being only 5½ in. long but conspicuously coloured; guinea-fowl; land rail, only 5 in. long; African moorhen and Senegal and Cameroonian pinfoot; Sudan bustard or paauw—the cock scales up to 22 lb. and has an enormous wing expanse in flight—Nubian bustard, Senegal bustard or knobhaan, and others; jacana or lily-trotter—a B. of reddish-brown body of striking appearance to be found over the whole Ethiopian region; snipe, plover, sandpiper, phalarope, gull, tern, pigeon, and dove; and parrots—notably the grey variety so well known to Europeans, the Congo red-crowned, the Gabun, Nim-Niam, and the scarlet and yellow-bellied varieties. (See David Bannerman, *Birds of Tropical West Africa*.)

India is less noted for B.s of gorgeous plumage than other tropical countries, but there are many curious kinds, and the parrot tribe is known for its beauty. The varieties of parrots are far more numerous than elsewhere in the world. Eagles, gerfalcons, vultures, and other B.s of prey abound, but mostly are not comparable for size and plumage with those in some other countries. Hawks were long trained for hunting, two of the most suitable varieties being the lagar and shain, both hawks of the peregrine type. The mina (or myna) of the starling tribe are kept as pets by the natives; kingfishers and herons are caught for their feathers. Other B.s found in India are the pigeon, quail, plover, widgeon, teal, sheldrake, etc., and various kinds of jungle and water fowl.

The following are the prin. B.s to be found in Canada: grebe, diver, loon—yellow-bellied, Pacific, etc.; puffin, horn-billed and other guillemot, and various kinds of auk and auklet; gull, kittiwake, tern, shearwater, petrel, pelican, mallard, sheldrake, duck, elder, scoter, Canada goose, bean goose, cackling goose; whistling swan—a rare and accidental visitor; whooping swan; heron, egret, coot, crane, woodcock, snipe, sandpiper—many species, especially the least sandpiper, which breeds on Sable Is.; marked godwit, ptarmigan, hawk, golden eagle—breeds in the Ungava dist.—grey sea, bald, and other eagles; owl, woodpecker, night hawk, lark, cowbird, oriole, and snow bunting—an abundant winter and early spring resident in the E. provs.; sparrow, martin, warbler—numerous varieties—shrike, wren—California, Alaska, Kadiak, and numerous other varieties; thrush, wheatear, bluthroat.

of Birds, 1867; C. Dixon, *Lost and Vanishing Birds*, 1898; F. H. Knowlton and R. Ridgway, *Birds of the World*, 1909; W. Rothschild, *Extinct Birds*, 1913; J. Arthur Thomson, *Biology of Birds*, 1923; A. L. Thomson, *Problems of Bird Migration*, 1926, and *Birds: an Introduction to Ornithology*, 1927; A. Wetmore, *Migration of Birds*, 1926; E. M. Nicholson, *How Birds Live*, 1927; C. S. Elton, *Animal Ecology*, 1927; E. F. Daglish, *Name This Bird*, 1934, and *Birds of the British Isles*, 1948; A. H. Chisholm, *Bird Wonders of Australia*, 1935; F. B. Kirman, *Bird Behaviour*, 1937; P. A. Taverner, *Birds of Canada*, 1938; H. F. Witherby, *Handbook of British Birds* (5 vols.), 1938-41; A. Roberts, *Birds of South Africa*, 1940; S. Gordon, *Wild Birds in Britain*, 1943; J. Fisher, *Watching Birds* (new ed.), 1953; *Birds as Animals*, 1939, (vol. 1 revised, 1954).

Bird-catching Spider, large hairy spider found in many hot countries. It belongs to the genus *Mygale*. When stretched out it takes up a space from 6 to 9 in. across, although the body is only about 2 in. It lives in trees, or in hollows under rocks, and there it spins its curiously shaped web or nest. It goes out at night to hunt for its food of insects and, as is stated, to ensnare young birds. It has been said that the webs are strong enough to make travelling difficult in the forests.

Bird Cherry (*Prunus padus*), family Rosaceae, native tree of the temperate regions of Asia and Europe, being frequently found in Britain. The Scottish name for it is hagberry, which means wood berry. Unlike the wild cherry, the flowers bloom after the leaves have fully appeared in early May. The fruits are small, black, and bitter in taste, and only fit for birds' food, though sometimes used for colouring brandy and wine. The wood is used by cabinet-makers.

Bird Lice, or Mallophaga, name given to a family of insects or parasites which affect birds. These parasites are shaped like lice, but they are not blood-sucking creatures, since their mouths are formed for biting. Their bodies are ringed round the thorax. They feed upon the skin of the birds and eat the feather and sometimes the blood too. It is found that they commonly affect the fowls of the farmyard, and will sometimes be discovered in animals. Where fowls are kept near cats or dogs, the latter are likely to be affected also by these pests, which feed on the hair and fur.

Bird Lime, sticky substance obtained in various ways. It is got from the bark of the holly-tree, and from mistletoe, and boiled with water. It is also prepared from flour; the starch is washed out of the flour, and the gluten left is used for B. L. The substance is frequently utilised for ensnaring birds.

Bird of Paradise, various species of birds of the family Paradisidae, which are natives of Australia and the Malay Archipelago. They are related to Corvidae, or crow family, but though the females are inconspicuous in appearance,

the plumage of the males is gorgeous and varied in colour. They are smallish birds, extremely active, and have compressed beaks, large toes, and strong feet. Their food consists chiefly of fruits, seeds, and the honey taken from flowers, but it may also include insects and small animals, such as worms. The bower-birds (q.v.) of Australia are closely related to this family, and are noted for their constructive ability. The chief species of the Paradisidae are *Paradisaea apoda* of Linnaeus, the great bird of paradise, about 18 in. in length, the males having brilliant plumes of great length springing from

BIRD OF PARADISE (MALE)

beneath their wings; *Cinnurus regius*, king bird of paradise, a native of New Guinea, which has scarlet and green plumage; *Ptiloris paradisica*, black rifleman of N. Australia; *Diphyllodes magnifica*, magnificent bird of paradise; *Pteridophora alberti*, common to New Guinea.

Bird of Paradise (constellation), see APUS.

Birdeage Walk, St James's Park, London, connecting Buckingham Gate with Storey's Gate, is named after the aviary estab. there in the reign of James I. The steps known as Cockpit Steps at the Storey's Gate end of the Walk led from Dartmouth Street to the Cockpit. The latter was abolished in 1816, though it had then long ceased to be used for sporting purposes.

Birdswald, site of the Rom. station of Camboglanna, on the bank of the R. Irthing, 14 m. NE. of Carlisle, Cumberland. It is the largest fort in Hadrian's Wall (q.v.).

Bird's Eye, name given to *Veronica chamaedrys*, also known as *Angels' Eyes* and *Germander Speedwell*, a common perennial; the B.'s E. *primrose* is *Primula farinosa*, with yellow-throated, rosy lilac flowers. Both plants are natives of Britain and Europe.

Bird's-eye Limestone, limestone found

in the Trentin group of N. America. It is named from the white cross-sections that appear in the stone.

Bird's-eye View, term used to describe drawings made in a manner of perspective where the eye is supposed to look down from above on to the land illustrated. The difficulty naturally is to show the relative vertical heights accurately so as to give a correct impression.

Bird's Foot (*Ornithopus perpusillus*), wild plant belonging to the family Leguminosae. Its name is derived from its pod cluster resembling the foot of a bird. It grows in sandy soil, and is sometimes cultivated on the Continent as food for sheep. The bird's-foot trefoil, or lady's slipper (*Lotus corniculatus*), also a leguminous herb, is a perennial, valuable in meadow and pasture.

Bird's-foot Trefoil (*Lotus corniculatus*), plant of the family Leguminosae, which is common in Brit. meadows, and is noted for its beaked carina or keel and nearly straight legume. It affords good pasture, and received its name from the resemblance of a group of pods to a bird's foot.

Bird's Nest, either the popular or book-name of sev. plants: the wild carrot (*Daucus carota*); the common parsnip (*Pastinaca sativa*); yellow bird's nest (*Monotropa hypopitys*); the fern, *Asplenium nidus*: bird's nest orchis, *Neottia nidus-avis*—a plant with dingy brown flowers growing spikes and found in N. countries.

Bird's Tongue, common name for *Ornithoglossum glaucum*, and *O. undulatum*, S. African liliaceous plants with perianth segments shaped like a bird's tongue. *Streptzia* species are known as B. T. Flower.

Birdwood, Sir George Christopher Molesworth (1832-1917), administrator and author, b. Belgium, in the Decenn, and educ. for the Indian medical services, which he entered in 1854 on the Bombay staff. Subsequently he became sheriff of Bombay, and did much to promote education there. B. left India in 1868 and in 1871 was appointed by the India Office in permanent control of Indian exhibits at S. Kensington, which collection he reorganised. He was one of the founders of 'Prismrose Day' in memory of Lord Beaconsfield. He was knighted in 1881.

Birdwood, Field Marshal William Riddell Birdwood, 1st Baron (1865-1951), soldier, educ. Clifton College and the Royal Military College, Sandhurst. He entered the Royal Scots Fusiliers in 1883; transferred to the 12th Royal Lancers, 1885; captain 11th Bengal Lancers, 1896; promoted to colonel, 1905, general, 1917, and field marshal, 1925. His earlier campaigns were the Hazara expedition, 1891, expedition, 1892, and the Tirah expedition, 1897-8. In the S. African war, 1899-1902, he was brigade-major to Mounted Brigade in Natal, later military secretary to Commander-in-Chief (Lord Kitchener). In the Mohmand expedition, 1908, he was chief of staff; awarded the D.S.O. in that year. In the First World

War he was with the Mediterranean Expeditionary Force, first as G.O.C. Australian and New Zealand Army Corps and then as Commander-in-Chief of the whole force. Commanded the Dardanelles Army during the evacuation of the Gallipoli Peninsula, 1915-16, and subsequently commanded Australian and New Zealand troops, and, later, the Fifth Army in France. By his fine handling of the Australian and New Zealand forces he gained a great military reputation. At the close of the war he received a baronetcy and a grant of £10,000. In 1920 he was appointed G.O.C. N. Army in India, and from 1925 to 1930 he was Commander-in-Chief of the Indian Army. G.C.M.G. 1919; G.C.B. 1923; G.C.S.I. 1930; G.C.V.O. 1937; raised to the peerage in 1938 as Baron B. of Anzac and Totnes. He was colonel of the 12th Lancers (1920), of the Royal Horse Guards (1933), and of other Indian, Australian, and New Zealand regiments. He was master of Peterhouse College, 1931-8. He wrote *Khaki and Gown; an autobiography*, 1941, and *In My Time; recollections and anecdotes*, 1946.

Biretta, stiff square hat with three erect wings and a central bob worn with a cassock in church by clerics. The confinement of the scarlet B. is part of the ceremonies at the creation of a cardinal. The B. of a bishop is purple, while that of an ordinary priest is black. It is derived, like the academic mortar-board, from the soft square cap common at the time of the Reformation.

BIRETTA

Birgus, generic name of some decapod crustaceans of the family Cenobridae which are chiefly terrestrial. They are hermit-crabs, dwelling in a hole by day, and coming out at night to seek for food, which consists largely of the fruit of the coco-nut tree. *B. latro*, the robber-crab or purse-crab, is a common species which inhabits the Indo-Pacific region.

Birjand, dist. and tn of Persia in the Khorasan prov., about 210 m. N.E. from Kerman, and 240 m. S. from Mashhad. Pop. of tn 23,000.

Birkbeck, George (1776-1841), doctor, b. Settle, Yorks. After studying medicine at Edinburgh and London he practised successfully in both cities. He is best remembered as a populariser of science, the founder of Mechanics Institutes and a founder and member of the first council of Univ. College, London. At 23 he accepted the chair of natural philosophy at Glasgow, and in 1809 gave a course of lectures there to which working men were admitted on payment of a low fee. After a long and successful growth this dept of the univ. became the Glasgow Mechanics' Institution in 1823. In the same year a Mechanics' Institution was opened in London 'for the purpose of giving education

to students in the principles of the Arts they practise, and the various branches of Science and useful knowledge.' B., who had come to London in 1804, lent a large sum of money to build a lecture room, and until his death continued to take an active interest in an institution which was later to be known as Birkbeck Institution and finally Birkbeck College (q.v.). Subsequently Mechanics' Institutes throughout the country did a great deal to popularise science.

Birkbeck College, school of London Univ. (q.v.) primarily for part-time students wishing to read for various internal degrees. All lectures are held in the evening. Following a proposal by Thomas Hodgskin and J. C. Robertson B. C. was founded in 1823 as the London Mechanics' Institution by Dr George Birkbeck with the support of sev. radical thinkers of the day, notably Francis Place. The original object was to instruct craftsmen in the physical sciences and in economics. In 1920 during the presidency of Lord Haldane of Cloan, who greatly assisted in its advancement, B. C. became a constituent college of London Univ. Present students number over 1400. See C. Delisle Burns, *A Short History of Birkbeck College*; E. H. Warmington, *Birkbeck College 1939-1946*; Thomas Kelly, *George Birkbeck, Pioneer of Adult Education*, 1957.

Birkdale, part of Southport, England. Pop. 22,000.

Birkebeinar, name of a political faction which existed in Norway in the 12th and 13th cents.; the name arising from the birch-bark footwear which the poverty of the members compelled them to substitute for boots. The party arose in opposition to Erling Skakke and his heir Magnus, and fought for the descendants of Sigurd Mund, i.e. for King Sverre and his heirs, being successful in 1217 in having Haakon Haakonsson elected King of Norway.

Birkenfeld, Ger. tn in the Land of Rhineland-Palatinate (q.v.), 55 m. WSW. of Mainz (q.v.). It was formerly the cap. of a principality (area 194 sq. m.) which was tributary to Oldenburg but was completely surrounded by Prussian ter.; in 1937 it was made part of Prussia. The tn has an agric. trade. Pop. 3000.

Birkenhead, Frederick Edwin Smith, 1st Earl of (1872-1930), statesman and lawyer, b. Birkenhead, and educ. at Birkenhead Grammar School and Wadham College, Oxford. He gained first-class honours, School of Jurisprudence, 1894; was Vinerian Law scholar, 1895; fellow and lecturer of Merton, 1896; lecturer of Oriel, 1897; Univ. Extension lecturer in Modern Hist., 1898; and examiner in Final Schools, 1899-1900. He was called to the Bar in 1899. In the 'Tariff Reform' election of 1906 he was elected as Conservative member for the Walton div. of Liverpool, and his maiden speech in the House that year, which was an unrestrained attack on the Gov. and 'Free Trade,' had the effect of lifting the depression from which the Conservative party was suffering after its crushing

defeat at the polls and establishing B. as a brilliant speaker. In 1911, while still under 40, he had become a privy councillor and a leader of his party, and when the first Coalition Ministry was formed in May 1915 he became solicitor-general, and in the following Nov. attorney-general with a seat in the Cabinet. The latter office he again held in the second Coalition of Dec. 1916, and was created a baronet in Jan. 1918. In Jan. 1919, at the age of 46, he became lord chancellor. On the Wool-sack his originality and strong personality were felt throughout the Lords, and he showed a generosity and breadth of view which compelled those who had thought of him merely as a combatant lawyer to change their views. He was made a viscount in 1921, and Earl of B. in 1922. In Baldwin's second gov., Lord B. became secretary of state for India but his conduct in this office caused much criticism. He resigned in Oct. 1923, not, apparently, owing to any disagreement with his Cabinet colleagues, but in order to enter business life. His greatest achievement as a lawyer was the Law of Property Act, 1922, which greatly simplified the conveyance of land. His pub. include *Points of View*, 1922, *Contemporary Personalities*, 1924, *Famous Trials of History*, 1926, *Fourteen English Judges*, 1926, *Law, Life, and Letters*, 1927, and *More Famous Trials*, 1928. See life by his son, 1933 and 1935.

Birkenhead, co. bor. and seaport of Cheshire, England, situated at the mouth of the R. Mersey, on the E. coast of the Wirral, 13 m. NNW. of Chester and 194 m. from London by rail. It has an area of 8598 ac. It is a tn of purely modern growth, owing its increase in size to the construction of its docks, having a meagre hist. previous to the year 1820 when it was a small hamlet. The railway station is the most northerly of the former G.W.R. connecting the W. of England with the N. and is the terminus for the sea journey to the Isle of Man. A Benedictine priory of which the ruins may still be seen, was founded at B. in the 12th cent. by a Norman baron, and to this priory was granted the monopoly of ferries by Edward II. Previous to about the year 1820, B. had a pop. of less than 50 and in 1822 this pop. had not risen to more than 300. In 1844 parl. powers were obtained for the erection of a tidal basin and dock which were first planned by William Laird, and opened in 1847. Eleven years later, the dock was handed over to the Mersey Docks and Harbour Board, a corporation created especially to control the harbourage of the Mersey. The tn itself had also during this time grown and improved. In 1836, it received the grant of a market, and in 1861 was made a parl. bor. It was granted a charter of incorporation in 1877, and in 1898, the townships of Cloughton, Oxton, Rock Ferry, and Tranmere were incorporated in the bor. and in 1928 the bor. boundaries were again extended by the inclusion of Landican, Thingwall, Prenton, and part of Bidston; in 1933 a further extension was made by the inclusion of

Noctorum, Woodchurch, and parts of Arrowe, Bidston, and Upton. In 1909, a new covered market was opened and also a large central and two small branch libraries, the gift of Sir Andrew Carnegie. In Dec. 1923, a new art gallery and museum were added to the municipal buildings. B. contains many fine buildings including a market hall, a tn hall, an art school (given to the tn by Sir John Laird), and a new central library opened in 1934. A new technical college is under construction. The main architectural feature of B. is Hamilton Square, one of the largest in England. The communications of the tn with Liverpool are good. An electric railway connects the two towns through the Mersey railway tunnel (opened in 1886), and road transport is carried through the Queensway tunnel (opened in 1934). The tn is also connected with Liverpool by the corporation's fleet of ferry boats, the monopoly of which was bought from the Lord of the Manor in 1842. On the docks are the flour mills which make B. the centre of the milling industry in Europe, and second only in the world to Minneapolis. The dock estate covers an area of 806 ac. and the docks have a lineal quayside of 9½ m. Huge storage warehouses and abattoirs are erected along the quays and the ship-building yards of Cammell Laird & Co., are situated at B. This firm has launched over a thousand ships from the B. yards. The tn has its own water undertaking, and motor bus services. It is a quarter sessions and parl. bor., returning 1 member to the House of Commons. During the war of 1939-45, the tn suffered severely from enemy air attack, and much damage was done to residential districts, but fortunately the prin. buildings were not affected. B. forms part of the Merseyside Development Area, and since the end of the war has attracted many new types of industry thus enlarging its sphere of industrial activity beyond the main industry of shipbuilding and repairing. Pop. 142,400.

'Birkenhead,' Brit. troopship, wrecked off Point Danger, Simon's Bay, 26 Feb. 1852. The soldiers were mustered on deck and remained steadily in their ranks while the boats took off the women and children; 436 men were drowned. King William I of Prussia ordered the story to be read out to each of his regiments on parade, as an example of disciplined heroism.

Birket-el-Keroun, or el-Qurun (lake of horns), lake of Middle Egypt, 50 m. SW. of Cairo. It has an area of nearly 80 sq. m., and is situated 141 ft below sea level, having a depth at its deepest parts of about 80 ft. The classical name is Moeris (q.v.).

Birkett, Sir Norman (1883-), lawyer and politician, b. Ulverston, Lancs, educ. at Emmanuel College, Cambridge. He was called to the Bar, Inner Temple, in 1913, and took silk in 1924. In 1923 he entered Parliament as Liberal M.P. for the E. div. of Nottingham. He lost his seat in 1924, but was again M.P. from 1929 to 1931. During the Second World War

he was chairman of the Advisory Committee for Defence Regulation 18s, and became a judge of the King's Bench Div. in 1941, in which year he was knighted. In 1945 he was appointed a deputy member of the International War Criminal Court. He became a Privy Councillor in 1947, and was President of the National Book League from 1949 to Dec. 1954. He was created a baron in 1958.

Birkhäuser, Swiss publishing house in Basel, with a branch in Stuttgart. The firm was estab. in 1879 as a printing office, and a year later started publishing. B. specialises in large popular eds. of classics—Goethe, Schiller, Heine, Shakespeare (Ger. trans.), Jeremias Gotthelf, Gottfried Keller, C. F. Meyer, Homer, Ulrich Bräker, and Pestalozzi; mathematical, scientific, and Swiss historical works; and books on Swiss monuments. B. also issues sev. scientific reviews.

Birlad, cap. of the prov. of Birlad, Rumania, on the railway from Jassy to Galati. Pop. (1930) 26,200. Noted for its ann. horse fair; manufs. soap and candles.

Birmingham, George, see HANNAY, J. O. Birmingham, city and municipal co. and parl. bor. of England, situated in the NW. of Warwickshire with suburbs extending into Staffs and Wores; 113 m. from London by rail and 85 m. from Manchester. The municipal area is about 80 sq. m. (51,147 ac.), with a pop. of 1,118,500. In 1911 the boundaries were extended to include the bor. of Aston Manor and other dists. In 1928 part of the urb. dist. of Perry Barr was incorporated. The tn was enfranchised in 1832, and now returns 13 members to Parliament. It became a bor. in 1838, and a city in 1889. The corporation consists of the lord mayor (created in 1896), 38 aldermen, and 114 councillors.

With Wolverhampton, Walsall, Wednesbury, and other tns of the 'Black Country' dist., B. forms one of the most important of industrial areas. It is the second city of Great Britain, and the chief hardware centre of the world, being the largest manufacturing city in England. It is famous for its metal industries, which have been important since the latter half of the 17th cent. The most outstanding is the motor-car industry. Next in importance come industries concerned with brass-working, jewellery, gold, silver, gilt, and iron. Extensive manufs. are those of pins, buttons, and other dress accessories, nails, screws, steel pens, tools, cycles, and machinery. Other industries are railway-carriage building, electro-plating, plastics, and chemicals. In all it is estimated that there are some 1500 distinct trades, and the city consequently possesses a large pop. of skilled artisans.

The city has many fine streets and notable buildings. Mention must be made of the thoroughfares of New Street, Corporation Street, Broad Street, and Colmore Row, and amongst the chief buildings, of the council house and art gallery (1874-81), containing a fine collection of Pre-Raphaelite paintings, Eng.

water-colours, sculpture, ceramics, costume, and sections on natural hist. and archaeology. There is a branch museum at Aston Hall, a Jacobean mansion furnished as a private house of that period, and a museum of Science and Industry in Newhall Street, which possesses early inventors' models and a fine collection of arms. Other notable buildings include the tn hall, completed in 1834, with a hall capable of seating 2000 people; the central free library; the Victoria law courts; the Civic Centre; and the Hall of Memory, opened in 1925, a memorial to the men and women of B.

educational estab. is the King Edward VI Grammar School, founded in 1552. Other educational institutions are the Midland Institute, the Municipal College of Technology, the Municipal College of Art, Selly Oak Colleges, and Queen's College. The prin. libraries are the Birmingham Library (private), founded in 1779 and greatly enlarged in 1798 by Dr Priestley; the Central Reference Library, including the Shakespeare Memorial Library, one of the finest collections of its kind in the world, and the Birmingham Collection; the Commercial and Patents Library, the Technical

Copyright City of Birmingham Information Department
THE CIVIC CENTRE (LEFT) AND HALL OF MEMORY, BIRMINGHAM

who fell in the two world wars. B. is the seat of a bishopric, and the present cathedral was formerly St Philip's Church, built in the early 18th cent. by Thomas Archer. Until 1715 there was only 1 par. church, St Martin's, dedicated in the 13th cent. but wholly rebuilt in 1873-5. Other churches are St Mary's (1774) and St Paul's (1779). A large number of the churchgoers of B. are non-conformist. The Unitarians are an old-estab. body in B., as also are the Wesleyan Methodists, who were estab. by John Wesley himself, in 1745; and the Baptists, whose original chapel in Cannon Street was built in 1738. The chapel known as the New Meeting, in Moor Street, was notable as having been the scene of Joseph Priestley's ministerial labours from 1780. There is also the Rom. Catholic Cathedral of St Chad, and the Methodist Central Hall. The city possesses a univ. (see B. UNIV.). The oldest

Lending Library, and the Central Lending Library with branches throughout the city.

There are about 4200 ac. of parks and open spaces, chief of which are Lickey Hills (523 ac.), Cannon Hill (80 ac.), Highbury (73 ac.), Handsworth (63 ac.), and Aston (50 ac.). The Welsh water-supply scheme, with its chain of reservoirs in the Elan Valley in Radnorshire, supplies B. with water, and the works, which were formally opened by King Edward VII in 1904, cost approximately £6,000,000. A new reservoir in the Claerwen valley was inaugurated by H.M. the Queen (1952). B., having a central position in the U.K., is an important railway centre, being served by 2 regions of the Brit. railways. A municipal airport opened in 1939 is now controlled by the Ministry of Civil Aviation. Within the city the transport system includes the largest municipal fleet of omnibuses in the country.

Much of B.'s municipal enterprise is due to the efforts of Joseph Chamberlain, who, as mayor of the city in 1873-5, was responsible for many undertakings. B. claims to be the 'best-governed city in the world.' Though essentially a modern tn, B. has a hist. that can be traced back to a period before the Conquest, the place having been a settlement of the Anglo-Saxons. It is mentioned in Domesday Book, and there valued at 20s. After the Conquest it passed into the possession of the Birmingham family. The owner, Wm de Birmingham, was killed on the side of Simon de Montfort at the battle of Evesham in 1265. By the end of the 13th cent. a fair-sized mkt. had grown up at the focal point of roads at the Bull Ring. In the 16th cent it was visited by Camden and the antiquary, John Leland. The latter states that there were many 'smiths in the town that use to make knives and all manner of cutting tools.' It remained in the hands of the family until 1527, when the Duke of Northumberland managed to transfer it himself by preferring a false charge against Edward de Birmingham. After the attainder of Northumberland the property passed through various hands. In the Civil war B. evinced strong parliamentary sympathies, for which it paid by being sacked by Prince Rupert in 1643. Subsequent outstanding events were the devastating plague of 1665, the 'church-and-king' riots of 1791, in which the famous Dr Priestley was an important figure, and the Chartist riots of 1839. Among a number of public monuments are those of Joseph Priestley, Thomas Attwood (banker and politician), James Watt, and Nelson. In its political hist. B. did much to win for the nation the enfranchisement of the middle classes during the days of the Reform Bill agitation. Amongst the distinguished men closely connected with B., in addition to those already mentioned, have been James Watt, who, with Boulton, perfected the steam engine here; Wm Murdoch, the inventor of gas lighting; Wm Hutton, the historian; John Baskerville, the printer; Joseph Parkes, and John Bright.

In both the world wars of 1914-18 and 1939-45 B. became a centre of munition manuf., and received influxes of pop. for that reason. During the air assault on Great Britain in the Second World War, B. was a foremost objective of the enemy. An air raid in Aug. 1940 was the first of nearly 100 attacks, many during the winter of 1940-1. There were serious fire raids during Oct. The heaviest raid took place on the night of 9-10 April 1941, having been preceded by a number of raids, particularly that of 11-12 Dec. 1940, lasting over 13 hrs. Since the war, house building has been the chief concern of the Corporation, and during the period 1 April 1945 to 3 June 1954, 35,197 houses of various types have been provided. A start has already been made on the formidable task of rebuilding 5 central areas where some 30,000 old houses have to be replaced and bomb-damaged areas

replanned. In 1946 B. secured an Act of Parliament to permit the building of an inner ring road to facilitate redevelopment, and to alleviate traffic congestion. Preliminary work is proceeding on these and other schemes which will eventually change the face of B. beyond recognition.

Among dists. now within the city boundary are Bournville (q.v.), Castle Bromwich (q.v.), Edgbaston (q.v.), Handsworth (q.v.), Kings Norton (q.v.), Northfield (q.v.), and Yardley (q.v.).

Birmingham: 1. City in the co. of Jefferson, Alabama, U.S.A., 86 m. NNW. of Montgomery. It is the most important seat of the iron industry of the S. states, having numerous factories, mills, and foundries. This has accounted for its rapid growth from a tn of 3000 inhab. in 1880 to a city of 326,000 inhab.

2. City in Oakland co., SE. Michigan, U.S.A., between Detroit and Pontiac, on R. Rouge. It manufs. trailer parts, machinery, and electrical equipment, and there is truck and dairy farming. Pop. 15,500.

'Birmingham Post,' newspaper estab. in 1857 by John Feeney and Sir John Jaffray. At its foundation the politics of the paper were Radical, and after the Home Rule split of 1886 it supported the Liberal Unionist party. Later it was associated with Joseph Chamberlain's propaganda. It is now an independent paper, though generally Conservative in its views. The *B. P.*, together with the *Birmingham Mail* and the *Birmingham Weekly Post*, were bought by Lord Hiffe, formerly part proprietor of the *Daily Telegraph*.

Birmingham University, immediate successor of the Mason Science College, founded by Sir Josiah Mason in 1836, the title being altered to Mason College in 1892. In 1907 the college was incorporated under the title of 'The Mason Univ. College.' In 1898, Joseph Chamberlain suggested the idea of founding a univ. in Birmingham. A public appeal reached a total of £500,000. The royal charter was granted in 1900. In 1909, new buildings were opened at Edgbaston, about 3 m. from the city centre. At present the faculties of science, commerce, and social science are housed on this site together with the Brit. School of Malting and Brewing. The faculties of arts and law are still accommodated in the old Mason College building but it is intended to transfer these to the Edgbaston site. It is also proposed to house the depts of education and extramural studies, together with the Arts Library, at Edgbaston, when the whole univ. will be accommodated there. The faculty of medicine is housed in the Medical School, a fine building (opened 1938) on the Hospital Centre site, near the Univ. buildings, Edgbaston.

Birmam, hill in Perthshire, Scotland, about 12 m. NW. of Perth and near the tn of Dunkeld. It was anciently included in a royal forest, and has been immortalised by the reference to it in Shakespeare's *Macbeth*. There is one

remaining oak of Birnam Wood. Near Dunkeld also there is a small vil. called B. Biroidjan, *see* BIROIDZHAN.

Biroidzhan, tn in the Soviet Far East, on the Trans-Siberian (q.v.), 78 m. W. of Khabarovsk, cap. of the Jewish Autonomous Oblast (q.v.). It has some industry. Pop. (1956) 37,000. Formerly a small railway station, Tikhon'kaya, it became a tn in 1928.

Biroidjan, *see* BIROIDZHAN.

Biron, title of the family of Gontaut, to which a number of distinguished marshals of France belonged.

Armand de Gontaut, Baron de Biron (1524-92), Fr. marshal. He distinguished himself in the Catholic cause at Dreux, St Denis, and Montcontour, and commanded the royal forces at the siege of La Rochelle, as a reward for which he was made a marshal of France. After 1589 he supported the interests of Henry of Navarre, and was killed at the siege of Epemay in 1592.

Charles de Gontaut, Duc de Biron (1562-1602), son of the above, distinguished himself by his bravery. He was made admiral of France, and in 1594 a marshal of France. He fought for Henry IV, and was employed by him on diplomatic missions, but in 1602, accused of treasonable correspondence with the Spaniards, he was executed in the Bastille.

Armand Louis de Gontaut, Duc de Biron (1747-93), descendant of the above. He fought during the war of Amer. Independence under Lafayette, and on his return was made a marshal. On the outbreak of the revolution he joined the revolutionaries, and was appointed to a high command. He fought in La Vendée, and was commander of the army of Flanders. He was later accused of treason and executed.

Biron, Ernst Johann de, Duke of Kurland (1690-1772), favourite of the Russian Empress Anna Ivanovna (q.v.), and during her reign (1730-40) the virtual ruler of Russia: ignorant, arbitrary, and cruel.

Birr, mkt tn of co. Offaly, Rep. of Ireland. It has a boot and shoe factory, and a textile factory. Pop. 3300.

Birrell, Augustine (1856-1933), politician and man of letters, b. near Liverpool, and educ. at Amersham Hall School and Trinity Hall, Cambridge. He subsequently studied law, became a barrister in 1875, and a bencher of the Inner Temple in 1903. He was Quain prof. of law at Univ. College, London, 1896-9. He entered Parliament as Liberal member for W. Fife in 1889, and made a name as a graceful and witty orator, his efforts in this direction giving rise to the expression 'birrelling.' He was defeated in N.E. Manchester at the 1900 election, but re-entered Parliament in 1906 as member for N. Bristol, and Minister of Education in the Liberal Cabinet. The failure of his Education Bill to pass the House of Lords led to his resignation in 1907, when he was appointed chief secretary for Ireland. Relying on the assurances of John Redmond as to the state of Ireland, he was taken unawares by the Dublin

revolt of Easter 1916. He resigned his office in May; and in 1918 he retired from public life. The first series of his *Obiter Dicta*, 1884, revealed him as an accomplished essayist with a delightful style, and was followed by a *Life of Charlotte Brontë*, 1887, the second series of *Obiter Dicta*, 1887, *Res Judicatae*, 1892, *Mom. Women, and Books*, 1894, *William Haslitt*, 1902, *In the Name of the Bodleian*, 1905, and other books on subjects connected with belles-lettres and law.

Birs, small riv. of Switzerland, in the canton of Basel. Near it was fought the battle of St Jacob against the French in 1444, when 1600 Swiss were annihilated in opposing 30,000 French, the French losing 10,000 men. It was also the scene of a victory of the Swiss over the Austrians in the year 1499, after which the Emperor Maximilian I recognised the independence of Switzerland.

Birs Nimrud, *see* BORSIPPA.

Birstall, *see* BATLEY.

Birth, *see* CHILD. For statistics of births *see* REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

Birth, Concealment of. In Eng. law it is a misdemeanour, punishable by a maximum of 2 years' imprisonment, for any person, including the mother, to conceal or attempt to conceal the birth of a child by any secret disposition of its body, whether the child d. before, after, or at the time of its birth. A bill is taken of this offence as an alternative charge in cases of persons charged with murder or manslaughter of infants, owing to the frequent difficulty of proving that the child has been, in the legal sense, a living human being. In Scots law, a woman is liable to a maximum penalty of 2 years' imprisonment if she conceals her pregnancy during the whole period, does not call for, nor has, assistance at the birth, and subsequently the child is found dead or is missing. Till 1803 such concealment was considered presumptive of murder and punished with death.

Birth, Registration of, *see* REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS.

Birth Control, term applied to the practice of preventing conception by chemical, mechanical, or other means. In its wider application, the term may be used to mean any method of restricting or regulating the pop., such as infanticide, abortion, enforced celibacy, or what Malthus named 'moral restraint.' Infanticide and abortion were practised among primitive peoples. B. C. in the sense of the mechanical contrivance of contraception was known to the people of early civilisations, notably the Greeks and Romans, the Hebrews, the Arabians, and among Ger. and African tribes. Although such knowledge was available in Europe from the Middle Ages, no effort was made to draw public attention to it until the 19th cent. The first book on B. C. in Eng. is said to be *Every Woman's Book: or, What is Love?* by Richard Carlile, pub. in 1825. Similar pubs. followed from time to time in both the U.K. and the U.S.A., until wider publicity

was given to the subject by the trial of Charles Bradlaugh and Mrs Besant in 1877 for the offence of selling a pamphlet inculcating what were then known as 'Neo-Malthusian' practices. The foundation of the Malthusian League followed the same year, Bradlaugh being president and Mrs Besant secretary. The movement rapidly became world wide. A parallel legal stimulus was given to the movement in the U.S.A. by the trial of Mrs Margaret Sanger, in 1914, as the author of the pamphlet *Family Limitation*. From these events the National B. C. League was formed, and 10 years later the first B. C. clinic was opened in New York. In Great Britain during the corresponding period the person most associated in the public mind with the dissemination of B. C. information was an Eng. woman scientist, Dr Marie Stopes (q.v.). A B. C. clinic was opened in London in 1921 largely as a result of her efforts, and clinics were subsequently opened in most cities and towns in the U.K. Both Mrs Sanger and Dr Stopes gained world-wide reputations as serious propagandists in the campaign for making B. C. information generally accessible, and the movement was further stimulated by the effects of the war of 1914-18, which brought this, among other social subjects, into the open as a matter of general interest and discussion. The movement has encountered some official opposition, amounting in some countries, as in Italy in 1925 and in Japan, to legal prohibition. In the U.K. and the U.S.A. no legal impediment was placed in the way of the movement, except by very strict interpretation of the laws relating to obscenity, and from time to time these have been invoked. The movement aroused irreconcilable opinions. The subject touches biology, medicine, psychology, economics, ethics, and religion; and as vital statistics concern the community as well as the individual, B. C. is becoming a question with which politicians may have to deal. The Rom. Catholic Church is foremost in denouncing as sinful the practice of all artificial contraceptive methods. A medical committee of the National Birth-rate Commission (not an official body), set up in 1924, was of opinion, *inter alia*, that no entirely successful contraceptive method has yet been found, and that no impediment should be put in the way of married persons obtaining knowledge of contraceptive methods. See Dr Stopes's treatise, in favour, *Contraception: its Theory, History, and Practice*, 1933 and 1937; Dr Halliday Sutherland's *Birth Control*, 1922, for a Catholic doctor's views against; A. M. Carr-Saunders's *The Population Problem*, 1936, for the wider social and economic aspects; J. G. H. Holt's *Marriage and Periodic Abstinence*, 1937; and the Amer. B. C. League's *One Hundred Years of Birth Control*.

Birth Palsy, Infantile Diplegia, or **Little's Disease**, paralytic affection caused by injury at birth, through protracted labour, the use of instruments, or other causes. The condition is often not

observed during the early years of childhood, but manifests itself when the child might ordinarily be expected to support itself on its own limbs. It is characterised by spastic paralysis, frequently limited to the lower limbs, and often associated with mental deficiency and convulsions. Considerable attention is now being given to the education of these children and to devising means for helping them to become as useful people as their infirmity will allow. There are about 20,000 spastic children in Britain. At least one special school for 'spastics' has been started. The National Spastics Society was formed in 1952 as a voluntary association to foster research into B. P. and to provide facilities for the special education and habilitation of those suffering from it.

Birtley, mining and industrial dist. of Durham, England, 5 m. from Gateshead, with cable and engineering works. Pop. 11,500.

Bisaccia (anc. *Ranula*), It. tn, in Campania (q.v.), 31 m. ENE. of Avellino (q.v.). It has a fine cathedral. Pop. 8,000.

Bisacquinio, tn in Sicily (q.v.), 27 m. S. of Palermo (q.v.). It has a trade in agric. produce and olive oil. Pop. 8,000.

Biscay, Bay of (Sp. *Golfo de Vizcaya*, Fr. *Golfe de Gascogne*, Rom. *Sinus Aquitanicus* or *Sinus Cantabrigius*), large bay of the Atlantic Ocean lying between the N. coast of Spain and the W. coast of France. Its most northerly point is the is. of Ouessant, and its most westerly point is Cape Ortegal. The coastline is, in general, regular, but there are some inlets on the Fr. coast, the chief being the Gironde and the estuary of the Loire. The Sp. shore, which is about 400 m. long, is bold and rocky, whereas the Fr. coast, which is also about 400 m. long, is, in most places, low and sandy. The bay is noted for the diversity of its currents: westerly gales are prevalent in it, and it is a by-word among travellers for its rough seas.

Biscay, Province of, see *VIZCAYA*.

Bisceglie, It. seaport, in Apulia (q.v.), on the Adriatic, 20 m. NW. of Bari (q.v.). It has a cathedral (partly 11th cent.), and a ruined Norman castle. There is a trade in agric. produce, olives, and wine. Pop. 39,100.

Bischof, Karl Gustav (1792-1870), Ger. chemist and geologist, b. Wirt, near Nuremberg. His most important work was a *Manual of Chemical and Physical Geology*.

Bischoff, Mount, in Tasmania, situated 160 m. from Launceston via Burnie. It is a mining dist., being specially noted for the rich yield of tin ore, which was discovered in 1872. In the short space of 2 years (1884-6) there was an output of more than 2000 tons.

Bischofgrün, Ger. vil. in Upper Franconia, Bavaria, at the N. foot of the Ochsenkopf. It is a winter resort.

Bischofswerda, Ger. tn in Upper Lusatia, Saxony, 20 m. E. of Dresden. B. has textile factories and machinery is manuf. Granite is quarried in the vicinity. Pop. 10,850.

Bischwiller, Fr. tn in the dept of Bas-Rhin, on the Moder. It was formerly an episcopal tn, and had a famous fair. It manu. textiles and cartridges. Pop. 7800.

Biscop, Benedict, *see* BENEDICT BISCOOP.
Biscuit (Fr. 'twice-cooked'), kind of hard, dry bread which has not risen, so made in order to be preserved without deterioration for a long time. Common sea B.s. or ship bread, are totally unfermented, whilst captain's B.s. are partly fermented. All the other forms of B. are fermented. Various machines have been invented for B.-making, and in a modern factory the B.s. are never touched by hand. The various ingredients for hard B.s. are kneaded into a stiff dough by a machine, 'braked' or rolled out between rollers, then cut up into squares by a machine which has a pair of rollers to compress it to the required thickness. The dough is then carried along on a web which takes it under a block, whose cutters cut it into the shape required. The cut B.s. then travel slowly through an oven for about a quarter of an hr, on a wire frame; they are then finished and are packed in tins. There are innumerable varieties of B.s. and B.-making is a rapidly increasing industry.

Biscuit, term applied to unglazed earthenware and porcelain, whether deliberately left without a glaze, as, for example, the soft paste figures of Vincennes, Sèvres, and Derby, or when in the unfinished state between the first firing and the application of decoration previous to the second firing and glazing. *See* EARTHENWARE; DERBY; PORCELAIN; SÈVRES.

Bish, *see* BIKIL.

A YOUNG BISHAR

E.N.A.

Bisharin, name of a people of E. Africa, to whose stock belong tribes dwelling between the Blue Nile and the Ethiopian

highlands. They belong to the Mohammedan religion. *See also* BEJA.

Bishop, Sir Henry Rowley (1786-1855), musical composer, b. London. He was trained by Francesco Bianchi, who was at this time settled in London. B.'s first composition performed publicly was the music to a one-act piece called *Angelina*. In 1809 he produced his first opera, the *Circassian Bride*, the scenery of which perished the day after the first performance in the great fire at Drury Lane. In 1810 he was appointed composer to the Covent Garden Theatre. In 1825 he transferred himself from Covent Garden to Drury Lane. He was already one of the directors of the Philharmonic Society, which had been founded in 1813. *Maid Marian* and *Clari*, or the *Maid of Milan* were produced in 1822 and 1823; in the latter occurs the famous air 'Home Sweet Home' in various forms as a kind of theme-song. In 1830 he was appointed musical director at Vauxhall. In 1842 he was knighted, being the first musician who ever received that honour, and in 1848 he succeeded to the chair of music at Oxford. His very numerous works for the stage, including operatic pieces, 11 adaptations from Scott's novels, incidental music (including 11 Shakespeare plays), ballets and adaptations of foreign operas amounting to perversions, are all forgotten; his glees survived longer, but perished with the fashion for that class of vocal music; all that remains are three songs that are still charming period pieces: 'Home, Sweet Home,' 'Should he upbraid,' and 'Lo, here the gentle lark.' He d. in impoverished circumstances, though up to his time few composers ever made more by their work.

Bishop, Isabella (1832-1904), Eng. traveller and author, daughter of the Rev. Edward Bird. *The Englishwoman in America*, her first book, consists of letters written during a visit to Canada at the age of 22. Among many journeys the most important was one she undertook into the interior of China. She wrote many books descriptive of her travels. The following were pub. between 1880 and 1889: *Unbeaten Tracks in Japan*, *Journeys in Persia and Kurdistan*, *Among the Tibetans, Korea and her Neighbours*, *The Yangtze Valley and Beyond*, *Chinese Pictures*. She was married in 1881 to Dr John B., an Edinburgh physician. In 1901 she rode 1000 m. in Morocco and the Atlas Mts. She was the first woman to become a fellow of the Royal Geographical Society.

Bishop, William (1554-1624), Eng. priest, studied theology at Rheims and Rome. In 1583, having been ordained priest, he was sent to the Eng. mission, and imprisoned in Marshalsea, 1583-4. Later he was again imprisoned, this time at the Eng. college in Rome, as leader of 'a factious party.' In 1611 he was imprisoned for refusing the oath of allegiance to James I. In 1623 he was appointed vicar apostolic with ordinary jurisdiction over the Catholics of Great Britain, and Bishop of Chalcedon, but d. shortly afterwards.

Bishop, William Avery (1894-1956), Canadian air-ace. In the First World War he joined the Canadian cavalry, and later was seconded to the Royal Flying Corps. On the W. front he brought down no fewer than 72 Ger. machines, and then in 1917 he was sent on training work to Canada, returning to France in 1918. He was awarded the M.C., D.S.O., with bar, V.C. (on 13 Aug. 1917), and the D.F.C. At the end of the war he was a member of the Canadian General Staff with the rank of lieutenant-colonel, and his military career continued in the Canadian Air Force: Group-Captain, 1931; Air Vice-Marshal, 1936; Air Marshal, 1938. In 1940 he was appointed director of recruiting for the Canadian Air Force. C.B., 1944.

Bishop (Gk *episkopos*; A.-S. *bisceop*), overseer or overlooker. A term that in the early apostolic Church was closely allied with the word elder. The word is used in the N.T. on sev. occasions, as synonymous with the word elder. There is no such clear difference made between these two ranks in the Church, as, for example, between B.s and deacons. The duties of B.s, as traced in the N.T., are general superintendence of the churches, pastoral duties which are specially emphasised, and teaching. Within the Catholic Church the B. was recognised as the highest dignitary of the hierarchy of the Church, with special spiritual functions and with certain rights of oversight over the lower orders of the clergy. By the end of the 2nd cent. AD the claims of the B.s were estab. much on the lines of the present day, and the theory of the apostolic succession was put forward. By the same time the limitation of the authority of the B. to the diocese had also been put forward and was generally accepted. In the early Church this was probably necessary, since the frequent attacks upon the Christian religion made it necessary that some definite order and ruling should be given to it. The power and the duties of the B. remained much the same during the Middle Ages, from the time of their conception during the 3rd cent. The Council of Trent laid down that the B. must be a man of approved learning, of at least 30 years of age, and legitimate. The method of election of B.s has altered considerably since the period of the early Christian Church. B.s were originally chosen by the people, the remaining B.s of the prov. having the right of veto. Gradually this power departed from the people and fell into the hands of the prov. B.s, who were subject to a veto from the metropolitan. Next the power passed into the hands of the cathedral chapter, still subject to the veto of the metropolitan and later of the papacy. Gradually the sole power of confirmation passed into the hands of the Pope in the W. Church, and with this right of confirmation there came also the demand for the sole right of nomination. This claim was made by the papacy from the early days of the 12th cent., and in Eng. hist. we find Pope Innocent III refusing to ratify the appointment either

of the nominee of the cathedral chapter or of the king himself, but taking the full right of nomination into his own hands and placing Stephen Langton in the archiepiscopal throne of the prov. of Canterbury. At the present time in the Rom. Catholic Church the Pope has the right to nominate the B.s in a number of countries. But in some, by concordat, the political authorities have some say in the nominations, e.g. in Spain, Austria, and France. The Pope, however, claims the right of excluding unworthy nominees, he being the sole judge of eccles. worthiness. The Council of Trent prescribed a formal examination before the cardinals in Rome, but this is now obsolete, academic degrees or equivalent testimonials being accepted as evidence of theological knowledge, evidence of neighbouring ecclesiastics, etc., being received as regards other qualities. In other countries the Pope nominates the B. after considering a list submitted by the cathedral chapter, as in England, or the B.s of the prov., as in Ireland, or the apostolic delegate, as in the U.S.A. His choice, however, is not confined to the names on such a list. Very few cathedral chapters have the right of *electing*, in the strict sense. After election the new B. must be consecrated within 3 months. On taking possession of his see, he becomes the immediate and ordinary pastor of his diocese, subject to the Pope, or in missionary countries, to the Congregation of Propaganda. Even if assisted by a coadjutor B., he is bound to residence, nor may he be absent for more than three months in the year without very grave cause. A metropolitan, usually an archbishop, has little power in the dioceses of the other B.s of his prov. (his suffragans), except by special delegation by the Holy See. Oriental B.s are subject to their own patriarchs and through them to the Pope. But as far as the 'power of order' goes, a B. is inferior to none. He has full and sole authority to confer holy orders, to consecrate, to confirm, to give benediction, and to anoint kings. There are also titular B.s, that is, B.s who have received the episcopal consecration but have no diocese, and hence are used chiefly to assist other B.s of the Church and to represent the Pope. The Rom. Catholic B. ranks next to a cardinal, is styled in England the Right Reverend, and receives in conversation the title of My Lord B. The *Catholic Directory* gives the number of archiepiscopal sees throughout the world as 347, the number of episcopal sees as 1212, and the number of titular sees as 227. There are 9 archiepiscopal sees in Great Britain and Ireland, divided into 14 dioceses in England and Wales, 4 in Scotland, and 25 in Ireland. The insignia of the B. are the ring, the pectoral cross, the pastoral staff, the vestments, the mitre, and the throne. In the Reformed or Lutheran Church of the Continent the title of B. remained after the Reformation. In many cases the spiritual duties of the B. ceased, and the title was used purely as a secular and political one. In these cases,

however, where the title was used in the spiritual sense, the holder of the title did not claim unbroken apostolic succession. The general term used at the present time is that of Superintendent. The title of B. also still survives in other Protestant churches, e.g. in the Moravian.

Anglican Bishops. When due allowance is made for the doctrinal changes of the Reformation, the position and functions of the Anglican B.s are similar to those of the Rom. B.s. Only they have the right of confirmation and the ordination of priests. The method of election, however, differs since the nomination of B.s, though nominally in the hands of the Cathedral chapter, has been firmly vested in the Crown since 1534, by a statute of Henry VIII, which was re-enacted during the reign of Queen Elizabeth I. Where the Anglican Church is not estab., as in Scotland, Ireland, and Wales, and elsewhere in the Brit. Empire, the state has no say in the appointments. In England, however, the Crown is notified of the vacancy, and a *compte d'élire* is given, accompanied by a letter which nominates the choice of the Crown. The chapter is bound by law to elect this nominee, and failing such election the B. can be declared elected by royal letters patent under the Great Seal. The archbishop of the prov. is then notified and proceeds to the consecration of the B. elect. This consecration is usually carried out by the archbishop in person assisted by some or all of the prov. B.s. But a bishopric in England is also a barony, and the B. has to pay homage and take the oath of allegiance to the queen in person according to the old rites of the feudal baronage. In the prov. of Canterbury there are 30 dioceses and in the prov. of York 14. The Church of Wales is divided into 6 dioceses, the Church of Ireland into 12, and the Episcopal Church of Scotland into 7. In England a certain number of seats are allotted to the B.s in the House of Lords. At an earlier period all B.s sat in the House of Lords, but since the growth of the Church has led to the appointment of a great number of B.s, it has since been decided that the 2 archbishops, together with the B.s of London, Winchester, and Durham, should always sit in the House of Lords, the remaining 25 seats being filled by the B.s in the order of the seniority of their consecration. In addition to the powers which B.s have of ordination, consecration, and confirmation they have also jurisdiction over the clergy of their diocese, a jurisdiction which is regulated by the Clergy Discipline Act and the Public Worship Regulation Act. The B.s of the Church of England are ranked just above the barons of the kingdom, and are addressed by the title of Right Reverend. They have also the legal style of My Lord; but their wives have no title or precedence. The insignia of the Anglican B. are the rochet and chimere, the episcopal throne, the mitre, the pastoral staff, and the pectoral cross.

Suffragan Bishops. For Suffragan B.s in the Rom. Catholic Church, see above. In the Anglican Church Suffragan B.s are

those appointed by the Crown to assist the B. of a diocese who is prevented from performing his duties properly either by physical infirmities or owing to the extent of the diocese. In the Eng. Church they are appointed by the Crown on the recommendation of the B. of the diocese.

The Greek Church. The spiritual functions of the B. of the Oriental and Orthodox Churches are the same as those of the B. of the Rom. Catholic Church. The B.s, however, are all chosen from the monastic orders, since the secular clergy are compelled to marry before ordination and the B. must be unmarried. See also APOSTOLIC SUCCESSION and EPISCOPACY.

Bishop, beverage of port with hak-oranges stuck with cloves heated until its vapour can be ignited and the wine served aflame.

Bishop Auckland, tn in B. A. parl. div., Durham co., England, some 10 m. SW. of Durham city. In the NE. of the tn is the bishop's palace, originally built by Anthony Beek in the time of Edward I. There are a number of fine buildings, including the par. church and the tn hall. It is a railway centre and the pop. is chiefly employed in the collieries which surround the tn. Pop. (urban) 35,650.

Bishop Rook, see ROSEVEAR.

Bishops, the Seven, B. who, called together by Sancroft the primate, signed (1688) at Lambeth a protest against the Declaration of Indulgence issued by James II, declaring it illegal. The 7 B. were committed to the Tower on a charge of seditious libel. At their trial, in spite of the fact that everything had been done to secure a committal, the jury passed a verdict of 'not guilty.' See JAMES II.

Bishop's Castle, mkt tn of Shropshire, England situated some 20 m. SW. of Shrewsbury, and about 10 m. NW. of Craven Arms, to which it used to be connected by a branch railway. Formerly an important tn of the marches of Wales, it returned 2 members to Parliament until the passing of the Reform Act of 1832. It is now included in the S. parl. div. of Shropshire. It has lost its former importance, and the anc. castle of the bishops of Hereford, from which it originally derived its name, has fallen into ruins. Area 1867 ac. Pop. 1302.

Bishop's Hatfield, see HATFIELD.

Bishop's Ring, name given to a peculiar tinge in the heavens, a corona or halo near the sun, called after its first observer, Bishop, who noticed it at Honolulu in the autumn of 1883, after the great volcanic eruptions at Krakatoa (Malay Archipelago). Its colour is bluish-white in the centre, shading off to reddish-brown. The diameter of the inner part was about 21°, of the outer 45°. The ring was oval in shape, the phenomenon, associated with the twilight glows and coloured suns (blue, green, silvery, and coppery) that were visible in tropical parts after the eruption, being a diffraction corona due to the dust particles ejected from the volcano. The B. R. was most intensely brilliant in the spring of 1884, then it declined gradually, disappearing entirely

in June 1886. The same phenomena were visible again after Mt Pelée's eruption in Martinique (W. Indies), 1902. See Symons, *Eruption of Krakatoa and Subsequent Phenomena*, 1888.

Bishop's Stortford, mkt tn of Herts, England, 29½ m. NE. of London. In the late Saxon and early Norman days it was the property of the Bishop of London; the ruins of the so-called Bishop's Prison are still to be seen. B. S. College is a boys' public school, and there is a girls' high school. It is chiefly employed in brewing and malting; holds important horse and cattle fairs. Pop. 13,270.

Bishop's Waltham, tn of Hants, England, some 10 m. SSE. of Winchester, and originally in the see of Winchester, though now in the Portsmouth diocese. The Bishop's Palace, built by Henry de Blois, was completely ruined during the civil war (1644). Pop. 2900.

Bishop's Weed (*Aegopodium podagraria*), species of Umbelliferae naturalised in Britain. It is also called gout-weed, goat-weed, ground elder, and herb Gerard.

Bishopwearmouth, see SUNDERLAND.

Bistun, see BEHISTUN.

Biskra, tn of Algiers about 120 m. SW. of Constantine, with which it is connected by rail. The climate in the winter months is delightful and B. is a favourite resort for Europeans. Pop. (1946) 19,215.

Bisley, par. of Surrey, England, 7 m. NNW. of Guildford, and 2 m. N. by W. of Brookwood station. B. is chiefly remarkable for the fact that since 1890 the National Rifle Association (q.v.) have held their ann. meeting (see RIFLE SHOOTING) at the ranges on B. Common. Pop. 1300.

Bismarck, Otto Eduard Leopold, Prince von Bismarck-Schönhausen, Duke of Lauenberg (1815-98), Ger. statesman, b. Schönhausen, near Stendal, of an impoverished but anct. Junker family. Though all his life he stressed his Junker connections, he was in fact much influenced by his mother, a clever sophisticated woman with intellectual pretensions, whose romantic temperament he inherited. After attending Göttingen Univ. (where he fought sev. duels) he passed the examinations necessary for a career in the diplomatic service, but then spent some years travelling abroad and on his family estates. He married in 1847. By this time he was already known as a fervent anti-liberal, although he was subsequently to use Ger. liberalism to help him carry out his basic aim—the unity of Germany under Prussian leadership. All his life B. was to show himself a supreme opportunist, ready to use any movement, liberal or anti-liberal, when it suited his immediate objective, and to discard it just as quickly when it had served its purpose. He was Prussia's representative from 1851 in the Frankfurt Diet, and soon became the dominant figure there. It was during this period that he became finally convinced that Prussian greatness was conditional on Austria's eclipse as a great Ger. power. He became Prussian ambas. in St Petersburg in 1858, and was later made minister in Paris. But in

1862 he was recalled and appointed minister-president of Prussia.

He faced a hostile legislature, and at first his early resignation seemed inevitable. In fact, he was to hold office for 28 years. He stormed and bullied to carry through his policy of reorganising the Prussian state to ensure its efficiency in the future wars of unification which he later said he had considered inevitable, and which he had certainly hoped for; and his emotional approach carried the day. Events played into his hands. In 1864 B. joined with Austria in a war against Denmark which paved the way

OTTO VON BISMARCK

for the ultimate annexation of Schleswig-Holstein with Prussia. Two years later, with France and Italy favourably disposed to Prussia, he picked a quarrel with Austria. Austria's defeat at Königgrätz was the end of Austrian predominance in Germany. The states of N. Germany were formed into the N. Ger. Confederation (q.v.) under Prussia's leadership (1867); but the S. states still stood aloof. Only fear of France would drive them to acknowledge Prussian supremacy.

Again B. was able to profit from the blunders of his opponents. Between 1867-70 France and Prussia seemed on the brink of war more than once; B. later claimed that he had all along considered a Franco-Prussian war inevitable, and had deliberately precipitated it by his suppression of parts of the famous 'Ems telegram,' but modern critics have suggested that events in 1870 possibly took B. more by surprise than he admitted. The Prussian military machine was ready, however, and during the war which followed on the pub. of the telegram B.

accompanied the army, conducted negotiations with the French, and completed the arrangements for the entrance of the S. Ger. states into the Ger. federation. By 1871 France was crushed, and a Ger. empire, with the Prussian king as its emperor, was the greatest power in continental Europe.

This was the moment of B.'s greatest personal triumph. From 1871, with the title of chancellor, he concentrated on consolidating the Ger. Empire internally. His centralising policy met with opposition from the Catholic Church and the Socialists: against the Catholics he had little success, but he combated Socialism by a programme of state-controlled social reform which became a European model. His foreign policy aimed continually at Fr. isolation and to this end he allied with Austria and Italy (the Triple Alliance, 1882) and sought an understanding with Russia. In 1878 he presided over the Congress of Berlin (q.v.): at this time his prestige in Europe was enormous. In 1888, however, the Emperor William I d. and B. and the new Emperor William II, soon quarrelled. In 1890 B. was dismissed, and though there was a formal reconciliation in 1893, B. never held office again.

He had once declared: 'It is not by speechifying and majorities that the great questions of the time will have to be decided . . . but by blood and iron.' He himself in his memoirs fostered this impression of himself as a man of iron will, utter ruthlessness, and studied purpose, and it has only been questioned seriously in recent times; when more importance has been laid on the blunders and weaknesses of B.'s rivals and enemies, both inside and outside Germany, on B.'s basically emotional temperament, and on his extraordinary political luck. It remains true, however, that even if he was not the creator of events he held himself to be, he was able to profit by them skilfully and unscrupulously, and in so doing was the prin. architect of the Ger. Empire 1871-1918, his policies exercising an influence on Ger. and European hist. long after the Empire he had built had ceased to exist. See B.'s memoirs (Eng. trans. *Bismarck: His Reflections and Reminiscences*, 1898). See lives by C. Grant Robertson, 1918, E. Ludwig (trans.), 1930, and A. J. P. Taylor, 1955. See also J. V. Fuller, *Bismarck's Diplomacy at its Zenith*, 1922, and A. J. P. Taylor, *The Struggle for Mastery in Europe, 1848-1918*, 1954.

Bismarck, co. seat of Burleigh co., and cap. of the state of N. Dakota, U.S.A. It is situated on the l. b. of the Missouri, on the N. Pacific railway, and is a railroad junction. It has an altitude of 1670 ft above sea level, and is the head of the navigation of the Upper Missouri. There are coal-mines, and the manu. of optical equipment, concrete products, and farm machinery; it ships farm produce, dairy products, wool, corn, and honey. Pop. 18,640.

'Bismarck'. The Ger. battleship, given officially as 35,000 tons, and said to have been a 50,000-ton vessel, and in 1941

the largest and newest of Ger. warships; centrally controlled; said by the Germans to be unsinkable; carrying a great armament and over 2000 men; sunk on 27 May 1941 by units of the Royal Navy after a pursuit lasting nearly 5 days over a distance of 1750 m. The *B.* was first sighted in the Denmark Strait between Iceland and Greenland on 23 May, and was sunk about 400 m. due W. of Brest. The only damage to the Brit. ships—apart from the loss of the *Hood* (q.v.)—was slight damage to the *Prince of Wales*. During the pursuit successive torpedo attacks were made both by aircraft of the Fleet Air Arm and by destroyers. These succeeded in slowing up and finally crippling the *B.* Naval units taking part included forces from the Home Fleet, from Gibraltar, and ships engaged on convoy duties in the Atlantic. She was eventually sunk after being hit by 8 or 9 torpedoes, and there were only about 100 survivors. Had the *B.*—which was accompanied for some time by a 10,000-ton cruiser, *Prins Eugen*—escaped, her raiding potentialities would have been a very grave menace to allied shipping, the losses of which at this time were already nearly 500,000 tons monthly. Following the loss of the *Hood*, it was imperative to restore the balance, and the pursuit and sinking of the great Ger. battleship, which was on its first ocean voyage, was a triumph of Brit. sea and air power. Precisely why the *B.* had sailed into the Atlantic is not certainly estab., but the mere presence of so powerful a ship in the Atlantic, where it might, at any moment, make its appearance off Iceland, Greenland, or the West Indies, would have profoundly altered Brit. naval dispositions in all oceans. The pursuit demonstrated, not only the importance of sea-power, but the value of reconnaissance aircraft, without whose co-operation the *B.* would not have been located. The *B.* and attendant cruiser—which latter succeeded in escaping to Brest—were first located by Brit. aircraft in Bergen harbour. After they had reported her departure the *Norfolk* and *Suffolk* (cruisers) took up positions in the Denmark Strait, but owing to snow, sleet, and mist it was difficult to keep her in sight. The 2 Brit. cruisers successfully shadowed her during the night of 23 May. Other ships now took up dispositions at high speed in order to intercept the *B.* and bring her to action. Early on 24 May the *Hood* made contact and in the ensuing engagement the *B.* was at one time seen to be on fire. The *Hood* then received an unlucky hit in the magazine at 13 m. range, and blew up. Despite the efforts of the *B.* to shake off the *Norfolk* and *Suffolk* those ships maintained touch. On the evening of the 24th the *Prince of Wales* (battleship) joined action for a short time, but the Ger. ships turned away and swung round on a southerly course. Other Brit. naval forces were now coming up, and during the night naval torpedo-bombing aircraft from the *Victorious* delivered an attack from a considerable distance, 1 torpedo being seen to hit the

B. After 3 a.m. on 25 May, the Brit. ships lost touch with the enemy owing to low visibility, the *B.* being then 350 m. SSE. of S. Greenland. The main body of the Home Fleet, including the new battleship *King George V.*, was now steaming at a high speed in a south-westerly direction from N. waters, while another force, including the *Rodney* (battleship) and *Ramillies* (battleship), which were escorting convoys, proceeded also to converge in the direction taken by the *B.* Extensive air searches were organised by the Coastal Command aircraft, and by the Canadian Air Force stationed at Newfoundland; and at about 10.30 a.m. on 26 May the *B.* was again located, by a Catalina flying-boat, about 650 m. W. of Land's End. The Catalina was attacked by the *B.* and lost touch, but at 11.15 a.m. the *B.* was again spotted by naval aircraft from the *Ark Royal* carrier. The *Prinz Eugen* had, however, parted company, and was not seen again. The cruiser *Sheffield* was now detached to shadow the *B.* Another force of naval aircraft now attacked, and torpedoes were seen to hit the *B.* amidships, and on the starboard quarter. The *B.* now slowed round in 2 complete circles, with her speed much reduced. Between 1.20 and 1.50 a.m. on 27 May the *B.* was attacked with torpedoes striking the ship and causing a fire on the forecabin. She now appeared to be stopped, having sailed 1750 m., and being 400 m. due W. of Brest—where but for the skill and persistence of Brit. aircraft she might soon have joined the *Gneisenau* and *Scharnhorst*. For the greater part of 25 and 26 May the *B.* had been lost to the Brit. fleet, and they were afraid they had lost her altogether. It was only in the teeth of a howling gale and with the flight deck wet with flying and treacherous spume and the ship plunging and rearing in tremendous seas that Swordfish torpedo-bombers took off from the *Ark Royal* and hit the *B.* with 2 vital torpedoes that sensibly reduced her speed; and but for the urgent need of crippling the battleship to enable the Brit. capital ships to close and bring her to action not a single aircraft would have been allowed to take off. During the night of 26 May and in the early hours of the following day Brit. warships were all round the doomed Ger. ship, the courage and tenacity of whose crew, who went on fighting when their position was hopeless, were outstanding. At dawn the Brit. ships closed in in squalls of rain to within 13 m. The *B.* was now yawing from side to side, and scarcely under control; but she was still capable of fairly accurate salvos. After 15 min. of terrible punishment her fore turret went out of action with the guns cooked up uselessly in the air. There was a great fire raging amidships. With bombs and torpedoes from the air and torpedoes and gun-fire from the ships, the Brit. fleet closed in still nearer on the *B.*, which, with her steering-gear destroyed, was now circling at 12 knots out of control. But she would not strike her colours, and, finally, the capital

ships having sailed away, the *Dorsetshire* was detailed to dispatch her. The cruiser, creeping cautiously across the *B.*'s bows, 2 m. distant, passed down the port side, and fired her torpedoes. The *B.* was now hidden in huge clouds of smoke, through which, amidships, was the glare of flames. The torpedoes took her. There was a tremendous explosion under water, and the *B.* listed to an angle of 45 degrees, steadied for a moment, then heeled right over and slid beneath the waters.

Bismarck Archipelago, group of is. which lie to the NW. of the Solomon Is., and to the N. of the E. extremity of New Guinea. Their former name was New Britain Is., and they were discovered by Dampier in 1699, but in 1885 Great Britain came to an agreement with Germany by which they were assigned to the Ger. sphere of influence, and their names were then changed. In Sept. 1914 they were occupied by an Australian force, and were temporarily under military rule. Since then they have formed part of the Australian mandated ter. of New Guinea. The prin. is. of the archipelago are New Britain (q.v.), formerly called Neu Pommern (area 15,000 sq. m.), and New Ireland (q.v.), formerly called Neu Mecklenburg (area 3000 sq. m.), which are separated from each other by St George's Channel, in which the currents are of great violence and subject to no fixed rules; Vitiaz Strait separates New Britain from New Guinea, and another important is., Lavongal, formerly Neu Hannover (area 530 sq. m.), lies off the north-western extremity of New Ireland, from which a tortuous system of reefs separates it; Duke of York Is. (area 22 sq. m.) and the Admiralty Is. (area 600 sq. m.) are also important. The archipelago, which is of coral and volcanic formation, is mountainous and well wooded. In New Britain, the interior of which is but little known, there are sev. active volcanoes. It is practically undeveloped, the only plantations being around the coasts. Coco-nuts are the chief crop, but coffee and cocoa have recently been planted. The is. has many fine but little used harbours, the chief being Simpson Harbour on Blanche Bay. New Ireland has been more thoroughly explored than New Britain. It is no longer actively volcanic, but in other respects is similar to the larger is. The chief tn is Kavieng, on the N. coast of Nusa Harbour. The climate of the archipelago is, on the whole, healthy, and the soil is very fertile. Cotton plantations were started by the Germans with native labourers. The inhab. of the is., mostly Papuans, are skilled in agriculture. Coco-nut fibre, copra, cotton, rubber, coffee, tortoiseshell, trepan, mother-of-pearl, and fruit are the chief articles of trade. Shells threaded on long strips of split cane form the money used by the natives. Total area 19,200 sq. m. The native pop. is about 155,000. It was occupied by Japan during the Second World War. For details of operations see PACIFIC CAMPAIGNS, OF FAR EASTERN FRONT, IN SECOND WORLD WAR.

Bismuth, metallic element. It was probably known in the Middle Ages under the name *marcasite*, but was often confused with zinc and antimony. It is a comparatively rare metal, usually occurring in nature in association with ores of silver and cobalt. The greater part of the world's supply comes from Schneeberg in Saxony, Joachimsthal in Bohemia, Cornwall, Bolivia, and Peru. The ore is roasted and then smelted with iron, carbon, and slag; 2 layers are thus obtained, the lower one containing nearly all the B., which may be removed by tapping the lower end of the cylindrical retort in which the process is carried out. The crude B. is then purified by heating it on an inclined iron plate, when the pure B. melts and runs down into the receptacles provided. B. is a hard brittle metal with a reddish-white colour; its sp. gr. is 9.75, it melts at 271° C., and expands as it solidifies. It burns with a bluish flame and readily oxidises at ordinary temps.; it also combines directly with sulphur and with elements of the chlorine group. B. forms many useful alloys with low melting-points under the general name of fusible metal. These alloys are used in making type metal, as their property of expanding on solidification serves to produce a good cast; for soldering, and for the manuf. of safety plugs in boilers, as the constituents of the alloy can be so arranged as to provide a melting-point at a particular temp. B. forms 4 oxides, of which the yellowish trioxide is the most important. Two chlorides, 2 sulphides, and a sulphate may also be prepared. Most valuable of the B. compounds is the nitrate together with the basic nitrates formed by diluting the acid solution with water; magistery of B., flake white, and Sp. white are some of the salts thus produced. The basic carbonate prepared by treating B. nitrate with ammonium carbonate is used in medicine for easing painful gastric affections, such as dyspepsia, diarrhoea, ulcers, and cancer. The action is that of a direct sedative, the salts coming into contact with the nerve-endings of the mucous membrane. The insoluble salts are opaque to X-rays and abnormalities in the structure of the alimentary canal can be demonstrated on a fluorescent screen by following the course of a large dose taken as an emulsion. Sodium bismuthate is an analytical reagent, used as an oxidising agent, e.g. in the estimation of manganese in steel.

Bison, name of a ruminant allied to the ox in the family Bovidae, comprising only 2 species, the European and the Amer. B.s. The European B. (*B. bonasus*) is often confused with the aurochs, and is now to be found only occasionally in Europe, as in the forest of Byelovitsa (Bialowiza) in Lithuania. It is more than 6 ft high at the shoulders and is a most powerful and formidable animal, able to level with a thrust a tree 6 in. in diameter. It is massive, has thick, elongated withers, and its head is covered with a mane, often a foot in length, which is thickest in winter and inconspicuous

in the females; the eyes are small and savage. It has a strong sense of smell and can be approached only from the leeward. In habit it is herbivorous and fond of the barks of trees; it is gregarious, but domestic cattle rouse its fury, and it attacks them fiercely; attempts to mix the breed have failed. A short deep grunt is its method of articulation, and can be heard at a considerable distance. The Amer. B. (*B. bison*) differs little from the European B., but is smaller, shaggier, and fiercer. *See* BUFFALO. It is gradually becoming extinct, but in a few places, such as Yellowstone Park, herds are preserved.

Bissagos Islands, group of is. off the W. coast of Africa, consisting of about 16 large and a number of small is.

Bisschop, Christoffel (Christoph), (1828-1904), Dutch genre-painter, b. Leewardwarden. He was a pupil of Comte and Gleyre in Paris. After an early historical subject painting 'Rembrandt going to a Lecture on Anatomy,' 1867, he settled down to depict popular life in Friesland.

Bissell, George Edwin (1839-1920), Amer. sculptor, son of a marble-cutter, b. New Preston, Connecticut. He served during the Civil war (1862-5). In 1875 he went to study in France and Italy. Among his chief works are a national monument at Waterbury, Connecticut, a statue of Abraham Lincoln at Edinburgh, a relief of 'Burns and Highland Mary' at Ayr, and emblematical groups at New York, Buffalo, St Louis, and elsewhere.

Bissen, Herman Wilhelm (1798-1868), Dan. sculptor, b. Slesvig, and educ. at Rome under Thorwaldsen, who on his death left instructions in his will that B. should finish his uncompleted works. B. was in 1860 appointed president of the Academy of Fine Arts at Copenhagen. Among his chief works are: 'Cupid sharpening his Arrow,' 'Valkyrie,' an 'Apollo,' and a 'Venus.' One of his most famous works, 'Orestes,' perished in the fire at Copenhagen, 1884.

Bissextile, or **Bissexus Dies**, *see* LEAP YEAR.

Bissing, Moritz Ferdinand von (1844-1917), Ger. general. Appointed Gov.-General of Belgium in 1915, in succession to Field Marshal von der Goitz. Perpetuated the arbitrary gov. of his predecessor and introduced a new judicial system, under which all idea of the personal safety of the populace was destroyed because military commanders had the power to inflict punishment on innocent persons when the guilty could not be found. B. will probably be notorious chiefly as the official who signed Nurse Cavell's death warrant.

Bissolati-Bergomaschi, Leonida (1867-1920), It. Socialist, b. Cremona, and educ. at Pavia univ. He became a lawyer, and joined the Socialist party formed in 1892; he was the first editor of the Socialist paper *L'Avanti!* B.-B. entered the Chamber of Deputies, 1897. He seceded from the Socialist party in 1911 and formed the Reformist group. B.-B. entered (without portfolio) the Boselli

gov., 1916; remained under Orlando minister of pensions; resigned, 1918.

Biston, in entomology, name given by Dr Leach to a genus of lepidopterous insects of the family Geometridae. Three Brit. species of these moths are *B. prodromaria*, the oak beauty; *B. betularius*, the pepper moth; *B. hirtarius*, the brindled beauty.

Bistre, warm brown-coloured pigment, which is prepared generally from beech-wood soot, and was used by many old masters in their drawings.

Bitche (Ger. *Bitich*), Fr. tn in the dept of Moselle, in a pass of the Vosges. Its citadel, hewn out of a precipitous rock, resisted the Prussians in 1793, 1815, and 1870-1. It has glass and ceramic manufs. Pop. 3500.

Bitur, tn in Uttar Pradesh, India, about 15 m. N. of Cawnpore. Interest in the tn is due to the fact that Nana Sahib made it his headquarters in the mutiny of 1857. Havelock stormed and captured the tn in July 1857, when the palaces of the Nana were destroyed.

Bithynia, anct div. of Asia Minor separated from Europe by the Propontis and the Bosphorus, and bounded on the N. by the Black Sea. On the E. it adjoined Paphlagonia, on the W. and SW. Mysia, and on the S. Phrygia. It is mountainous and well wooded, but near the sea coast there are many fertile valleys. Its natural sources of wealth are not yet fully developed, although its forests provide the material for an excellent and flourishing industry, and coal is also known to exist in the country. The Bithynians are supposed to have been of Thracian origin. They became part of the Lydian monarchy under Croesus, and later were conquered by the Persians (546 bc). B. became, however, ultimately one of the most flourishing of the smaller kingdoms of Asia Minor, its cap. Astacus, a Megarian colony, being rebuilt and called Nicomedia by Nicomedes I (c. 280 bc). The last king, Nicomedes IV, made the Romans his heir in 74 bc. It became a Rom. prov., and for some time under Trajan was governed by the younger Pliny. In 1298 the Turks under Osman invaded the country, and it became in the course of time a Turkish possession. The sole flourishing tns at the present time are Prusa (Brusa, q.v.), Izmid (q.v.), (Nicomedia, q.v.), and Scutari (q.v.).

Bitlis, tn in il of Bitlis, Turkey, situated on a trib. of the Tigris, in a high valley, 4700 ft, amid the wild mt scenery W. of Lake Van. An old Arab castle is said to occupy the site of a fortress built by Alexander the Great. The prin. industry is the weaving of red cloth. Tobacco is largely grown, and there is a trade in gum and fruit. Pop.: il, 88,000; tn, 11,000.

Bitola (Turkish *Monastir*; anct *Heraclaea Lyncestis*), tn in Macedonia, Yugoslavia, in the strategic Monastir Gap, at the junction of the main N.-S. and E.-W. roads of the S. Balkans. It has many interesting buildings, including an anct mosque. It was taken from the Turks by the Serbs in 1912, during the Balkan

War (q.v.). B. has a large trade in agric. produce, tobacco, and wool, and manufs. textiles and flitree work. Pop. 31,000.

Biton and **Cleobis**, sons of Cydippe, a priestess of Hera at Argos. In their love for their mother they dragged her chariot to the temple of Hera, 45 stadia, or nearly 6 m. The mother prayed Hera to grant them the best that mortals might have, and they died in the temple while asleep.

Bitonto (anct *Butuntum*), It. tn, in Apulia, 10 m. W. of Bari (q.v.). It has anct walls, and a fine 12th-cent. Romanesque cathedral. There is a trade in agric. produce, wine, and olives. Pop. 34,900.

Bitter Apple, **Bitter Cucumber** (*Citrullus colocynthis*), fruit of a species of Cucurbitaceae. It is a round, yellow fruit, and the pulp is used as a purgative under the name of colocynth. Other names for it are colocynth gourd, and colocynthia.

Bitter Lakes, known as the Great and the Small, form part of the Suez Canal. These lakes were 25-40 ft below sea level, but were almost dry when the canal was cut.

Bitter Vetch, see LATHYRUS.

Bittercress, see CARDAMINE.

Bitterfeld, Ger. tn in the dist. of Halle, on the Mulde, 18 m. NE. of Halle (q.v.). It is in an important lignite-mining dist., and has metallurgical, chemical, and textile industries. Pop. 33,000.

Bitterling (*Rhodeus amarus*), small species of cyprinid fish found in the freshwaters of Central Europe. The breeding female has a long tube down which the eggs are laid in the gills of freshwater mussels. When the young are hatched they bear in their skin the encysted embryos of the mussel and these eventually leave their fish carrier.

Bittern, wading bird, buff-coloured, speckled with black and tawny brown, living in swampy ground. It has a short neck and long bill; its habit of holding neck and bill in a vertical position conceals it among the reeds, where it rests by day, hunting its food—frogs, reptiles, and fish—towards nightfall. Its loud booming call marks the breeding season. The genus *Botaurus* belongs to the family Ardeidae, which includes the herons. The European B. (*Botaurus stellaria*) is rarely seen now in Great Britain, but it was once common, especially in the Fens. The bird has been reintroduced into Norfolk, especially in the Broads, where its booming note was once a feature of those haunts.

Bitterroot Mountains, range of mts, with a maximum altitude of between 9000 and 10,000 ft, forming part of the boundary between Idaho and Montana, U.S.A. It is an outlying part of the Rocky Mt system, branching off S. where the main range turns E. through Montana.

Bitters, alcoholic infusions of anct roots, barks, and herbs, variously flavoured, which are regarded as whetting the appetite and stimulating the digestive organs. The best known and strongest is Angostura (q.v.), which dodged Prohibition in the U.S.A. as a 'medicinal bitter.' Others are Amer. Picon (Fr.),

one of the many forms of orange B., Campari and Fernet-Branca (It.), and peach B.s made in England from peach kernels.

Bitterspar, general name for the crystallised varieties of dolomite, or magnesian limestone (q.v.). It possesses various degrees of transparency, and has a pearly lustre, whence it has been called pearspar.

Bittersweet, or 'woody nightshade,' *Solanum dulcamara*; it derives its name from the taste, which is first bitter and then sweet. It is found in hedges and thickets, with a slender climbing stem, pointed leaves with 2 projections at the base; the flowers, resembling those of the potato, are lilac-coloured with yellow centres. The scarlet fruit, growing in clusters, is poisonous.

Bitterwood, common name given to various trees such as *Xylopi glabra* of W. Indies, family Annonaceae; Chinese *Picrasma ailanthoides*, family Simarubaceae; and *Simaruba amara*, family Simarubaceae; all yielding very bitter bark.

E.N.A.

BITTERNS

Bitumen, name sometimes loosely applied to naturally occurring hydrocarbons in general, in its narrower sense denotes a solid or viscous non-crystalline material derived from petroleum (q.v.), which is soluble in carbon disulphide. B. is black or brown in colour and has adhesive properties. Chemically, the various types of B. consist largely of the aromatic or naphthenic hydrocarbons (q.v.) together with traces of sulphur, nitrogen, and oxygen compounds. B. is usually produced commercially as an extract or distillation residue from certain petroleum; various types also occur naturally. The natural B.s include elaterite (q.v.), found in Derbyshire; manjak or glancepitch, which occurs in Barbados and is similar to B.s from Trinidad and Colombia; wurtzilite and gilsonite or untaita from Utah and Colorado, U.S.A.; albertite

from New Brunswick; grahamite, with a relatively high carbon content, found in various parts of the U.S.A., Mexico, and Cuba; and the very high carbon-content impsonite of Oklahoma, Arkansas, and Nevada, U.S.A. The crude petroleum suitable for the manuf. of B. include those from Mexico, Venezuela, California, and Egypt, all of which have a high content of the appropriate range of hydrocarbons. The most important application of B. is in roadmaking, for which purpose it may be supplied either as an emulsion with water or as a 'cutback' consisting of B. blended with a solvent such as kerosene or creosote. B. has been used for 5000 years as a mortar and waterproofing material in building construction. To-day, in addition to its many applications in civil engineering, B. is used in the manuf. of roofing-felt and waterproof paper, and for the insulation and protection of electric cables and pipelines.

Bituminous Coals, see COAL.

Bituriges, Celtic people of auct Gaul. They were divided into the B. Cubi, whose cap. was Avaricum (Bourges), and the B. Vivisci, cap. Burdigala (Bordeaux). The former joined in the rebellion of Vercingetorix (52 BC), their cap. was taken by the Romans, and its people massacred.

Bitzius, Albert (1797-1854), Swiss novelist, usually known by his pseudonym, Jeremias Gotthelf, the name of the prin. character in his first novel *Bauernspiegel*. He was the son of a pastor, and from 1831 till his death was himself pastor at Lützelbühl, in the Upper Emmenthal. His novels, in which, with crass realism, he describes Swiss peasant life, include *Bauernspiegel*, 1837, *Leiden und Freuden eines Schulmeisters*, 1838, *Uli der Knecht*, 1841, and its sequel, *Uli der Pächter*, 1849, *Käthi die Grossmutter*, 1847, and *Erlebnisse eines Schuldenbauers*, 1854.

Bivalves, Pelecypoda, or Lamellibranchia, one of the largest groups of molluscs, characterised by their 2 bilaterally symmetrical, limy plates or valves to the right and left of the body. The mantle secretes a covering over the whole outer surface, and this forms at the dorsal middle line an elastic membrane, called the hinge-ligament, which connects the 2 valves. The body of this mollusc is itself bilaterally symmetrical and is compressed; the head is rudimentary; the foot is usually present, when it is ploughshare-shaped, may contain some of the viscera, and has often a byssus (q.v.) gland which serves in the attachment of the animal. The nervous system consists of 3 pairs of ganglia: there are no jaws or tongue, and a short oesophagus leads to the stomach; respiration is mainly effected by means of 2 ctenidia, which are developed right and left of the elongated body. Tracts of cilia on the ctenidia create ingoing currents bringing minute plants and animals and organic debris into the mantle cavity. This food material is conveyed by other cilia to the labial palps and mouth. The heart consists of a ventricle and 2 auricles, and the reproductive organs occur in the foot, the sexes being usually distinct. B.

are found all over the world and more than 11,000 species are known to exist. They live chiefly in the sea, where they are found at all depths, but some inhabit fresh water; muddy and sandy shores are those which they prefer. Nearly all feed on vegetable matter, but the Septibranchia, a wholly marine order, are carnivorous. Many remain attached to one spot during life, others can crawl slowly, while others again swim by opening and shutting the valves of their shell. Some, e.g. *Teredo*, are boring animals, and have a damaging effect on the wood of ships. They are of use to man in various ways: some are edible, e.g. mussels, cockles, oysters; savages use the shells in place of coins; pearls are obtained from oysters, and mother-of-pearl is of value commercially; many B. are used as bait in deep-sea fishing. In the classification of Lamellibranchia zoologists are divided, but most agree in grouping them into 4 orders: Protobranchia, with gill-filaments flattened and not reflected, e.g. *Foldia*; Filibranchia, with long, reflected gill-filaments, united by ciliary junctions, e.g. mussels; Eulamellibranchia, with branchial filaments united by interfilamentar and interlamellar junctions, both vascular, e.g. clams, cockles, freshwater mussels; Septibranchia, with gills transformed into a muscular septum, e.g. *Poromya*.

Bivouac (from Ger. *Beiwache*: bet, by, and wache, watch), military term for a temporary encampment. No tents are used, and each soldier remains fully dressed, with his arms close at hand. At first only the guards had to B. while the rest of the army remained in camp, but since the time of the Fr. Revolution it has been customary for forces actually engaged or about to be engaged in conflict to B. This enables them to dispense with tents and all encumbrances, and facilitates speedy action. Temporary protections of straw and branches are erected if possible, and the position is chosen so as to afford as much protection from the weather as can be obtained. There are various plans for B.s, according to the regiment and occasion, but the chief object always is that all should be as ready for action as possible.

Biwa Lake, largest lake of Japan, in Shikaken, Honshu. It is 36 m. long, 12 m. broad, and is famous for its beauty, especially at the S. extremity. B. L. is 10 m. by water from Kyoto, drained by R. Yodo, and connected with R. Kamo by the Lake B. Canal. The water is used for drinking, as well as for the factories and mills of Kyoto.

Bixa Orellana, only species of its genus, family Bixaceae, native to the W. Indies. It is an evergreen tree, which bears seeds covered with a soft, sticky, vermilion-coloured rind, which furnishes the annatto (or annatto) of commerce, used in dyeing confectionery.

Bixby, William Herbert (1849-1928), Amer. military engineer, b. in Charlestown, Massachusetts. After graduating in 1873 at the U.S. Military Academy, he joined the Corps of Engineers and became

prof. of engineering at W. Point. In 1880 he went to France and graduated the next year from the École de Ponts et Chaussées. He became an authority on the control of floods, and, later, with the rank of general, was appointed head of the Mississippi R. Commission; also chief of the Engineers, U.S. Army, 1910-1913. In 1912 directed the raising of the U.S.S. *Maine* in Havana Harbour.

Biysk, tn in the Altay Kray of S. Siberia, starting point of a highway to Mongolia. It has engineering, food, and textile industries, and a museum with rich collections on ethnography and the hist. of the Altay Mts area. Pop. (1956) 112,000 (1926, 46,000). It was founded in 1709 as a Russian fortress.

Bizerta, seaport, fortified harbour, and naval station in Tunisia on the N. African coast of the Mediterranean Sea, 42 m. SE. from Toulon and 60 m. by rail NNW. from Tunis. B. was formerly a Fr. Protectorate. In Sept. 1955 Tunisia gained full local autonomy. B. is strongly fortified by coast batteries. The modern tn of B. (Arab. *Ben-zert*), lies N. of the canal, and S. of the Arab tn and the anct citadel. The anct name of the harbour, always the safest on the coast, was Hippo Zaritus or Diarrhytus, once a Tyrian, later a Rom., colony. It was taken by the Arabs in the 7th cent., and by Spain in 1535. Long neglect allowed the fine harbour to decay utterly till the declaration of the Fr. protectorate over Tunis in 1881, and its subsequent rise to importance as a naval station. It was occupied by the Germans during the Second World War, and was retaken by Amer. troops on 7 May 1943. Pop. 39,371 (1969 Europeans). See AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS in.

Bizet, (Alexandre César Léopold Georges (1838-75), Fr. composer, b. near Paris, the son of a teacher of singing. He studied under Halévy at the Conservatoire, and won the Prix de Rome, 1857, with a cantata, *Clevis et Clotilde*. The best of his earlier operas, *Les Pêcheurs de perles*, produced 1863, *La Jolie Fille de Perth* (after Scott), 1867, and *Djamileh*, 1872, suffered in popularity from the charge of 'Wagnerism', reserved at the time with little understanding for all music which appeared to the critics as strange or progressive; the others were neglected or remained unfinished. His music for Alphonse Daudet's drama, *L'Arlesienne*, 1872, was more successful, and has remained a standard work in the form of 2 suites for orchestra. His masterpiece, *Carmen*, 1875, written to an adaptation by Molière and Halévy of Mérimée's tale of the same name, at first scandalised Paris by its realism and did not achieve its great popularity until after B.s death on the night of its 31st performance. His symphony in C, undiscovered till recently, and written when he was 16, is now frequently performed. B. married a daughter of Halévy in 1865. See lives by Pigot, 1886 (revised ed., 1911); Bellaigue, 1891; Weissmann, 1907; D. O. Parker, 1926; Martin Cooper, 1938; Winton Dean, 1948.

Bjørregaard, Henrik Anker (1792-1842), Norwegian author. He was educ. for the law, and became a chief justice. Among his best-known books are *Blandede Digtinger*, 1829-30, and *Digtninger*, 1848; he is also the author of the Norwegian national anthem, *Sønner av Norge*, and an operetta, *Pyttelandsfest*, 1825, which took a high place in Norwegian drama.

Blarkind, Rinnur Benediktsson (1881-1946), Icelandic poetess who ranks among the major poets of her time. She wrote under the pseudonym of *Hulda*. Her poetry is of high lyrical quality and polished in form. She was country-bred and the roots of her verse are rural. She also wrote novels. See R. Book, *History of Icelandic Poets*.

Bjorneborg, see PORI.

Björnson, Bjørnstjerne (1832-1910), Norwegian dramatist, novelist, and poet, b. Osterdal, son of the pastor of Kvikne. In 1852 he graduated at the univ. of Christiania, where he took to journalism, chiefly dramatic criticism, but soon embarked on his independent literary career. His series of pastoral novels, some of the most exquisite pictures of peasant life in modern fiction, began with *Synnøve Solbakken*, 1857, and include *Arne*, 1858, *En Glad Gut* (A Happy Boy), 1860, and *Fiskerjenten* (Fisher Maiden), 1868. In 1897 he was made director of the Bergen theatre. B.'s dramatic work began with his national saga plays, the earliest being *Mellem Slagene* (Between the Battles), produced 1857, and *Halte-Hulda* (Lame Hulda), 1858. In 1860 he was given a travelling allowance by the gov., and spent from 1860 to 1863 in Italy and on the Continent. *Kong Sverre*, 1861; the great trilogy, *Sigurd Slembe* (Sigurd the Bastard), pub. 1862; *Sigurd Jorsalfar* (the Crusader), not pub. till 1872, complete his heroic and historical dramas. On his return to Norway he became manager of the theatre at Christiania. His literary reputation was now estab. His tragedy, *Maria Stuart i Skottland*, 1864, and a comedy, *De Nygifte*, 1865, were produced under his management. At this period he threw himself into politics as a strong reformer and radical. From 1868 to 1874 he was constantly travelling, not only in Norway but on the Continent, lecturing on politics, literature, art, and religion. His magnificent voice and noble presence helped his great oratorical powers. In 1870 he pub. his collection of poems, *Digte og Sange*, and his epic, *Armijot Gelline*. From 1873 to 1876 he lived abroad, and did not return to Norway till 1877. His third literary period may be dated from this time; it is marked by a complete change, and B. takes his place with Ibsen as one of the pioneers of modern drama with a direct appeal to life as it is actually lived, and with a close insight into the motives of everyday action. These plays were at first unsuccessful, though they excited much controversy; they include *En Fallit* (A Bankruptcy), 1874, *Redaktøren* (The Editor), 1874, *Kongen* (The King), 1877, *Det ny System* (The New System), 1879,

and *Geografi og Kærlighed* (Geography and Love), 1885. His symbolic play, *Over Aeneas* (Beyond our Powers), was pub. 1883, but not produced till 1899. In the political crisis over the royal veto he supported Sverdrup with his old vehemence, and for a time he lived abroad and wrote the analytical and psychological novels, dealing with heredity and education, *Det Flager i Byen og paa Havnen*, 1884, and *Paa Gud's Vej*, 1890. A collection of powerful stories (*Nye Fortællinger*) was pub. in 1894. His later work includes the plays *Paul Lange*, 1898, *Laboremus*, 1901, *Paa Størhøve*, 1904, *Dagbladet*, 1904, and *Naar den ny Vin blomstrer*, 1909. He received the Nobel prize for literature in 1903. Though an ardent nationalist he adopted a moderate policy during the rupture between Norway and Sweden. See C. Collin, *Björnson* (2 vols., 2nd ed.), 1924; G. Brandes, *Ibsen and Björnson*, 1899; O. Gjerløff, *B. Björnson*, 1932; H. Larson, *B. Björnson, A Study in Norwegian Nationalism*, 1944. There is a short memoir and full bibliography by R. F. Sharp in *Three Comedies by Björnson* (Everyman's Library).

Björnsson, Gudmundur (1864-1937), director-general of medical service in Iceland from 1906 to 1931, and the greatest 20th-cent. social reformer in that country. He was uncommonly gifted, a man of high ideals and boundless energy, far-seeing and practical, a brilliant writer and speaker, and an original poet. In 1894 he was appointed medical officer of Reykjavik and embarked upon a campaign of reforms which he relentlessly maintained until his health broke down 3 years before his death. He left no aspect of the national life untouched. The greatest visible results are those of his fight against tuberculosis, which was at one time a national scourge, and of his work for the National Life-saving Association, which he founded in 1928 and of which he was the first president.

Björnsson, Sveinn (1882-1952), Icelandic politician, diplomatist, and the first President of the Rep. of Iceland (1944-52), son of Björn Jonsson (q.v.).

Björnstjerna, Magnus Frederik, Count (1779-1847), Swedish diplomat, b. Dresden; he joined the Swedish army and fought against the French at the battle of Leipzig, and later served in Holstein. In 1814 he signed the treaty uniting Sweden and Norway. He was minister plenipotentiary to Britain, 1828-46.

Black, Adam (1784-1874), publisher, b. Edinburgh. First apprenticed to book-selling in London, he estab. in Edinburgh, 1807 (being later joined by his nephew Charles B.), the still flourishing publishing house of A. & C. Black. He was twice Lord Provost of Edinburgh, and M.P. for the city from 1856 to 1865 as a Liberal. His firm owned the *Encyclopaedia Britannica*, 1827-1901, publishing the 7th, 8th, and 9th eds.; they have also pub. *Who's Who* annually since 1897.

Black, Jeremiah Sullivan (1810-83), Amer. statesman, b. Stony Creek, Pa; self-educ., he soon became foremost at

the Bar, and in 1857 was attorney-general in Buchanan's Cabinet. He successfully contested the validity of the Californian land claims, opposed the Congressional plan for reconstructing the Confederate states after the Civil war, and was counsel for President A. Johnson and W. W. Belknap on their impeachments. There is a life by his son, C. F. Black, 1885.

Black, Joseph (1728-99), Scottish physicist, b. France. After an education in Belfast, he studied medicine and chem. under Prof. Wm Cullen, whom he succeeded in 1756 as prof. of anatomy and chem., a position he later exchanged for the chair of medicine. In 1754 he rediscovered carbon dioxide, the first gas to be discovered other than air. His experiments on heat led to a clearer distinction between heat and temp. He found that different substances had different values of what are now known as specific heat and latent heat (q.v.). In 1766 he became prof. of chem. at Edinburgh, where he d.

Black, William (1841-98), Scottish novelist, b. Glasgow. He studied art with little success, and became a journalist, writing for the *Morning Star*, for which he acted as war correspondent during the Austrian and Prussian war of 1866; he then joined the staff of the *Daily News*. His first novels made no mark, but *In Silk Attire*, 1869, and *Kilmory*, 1870, were more successful; his popularity, however, as a novelist, may be dated from *A Daughter of Helth*, 1871. B.'s special power was that of vivid description of Scottish scenery and outdoor life. His long series of novels includes *The Strange Adventures of a Phaelon*, 1872, *A Princess of Thule*, 1874, *Macleod of Dare*, 1878, *White Wings*, 1880, *Shandon Bells*, 1883, *White Heather*, 1885, *In Far Lochaber*, 1888, *Highland Cousins*, 1894, and *Wild Eelin*, 1898. A light-house was built to his memory at Duart Point, Sound of Mull, in 1901. See life by Wemyss Reid, 1902.

Black, see PIGMENTS.

Black Acts, popular name for various enactments: 1. The statutes of the Scottish Parliament, 1424-1594, which were printed in black letter.

2. The Scottish Acts of 1584, passed at the instigation of James VI, to suppress Presbyterianism and re-establish Episcopacy. These acts declared the supremacy of the king, overthrew the jurisdiction of the kirk; the functions of the presbyteries and assembly were handed over to the bishops; it was made treason to attack episcopacy. Abrogated in 1592.

3. An Act of 1722, directed against gangs of men with blackened faces who were responsible for an outbreak of robberies. The Act, which made it a felony to blacken the face, was repealed in 1827.

Black Agnes, sobriquet given on account of her complexion to Agnes, Countess of Dunbar (c. 1312-69), who defended Dunbar Castle against the English in 1338, for 5 months, until reinforcements having reached her by sea, the English withdrew.

T. Fall

BLACK-AND-TAN TERRIER

Black-and-Tan Terrier, original type from which have sprung the Welsh, Irish, and Airedale terriers. The earliest recognisable B.-and-T. T. is portrayed in an illuminated MS. book of hours of the 15th cent. Later they were known as Eng. terriers, and also as Manchester terriers; but there have been many cross-breeds. It is generally accepted that the pure breed had its origin in and around Manchester. Dog shows have conducted to the refinement of the original breed down to the quality of a mere pet, though it is still useful as a rat catcher, besides having great intelligence. The head should be long, flat, narrow, and wedge-shaped; eyes, very small, sparkling, and dark; nose, black; erect or semi-erect ears; neck long, and tapering from the shoulders to the head, with sloping shoulders; narrow and deep chest; legs quite straight; feet more inclined to be cat- than hare-footed; tail thick where it joins the body and tapering to a point; and smooth, short, and glossy coat. In colour the dog should be jet black and rich mahogany tan on the head; the muzzle should be tanned to the nose, which, with the nasal bone, is jet black; forelegs should be half tanned, and the hind legs tanned on the inside, but not on the outside. The toy breed, the only B.-and-T. T. recognised by the Kennel Club, retains much of the quality of the It. greyhound. A dog so small has been known as could stand on the palm of one's hand. The usual weights are: for the large or normal breed, 16-20 lb.; for toy breeds, not exceeding 7 lb.

'Black and White', illustrated weekly, founded in 1891 by Charles Norris Williamson. Beginning as an artistic journal, it became one of the pioneers in photographic illustration of current events, and pub. both drawings and photographs dealing with news and interesting personalities. The literary matter included short illustrated stories and articles on politics, society, sport, and professional subjects. In 1912 it was incorporated with the *Sphere* (q.v.).

Black Ape (*Cynopithecus niger*), species of monkey found in Celebes, related to the macaques. Its hair and skin are coal-black, and it has a crest on the head.

Black Art, see MAGIC.

Black Assizes, name given to certain

assizes at which a virulent epidemic of gaol fever, or typhus, broke out; particularly to one which occurred at the close of the Oxford assizes, July 1577, of which more than 300 persons *d.*, including the high sheriff and many officials of the court.

Black-band Ironstone, in mining and metallurgy, an iron-ore siderite, found chiefly in Scotland; it is a carbonate of iron, mixed with a large proportion of coal or bituminous matter. It is of intensely black colour, and was highly prized for its ease in smelting.

Black Bass, fish, belonging to the sun-fish family, Centrarchidae, of the genus *Micropterus*. It is akin to the perch, has an oblong body, with dorsal fin low and anal fin shorter than the soft part of the dorsal. It is essentially a N. Amer. fish, and the 2 species are *M. salmonides*, which is found from Canada to the Great Lakes and as far S. as Texas; and the small-mouthed *M. dolomieu*, which is found from the Great Lakes to Arkansas and N. and S. Carolina. Other names given to one or both species are trout, in the S., and in the N., chub, Welshman, and jumper.

Black Bear Cat, see BINTURONG.

Black Beetle, see BLATTIDAE.

Black Book: 1. Of the Admiralty, contains, under the title of 'Laws of Oleron,' the earliest collection of 'sea laws,' dating back to the 14th cent. It was first ed. by Sir Travers Twiss, 1871-6, and embraces the various maritime laws and customs on which the judge in the Admiralty Court bases his decisions.

2. Of the Exchequer, is a meagre record of the royal household in Henry II's reign.

3. Of the Household, is a similar record to (2), compiled in Edward IV's reign.

4. The term B. B. was also applied to the reports, the accusations of which are for the most part uncorroborated or exaggerated, presented to Parliament in 1536, upon which were based the laws for the dissolution of the monasteries.

Black-boy, see GRASS-TREE.

Black Bryony, see TAMUS.

Black Buck, Indian antelope, *Antelope cervicapra*. Has large ringed spiral horns. Blackish brown coat, white beneath.

Black Bulb Thermometer, maximum thermometer, of which the bulb and part of the stem are coated with lampblack, and which is enclosed in an evacuated cylinder. It thus provides a delicate instrument for the measurement of temp. by radiation only, and if placed in open sunshine and compared with the readings of an accurate thermometer in the shade, gives an indication of the difference of temp. due to direct solar radiation.

Black Cap, piece of black cloth worn over the wig by judges in Great Britain when sentence of death is to be delivered.

Black-capped Titmouse (*Pensthes atricapillus*), bird of the family Paridae, found in Europe, N. Asia, and N. America. It is known as the chickadee in N. America. It is small but strongly built, has a sharp black bill, and in colour varies between black, white, grey, and yellowish-grey. The Brit. marsh titmouse (*P.*

palustris) is sometimes called by this name.

Black Cocktail, see DEVIL'S COACH-HORSE.

Black Country, The term used to denote the mining and manufacturing dist. situated partly in the S. of Staffs, and partly in Warwickshire. It is so named from the numerous factories and coal-mines around. The manuf. of iron in all its branches is carried on, and the chief smelting centres are Wolverhampton, Dudley, Wednesbury, W. Bromwich, Walsall, Bilston, and Tipton, while Birmingham is the central market.

Black Death, name of a pestilence which was pandemic in the 14th cent. Though there were outbreaks in 1361-2 and 1369, its worst visitation was in 1348. Beginning in China—it was probably a form of the oriental plague—it reached the coast of Italy through Constantinople, and thence spread all over Europe. Its symptoms were blood-spitting, putrid pulmonary inflammation, and black spots and tumours on thighs and arms. The victim usually succumbed a few days after the appearance of the boils. The death-rate, though phenomenal, cannot be estimated, there being no scientific record of births and deaths. It is believed that 37,000,000 perished in the E., whilst in England alone something like 1,500,000, that is, between one-third and one-half of the entire pop., were mortally affected. It is said that the advent of the contagion was preceded by ominous portents—famine, drought, earthquake, dense fog, and seasonal disturbance. As in the plague at Athens, the ravages of the scourge led to outbursts of religious frenzy, but more often to demoralisation and debauchery. Mothers deserted their stricken children, and the sick were left to die and rot in public highways. The enormous mortality is a landmark in Eng. economic hist. Laws were futile to interfere with the rapid rise in wages, engendered by the scarcity of labour, whilst Wat Tyler's rebellion was only one outward indication of the far-reaching and inevitable changes that resulted in the relations between landlord and peasant.

Black Eagle, Order of the, instituted by the elector of Brandenburg on the occasion of his coronation as Frederick I of Prussia, in 1701. Its badge was a blue Maltese cross, and in the angles was a crowned B. E. It was conferred only on persons of noble birth.

Black Earth (Russian *chernozém*), rich and fertile black soil, containing a proportion of humus, found stretching in a belt across Russia from the Carpathians and the Black Sea to the Altay Mts, and in small is. further E. Its normal depth is about 1 ft., but in some places it is over 3 ft. deep.

Black Fish: 1. *Dallia pectoralis*, fish found in Alaska, characterised by the dorsal fin being far back and opposed to the anal fin—in the latter way resembling a pike to which it is allied. The scales are very small and embedded in the skin. It is a fresh-water fish, and is used for

food by the people in some parts of Alaska.

2. *Centrolophus niger*, fish of the order Stromateidae. Something like a perch, it has small cycloid scales which are deciduous. The species of this family are widely distributed, and this particular species has been found on the coasts of England. The name is also given to other varieties of dark-coloured fishes, particularly the tautog (q.v.).

Black Flux, see FLUX.

Black Forest (Ger. Schwarzwald), thickly wooded mountainous dist. of SW. Germany, in the Land of Baden-Württemberg (q.v.), running on the E. side of the valley of the Rhine (q.v.), which bounds it from Switzerland on the S. On the N. it extends to the Neckar (q.v.) valley. Its area is about 1800 sq. m., its length 100 m., greatest breadth 36 m. The S. portion is the wildest and most mountainous, containing the highest peaks: Feldberg, 4898 ft.; Herzogenhorn, 4600 ft.; Blössling, 4260 ft. The Kaiserstuhl (Emperor's Chair) is an independent group of volcanic origin, 10 m. long, 5 m. broad, the highest point being 1760 ft. The valley of the Kinzig divides the S. from the lower N. portion. The forests of the dist. consist mainly of spruce, silver fir, Scotch pine, on the higher slopes, with birches, beech, and oak below. The former large trade in logs floated down the Rhine decreased when industries were set up in the dist. dependent on the supply of wood locally for the manuf. of wood-pulp, making of toys, wooden clocks, musical instruments, etc. There are many mineral springs, those of Baden-Baden (q.v.) being the best known. The prin. tns. Freiburg and Offenburg (qq.v.), lie along the W. border. As a touring resort the B. F. has long been famous for its beautiful valleys, picturesque wooded heights, and 1st and forest lakes.

Black Friars, see DOMINIC, Sr.

Black Friday, 6 Dec. 1745, the day when the news that the Young Pretender had arrived at Derby was known in London. In the U.S.A. this term is (1) applied to 24 Sept. 1869. For some time during the summer of that year the balance of trade had been going against the U.S.A. and gold was being drained out of the country. The U.S. Treasury therefore discontinued the sale of gold in its possession. Two Wall Street speculators, Jay Gould and James Fiske, conceived the idea of cornering the visible gold supply in the U.S.A. They were so successful that they pushed it up to a very high price. The gov. ended their grip on things when it sent gold into the open stock market in large quantities to buy up U.S. bonds. A big stock exchange smash resulted. (2) There was another B. F. on the New York stock exchange on 19 Sept. 1873. In England, 11 May 1866, the date of suspension of payments by Overend, Gurney & Co., bankers, is also known as B. F.

Black Hand (It. *Mafia*), secret society which originated in Sicily and later was active in the U.S.A. after some of its members arrived there in the late 19th

cent. They practised blackmail and extortion. For sev. years the Black Handers escaped detection owing to the fact that they chose their victims from among the poorer inhab. of the It. quarter of New York, who were too intimidated to take action. It was not until May 1914 that the police were afforded sufficient clues to effect an arrest of the B. H. gang on a large scale. Soon after this the gang was entirely dispersed. The Black Handers signed their letters of threat with the picture of a black hand clutching a dagger.

Black Hawk, Amer. Indian chief, who took part in the war of 1812 against the Americans. He was finally defeated in the Black Hawk war, 1832, after many times refusing to agree to treaties made to the effect that his tribes should relinquish their lands. After being released from Fortress Monroe, he settled in Iowa, where he d. in 1870.

Black-headed Thistle-finch, see SISKIN.

Black Hellebore, see CHRISTMAS ROSE.

Black Hills, mt system SW. of S. Dakota, and NE. of Wyoming, U.S.A. The area covered by the hills is about 6000 sq. m., and the highest point, Harney Peak, attains an altitude of 7242 ft. Large forests of pine and other coniferous trees cover their slopes. Among the minerals deposited there are gold, carboniferous limestone of good quality, and lead. The B. H. are enclosed by Belle Fourche and Cheyenne R.s. The fertility of the valleys renders dairy farming most successful.

Black Hole of Calcutta, popular name given to an atrocity perpetrated by Suraj-ud-Dowlah, nawab of Bengal. When he sacked Calcutta and seized Fort William in 1756, most of the Eng. residents escaped, but some few, under the command of Holwell, remained, and were obliged to surrender. At his command they were all confined in a guard chamber, 22 ft by 14 ft, and about 18 ft high, with only 2 small windows high up. It was a stifling summer's night, and next morning 23 alone of the 146 prisoners staggered out, or were carried out, alive. The monument commemorating the tragedy has since been removed.

Black Hundreds, name given by their opponents to the extreme right-wing elements in Russia at the beginning of the 20th cent. They stood for nationalism, absolutism, anti-Semitism, and resorted to pogroms against Jews and students. During the revolution of 1905 (q.v.) B. H. formed organisations of a Fascist type, e.g. The Union of the Russian People.

Black Isle, peninsula on the E. of Ross and Cromarty, Scotland; it lies between Cromarty Firth, N., and Beaulieu and Inverness Firths, S. and SE.; on the NE. and E. it projects into Moray Firth. It has a coast-line of 52 m. The Highland railway runs from Muir of Ord to Fortrose. The prin. tns. are Cromarty and Fortrose. The soil is fertile: the highest point of the Mulbuie ridge is 838 ft.

Black-lead, Plumbago, or Graphite, mineral crystallising in the hexagonal system. It is usually found in six-sided

tabular crystals, black or dark steel-grey in colour, greasy to the touch, and with a hardness of 1. Chemically it consists of carbon with impurities of iron sesquioxide and clay. It resists chemical change more than other forms of carbon, fusing only in the electric arc, and is unaltered by most acids. It is a good conductor of electricity, and is so soft that it marks anything it touches; hence its use for the manuf. of writing pencils and as a polish for ironwork. Its greasy nature makes it an excellent dry lubricant for the breech-locks of rifles, etc., where a volatile lubricant is not desirable. Graphite is found in beds and embedded masses, scales, or leaflets in granite, gneiss, mica schist, and crystalline limestone. It occurs amongst slate in Cumberland and gneiss in Scotland; quantities are exported from Ceylon, and that found at Irkutsk in E. Siberia is probably the best in the world. America is supplied by beds at Ticonderoga in N. Carolina, and at Sonora, Mexico. It is artificially produced in iron furnaces and is produced electrically from anthracite for the manuf. of black-lead pencils.

Black Letter, name given to type used in the earliest printed books, sometimes as equivalent term to 'Gothic,' sometimes confined to the early Eng. types used by Caxton, also styled 'English type.' The words following are printed in Black letter, which is used in ornamental printing. Early types were copied, from the handwriting in use at the time, and thus the Ger. script was adopted. Gothic or B. L. was used extensively all over Europe in various forms and modifications. It was succeeded by the It. or Rom. type, founded on the purer and simpler It. or Rom. script of the 12th cent., but it long remained in use for printing Bibles, law-books, proclamations, and the like. B. L., or rather a modification, was the national Ger. type for printing, but since the Second World War it has given place to the roman type (or 'white letter,' as it was called). In old church calendars the greater festivals and saints' days were marked by being printed in red ('red-letter days'), the lesser days were printed in black ('black-letter days'), hence the term came to be applied to unlucky, inauspicious days.

Black List: 1. The name given to a printed list issued to subscribers by various trade protection societies, which shows the names of those whose credit is bad, thus serving as a warning against allowing them to incur fresh debts. Such lists are made up from judicial and other sources, and include the records of bankruptcies, arrangements or compositions with creditors, unsatisfied judgments for debts, bills of sale, liquidations, warrants of attorney, dissolution of partnership, and all matters of public record that affect the financial standing of the parties named in the list.

2. The list of individuals or firms who shall not be supplied or dealt with by members of a trade association in order to enforce prices or other conditions of trading. B. L.'s were used to enforce

resale price maintenance before the 1956 Restrictive Trade Practices Act.

Black Mountain, collective name of a group of hills lying to the W. of the Brecon Beacons on the border of Breconshire and Carmarthenshire, of which the highest is Carmarthen Van (Fan Fael), 2632 ft.

Black Mountains: 1. Group of mts W. of N. Carolina, U.S.A. Most of the area is situated in Yancey and Buncombe cos. They are the highest mts (6684 ft) of the Appalachian system.

2. A fine range of hills on the borders of Breconshire, Herefordshire, and Monmouthshire, of which the highest is Waun Fach (2660 ft).

3. See SCHWARZGEBIRGE.

Black Prince, The (1330-76), name given to Edward, Prince of Wales, eldest son of Edward III. He was b. Woodstock; made Earl of Chester, 1333. Duke of Cornwall, 1337, created Prince of Wales 1343. His military career began with the Fr. campaign of 1346, and he distinguished himself at Crécy and at the siege of Calais. He was one of the original knights of the Garter and was present at the naval battle off Winchelsea with the Spaniards in 1350. In 1355, as lieutenant for his father in Gascony, he reconquered much ter., and made many marauding expeditions, and in 1356 won the victory of Poitiers, showing himself a master of tactics, and returning in triumph to London with King John his prisoner. He took part in the expedition to France in 1359 which ended in the peace of Calais, 1360. In 1361 he married Joan, Countess of Kent, his cousin, and in 1362 was made Duke of Aquitaine, where he ruled as a vassal sovereign. In 1367 he lent his aid to Pedro the Cruel, deposed King of Castile, led his army into Spain, and defeated the usurper Henry of Trastamare and Bertrand du Guesclin at Najera. The expedition ruined him in health and resources, and his own vassal barons rose in rebellion against him. His dominions shrank, and after the cruel and indiscriminate sack of Limoges, 1370, he returned to England, resigning his dukedom in 1372. He was buried in Canterbury Cathedral in the great tomb with his arms above it. His name of Black Prince cannot be traced earlier than the 16th cent.; tradition makes it due to his black armour. His contemporary reputation for chivalry cannot be sustained after c. 1360 but he had great qualities as a military leader. See R. P. Dunn-Pattison, *The Black Prince*, 1910.

'**Black Prince**,' the second Eng. iron-clad (9210 tons, 13.6 knots, 40 guns, heaviest 68-pounders), was launched in 1861. Another *B. P.*, armoured cruiser (13,550 tons, 22.3 knots), was launched in 1904 by the Thames Shipbuilding Co., and was sunk in the battle of Jutland (q.v.). The first *B. P.* in the Eng. Navy served under Prince Rupert, and was driven ashore by Blake.

Black River, riv. of New York, U.S.A. It forms the boundary between the cos. of Hamilton and Herkimer, and empties itself in Lake Ontario. Its length is 130 m.

Black Rod, official of the Brit. House of Lords, the full style being the 'Gentleman Usher of the Black Rod.' The name is derived from his staff, the insignia of his office, an ebony rod topped with a golden lion. The office dates from Henry VIII. B. R. is also the first usher of the court and the kingdom, and as such takes part in all court and other ceremonials; he is also the prin. usher of the order of the Garter, and as such his duties include the guarding of the door at a chapter of the knights. His duties as an official of the House of Lords are the most important; they correspond to those of the sergeant at arms in the House of Commons. He maintains order and has the power to arrest a peer for breach of privilege of the House or other offences noticed by the House. He is the official messenger from that House to the House of Commons. These duties are performed personally or by his deputy, the 'Yeoman Usher of the Black Rod.' Certain formalities and ceremonies are observed, interesting as dating from the attempt of Charles I to arrest the 5 members in 1642 and as signifying the right of the Lower House to freedom of debate and security from interruption. When the House of Commons is summoned to the House of Lords to hear the queen's speech from the throne or to attend at the giving of the royal assent to bills, B. R. has to summon their attendance; at his approach the doors are closed upon him: he knocks thrice, and announces his presence. On his admittance he addresses the Speaker, and if the queen is present in person, the message is that 'the queen commands the presence of the honourable House'; if she is represented by commissioners, then the word used is 'desires.' The office of B. R. is held by a distinguished service officer; the salary is £1700 a year. See HOUSE OF LORDS.

Black Scab, wart disease in potatoes, is due to a fungus, *Synchytrium endobioticum*. It causes excrescences which become black. It is avoided by growing immune varieties, of which there are many. An outbreak of B. S. must be notified to the Ministry of Agriculture.

Black Sea, or **Euxine** (anc. Pontus Euxinus, Turkish Kara Dengiz), inland sea situated between E. Europe and Asia Minor, bounded on the N. and E. by Russia, on the W. by Rumania, Bulgaria, and Turkey, on the S. by Turkey. Its greatest length is about 720 m., and the greatest breadth 380 m. The total area is about 170,000 sq. m. By the strait of Kerch it communicates with the sea of Azov on the N., and by the Bosphorus, sea of Marmora, and the Dardanelles with the Mediterranean. On the NE., E., and SW. the coast is high, and flat on the N. and NW. Its maximum depth reaches the prodigious figure of over 7000 ft, the 100-fathom line running close to the shores, except on the E. and W. of the Crimean peninsula. The salinity of the water is on the average only half that of the ocean, a fact due to the enormous body of fresh water poured in by the large rivers, such as the Danube, Dniester, Bug,

Dnieper, Kuban, Rion, Kizil-Irmak, and Sakaria. There is a strong surface-flow out through the Bosphorus, and a deeper inward flow from the same direction. The strong currents, sudden and frequent storms, fogs, and occasional drift-ice sometimes render navigation difficult in winter. There is no perceptible tide. The deeper waters are apparently devoid of organic life, the higher forms not being known to exist below 100 fathoms. There are no is. of importance. The chief ports on the sea are Odessa, Nikolayev, Novorossiysk, Batumi, and Poti in Russia, Constanta in Rumania, Varna and Burgas in Bulgaria, and Trebizond in Turkey. By the treaty of Paris (1856) the sea was closed to all ships of war. This provision, however, was abrogated in 1871, and Russia and Turkey both have fleets in its waters. The question of naval forces in the B. S. naturally formed part of the discussions at the conclusion of the First World War, for whatever conditions were laid down by the victors as to the status of the Dardanelles and the Bosphorus *ipso facto* included the B. S. In the armistice signed at Mudros (30 Oct. 1918), one of the chief conditions was that the straits should be open to the allied fleets. Thus Great Britain made a complete reversal of her former policy, which for a century had aimed at closing the straits to all nations' warships except Turkish. The result of this change was that the Brit. Navy secured the legal right to enter the B. S. when it intervened in the struggle between the Russian Whites and Reds in 1919 and 1920. At the same time the policy of the present rulers of Russia is a reversal of that of the old Russian Empire, and the U.S.S.R. now seeks to keep the B. S. open to only the warships of those powers with ter. on its littoral. For military operations at the B. S. ports in the Second World War see EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Black Shirts, see FASCISM.

Black Snake (*Coluber constrictor*), ophidian reptile of the family Colubridae. The name was given to it long ago by Mark Catesby (q.v.). It is a slender snake, harmless and non-poisonous. The male is smaller than the female; the largest specimen does not exceed 6 ft in length. The colour is usually a dark shining black above, slate-grey beneath, with white markings, and a black tongue, but some of these animals are pale green and yellow, and are called green racers. The snake can swim, move swiftly on the ground, and climb lofty trees. Its food consists of frogs, toads, mice, smaller snakes, insects, birds, and eggs. It inhabits both N. and S. America.

Black Thursday, 6 Feb. 1851, the date of a bush fire of unprecedented magnitude in Victoria, Australia, causing enormous damage and loss of farming stock.

Black Varnish, *Melanorrhoea usitata*, large tree of the cashew nut family (Anacardiaceae). Native of Burma and Malaya and said to reach a height of 80-100 ft. Large spreading head, broad leathery leaves; its wood is hard, black,

and heavy. It has a white sap, that is tapped, and becomes black on exposure to the air, and is used for lacquering. Also called Pegu lignum.

Black Watch, The (Royal Highland Regiment), name of the first of the Highland regiments, so called because its uniform was a dark tartan, whilst the regular soldiers wore red. The regiment was formed from independent companies of Highlanders for service in Scotland in the 17th cent., and later became the 42nd Foot. In the year of its creation, John, 2nd Earl of Atholl, was granted a commission to raise a body of men to keep the peace in the Highlands. Three companies only existed from 1704 to the Union, these being under the direct control of the Treasury as regards pay, uniform, and fire-arms. But in 1729 the number was raised to 6, 3 of 100 men each, and the remaining of 70. Drawn chiefly from the Whig clans of the Campbells, Munros, etc., the B. W. enforced the Disarming Act under George II, and effectually helped to prevent any further national risings. In 1743 this regiment, now enrolled as the 42nd, served in Flanders, fighting at Fontenoy, etc., and later served for many years in Canada, W. Indies, and during the Amer. War of Independence. Under Wellington it served throughout the Peninsular war and at Waterloo. The Crimea, Indian Mutiny, and 1882 Egyptian campaigns are also among its honours. In 1756 its 2nd Batt. became the 73rd Foot, whose early service was in India. It was at Waterloo, after which it served in the E. Indies, Mediterranean, Canada, Cape Colony, S. America, and Indian Mutiny. In 1881 the 42nd and 73rd were again united to form the B. W., which served with distinction in the S. African war, 1899-1902. A monument erected by the officers in Dunkeld Cathedral commemorates all who had died in battle up to the settlement of the Indian Mutiny in 1859. During the First World War 25 of its battalions served overseas in France, Flanders, Macedonia, Palestine, and Mesopotamia. In the Second World War the B. W. fought in France and the Low Countries, in Italy, and in the Far East. They were among the *elite* Brit. troops pitted against the best Ger. troops in the great battles of the winter of 1944-1945 for the Rhenish plain N. of Cologne. As part of the 51st (Highland) Div. of the Eighth Army (q.v.), they fought in N. Africa and Sicily, and were in the very hard fighting around Corradini and Homs in Sicily later in the summer of 1943. Earlier, they took part in the fierce fighting in the battle of Akarat. In Burma other units formed part of the famous Chindit force of Maj.-Gen. Wingate.

Blackberry, *Rubus*, sub-genus of Rosaceae which has sev. species in Britain. The plant is a hook-climber, and frequently roots where the branches touch the earth, thus forming a new plant. The fruit grows on a flattened thalamus with a conical protuberance on which are borne many one-seeded drupelets; it therefore consists of an etaerio of drupes,

BLACKBERRY

and is not properly a berry. It is also commonly called bramble. *See also* DEWBERRY.

Blackbird (*Turdus merula*), name of a common bird, found all over Europe, in Asia, and N. Africa. It has been acclimatised in New Zealand. In Great Britain it is a resident, but large numbers of emigrants also come in the autumn. The male is entirely black, with bright yellow beak, taking a deeper and more vivid colour in the breeding season. The female is of a dusky brown, fading to a paler hue beneath. The nest, built in thickets or creeper-clad trees, is of grass and moss, and plastered with mud; the eggs, 4 to 6 in number, are blue with brown specks. The B. is a fine song-bird, its notes being clear and loud, but it has not the range or modulations of the thrush. Destructive to fruit and seeds, it also feeds largely on worms, grubs, snails, and is useful in keeping down garden pests. Its O.E. name 'ousel,' appears in the name of a variant, the ring-ousel, so called from its white neck marks. It is a large moorland B., a migrant from Africa. *See* RING OUZEL.

Blackbirds, Field of (the Kosovo Polje), plain in Serbia, Yugoslavia. It is in the region of Kosovo-Metohija (q.v.), and was the scene of 2 great battles: (1) the Turkish victory of 1389 (*see* SERBIA, *History*); (2) the defeat of Janos Hunyadi (q.v.) by the Turks in 1448.

Blackburn, Colin, Baron (1813-96), judge, b. Selkirk. In 1838 he was called to the Bar, and he became a judge in the court of queen's bench in 1859. In 1876 he was made a life peer and a lord of appeal. His *Contract of Sales* was pub. in 1845.

Blackburn, municipal co., and parl. bor. of Lancs, England, 24½ m. NNW. of Manchester, 9 m. E. of Preston. It lies on the brink of the Ribbles Valley, and on the first eminence between the W. coast and the Pennines, the surrounding hills being 700 to 900 ft high. B. is the prin.

cotton-weaving centre of Lancs, and, despite the general downward trend of the industry during the last 25 years, it still maintains an important position in the textile world. It is true that whilst cotton weaving was formerly the staple trade of B. the number of cotton mills now operative represents only one-half of the number in 1920; but many persons redundant to the cotton trade have found employment in the manuf. of slippers, electrical and wireless components, fancy leather goods, and in dye-works, and the making up of cotton garments. The manuf. of textile machinery and utensils, and other types of engineering still are an important part of the industrial activity of the tn. There are good rail and road facilities to all parts. James Hargreaves, the inventor of the spinning jenny, was b. at Stand Hill on the outskirts of B., and his employer, Robert Peel, grandfather of the Prime Minister, Sir Robert Peel, greatly fostered the growth of the cotton industry. Viscount Morley was another famous native of B. The tn was incorporated in 1851, and made a co. bor. in 1888. There are fine parks, the prin. being Queen's Park, Corporation Park, and Roo Lee Park. St Mary's Church, a very anct foundation, although the present building dates only from 1826, forms the nave of the cathedral of the B. diocese, which was created in 1927, and is a fine representative of modern Gothic. Among other notable public buildings are the fine public halls in Northgate, the new sessions house and police courts adjoining, and the public library, all in close proximity to the tn hall, a noble building in the 16. Renaissance style. Historical places near by are Hoghton Tower, Clitheroe Castle, Whalley Abbey, and Stonyhurst College at Hurst Green. It is divided into 2 parl. constituencies, B. E. and B. W., each returning 1 member. Pop. 111,220.

Blackburne, Francis (1782-1867), lord chancellor of Ireland, b. co. Meath; educ. at Trinity College, Dublin; called to the Eng. Bar, 1805, and to the Irish Bar, 1822, when he was employed in repressing disorder in Limerick under the Insurrection Act. He was attorney-general for Ireland, 1830 and 1841; master of the rolls, 1842; chief justice of the queen's bench, 1846 (in this capacity he presided at the trial of Wm Smith O'Brien, q.v.); and lord chancellor, 1852; in 1856 he was made a lord justice of appeal. In 1866 he again became lord chancellor.

Blackburne, Lancelot (1658-1743), Eng. prelate. He was educ. at Westminster School, afterwards entering Christ Church, Oxford, in 1676. His rise in the church was due originally to Bishop Trelawney. He became Bishop of Exeter in 1717, and Archbishop of York in 1724. His disposition was gay, and he seems to have been noted as a wit. A certain freedom from the restraint usually observed by the clergy caused many fables to be circulated regarding his "licentiousness."

Blackburn's Pendulum, see PENDULUM.

Blackcap (*Sylvia atricapilla*), bird of

the family Sylviidae or Warblers. The general colour of the bird is an ashen-grey, turning to an olive-brown above and pale or whitish-grey below. The cock bird alone has the jet-black cap which gives the name, the hen's head-covering being brown. It is one of the sweetest of song-birds. It leaves Great Britain at the end of summer.

Blackcock and **Heathcock**, names applied to both sexes of the black grouse, *Lyrurus tetrix*, though greyhen is a more suitable designation of the female. They are allied to the quail, partridge, and capercaillie, and are common in N. Scotland. The food consists of buds, young shoots, berries, and insects. The plumage of the male is very beautiful, the tail is lyrate, and above the eyes is a piece of bright red skin which becomes more intense during the pairing season. The bird is polygamous, and in the spring the males attract the females by curious crowings and noises as of the whetting of a scythe.

E.N.A.

A YOUNG BLACKFOOT INDIAN

Blackfoot, Eng. name given to a tribe properly called Siksika—they were so called because their moccasins were stained or dyed black. They are of Algonquian stock, and were one of the largest and fiercest tribes of the plains. They suffered severely from smallpox, and from an estimated 15,000 in 1780 they have dwindled to about 6000 in Montana and Saskatchewan.

Blackfriars Bridge, bridge over the Thames, London, crossing the riv. approximately at the point where the R. Fleet once debouched into the Thames. The first B. B. was begun in 1760, completed in 1770, and removed in 1860. The present was begun in 1885, and opened in 1869, from designs by J. Cubitt. It was widened for the London County Council electric tramway along the Embankment to Westminster Bridge in 1907-9. The name commemorates the monastery of the Blackfriars or Dominicans on the N. side of the Thames at this point.

Blackfriars Theatre, see THEATRE.

Blackheath, common and residential dist. in SE. London, the former lying mostly in the bor. of Lewisham. Once extending about 4 miles between Lewisham and Woolwich, it is now only about 70 ac. owing to building encroachments. Greenwich Park, on its N., once formed part of it. The heath, lying across the main Dover road, was the scene of the rebellious gatherings under Wat Tyler (1381) and Jack Cade (1450). Lord Audley's Cornish rebellion of 1497 against Henry VII was suppressed here, and here the people met Henry V after Agincourt and Charles II at the Restoration. It was also the resort of highwaymen. Golf was probably played on B. earlier than elsewhere in England, and the Royal B. Golf Club, founded 1608, is the oldest golf club. Rectory Field on B. is the ground of the B. Rugby Football Club and a ground of the Kent County Cricket Club. On the SE. is Morden College, founded by Sir John Morden in 1695 as a pensionary for Turkey merchants. The pleasant residential area of B. at the SE. is in the bor. of Greenwich.

Blackie, John (1782-1874), publisher, b. Glasgow, Scotland. At 12 years of age he was apprenticed to a weaver in Glasgow and later worked for John Duncan, whose daughter he married. He left weaving in 1805 to work for W. D. & A. Brownlie, publishers, and, on the retirement of the Brownlies in 1807, acquired their business; this subsequently, 1809, became the firm which still flourishes under the name of Blackie & Son Ltd.

Blackie, John Stuart (1809-95), Scottish writer and scholar, b. Glasgow. He was educ. at Marischal College, Aberdeen, Edinburgh Univ. (1825-6), and in Germany. He was prof. first at Aberdeen, and then at Edinburgh Univ., a chair he held till 1882. He took a prominent part in educational reform and the remodelling of Scottish univs. His literary output was great, and he was also instrumental in the founding of a professorship of Celtic at Edinburgh Univ. The grievances of the Highland crofters, and all questions of Scottish nationality and customs, drew his enthusiastic support. See A. M. Stoddart, *J. S. Blackie*, 1895.

Blacking, mixture applied to leather, especially that of boots and shoes, in order to produce a polished surface. It is made from various fats, using nitrobenzene to cover any odour, in conjunction with a suitable colouring material such as lampblack.

Blacking Plants (*Hibiscus rosa sinensis*), shrub of about 6-8 ft, family Malvaceae, native of China; a showy plant in hot-houses, having single or double red and yellow flowers. The red, when bruised, turn black, and are used for colouring eyebrows and blacking shoes.

Blackley, residential dist. of Manchester (q.v.).

Blacklock, Thomas (1721-81), Scottish poet, b. Annan, Dumfriesshire, son of a bricklayer. He lost his sight through smallpox when 6 months old. Some early poems pub. in 1746 led to his education at Edinburgh, where he studied divinity. He was an early admirer and friend of Burns, and persuaded him to abandon his leaving Scotland for the W. Indies. He supported himself by taking pupils in Edinburgh. See H. Mackenzie's ed. of poems with life, 1793.

Blackmail once referred to rent paid in labour, corn, or baser metal (*reditus nigri*) so called to distinguish it from silver money (*maillies blanches*). It is now applied to unlawful extortion of money by menaces. In Eng. law it is loosely used to refer to certain offences under the Larceny Act, 1916. These may be broadly defined as: (a) to threaten to accuse a person (living or dead) of certain specified crimes with intent to extort any property; (b) to demand money or property with menaces; (c) to publish or propose to refrain from publishing, any matter about a person (living or dead) with intent to extort property or an office of profit or trust.

Blackmore, Sir Richard (c. 1650-1729), physician and author, b. Corsham, Wilts. He was first a schoolmaster, then studied medicine and practised in London. Supporting the revolution he was knighted 1697, and became court physician to William III and to Queen Anne. He was a writer of dull and turgid epics, which merit the ridicule of Pope's *Dunciad*, though they were praised by Addison; and one, *Creation*, 1712, expounding Locke's philosophy as against the infidelity of Hobbes, was thought worthy by Johnson of appearing in the booksellers' collection of the Brit. poets to which Johnson supplied the lives.

Blackmore, Richard Doddridge (1825-1900), novelist, b. Longworth, Berks. Educ. at Bundell's School and Exeter College, Oxford, he was called to the Bar and practised till he had a breakdown in health. He then combined literary work and market-gardening at Teddington. His poems were not successful, but his first novel, *Clara Vaughan*, 1864, was at once welcomed. In 1869 was pub. his best work, *Lorna Doone*, a romantic story set in the scenery of Exmoor, which gained the author a lasting popularity. His other novels include *Cradock Nowell*, 1866, *The Maid of Sker*, 1872, *Cripps the Carrier*, 1876, *Christowell*, 1880, *Springhaven*, 1887, *Perlycross*, 1894, *Tales from the Telling House*, 1896, and *Daniel*, 1897. See life by W. H. Dunn, 1956.

Blackmur, Richard Palmer (1904-). Amer. poet and critic, b. Springfield, Massachusetts. From 1936 to 1938 he

held a Guggenheim fellowship, and in 1940 he joined the staff of Princeton, where he became prof. of English in 1951. He pub. three vols. of poems: *From Jordan's Delight*, 1937, *Second World*, 1942, and *The Good European*, 1947. His critical works include a collection of essays, *The Expanse of Greatness*, 1940, *Henry James* (a study), 1941, *Language as Gesture*, 1952, and *The Lion and the Honeycomb*, 1955.

Blackpool, municipal, co., and parl. bor. of Lancs, England, situated on the W. coast, 46 m. N. of Liverpool and 8 m. SW. of Fleetwood, on the Irish Sea, between the mouth of the Ribble and Morecambe Bay. It is one of the most popular holiday resorts in the world—catering for 7,000,000 visitors in the course of a season. Its magnificent promenade stretches for 7 m. along the coast, and contains sunken gardens, waterways, colonnades, sun-lounges, and cliff walks, whilst the whole length is fringed by sands, free from shingle, and practically a mile in width at low water. The gradually sloping beach makes for safe sea-bathing. The tn is dotted with many tennis courts, bowling and putting greens, and, in the largest of the parks—Stanley Park—there are 32 tennis courts, 6 bowling greens, 2 putting greens, a golf course, and a 26-ac. boating lake. The tn's indoor entertainments include a permanent circus, 4 theatres, an ice drome, 18 cinemas, 7 ballrooms, the one in the Winter Gardens being the largest in Europe, and home of the International Dance Festival. The Tower, B.'s landmark, 520 ft high, houses a menagerie, aquarium, aviary, roof-gardens, ballroom, etc. The Derby Baths, which were completed in 1939 (accommodation for 5000 spectators and 3000 bathers), and the open-air swimming pool at South Shore are amongst the finest in the world. There are over 5000 hotels, private hotels, and boarding and apartment houses. B., which owes its name to a peaty-coloured pool, now covered in, at the S. side of the tn, was made a parl. bor. in 1918, including the bor. of Lytham St Anne's. The same year the urban dist. of Bispham with Norbock and part of Carleton were incorporated in it. The Princess Parade was opened by H.R.H. Princess Louise in 1912, and the Opera House rebuilt the same year and again in 1939. B. returns 2 members to Parliament. Pop. 146,300.

Blackrock: 1. Seaside suburb of Dublin (5 m.). Rep. of Ireland. Pop. 9000.

2. Suburb of Cork (q.v.).

3. Vil. of co. Louth, Rep. of Ireland, on Dundalk Bay. Pop. 900.

Blackrod Bay, bay in Mayo co., Rep. of Ireland, N. of Achill Is., some 10 m. in extent, and a safe anchorage.

Blackstone, Sir William (1723–80), jurist, b London, educ. at Charterhouse and Pembroke College, Oxford. He entered the Middle Temple, 1741, and was made fellow of All Souls, 1744. In 1749 he became recorder of Wallingford. In 1753 he abandoned his legal practice and returned to Oxford to college duties. In

1758 he became the first Vinerian prof. of law. The success of his lectures led to a pirated ed., and in 1765 he pub. the first vol. of the *Commentaries on the Laws of England*. The 4 vols. were completed and pub. in 1769. The reputation which he thus made drew him back to practice and public life. He was Member of Parliament for Hindon, and later for Westbury, and in 1770 was made a judge of the court of common pleas. B. made no mark as a judge, nor are his miscellaneous writings of value; his fame rests upon his *Commentaries* alone. This work became the indispensable text-book for lawyers for nearly a century, and was also a model on which the body of Eng. law was built up in America and the Brit. colonies. Written in a readable style, it gave the first clear picture of Eng. law as a whole. It has permeated the whole idea of law for the ordinary man, and for long was treated with as much respect as if its text contained a final legal decision to which all must bow. Historians and jurists have broken the false position in which it was placed, but it must be remembered that the author aimed only at what he succeeded in achieving, an admirable and lucid exposition of the great body of law, which till the appearance of the *Commentaries* was a closed book to all but the highly trained expert.

Blackstonia, family Gentianeaceae, genus of annuals, of which *B. perfoliata* (synonym *Chlora perfoliata*), Yellow-wort, grows on calcareous soils in Britain and Europe. Four other species are found in Europe and Mediterranean region.

BLACKTHORN

Blackthorn (*Prunus spinosa*), family Rosaceae; common shrub in hedgerows and thickets, marked by its black stems, hard sharp spines or thorns, and the pure white blossoms which appear before the leaves in Mar. and April. The fruit, generally known as sloes, is a small bluish-black drupe of a sour flavour. The hardness of the wood of the B. and the fact that its black bark takes a fine polish.

makes it a favourite walking-stick; in Ireland it was used for making 'shillelaghs' or cudgels. *P. domestica*, the plum, is held to be a hybrid of *P. spinosa* × *P. cerasifera*.

Blackwall, Anthony (1674–1730), Eng. scholar, graduated at Emmanuel College, Cambridge, and was early appointed headmaster of the Derby School. From 1722 to 1730, with the exception of the years 1726–9, when he was rector of Clapham, Surrey, he was headmaster at Market Bosworth Grammar School, Leics. His most famous work, *The Sacred Classics*, 1725, in which he demonstrated the purity of the Gk Testament, appeared in 1725.

Blackwall, riverside dist. in the bor. of Poplar, E. London, containing the E. India Docks and the Thames Iron Works. It has been a shipbuilding centre from early Stuart times, and many vessels have been built there for the Royal Navy. B. Tunnel, constructed 1892–7 at a cost of nearly £1,500,000, connects with N. Greenwich.

Blackwater: 1. Riv. of Essex, England, rising near Saffron Walden. After a S.-easterly course, it flows with the Chelmer into the N. Sea.

2. Riv. of N. Ireland, rising in the S.E. of Tyrone, and falling into Lough Neagh at the SW. corner. It is the boundary between Tyrone and Armagh.

3. Riv. in SW. Ireland, rising in Co. Kerry and forming the boundary between Kerry and Cork till it flows E. through Cork and Waterford. At Cappoquin it becomes navigable and turns S. to reach the sea at Youghal (Cork), after a course of 106 m. It is celebrated for its salmon fishing.

Blackwater Fever, condition associated with malaria (q.v.) and perhaps related to the administration of quinine. The immediate cause of an attack of B. F. is still not known, although its relationship to recurrent attacks of falciparum malaria and quinine administration is certain. B. F. is essentially a disintegration of the red blood corpuscles within the blood vessels, resulting in the liberation of haemoglobin and the passing of haemoglobin in the urine (i.e., blackwater). The onset is abrupt with headache, vomiting, severe backache, and prostration. The urine is dark red or almost black. The patient is restless and anxious, with difficulty of breathing. Jaundice appears a few hours after the onset of the attack. The spleen and liver are enlarged and tender. Suppression of urine may occur, with uraemia (q.v.), heart failure, and early death. Patients who survive the early stages remain in a precarious condition from extreme anaemia and heart weakness. Treatment consists in absolute rest and nursing. If malarial parasites are seen in the blood antimalarial drugs are given, but quinine and pamaquin must be avoided. Intravenous transfusions of glucose, saline, and plasma are usually called for.

Blackwell, Benjamin Harris (1814–1855), Brit. bookseller, commenced book-selling in Oxford in 1846, but d. when his

eldest son Benjamin Henry B. was 6 years old. So the business came to an end. It was refounded by Benjamin Henry B. on its present site in 1879. In 1912 his son Basil Henry B. joined the firm and developed its publishing business with the imprints of Basil Blackwell and of the Shakespeare Head Press. In 1919 the firm took the title of B. H. Blackwell Ltd, Booksellers. In 1921 the firm of Basil Blackwell & Mott Ltd, Publishers, was founded at the same address.

Blackwell, Elizabeth (1821–1910), physician, b. Bristol, England. Her parents settled in Cincinnati, where, her father dying prematurely, she had to assist her mother to support a large family by running a boarding school. Decided to become a physician, and, in 1849, graduated with the highest honours at the Geneva Medical College, New York, being the first woman to obtain a medical degree in the U.S.A. Later, with a sister, she studied in Paris, and in spite of the prevailing prejudice and opposition to women practitioners, she started, in 1853, the Infirmary for Women and Children in New York, the first of its kind. Fifteen years later the sisters founded the Women's Medical College of New York Infirmary, afterwards affiliated to the Cornell Medical College. The following year she settled in London, where she took part in founding the National Health Society of London, and the London School of Medicine for Women. Lectured on medical and educational topics, and wrote *The Physical Education of Girls*, 1852, *Moral Education of the Young*, 1879, *The Human Element in Sex*, 1884, *The Influence of Women in Medicine*, 1889, and *Pioneer Work in Opening the Medical Profession to Women*, 1895. See E. M. Bell, *Storming the Citadel*, 1953.

Blackwell, George (c. 1545–1613), priest, b. probably in London. He graduated at Trinity College, Oxford, but his Catholic convictions forced him to go to Douai, 1574, and he was ordained priest in 1576. He joined the Eng. mission, 1576, suffered imprisonment for a short time, and thereafter lived in hiding. In 1598 he was made archpriest over the secular clergy of England and Scotland, but was unpopular among many of his fellow Catholics because of his arbitrary manner. In 1608 B. was deprived of his office for subscribing to the oath of civil loyalty imposed on Catholics in 1606, which had been condemned by the Pope.

Blackwell, Thomas (1701–57), classical scholar, b. Aberdeen; educ. at a grammar school there, and at Marischal College, Aberdeen Univ. He took his M.A. in 1718, and was elected to the professorship of Greek at Marischal College in 1723. In 1748 he was made prin. of the college, a post which he held till his death, being the only layman to hold the post since it was under crown patronage. He became doctor of laws in 1752, and d. at Edinburgh.

Blackwood, Algernon Henry (1869–1951), novelist, b. Kent, son of Sir Arthur B. and the former Duchess of Manchester.

Educ. at Wellington and Edinburgh Univ., at the age of 20 he went to Canada and worked at a great variety of jobs; in *Episodes before Thirty*, 1923, he tells of his early roving life. Greatly interested in the occult, he has been called 'the ghost man' because of his subjects. His novels include *John Silence*, 1908, *The Human Chord*, 1910, *The Wave*, 1916, and *Dudley and Gilderooy*, 1929. *Incredible Adventures*, 1914, *Tongues of Fire*, 1924, and *Tales of the Uncanny and Supernatural*, 1949, are vols. of short stories. In 1949 he was made a C.B.E.

Blackwood, Admiral Sir Henry (1770-1832), naval officer, the son of an Irish baronet. Entering the navy in 1781, he became captain, 1795; rear-admiral, 1814; vice-admiral, 1821. He was warmly congratulated by Nelson for his conduct in a sea fight between the *Penelope*, which B. was commanding, and the *Guillaume Tell* in 1800. He was with Nelson at Cadiz, and afterwards served under Lord Collingwood. In 1807 he narrowly escaped drowning at the entrance to the Dardanelles, where his ship was destroyed by fire. He was present at the blockade of Toulon, and in 1819 he was made K.C.B., and commander-in-chief in the E. Indies. He was commander-in-chief at the Nile from 1827 to 1830.

Blackwood, William (1776-1834), publisher, b. Edinburgh. B. served his apprenticeship to the bookselling business in Edinburgh, and afterwards worked in Glasgow and London before settling in Edinburgh in 1804 as a bookseller, dealing principally in old books. In 1810 he set up as a publisher, and in April 1817 the first number of *Blackwood's Magazine*, still in existence as a monthly of high standard, was issued.

Blackwood, timber of various Indian leguminous trees, common on the Coromandel and Malabar coasts. The chief species are the Indian papilionaceous tree, *Dalbergia latifolia*, the wood of which is used for making furniture; *Melbania melanoxylon* of New S. Wales; and the *Acacia melanoxylon*.

Bladder, Urinary, hollow organ situated in the front part of the pelvic cavity. Its wall is composed of muscular tissue, and the urine from the kidneys is conveyed to it by 2 *ureters* which open into the posterior part of the B. (see KIDNEY). The fluid is expelled through the *urethra*, the opening of which lies at the bottom of the B., and is normally closed by a sphincter muscle. The epithelial lining of the B. is ridged and convoluted in a series of trabeculae. The shape when empty is approximately that of a tetrahedron, but it becomes rounded when distended. The function of the B. is to serve as a reservoir for the urinary fluid from the kidneys before it is ejected from the body. Micturition, or the passing of urine, is an automatic reflex action in infants. Distension of the B. causes impulses to travel along the afferent nerve paths to the lumbar region of the spinal cord. Here the afferent impulses are transferred to the efferent motor nerve paths which supply the urethral sphincter muscle, causing it to

relax and thus allow the fluid to escape from the B. As from about the age of 2 years, the child learns to exert conscious control over micturition, and impulses from the cerebrum inhibit the reflex mechanism, which now comes into action only, as it were, with cerebral permission. This cerebral control of micturition gradually becomes so estab. that it can be maintained even in sleep. Sometimes, however, nocturnal control is not estab., or it may be estab. but breaks down, and the condition known as *enuresis*, or bed-wetting, occurs. *Enuresis* is not a disease: it is merely a symptom of failure of cerebral control. Only very rarely is there any local pathological lesion of the genito-urinary organs to account for it. It is often hereditary. Most enuretic children develop the necessary control as they get older. In a few cases, however, the condition persists into adolescence and adult life and may be a considerable handicap. In a number of cases, and particularly in those in which control has been estab., but has broken down again, there is a psychological cause for the trouble. If this can be ascertained and eradicated dramatic improvement often occurs. A child who wets the bed should never be scolded or punished for something over which it has no control. Rather should praise be given on those occasions on which the bed is dry. However pessimistic the mother may feel, she must maintain an air of cheerful optimism in front of the child, adopting an attitude of 'together we will get the better of this.'

Diseases. Since the B. is one part of the whole genito-urinary tract, infections from other parts are liable to spread to it, and vice versa. *Cystitis*, or inflammation of the B., may be caused by any organism. Infection from the *Bacillus coli* may arise from a pyelitis (q.v.) due to that organism. Tuberculous cystitis is also associated with tuberculous pyelitis. Gonorrhoeal cystitis also occurs from gonorrhoea (q.v.). The symptoms of cystitis are pain in the lower abdomen, frequency and pain on micturition. The urine is offensive and cloudy. The treatment consists in treating the cause. Plenty of bland fluids should be taken and alcohol avoided. Chronic cystitis may occur in association with any condition in which emptying of the B. is incomplete and in which, in consequence, there is a constant retention of a pool of stagnant urine. The condition occurs most often in old people, particularly in men with an enlarged prostate gland (q.v.), or it may be associated with a stone in the B. Stricture (q.v.) is another cause of chronic cystitis. The symptoms of chronic cystitis are similar to those of the acute form, but not so severe. Incontinence of urine may occur in any disease of the nervous system in which the neuro-muscular control of the B. sphincter is interfered with. *Fesical calculus*, or stone in the B., is not uncommon and may be a cause of chronic cystitis. It too large to pass by natural means stones must be removed by operation. *Acute retention* of urine can occur in any condition in which the urethral

opening is blocked either by a stone within the B., by pressure from without, as from a fibroid growth of the uterus (q.v.), or by an obstruction in the urethra, such as an enlarged prostate gland or a stricture. It may also occur in diseases of the spinal cord which interfere with the neuromuscular mechanism of micturition. Acute retention is relieved by passing a catheter (q.v.) or by making an opening into the B. above the pubic bone—an operation known as suprapubic cystotomy. Benign and malignant new growths of the B. may occur, and the first symptom is often haematuria (blood in the urine). With modern surgical techniques it is now possible to remove a diseased B., the ureters being transplanted into the colon, which then receives the urine excreted by the kidneys. The inside of the B. may be inspected by means of the cystoscope, an instrument which consists in a hollow tube with a light at the end and a series of magnifying lenses. The instrument is passed through the urethra into the B., and with the aid of the light and the lenses the surgeon is able to view every aspect of the interior. The cystoscope may also be used as a means of passing surgical instruments into the B. for the purpose of removing small fragments of tissue for histological examination, and also for passing small catheters into the ureters. Ureteric catheterization is a means of obtaining for analysis specimens of urine excreted by each kidney separately.

Bladder Campion, popular name of the *Silene cucubalus*, a herbaceous plant of the family Caryophyllaceae. Found in waste places and on hedgerows, it has inflated or bladder-like calyx, drooping flowers, and oval leaves.

Bladder-nut (*Staphylea pinnata*), species of Staphylaceae. It is a shrub which grows in N. lands, and has a large, bladdery capsule as its fruit. The seeds are edible and yield oil.

Bladder-seed (*Danae cornubiensis*), perennial plant of the family Umbelliferae, common to Britain, Europe, and W. Asia. The fruit is a schizocarp much inflated.

Bladder-senna (*Colutea arborescens*), species of Leguminosae cultivated in India and S. Europe. The legume dehisces when touched or in a strong wind, and thus scatters the seed. The leaves have properties similar to those of the genus *Cassia*, and are used in the adulteration of senna.

Bladder-worm, or Hydatid, stage in the development of a cestode, or tape-worm. The egg of the tape-worm gives rise to a six-hooked embryo, which reaches the first host. It then develops into the larval form, when a cyst or bladder is formed round the vital portion. When the B. is swallowed by its final host, the scolex or vital portion is everted, the tail is thrown off, and the worm proceeds to develop segments and becomes the complete tape-worm.

Bladderwort, family Lentibulariaceae, genus of aquatic herbs, epiphytes and terrestrial plants, *Utricularia*. Typical Brit. species is *U. vulgaris*, a submerged

aquatic, with much divided leaves, bearing small bladders with trap-door entries, into which insects, small crustaceae, etc., can pass but not return, to decay and be absorbed by the plant. *U. minor* is the Lesser B., and *U. intermedia*, the Intermediate B. Tropical epiphytic species are sometimes grown in hot-houses.

Bladensburg, vil. of Prince Georges co., Maryland, U.S.A., situated on the Anacostia R., 6 m. NE. of Washington. On 24 Aug. 1814 a battle was fought, in which the British were victors, which decided the fate of the cap. Pop. 2900.

Blades, William (1824-90), Eng. printer and bibliographer, became partner in his father's printing business. His interest in the hist. of printing led to the pub. of his *Biography and Typography of William Caxton, England's First Printer*, 1877, in which, by a careful comparison of types, he classified many Caxton eds. In his popular *Enemies of Books*, 1881, he discusses their foes, human and insect. A collector of old books and medals, he took an active part in public work, and was a keen supporter of the Library Association. He actively promoted the organization of the Caxton Celebration Exhibition at S. Kensington in 1877. At his death his library of some 3000 items was purchased by the Governors of St Bride Foundation, forming the nucleus of the well-known typographical library at St Bride Institute, London.

Blaberry, see BILBERRY.

Blauenau Ffestiniog, tn of Merioneth, Wales, 9 m. NE. of Portmadoc. It has extensive slate quarries. Pop. 7200.

Blauenavon, tn of NW. Monmouthshire, Wales, with ironworks and collieries. Pop. 10,000.

Blaeu, **Blaeuw**, or **Blauw**, Willem Janszoon (1571-1638), Dutch cartographer, b. Alkmaar in Holland. A pupil of Tycho Brahé, he excelled all his predecessors in making terrestrial and celestial globes, and founded a notable map-publishing house at Amsterdam.

Blagoveshchensk, tn on the Amur in the Russian Far East, cap., economic and cultural centre of the Amur Oblast (q.v.). Pop. (1956) 85,000 (1914, 76,500; 1939, 59,000). It was founded in 1653, and restored in 1856; 5000 Chinese inhab. were evicted and drowned by Russian troops in 1900 in connection with the Boxer rising.

Blagoyevgrad (formerly Gorna Dzhumaya), tn of SW. Bulgaria, cap. of B. prov. (area 2804 sq. m.), 48 m. SSW. of Sofia (q.v.). It has Rom. remains, and is a health resort and commercial centre. Pop. 14,000.

Blakie, Walter Biggar (1847-1928), historian and publisher, b. Edinburgh, son of a prof. Educ. at Edinburgh Univ. and Brussels, he went to India, where from 1870 to 1879 he was in the Public Works Dept. Returning to Scotland, he ultimately became head of the publishing house of Constable. He did much research in Jacobite hist., and pub. *The Itinerary of Prince Charles Edward Stuart, 1745-46*, 1896, *Edinburgh in the Time of the Occupation of Prince Charles*,

1910, and *Origins of the Forty-five*, 1916. He founded the *Seots Observer* and helped to found the Scottish Geographical Society.

Blaine, James Gillespie (1830-93), Amer. statesman, b. W. Brownsville, Pennsylvania. Of Scots-Irish parentage, he graduated at Washington College in 1847. He studied law and moved to Maine, where he was editor of the *Kennebec Journal* and of the *Portland Advertiser*. He was elected to the Lower House of the state legislature in 1858 as a Republican. In 1862 he was elected to Congress, where he sat for 13 years, being Speaker in the House from 1869 to 1875; he sat for 4 years in the Senate. In 1881 he was appointed secretary of state under President Garfield; he resigned after the assassination of the latter, but held the same office, from 1888 to 1892, under President Harrison. B. was nominated for the presidency in 1884 by the Republican party. The Democrats nominated Grover Cleveland. A campaign of almost unprecedented bitterness ensued. The orator who nominated B. at the Republican convention referred to him as the 'White-plumed Knight.' The Democrats seized upon this for all sorts of grotesque cartoons. The Republicans, who had not been defeated nationally since the Civil war, seemed to be winning the presidency as usual, when a Protestant preacher, who was campaigning for B., uttered the sneer that all that was at the back of Cleveland was 'Rum, Romanism, and Rebellion,' meaning that the liquor interests, the Rom. Catholics, and the 'rebels' of the Confederate S. of Civil war times alone were supporting the Democratic candidate. The speech created intense feeling, and to it is attributed a large share in the defeat of B. B. strongly opposed the issue of paper money during the Civil war and the immigration of Chinese. As secretary of state he was in favour of reciprocity treaties with other nations, but adopted a firm position in the seal-fisheries controversies with Great Britain. He was a ready debater, and resourceful in controversy. He wrote *Twenty Years of Congress* (2 vols.), 1884-1886, and *Political Discussions*, 1887.

Blair, Francois Preston (1791-1876), Amer. journalist and politician, b. Abingdon, Virginia. After graduating at Transylvania Univ., he took to journalism and ed. the *Argus* at Frankfurt. In 1830, as editor of the *Washington Globe* and a member of Jackson's 'Kitchen Cabinet,' he became a powerful influence at Washington, but was ousted by Polk and Calhoun. He then supported Van Buren, and later helped to organize the new Republican party. After Lincoln's reelection in 1864 B. succeeded in persuading Jefferson Davis to appoint a conference for the cessation of hostilities, but the conference proved abortive. After the Civil war he rejoined the Democrats.

Blair, Francis Preston (1821-75), Amer. soldier and politician, b. Lexington, Kentucky, son of the above. He first practised law, then served in the Mexican war, and later became a member of the Missouri

legislature. Elected as Republican to the House of Representatives in 1856, 1860, 1862. He was instrumental in preventing Missouri from joining the Confederacy. In 1868 he was Democratic candidate for the vice-presidency, and from 1871 to 1873 was U.S. senator for Missouri.

Blair, Hugh (1718-1800), author and minister, b. Edinburgh. He was minister of Canongate Church, Edinburgh, in 1743, and in 1754 of Lady Yester's church for 4 years. His *Lectures* were pub. on his resignation of the chair of rhetoric and belles-lettres. His chief fame rests upon his *Sermons*, in 4 vols., which had an extraordinary popularity, and secured him a pension of £200. Time, however, has not confirmed the opinion of his contemporaries.

Blair, James (1656-1743), Scottish author and minister. He went as a missionary to Virginia, 1685. Perceiving the lack of education he endeavoured to collect subscriptions to found a college at Williamsburg, and coming to England obtained the necessary charter; he was appointed the first president. B. was for some time president of the Council of Virginia, and rector of Williamsburg. In 1727 he assisted in compiling *The Present State of His Majesty's Colony in Virginia*.

Blair, John (d. 1782), Scottish chronologist, b. and educ. at Edinburgh. In 1754 his *Chronology and History of the World from the Creation to the Year of Christ 1753* was pub. by public subscription.

Blair, Montgomery (1813-83), Amer. politician and lawyer, b. Franklin co., Kentucky. After service in the Seminole war, he took to the study of law and practised at St. Louis, Missouri. He was mayor of St. Louis (1842-3). Removing to Washington, D.C., he was U.S. solicitor in the court of claims from 1855 to 1858, being associated with Curtis in the Dred Scott case. He was postmaster-general in Lincoln's Cabinet, and from 1861 to 1864 introduced free city delivery, money order system, and the use of railway mail cars. He went over to the Democrats after the Civil war as a consequence of his views on the reconstruction policy.

Blair, Robert (1593-1666), graduated at Glasgow Univ. and became a licensed preacher of the Scottish Presbyterian Church in 1616. Ordained as Bishop of Down, Ireland, in 1623, he was deposed 9 years later for nonconformity. When he was excommunicated in 1634, he set out for New England, but stormy weather drove the ship home again. In 1640 he came to England as one of the commissioners from the General Assembly to explain Presbyterianism to Episcopal clergy. Six years later he was elected moderator of the General Assembly.

Blair, Robert (1699-1746), poet and minister, b. Edinburgh. In 1731 he became pastor of Athelstaneford in E. Lothian. His one outstanding work was *The Grave*, 1743, a poem in blank verse, extending to nearly 800 lines, in some passages sinking to commonplace and in others rising to sublimity. It was illustrated by Wm Blake (q.v.).

Blair, Robert (d. 1828), Scottish astronomer. He was prof. of practical astronomy at Edinburgh Univ. from 1785 till his death. He is chiefly remembered for his work in optics for the improvement of the telescope.

Blair, Robert, of Avontoun (1741-1811), Scottish judge, son of the preceding, *b.* Athelstaneford. From 1789 to 1806 he held the post of solicitor-general for Scotland, and in 1808 became lord president of the court of session, which office he held till his death.

Blair Atholl, vil. of Perthshire, Scotland, 35 m. NNW. of Perth at the confluence of the Garry and the Tilt. Blair Castle, seat of the Duke of Atholl, is situated ½ m. from the vil.; part of it dates from the 12th cent. Pop. 1557.

Blairgowrie and Rattray, joint burgh of Perthshire, Scotland, on both banks of the R. Erich, 20 m. NNE. of Perth. The prin. industry is rayon, jute, and flax spinning and weaving, the factories for which obtain their power from the Erich. Other industries are agriculture, light engineering, and soft-trock canning. B. is a summer resort. Pop. 5500.

Blaise, St. see BLASTUS, ST.

Blake, George (1893-), novelist, *b.* Greenock. He was educ. at Greenock Academy and studied law, but after the First World War, in which he was wounded at Gallipoli, he turned to journalism, succeeding Neil Munro as literary editor of the *Glasgow Evening News*. In 1924 he became acting editor of *John o' London's Weekly*, and in 1928 editor of the *Strand Magazine*. His novels are in direct opposition to the sentimental 'kailyard' school, *Mince Collop Close*, 1923, a sordid tale of slum life in Glasgow, being followed by *The Wild Men*, 1925, and *The Path of Glory*, 1929, a war story. Returning to Scotland in 1932 he settled at Helensburgh and pub. sev. works with a Clyde setting, including *Down to the Sea*, 1937, and *The Firth of Clyde*, 1952.

Blake, Robert (1598-1657), parliamentarian, soldier, and sailor, *b.* Bridgwater, Somerset, the son of a merchant-venturer. He attended the free grammar school at Bridgwater, and then went to St Alban's Hall, Oxford, and in 1617 to Wadham College, obtaining his B.A. in 1618. His father *d.* in 1625, and B. probably succeeded to his business. In 1640 he was returned to the Short Parliament as Member of Parliament for Bridgwater. When the Civil war broke out he sided with Parliament, and in Mar. 1643 was a member of the Committee for the Sequestration of the Estates of Royalists in Somerset. In the same year, as a captain, he commanded Prior's Hill Fort in the defence of Bristol against Prince Rupert. He was promoted lieutenant-colonel and took part in the defence of Lyme (1644) and was then made Governor of Taunton, which he defended from Royalist attacks until finally relieved by Fairfax and Cromwell in July 1645. In the autumn of 1645 he was returned to Parliament again, but, being given the task of reducing Dunster Castle, he did not take his seat until May 1646. He

took the covenant on 24 June 1646, but took no part in the trial of Charles I. On 27 Feb. 1649, he was appointed a general-at-sea, and, in April, began the pursuit of Rupert's Royalist fleet. He blockaded the Royalist fleet in Kinsale and later, in Cadiz, and when the Portuguese refused him permission to attack the Royalists in Cadiz harbour, B. took his revenge by intercepting and capturing a portion of a Portuguese fleet bound from Brazil. The Portuguese king was forced to ask Rupert and his ships to leave Cadiz, and B. was able to pursue and capture or scatter the last remnants of the Royalist fleet. He received the thanks of Parliament and a grant of £1000. During his action against Rupert, B. had been offered the post of major-general of the foot by Cromwell, but being free to accept or remain at sea, he decided to continue at sea. His next task was the capture of the Scilly Isles, which were held by the Royalists, under Sir John Grenville, and after this he went on to reduce the last Royalist strongholds in Guernsey and Jersey. For these services he received the thanks of Parliament, and was appointed a member of the council of state.

When the first Dutch war broke out in 1652, B. defeated Tromp off Dover on 19 May, and routed De Witt on 28 Sept. On 30 Nov. a strengthened Dutch fleet under Tromp met a weakened fleet under B. off Dungeness, and after a fierce battle, B. withdrew into the Thames. B. asked for 'a discharge from this employment so far too great for me,' but the council merely thanked him for his gallant action, and strengthened his fleet. At the battle of Portland, 18-20 Feb. 1653, he decisively defeated Tromp, although he was gravely wounded, and was awarded a gold medal and chain. At the close of the Dutch war, B. with his colleagues Deane and Monck, compiled 'Instructions for the better ordering of the fleet in fighting' which introduced the line ahead formation when going into action. In 1654 B. was elected a Lord Warden of the Cinque Ports and Constable of Dover Castle, and on 14 July was again returned as Member of Parliament for Bridgwater. In Oct. he sailed for the Mediterranean, where the presence of his fleet had a great effect on Europe's politics. He demanded the release of a Brit. ship and Brit. captives from the Bey of Tunis, and being 'insolently' refused, he attacked the shore batteries and destroyed the Bey's fleet in Tunis harbour. He reached England in Oct. 1655, his health undermined, but when Spain declared war, he set sail in Mar. 1656 for the Sp. coast, and in Sept. captured a fleet from Brazil bringing treasure to Spain. He blockaded the coast through the winter, and then went to Santa Cruz, where he destroyed, in a well-fortified harbour, a Sp. fleet of 16 vessels. This victory had far-reaching results, including the collapse of a Sp. invasion of Portugal. The victory of Santa Cruz was a brilliant exploit, and Parliament ordered a day of thanksgiving, while Cromwell sent B. a jewel in the form of the Protector's portrait set in gold and

diamonds. Santa Cruz was B.'s last great action, for, on the voyage home, he *d.* at sea within sight of Plymouth. He was buried in Westminster Abbey, but his body was disinterred at the Restoration, and buried in the churchyard of St Margaret's. See lives by C. D. Curtis, 1934, and R. Beadon, 1935; also J. R. Powell (ed.), *Letters of Robert Blake* (Navy Record Society), 1937.

Blake, William (1757-1827), poet and engraver, *b.* London, the son of a hosier,

became his skilful, sympathetic assistant in artistic and literary work. His first vol. of poems, *Poetical Sketches*, appeared in 1783, but met with an indifferent reception. In 1784 he opened a print-seller's shop, having as assistant his younger brother Robert, who *d.* in 1787. In that year he experimented in printing with etched copper-plates, and it is related that the secret of this process was revealed to him in a vision by his brother, Robert. Others, however, say that he learned the

AN ENGRAVING FROM BLAKE'S 'BOOK OF JOB'
'Let the day perish wherein I was born.'

James B., who had a business near Golden Square. His father seems to have been a disciple of Swedenborg (q.v.), who had prophesied that the year 1757, the date of B.'s birth, would be the beginning of a new world. Visionary by nature, B. as a child saw visions and conversed with angelic beings and in early manhood was for a time a professed Swedenborgian (q.v.) much influenced by the doctrines of the Swedish mystic. He early showed a taste for art, and at the age of 10 he was sent by his father to Pars's drawing-school in the Strand, and at 14 he was apprenticed to the engraver Basire, who set him to drawing monuments in old London churches, thus inducing his love of Gothic art. In 1778, after studying for a short time at the Royal Academy, he became an independent engraver, producing some of the early work of Stothard, and making the acquaintance of Flaxman and Fuseli. In 1782 he married Catherine Boucher, daughter of a market-gardener, who

process through his friend, George Cumberland, of Bristol (Geoffrey Keynos). Be that as it may, B. conceived the idea of engraving his poems and illustrating them with his own conceptions. In 1789 he issued *Songs of Innocence*, the book being entirely designed and produced by himself and his wife. In the same year appeared the *Book of Thel*, the first of his 'prophetic books,' a prophet to B. being a poet, in the sense of one inspired. These were followed by *The Marriage of Heaven and Hell*, 1790, *The Gates of Paradise*, 1793, *America*, 1793, *The Vision of the Daughters of Albion*, 1794, *Songs of Experience*, 1794, *Europe*, 1794, *The Book of Urizen*, 1794, *The Song of Los*, 1795, *The Book of Ahaniah*, 1795, *Jerusalem*, 1804, and *Milton*, 1804. From 1800 to 1803 he lived at Felpham in Sussex with Hayley, for whose *Life of Cowper* he engraved the illustrations. After 1804 he devoted himself to illustrative work, which included engravings for Blair's *The Grave*,

and to designs (which were great original conceptions rather than illustrations) for *The Book of Job*, 1821, *Paradise Lost*, 1822, and the *Divina Commedia*, 1825. His artistic work reveals great natural genius, and is unique in its imaginative design. His place among poets is assured by his lyrics alone, and the prophetic works have yielded much of great interest to sympathetic interpretation. See life by A. Gilchrist, 1863 (reprint by Graham Robertson, 1907). There was also an enlarged ed. of Gilchrist's work in 1880, which has been reprinted, with notes, by Ruthven Todd, in Everyman's Library, 1942, and revised, with additional notes and copious bibliography, in 1946. *Poems*, ed. by Alice Meynell, 1911, and Max Plowman, 1927. *Poetry and Prose*, ed. by Geoffrey Keynes, 1927. See Max Plowman, *An Introduction to the Study of Blake*, 1927; O. Burdett, *William Blake* (Eng. Men of Letters series), 1927; J. Winksteed, *Commentaries on The Book of Job and Jerusalem*, 1954; *The Notebook of William Blake*, ed. by Geoffrey Keynes, 1935 (includes the *Rossetti Manuscript*); Facsimile of *Jerusalem* (Blake Trust), 1954; Sir Geoffrey Keynes (ed.), *Pencil Drawings of William Blake*, 1957. For the bi-centenary celebrations a bronze bust by Sir Jacob Epstein was unveiled in Westminster Abbey.

Blakeney, William, Baron (1672-1761), Eng. soldier. He is said to have been the first to employ colour or drum to drill companies. Throughout Marlborough's campaigns he served as adjutant to his regiment. The enmity of Lord Verney hindered his advancement, so that he was 65 before he was promoted colonel. The Duke of Richmond, however, secured him the Lieutenant-governorship of Stirling Castle in 1746, having recognised his gallant services in the Cartagena expedition of 1741. His successful defence of that castle against the Highlanders led George II to appoint him Lieutenant-governor of Minorca in 1747. As the governor never appeared, he undertook the defence of the is. against the Fr. troops under Richelieu and La Gallissonnière at the commencement of the Seven Years War, 1756. Adm. Byng, who was afterwards executed for cowardice, came with a relieving squadron, but sailed away again, thus leaving B. no alternative but to surrender. Many honours, including the command of the Inniskilling regiment of infantry, awaited the veteran on his return home.

Blakeney, vill. on the N. coast of Norfolk, England, 5 m. from Holt. Good sailing is to be had on a lagoon-like stretch of sea, and at B. Point there is a bird sanctuary of over a thousand ac. in extent. Pop. 641.

Blakesley, Joseph Williams (1808-85), dean of Lincoln, b. in London. He was educ. at St Paul's School and Corpus Christi and Trinity Colleges, Cambridge, becoming fellow and tutor of the latter college. He became dean of Lincoln in 1872. A *Life of Aristotle*, 1839, and an ed. of Herodotus, 1852-4, were his chief works.

Blakiston, Thomas Wright (1832-91), explorer, b. Lymington, Hants. Joining the army in 1851, he saw service in the Crimea and elsewhere. His chief work as an explorer was done on the upper course of the Yang-tse-Kiang in 1861. From 1863 to 1884 he was a merchant in Japan, and there interested himself in ornithology. He d. in California.

Blamire, Susanna (1747-94), poetess, b. near Carlisle, daughter of a farmer, received the sobriquet of 'The Muse of Cumberland.' Her poems, which were not collected till 1842, depict Cumbrian life with truth and vivacity. She also wrote some fine songs in Scottish dialect, such as 'Ye shall walk in silk attire.'

Blamire, William (1790-1862), agriculturist. He graduated at Christ Church, Oxford, and then took up farming near his home at Dalston, Cumberland. He became popular with the yeomen of the co., because he was always willing that his neighbours should profit by his experiments in agric. improvements, and in 1828 he was appointed high sheriff, and 3 years later, after an exciting election, was returned to Parliament as a representative of the Whig party. In 1836 he made a remarkable speech on the Tithe Commutation Bill, and, when it became law, was nominated chief commissioner to supervise its administration. The work of assessing the rent charges for each par. and of apportioning those charges between various properties was complicated by the lack of reliable maps, and lasted from 1836 to 1851. It was at B.'s suggestion that the ordnance survey of 1842 was undertaken. His practical and expert knowledge of land tenure also rendered his assistance invaluable to the gov. in preparing both the Copyhold Enfranchisement Act of 1841, and still more the Commons Enclosure Act, 1845. The principles he laid down in a Highways Bill of 1846 have guided all later legislators on that subject.

Blanc, François, Fr. financier, originally the owner of a casino in Homburg. See MONTE CARLO.

Blanc, Jean Joseph Charles Louis (1811-1882), Fr. politician and historian, b. Madrid. He studied law at Paris, and contributed to various progressive journals. He founded the *Revue du progrès* in 1839, and pub. in it an article on 'L'Organisation du travail,' which embodies the principles which guided him all his life. In this article he stated his view that competition is the main evil of industry. For a remedy he proposed equalisation of wages, national workshops, and declared that personal interests are of less importance than the welfare of the community. After the revolution of 1848, he became a member of the provisional gov. and presided over a gov. commission to report on labour questions. The national workshops he had advocated were estab. but gov. hostility predetermined their failure. B. was unjustly charged with complicity in the disturbances which followed. He took refuge in England, and remained here until the downfall of the empire, where he completed his *Histoire de la*

Révolution Française, in 12 vols. (1847-1862). On his return to Paris he was in 1871 elected a member of the National Assembly. Though he possessed a vivid style and relied a good deal on detailed research, his writings are too political in tone to be of any real historical value. His works have, however, considerably influenced socialist opinion in France.

Blanc, Mont, 15,782 ft, is the highest mt in the entire chain of the Alps, and in Europe with the exception of certain

and Jacques Balmat. In the following year Jacques Balmat and 2 local men again made the ascent, whilst later in 1787, the Genevese naturalist, to whom a statue has been erected at Chamonix, H. B. de Saussure, made the third ascent. The first Englishman to attain the summit was Col. Beaufoy (1787). These ascents were all made from Chamonix, which is the usual starting-place, though in the course of time ascents have been made from every side. The easiest route is by way of the inn of the Grands Mulets, from

D. McLeish

MONT BLANC

The huge Bossons and Tacconnaz glaciers from the NW.

peaks in the Caucasus Mts. It rises to the S. of Chamonix, in Fr. ter., and to the NW. of Courmayeur, which belongs to Italy. When the treaty which ceded Savoy to France was ratified in 1861 France had the highest summit. The whole range bearing the name M. B. forms part of the Pennine Alps and is unequally divided between France, Italy, and Switzerland. In former days the mt was called in some places the Montagne Maudite, or simply Les Glacières, but the present name appears to have been always in local use; the name M. B. occurs in an It. document of the year 1694. Its old name, Les Glacières, had its origin in the distinguishing feature of the mt, the immense glaciers which are found on all sides of it. Among the best known may be mentioned those of Bossons and Tacconnaz, on the N. slope, and those of Brenva and Miage on the S. slope. The first ascent of M. B. was made in 1786 by 2 Chamonix men, Dr Michel Paccard

Chamonix, to the Bosses du Dromadaire shelter-hut, and thence to the summit. Miss Isabella Straton, in Jan. 1876, was the first to make an ascent in winter. The view from the summit of the mt is naturally extensive, Lyons being visible. The inn at the Grands Mulets stands at a height of 9909 ft, the shelter-hut at the Bosses du Dromadaire, built in at a height of 14,312 ft, whilst in 1893 an observatory was constructed just below the summit by T. J. C. Janssen. See A. W. Moore, *The Alps in 1864*, 1867; C. E. Mathews, *The Annals of Mont Blanc*, 1898; Sir C. Schuster, *Peaks and Pleasant Pastures*, 1911; M. Kurz, *Guide de la Chaîne du Mont Blanc* (4th ed.), 1935; T. Graham Brown, *Brenva*, 1943; T. Graham Brown and Sir Gavin de Beer, *The First Ascent of Mont Blanc*, 1957.

Blanca Peak, estimated to be the highest peak in Colorado, U.S.A. It is in the co. of Costilla, and is among the Sangre de Cristo Range. Its altitude is 14,363 ft.

Blanch, or **Blench**, **Holding**, name of one of the anct feudal tenures in the law of Scotland. Under this holding the vassal has to pay to the superior only a nominal duty, as a badge of servitude, such as a penny Scots, a bunch of roses, or, as in the case of Jock Howieson, the service of a ewer and basin in order that the king may wash himself. It is now seldom adopted in the constitution of the original right of property.

Blanchard, **Edward Litt Laman** (1820-1889), miscellaneous writer, b. London. He was the author of a number of dramas, farces, and burlesques. For 37 years he wrote the Drury Lane pantomime, and he sold plays to prov. theatres at 10s. an act. As dramatic critic he contributed to many papers, among them being the *Weekly Dispatch* and *Daily Telegraph*. From 1841 to 1845 he was in turn editor of 3 papers. He also wrote 2 novels, countless comic songs, and illustrated guides to places of interest. See life by Clement Scott, 1891.

Blanchard, **Jacques** (1600-38), Fr. painter, b. Paris. He studied under his uncle. In 1624 he visited Rome, and 2 years later Venice. Here he studied the paintings of Titian and others. He returned to Paris and executed numerous works. In virtue of these he was called the Fr. Titian. 'The Descent of the Holy Spirit,' which hangs in Notre-Dame, is considered his best painting.

Blanchard, **William** (1769-1835), comedian, was prompted by his delight in Shakespeare to become an actor. In 1785 he joined Mr Welsh's travelling company, and after an unsuccessful attempt as a theatre manager, made his debut at Covent Garden as Bob Acres, in 1800. With this theatre he was connected until 1834, except for one break when he toured in America. In his youth he was favourably compared with John Kemble, and was especially famous for his Shakespearean impersonations of Fluellen, Polonius, and Menenius, whilst Leigh Hunt enjoyed above everything his interpretation of the role of the Marquis de Grand-Château in the musical play, *The Cabinet*. De Wilde painted him as Sir Andrew Aguecheek.

Blanche, **Jacques Emile** (1861-1942), Fr. painter and art critic; educ. at the Lycée Fontanes, where Mallarmé was his Eng. master. Encouraged by Manet and Renoir, he set up a studio at Bas Fort Rouge, Dieppe, where he was often visited by Sickert, who became one of his closest friends. His work shows the strong influence of Manet, Degas, and, later, the early Eng. portrait school, in the style of which he produced a successful series of portraits of women. Portraiture was his main study, and his best portraits include those of Beardsley, Debussy, Degas, Henry James, Maeterlinck, Ricketts, and Rodin. He wrote much art criticism, especially in the *Revue de Paris* and *L'Art Vivant*; he also wrote novels and reminiscences, including *Cahiers d'un artiste*, a work which notably influenced Proust's *A la recherche du temps perdu*. His short stories appeared under the nom de plume

of Jaime de Beslou. He also pub. 2 books of memoirs: *Portraits of a Lifetime*, 1937, and *More Portraits of a Lifetime*, 1918-38, 1939, containing vivid sketches of international celebrities.

Blanche, **Dent**, Alpine peak in the canton of Valais, Switzerland, rising to the W. of Zermatt and opposite to and N. of the Matterhorn. Its altitude is 14,318 ft. The ascent, which presents great difficulties, was first made by T. S. Kennedy and W. Wigram in 1862.

Blanchefleur, see FLOIRE ET BLANCHE-FLEUR.

Blanching, or **Etiolation**, horticult. method of growing certain plants and vegetables to render them more succulent. The exclusion of light produces stems and leaves free from chlorophyll, green colouring matter. Many vegetables are made more tender and tasteful by B. B. is usually an artificial process, though a kind of natural etiolation may be observed in the cabbage. There are 4 main ways of B. plants: (a) By earthing up the leaves and stems of plants. This practice is followed in the case of celery, asparagus, etc. Celery is planted in trenches, and earth is drawn up round the plants as they grow. (b) By tying up the leaves with pieces of bass; this is the method adopted in the case of cos lettuces, and sometimes with endive. (c) By wrapping up stems in opaque paper or cardboard. (d) By overlaying with tiles, slates, or B. pots, which are earthenware vessels of a sugar-loaf shape. By this means the light is excluded from seakale, rhubarb, etc., and no green appears in the leaves. The B. pot is often employed in France for lettuce, and in the Pyrenees celery is blanched by this means. Cardoons are blanched by tying up each plant into a long, oval, and compact bunch. A drainpipe later filled with sand is then placed over each plant, or they are earthed up after the fashion adopted with celery. B. has very important results. Not only is growth made more succulent and less fibrous, but less bitter in flavour, and blanched celery, seakale, chicory, rhubarb, and dandelion are much improved.

Blancmange (O.F. *blancmanger*, 'white food'), originally a dish of fowl minced with cream, rice, almonds, sugar, eggs, etc. It is now a sweet dish made of corn-flour, gelatine or isinglass, and milk.

Blanco, **Antonio Guzman** (1828-99), Venezuelan soldier and a native of Caracas. The Federal revolts of 1859-63 saw him actively engaged. He became vice-president under Falcón in 1863. By a counter-revolution he triumphed over an attempt to depose him, and became president on the death of his superior. A series of re-elections skillfully manipulated kept him in office till 1888.

Blanco, **Cape**, headland on the W. coast of Africa, in 20° 47' N. lat. and 16° 58' W. long. It lies at the end of a rocky ridge projecting from the W. extremity of the Sahara.

Bland, **Edith**, who wrote under her maiden name of Nesbit (1858-1924), novelist and writer of children's books, was brought up in Kent. She married

Hubert B. in 1880 and wrote many articles, stories, and poems, but found her true vocation when *The Treasure Seekers*, a story for children, brought her financial success in 1899. *The Would-Be Goods*, 1901, and *Five Children—and It*, 1902, were other favourites among her books, which struck a new note by portraying young folk as real human beings. In 1915 she was granted a Civil List pension. See life by D. L. Moore, 1933.

Bland, Humphrey (1686-1763), Eng. soldier and military writer, served against the Jacobite rebels in 1715 and also in 1745-6 when he was major-general in the Culloden campaign. It was whilst he was lieutenant-colonel of the king's dragoon guards that he pub. his *Treatise on Discipline*, 1727, which served for many years as the recognized textbook on that subject. He distinguished himself at Dettingen and Fontenoy during the Flanders expedition. From 1749 he was governor of Gibraltar, till he was appointed in 1753 commander-in-chief of the Scottish forces—a post which he held to his death.

Bland, Maria Theresa (1769-1838), It. vocalist, b. probably in Italy of Jewish parents named Romanzini. Her first appearance in London was in 1773, and after a successful time at Dublin she appeared at Drury Lane in 1786. She was connected with this theatre almost continuously until 1824, when an attack of melancholia obliged her to renounce the stage. She also sang at Vauxhall and the Haymarket Theatre. She was remarkable for the sweet quality of her voice (mezzo-soprano) and her unaffected style, whilst as an actress it was her vivacity that charmed.

Bland-Sutton, Sir John (1855-1936), surgeon, b. Rnfield, Middx. The son of poor parents, he was trained as a teacher but determined to become a surgeon. He entered the Middlesex Hospital in 1878 and remained associated with that institution for the rest of his life. He qualified in 1881, became assistant surgeon to the Middlesex in 1886, and full surgeon in 1905. He was a fellow of the Royal College of Surgeons and its president, 1923-6. In his early years he carried out a great deal of research work, particularly on comparative anatomy, embryology, and pathology. He was a brilliant operator, with the faculty of instant appreciation and decision. From 1896 to 1911 he was also surgeon to Chelsea Hospital for Women, and became a leading gynaecological surgeon. He was convinced that a wide knowledge of pathology was essential in all medical teaching, and in 1912 he presented to the Middlesex Hospital the Institute of Pathology which now bears his name. He was knighted in 1912 and given a baronetcy in 1925. He wrote *Ligaments, their Nature and Morphology*, 1887, *Surgical Diseases of the Ovaries*, 1891, *Tumours, Innocent and Malignant*, 1893, *Gall-Stones and Diseases of the Bile Ducts*, 1907, *On Faith and Science in Surgery*, 1930, and sev. other works. See his autobiography, *The Story of a Surgeon*, 1930, and life by W. R. Bett, 1956.

Blandford Forum, tn of Dorset, England, on the R. Stour, 16 m. N.E. of Dorchester by road. It was almost destroyed by fire in 1731. There are many Rom. and prehistoric remains in the vicinity. There is a large military camp and an aerodrome in the dist. Pop. 3500.

Blandrata (properly **Blandrata**), **Giorgio** (1516-88), Unitarian, b. of an old Piedmontese family and educ. in France. He early attached himself to the left wing of Protestantism, and fomented the anti-trinitarian heresy of the It. Church of Geneva. He had been obliged to flee from Montpellier to Geneva in 1556 because of his heterodoxy, and there he remained until in 1558 Calvin's wrath drove him to Poland, where Unitarianism was gaining ground. Finally he took refuge in Transylvania where, as physician to John Sigismund, the prince, and in association with Francis David, he was able to spread his doctrines over a wide field. He secured legal recognition for Transylvanian Unitarianism and thus ensured its continued existence.

Blane, Sir Gilbert (1749-1834), physician, b. Blaneffield, Ayrshire. At 14 he went to Edinburgh Univ., originally to study for the Church, and ultimately for a doctor's career. He took his M.D. degree at Glasgow Univ. in 1778. In 1779 he went to the W. Indies as physician to Adm. Rodney, and from that time he was physician to the fleet. He wrote accounts of sev. engagements and victories which he witnessed, and he received a pension from the Crown. In 1781 he accompanied Rodney home. He introduced reforms while he had medical charge of the W. India fleet, including the issue of citrus fruits to prevent scurvy. He helped in drawing up the rules for the Quarantine Act of 1799. He was made a baronet in 1812.

Blanesburgh of Alloa, Robert Younger, Baron (1861-1937), Judge, youngest son of James Younger, of Alloa, co. Clackmannan, and brother of the 1st Viscount Younger of Leckie. Educ. at Edinburgh Academy and at Balliol College, Oxford, of which he was made honorary fellow, 1916. Called to the Bar (Inner Temple), 1884; took silk 1900. Judge of the chancery div. of the High Court, 1915-19; Lord Justice of Appeal, 1919-23; Lord of Appeal in Ordinary and life peer, 12 Oct. 1923. He was very rapid in thought and fluent in language.

Blanford, Henry Francis (1834-93), geologist and meteorologist, studied at the Royal School of Mines and at Freiberg, Saxony. As a member of the Geological Survey of India, he classified the Cretaceous strata near Trichinopoly. Later he was appointed meteorological reporter to Bengal, in which capacity he made discoveries about the cause of cyclones and also pub. treatises dealing with the meteorology of India. In 1880 he was elected F.R.S., and in 1884 president of the Asiatic Society of Bengal.

Blanford, William Thomas (1832-1905), geologist, b. in London; educ. at the Royal School of Mines, London, and later at the Mining Academy, Freiberg, Saxony.

He was a member of the geological survey of India from 1855 to 1882, being detached for work in Abyssinia in 1867-8 and in Persia in 1872. President of the geological section of the Brit. Association in 1884, and pub. *Observations on the Geology and Zoology of Abyssinia*, 1870, *A Manual of the Geology of India*, 1879, and *Mammalia*, 1888-91.

Blank Verse, verse without rhyme. In its wider sense the term B. V. signifies all verse in which the rhymes are lacking, but the term has come to have a more restricted significance, being generally applied to verse consisting of ten-syllable iambic lines. The major part of Eng. dramatic and epic poetry is written in B. V. of this measure. It was first used by the Earl of Surrey (q.v.) in his trans. of the *Aeneid*, and popularized for epic use by Milton. Later skilful users of B. V. were Thomson, Cowper, Wordsworth, Tennyson, and Bridges. See also **POETRY** and **VERSE**.

Blankenberghe, small tn on the coast of W. Flanders, Belgium, 13 m. N.E. of Ostend. It has a fishing industry, and shipbuilding is carried on. The normal pop. is 9700, but this is swollen in summer when B. becomes one of the most popular seaside resorts of Belgium.

Blankenburg, Ger. tn in the dist. of Magdeburg, 37 m. S.W. of Magdeburg (q.v.). It is at the foot of the Harz Mts (q.v.), and has an 18th-cent. castle which was the residence of Louis XVIII (q.v.), 1796-8. It has an iron industry and seed nurseries, and is a health resort. Four m. S.W. on the Bode R. is the Bodetalsperre (dam) with hydro-electric installations. Pop. 18,500.

Blankenburg, Ger. spa in the dist. of Gera, on the Schwarza, 38 m. WSW. of Gera (q.v.). It is overlooked by the ruins of the medieval Greifenstein castle, and has a fine church (14th-15th cents.) and 18th-cent. in hall. There are manufs. of wool, paper, and precision instruments. Pop. 6600.

Blanket, woollen or cotton fabric used as a covering on beds, etc. Whilst all good B.s are made wholly of wool, B.s of inferior quality are made of cotton warp and woollen weft. In these B.s the threads of the woollen yarns are raised to the face of the fabric in a loose, soft mat so as to hide the cotton threads. The process by which this is done is called teaselling, and it is effected by means of steel brushes called teasels, which are fixed in gigs, or brushing machines, and brush up the threads on the face of the B. The prin. varieties of Eng. B.s are the Witney, the Kersey, the Yorks, the Bath, and the Bury, the last named being more like ordinary wool cloth. The Scotch B.s are always made wholly of wool, and are more durable than the Eng., though sometimes not so comfortable. The prin. Scottish mills are in Ayrshire, Berwickshire, and at Markinch in Fifeshire. Very delicate B.s come from Mysore, in India, being made of such fine fabric that they can be rolled up into a small compass.

Blanketeers, nickname given to the

Lancs operatives, who met in St Peter's Field, near Manchester, on 10 Mar. 1817. They determined to march to London and see the prince regent in order to obtain redress of their grievances. The Habeas Corpus Act was suspended, and the leaders were imprisoned, whilst the bulk of the operatives gave in. The name B. was given to them because each carried a blanket for camping out.

Blankney, vil. of Lincs, England, 8 m. from Sleaford by rail. Centre of a famous hunt. Pop. 600.

Blanqui, Jérôme Adolphe (1798-1854), Fr. economist, b. Nice. He was a schoolmaster in Paris, when he was caused to study economics by reading the works of J. B. Say, whose pupil and assistant he became. He was appointed to a professorship of industrial economy and of hist. at the Conservatory of Arts and Commerce, upon Say's recommendation, and succeeded the latter as prof. of political economy in 1833. In 1838 he became a member of the Academy of Moral and Political Sciences. His most important work is his *Histoire de l'économie politique en Europe*, 1838.

Blanqui, Louis Auguste (1805-81), Fr. politician, b. Pujet-Théniers, near Nice. He studied both law and medicine before taking up a political career. He took part in the 1830 revolution. He was leader of the extreme Socialist party after the revolution of 1848, but was sentenced to 10 years' imprisonment in 1849, and again in 1861, but escaped and went abroad till after the downfall of the empire, when he returned and founded *La Patrie en Danger*. On 31st Oct. (1870) the National Guard, led by B., came into conflict with the gov. troops, and for a brief space he became head of a provisional gov. But following the fall of the com. in May (1871) B. was sentenced to death, the sentence being subsequently commuted to life imprisonment. He was freed before his death.

Blantyre (Gaelic, 'warm retreat'): 1. Par. of Lanarkshire, Scotland, 8 m. S.E. of Glasgow, comprising Blantyre, High Blantyre, and Stonefield. It is the bp. of David Livingstone, whose home and property is now a national memorial (open to the public). Ruins of B. priory, founded late 13th cent., can be seen further along the bank of the R. Clyde. Formerly a coalmining dist., B.'s industries comprise mining, engineering, and general trades on a large industrial estate. Pop. 17,000.

2. Tn of Nyasaland Protectorate, important commercial centre, 350 m. by rail from the port of Beira, Portuguese E. Africa. B. is situated in the Shiré Highlands at foot of Mchiru Mt. The Church of Scotland Mission, in 1876, estab. its H.Q. 2 m. away, and the residence of its head is said to be the oldest European dwelling between the Zambesi and Khartoum. Here is the airport of Nyasaland. Pop. (dist.): Europeans, 1000; Asians, 1500; Africans, 5000.

Blaps, genus of black beetles which numbers more than 100 species. They are dark, wingless, and slow in movement; of

nocturnal habits, they feed on dead vegetable matter, and possess the power of ejecting an acrid fluid with a pungent odour for a distance of sev. inches. A common Brit. species is the *B. mortisaga* or 'churchyard' beetle, which used to be considered as the harbinger of death. The species *B. sulcata*, when cooked in butter, was used as a food in Turkey, especially by women, as it was believed to be fattening.

Blarney, small tn. co. Cork, Rep. of Ireland, 5 m. NW. of Cork. Contains an old castle, built on the site of a still more ant. one founded in 1446 by Cormac McCarthy. The noted 'B. stone,' which is supposed to confer the power of persuasive eloquence on all who kiss it, is situated about 20 ft from the summit. Pop. 885.

Blasco-Ibañez, Vicente, see IBAÑEZ.

Blasius, or **Blaise**, St. Bishop of Sebaste in Asia Minor, who, according to his legend, was martyred in the reign of Diocletian, c. 303. His feast is on 3 Feb. He is the patron saint of woolcombers, as his flesh was said to have been torn by their irons, and he is invoked against diseases of the lungs and throat.

Blaskets, 7 is. off the W. coast of co. Kerry, Rep. of Ireland, near Sleat Head. Great Blasket is 4 m. by $\frac{1}{2}$ m. See M. O'Sullivan, *Twenty Years A-growing*, 1933.

Blasphemy, insulting and opprobrious speech offered to God or persons or objects esteemed sacred. Among the canonists the definition of B. is made to include the denying of God, or the asserting of anything to be God which is not God. Blackstone describes B. at common law as comprising 'the denying the being or providence of God, contumelious reproaches of our Saviour Christ, profane scoffing at the Holy Scripture, or exposing it to contempt and ridicule.' The punishment is fine and imprisonment. The 9 Will. III, c. 35, enacts that if any person educ. in or having made profession of the Christian religion should by writing, printing, preaching, teaching, or advised speaking deny any one of the persons of the Holy Trinity to be God, or shall assert that there are more Gods than one, or shall deny the Christian religion to be true, or the Holy Scripture to be of divine authority, he shall upon the first offence be rendered incapable of being a guardian or executor or of taking a legacy or deed of gift, and suffer 3 years' imprisonment. According to the decision in *R. v. Carlisle*, the statute is merely declaratory of the common law, although apostasy is constituted by the statute a distinct substantive offence included in B. But it has been held that the offence does not consist in an honest questioning of the truths of the Christian religion, but rather in a wilful intention to pervert, insult, and mislead others by means of licentious and contumelious abuse applied to sacred subjects. The disputes of the learned on religion are not punished as B. (*R. v. Woolston*). Whether these latter dicta be sound common law

or not, they are in harmony with the trend of public opinion against putting in active operation the law of B. in all its rigour. Smith's Act, 1813, relieves 'persons denying as therein mentioned' the doctrine of the Holy Trinity. Publications which assail in an indecent and malicious spirit Christianity or the Scriptures in language calculated and intended to shock the feelings and outrage the belief of mankind, are regarded as blasphemous libels (*R. v. Bradlaugh*). The law is rarely put in force.

Blaas, Friedrich (1843-1907), Ger. scholar, b. Osnabrück, Hanover, prof. at Kiel Univ. from 1881 to 1892, and at Halle Univ. after 1892. He ed. numerous classical texts, notably the orations of Aeschines, Andocides, Antiphon, Demosthenes, Dinarchus, Hyperides, Isocrates, and Lysurgus. His other works include *Phularch, Tiberius und Gaius Gracchus*, 1875, *Die attische Beredsamkeit*, 1887-98, *Die Aussprache des Griechischen*, 1888, *Bacchylidis Carmina*, 1898, and *Grammatik des neustamentlichen Griechisch*, 1902.

Blast Furnace, see FURNACES; IRON AND STEEL; METALLURGY.

Blasting, method of shattering or loosening masses of mineral, rock, coal, or obstruction by the discharge of an explosive. It is used both in excavation or tunnelling where the material has no particular value, and in mining, where the material has to be recovered, often in a certain state of coherence. In B. for the purpose of loosening obstructing rock, a large charge of a B. explosive or a series of charges round a central core is used, the effect being to fragment the material for a certain limited distance around a given point, the debris being then removed by ordinary pick or navvy work. In B. for minerals of economic value it is usually advisable to break up the material, often along the natural lines of cleavage. Small charges are therefore used, and the material can then be removed in bulk without the admixture of foreign substances and the over-pulverisation that a shattering charge would cause. To effect B. holes are drilled in the material of varying depth according to the fragmentation required, from a few feet to the full depth of the quarry face. The number, distance from the face and each other, relation to the strata and cleavage planes, and general positioning of these drills is of importance no less than the quantity and strength of the B. explosive used. The explosive is usually provided in round tins of about 10-lb. charge each, and these are let down into the drill hole on top of each other sometimes with prearranged blank spacings at intervals. The charges are set off usually by electric detonator. Delay effects along the charges, and between drills, are employed to enhance the required disruption per unit weight of explosive and size of fragments. Primers are frequently used to ensure satisfactory detonation throughout. See also CHEDDITE; DYNAMITE; EXPLOSIVES.

Blastoderm, first mass of primitive cells

which forms around the protoplasm in the ovum.

Blastoids, group of extinct stemless or short-stemmed pelmatozoan echinoderms with a bud-like skeleton made of relatively few calcareous plates which are symmetrically arranged. They possess an elaborate system of enclosed canals or hydrospheres, which probably served a respiratory function. They existed from Ordovician to Permian times, but were particularly abundant in the Carboniferous (e.g. the genus *Pentremites*).

Blatchford, Robert (1851-1944), journalist, b. Maidstone, the son of an actor. After being an apprentice to brush-making, a soldier in the Dublin Fusiliers, and a clerk at Northwich, he became a journalist, and was connected with the *Sunday Chronicle* from 1885 to 1891. In 1891 he started the *Clarion*, and chiefly under the nom de plume of 'Nunquam' contributed articles of a socialistic and agnostic character, which did much to popularise Socialism among Brit. working people. The simplicity and genial humour of his style made his writings popular even among those who did not share his economic and religious views. His ideals owed much to Wm Morris, and were but little influenced by Marxian economic theories. His pub. works include *Merrie England*, 1894, *Tommy Atkins*, 1896, *Britain for the British*, 1902, *God and my Neighbour*, 1903, *Not Guilty, a Plea for the Bottom Dog*, 1905, and *As I Lay a-Thinkin'*, 1926.

Blattidae, family of insects of the order Orthoptera, which includes the cockroaches (q.v.), often improperly called black-beetles. There is a large number of species found in all lands as active and extremely voracious insects. The head is hidden by the thorax, and the antennae are long and thread-like. The common cockroach of Eng. kitchens is *Blatta* (or *Periplaneta*) *orientalis*, said to have come originally from Asia.

Blavatsky, Helena Petrovna (1831-91) (née Hahn), usually known as Mme B., theosophist, b. Ekaterinoslav, Russia, on 31 July (O.S.). Married at 17, she left her husband after 3 months, and in later years described the marriage as nominal only. She travelled in Asia, S. America, Africa, and India, and on her return in 1858 declared that she had been initiated into esoteric Buddhism, and could perform supernatural feats by the aid of 'mahatmas,' her spiritual tutors. In 1875 she founded the Theosophical Society, whose objects are: (1) To form a nucleus of the Universal Brotherhood of Humanity, without distinction of race, creed, sex, caste, or colour. (2) To encourage the study of comparative religion, philosophy, and science. (3) To investigate unexplained laws of nature and the powers latent in man. Her books, which include *Isis Unveiled*, 1877, *The Secret Doctrine*, 1888, and *The Key to Theosophy*, 1889, are a curious mixture of magical and cabalistic lore, theosophy, and more or less esoteric Buddhism. She d. in London. The secret powers she claimed were rejected by the London

Society of Psychical Research. See E. Garrett, *Isis very much Unveiled*, 1884, and F. Podmore, *Studies in Psychical Research*, 1895. Also under THEOSOPHY.

Blavet, River, coastal riv. of France, which rises in the Landeret Hills and flows into the Atlantic at Port Louis. It crosses the B. swamp, and the Scorff R. flows into it at Lorient. The length of its course is about 87 m.

Blavia, see BLAYE.

Blaydes, Frederick Henry Marvell (1818-1908), scholar, b. Hampton Court Green, a descendant of Andrew Marvell. He was educ. at St Peter's School, York, and Oxford Univ. He took holy orders, and became vicar of Harringworth, Northants, in 1843, holding the benefice until 1886. He ed. numerous classical texts, and his pub. exercised a distinct influence on the study of the classics at public schools during the latter part of the 19th cent.

Blaydon, tn in Durham, England, on the R. Tyne, 4 m. SW. of Newcastle with which it is connected by a bridge. It has manufs. of bricks, paint, and fertilisers, and there are collieries, iron foundries, and coke ovens. Pop. 30,500.

Blaye (ancnt Blavia), Fr. tn., cap. of an arron. in the dept of Gironde. Its citadel is part of a defensive system built by Vauban (q.v.) on the Gironde estuary. It has a trade in wines, fruit, and wood. Pop. 3800.

Blayne, Andrew Thomas, Baron (1770-1834), lieutenant-general, was gazetted major of the 89th regiment, part of which he had raised himself in 1794. He joined the Duke of York, who was fighting in Flanders, and experienced all the perils and misery of the retreat through Holland, 1794-5, but in many of the encounters he gained signal distinction. After assisting Lord Cornwallis in suppressing the Irish Rebellion in 1798, he helped in the reduction of Malta. During the Peninsular war he made a disastrous descent on Malaga. In his *Narrative of a forced Journey through Spain and France as a Prisoner of War*, 1810-14 he describes his own experiences and the state of the 2 countries.

Blazon and Blazonry (derivation uncertain. Wyld gives O.F. *blason* 'shield,' later 'coat-of-arms'; but the Fr. word may come through Ger. *blasen*, 'blow' or 'proclaim'), heraldic terms which originated with the custom of blowing a trumpet to announce a knight's entrance into the lists at a tournament; the knight's coat-of-arms was explained in heraldic phraseology by the heralds who called his name. Thus B. and B. came to mean the art of describing a coat-of-arms in such a way that any one who possessed a technical knowledge could accurately portray it from the description. See HERALDRY.

Blea Tarn (Blue Tarn), name of 2 small lakes in the Eng. Lake Dist.: (1) in Cumberland, on the moor between Borrowdale and Wythburn (1562 ft); (2) in Westmorland, between Dungeon Gill and Fell Foot, the scene of Wordsworth's *Excursion*. The excursionists climbed Lingmoor from Little Langdale vil. and

dropped upon B. T., 'the little lowly vale' from the wild table-land of the 'savage region.'

Bleaching. All textile fibres contain substances (impurities) additional to the main ingredient (cellulose or protein) of which they are composed, and to facilitate the manuf. of these fibres into yarns and fabrics it is usually necessary to add other substances in the form of sizes containing fibre lubricants and agglutinants. When it is desired to dye, print, and finish these yarns and fabrics, it is necessary to remove these extraneous substances by a B. treatment since they would very likely adversely influence the absorption of dyes and finishing agents either because of their water-repellent nature or by reason

impurities, and it is necessary to control B. processes closely so that fibre damage is kept to a minimum—any excessive damage, especially if it is unevenly distributed, leads to uneven dyeing and localised low wear values. The emphasis to-day is on B. processes which can be of the continuous type, that is, allow yarn or fabric to enter a plant at one end and emerge at the other fully purified and whitened. This is possible with cellulose fibre materials, particularly those of cotton, but not with protein fibres such as wool and silk.

B. processes usually involve 2 stages of treatment—a hot scouring with a detergent solution with the object of removing fatty, oily, and waxy impurities by a

BLEA TARN AND THE LANGDALE PIKES

of their chemical reactivity. It has been well said that 'a well-bleached textile material is half dyed.'

Very early processes were based on the power of sunlight and exposure to weathering to disintegrate and make water-soluble the various impurities, so that these could be removed by washing. Sunlight can destroy the natural colouring matters present in most fibres. The obvious disadvantages of having to depend on sunshine, rain, dew, etc., led to the devising of B. methods based on the use of the chemicals which gradually became available towards the end of the 18th cent., e.g. acids, alkalis, soaps, B. powder, sulphur dioxide, etc. The later introduction of hydrogen peroxide as a fibre agent has proved very important.

Modern B. methods involving the use of a limited number of chemical oxidising and reducing agents, supplemented by the use of various types of detergent (q.v.), now allow the purification of all kinds of textile materials to be effected rapidly and (important) with the minimum harm to the fibres. Most of the chemicals employed are capable of impoverishing the fibres at the same time as they attack the

process of emulsification, and a subsequent oxidation or reduction treatment to destroy residual impurities and especially any colouring matters. The conditions of treatment and the chemicals used are chosen to suit the chemical nature of the fibre. It is important that cellulose fibres such as cotton and linen are not harmed by hot to boiling alkalis or by active chlorine in the form of hypochlorite or chlorite, but are readily damaged by acids, while protein fibres such as wool and silk are fairly resistant to acid treatments but readily harmed by active chlorine and by alkalis, especially when these are applied at elevated temps. Thus cellulose fibres can be satisfactorily purified by scouring with boiling dilute solutions of caustic alkalis, followed by B. with alkaline or acidified hypochlorite or chlorite solutions, while protein fibres are preferably purified by scouring at moderate temps. with neutral or very mildly alkaline soap solutions, followed by B. with mildly alkaline hydrogen peroxide solution or by exposure to sulphur dioxide. Hydrogen peroxide is a very useful and satisfactory B. agent for both cellulose and protein fibres and is much used; it

has the great advantage of leaving in the fibres no harmful residual compounds.

The introduction of artificial fibres comprising the earlier so-called rayons, including viscose and cellulose acetate fibres, and also the regenerated protein fibres, and the more recently discovered synthetic fibres such as nylon, Terylene, Orlon, dynel, etc., have necessitated the devising of new or modified B. processes. The rayons are manuf. in a bleached state so that it is generally unnecessary to bleach them further, but when such fibres are present with the natural fibres in yarns and fabrics, they may have to pass through the B. treatment applied to those. Since the rayons are more sensitive to B. damage than the natural fibres, it is necessary to bleach as lightly as possible. On the other hand, some of the synthetic fibres tend to have a yellowish or brownish tint which is difficult to remove even when drastic processes are used. The production of a pure white with synthetic fibre fabrics is often made more difficult by the necessity for heat-setting these (usually at temps. around 250° C.) before wet processing—such treatment may cause increased discoloration. The purification of textile materials has been much assisted by the discovery around 1930 of the so-called synthetic detergents which have now largely displaced ordinary soap. A difficulty met with in scouring textiles with ordinary soap solutions is that if hard water is used a soap scum is formed which can be highly objectionable. The scum consists of insoluble calcium and magnesium salts formed by reaction of the hardness of the water with the sodium fatty acid salts which constitute an ordinary soap. The new synthetic detergents are mainly sulphonic acids or sulphates of fatty alcohols or aromatic compounds, and they are particularly characterised in not forming insoluble calcium and magnesium salts and thus in not giving a scum with hard water. These new detergents have the further advantage of being effective in hard water, whereas ordinary soap under such conditions becomes ineffective. There are many different synthetic detergents now available but the most widely used are those based on sulphonates of alkyl benzenes; such products are assisted in their scouring action by powerful wetting and penetrating properties.

Cotton and linen bleaching. Early B. processes were extremely tedious to carry out, being based on the use of lime as a preliminary treatment for the B. process proper which used calcium hypochlorite (B. powder), but they have now been almost completely superseded by more rapid although perhaps not more effective processes. A typical process for an all-cotton woven fabric consists of running the fabric very rapidly in open-width over a gas flame issuing from a suitably long slot to burn off fibre ends protruding through the fabric surface, and thus make this less hairy and more sheer, quenching any dangerous sparks by a run through a water-trough, running the fabric through a 1 to 2 per cent solution of caustic soda

+ sodium carbonate (a more drastic treatment results by using a higher proportion of caustic soda) and evenly packing it within a kier (a vertical steel container provided with a false bottom and in communication with a heater and with a top cover which can be fastened down watertight) so as to allow a continuous circulation of the alkaline liquor downwards through the cotton fabric to be maintained. In this kieren stage, the alkaline liquor is sprayed over the top of the fabric and is withdrawn through the false bottom, whence it passes through the heater to be raised to the boil at 100° C. or higher (under pressure) and pumped again to the spraying device. Kieren of the fabric may occupy from say 4 to 12 hrs and then the fabric may be run out of the kier through a washing machine and be returned to the kier for a further treatment with the boiling alkaline liquor, so as to complete solubilisation and emulsification of all the impurities with the exception of the natural yellow colouring matters. The fabric is withdrawn, again washed, and then impregnated with a dilute solution of sodium hypochlorite and piled in smooth tiled cisterns to lie for 1 to 2 hrs while the cotton is bleached to a pure white as the yellowing colouring matters are destroyed by oxidation. Then follows a thorough washing to remove all soluble impurities and extraneous chemicals. The fabric is at this stage ready for finishing in its white bleached state or for dyeing or printing. If the cotton fabric contains rayon or synthetic fibres then it may be desirable to avoid the kieren. In this case the fabric will be singed and run through a liquor containing a dilute solution of a starch-liquefying enzyme, such as a diastase made from malt or from fermented starch or from animal waste matter, then to be piled in cisterns to allow sufficient time for the enzyme product to solubilise most of the impurities. Then will follow a thorough washing and a hypochlorite B. If the rayon present is of the regenerated protein type adversely affected by active chlorine, then hydrogen peroxide will be used as the B. agent as for wool B. Linen fabrics are bleached similarly to those of cotton, except that it is not necessary to be so thorough. Indeed too complete a removal of the natural impurities would result in a loss of weight not commercially acceptable. Cotton and linen yarns are kieren and bleached in much the same manner as fabric, except that the methods of manipulation are appropriately modified. In all such B. it is especially important to avoid irregular oxidation of the cotton fabric or yarn; such oxidation is promoted by exposure of the cotton saturated with hot alkaline liquor to air, or by contact of the hypochlorite saturated cotton with metal such as iron or copper, and it leads to formation of patches of oxycellulose which resist dyeing with direct cotton dyes and which are a source of fabric or yarn weakness. Viscose and cellulose acetate rayon fibres are much weaker in their wet state, so that they must be handled with more care

than is necessary for cotton; they are particularly liable to damage by sheering during mangling operations.

Wool and silk bleaching. Wool is very greasy and may contain up to 50 per cent of wax and fatty impurities mixed with suint (perspiration residues). Silk as spun by the silkworm is a double thread consisting of 2 fibroine fibres cemented together by silkum (alkali-soluble sericin). Both fibres contain yellow to brown colouring matters.

Wool is brought into a purified condition by first scouring it (usually in the form of loose fibre as a preparation for spinning into yarn) with a warm mildly alkaline soap solution. If the wool contains much vegetable impurity such as twigs, leaves, etc., then it is impregnated with a 4 per cent solution of sulphuric acid, dried, baked at 100° C., and then 'willowed' or beaten to disintegrate the vegetable matters made friable by the acid baking (carbonising), so that these can be finally easily removed by washing. Since loose wool must have added to it a lubricant before spinning, it follows that yarns and fabrics must also be scoured to remove this before dyeing and finishing. Such scouring is usually effected with the aid of soap and alkali, but there is a risk of impoverishing the wool if too much alkali is used. The B. of wool to secure a good white is achieved by suspending the moist scoured yarn or fabric within chambers filled with sulphur dioxide produced by burning lumps of sulphur in one corner, or by treating the wool with a warm moderately alkaline dilute solution of hydrogen peroxide. In the latter case it is usual to pack the wool into a large container holding a 2- to 4-volume hydrogen peroxide solution stabilised with sodium silicate or an oxalate and leave it overnight; the wool is then washed. The white produced by treatment ('stoving') with sulphur dioxide is not permanent, so that the yellow colour gradually returns, but hydrogen peroxide B. yields a permanent white. Raw silk is purified from silkum and the double thread separated into single threads by a thorough boiling in a 1 per cent soap solution; the removal of the silkum involves a 25 to 30 per cent loss of weight which is sometimes made good by a subsequent weighting treatment. The silk is made white by B. it as for wool with an alkaline hydrogen peroxide solution. Both wool and silk (but not so easily wild silks) can be easily impoverished and given a harsh handle by using alkali under too drastic conditions in the scouring and B. operations.

Various materials such as jute, hemp, straw, and paper-making fibres can be purified and made white by alkaline scouring or kiering followed by treatment with hypochlorite or hydrogen peroxide solutions; the exact conditions have to be adjusted to suit the particular type of fibre.

Fluorescent whitening agents. A very important new method for whitening textile materials of all kinds has been developed by the discovery that if a substantially white or colourless substance

having the power to emit a bluish fluorescence in ultra-violet light is applied to a half-bleached or off-white yarn or fabric (this will usually be slightly yellowish), then to one observing it in daylight (this contains a sufficient proportion of ultra-violet light) the bluish fluorescence will not only mask the yellowish tint but also contribute added whiteness, so that the yarn or fabric appears much whiter than it really is. If a fully bleached and white material is similarly impregnated with the fluorescent substance, then a remarkably brilliant white is produced. Many proprietary so-called fluorescent whitening or optical B. agents of this kind are now available and they are widely used in circumstances where the use of a chemical B. agent such as a hypochlorite or hydrogen peroxide would harm the fibre; the new whitening agents have no chemical action on the fibres whatever. In the past, improvement of white materials has been obtained by application of ultramarine as a bluing agent, but this has the disadvantage of introducing a certain degree of greyness. The new whitening agents have not this defect and actually increase the whiteness as well as make it a purer white. See S. H. Higgins, *The History of Bleaching*, 1924; J. T. Marsh, *An Introduction to Textile Bleaching*, 1946; A. J. Hall, *The Standard Handbook of Textiles* (4th ed.), 1954, and *A Handbook of Textile Dyeing and Printing*, 1955.

Bleaching, cap. of the Marlborough dist. of New Zealand, situated on the Wairau R., near the coast, 20 m. S. of Picton by rail. Pop. 9210.

Bleaching Powder, rather dirty white powder made by the action of chlorine upon slightly moist slaked lime. In Bachmann's process the lime is blown to the top of a chlorinating tower by means of compressed air, and is distributed to the highest floor of the tower through a hopper. It then falls to successive lower floors, on each of which it is mechanically raked, while a current of chlorine is driven up the tower in the opposite direction. Conditions are so adjusted that by the time the product reaches the last floor it is fully chlorinated. Hot air is now blown through it to remove free chlorine, and the B. P. falls into a hopper from which it can be delivered into containers. B. P. or 'chloride of lime' is a mixture of calcium hypochlorite, $\text{Ca}(\text{OCl})_2$, with basic calcium chloride monohydrate, $\text{CaCl}_2 \cdot \text{Ca}(\text{OH})_2 \cdot \text{H}_2\text{O}$. When treated with dilute acids it yields chlorine gas. The chlorine so obtained is known as 'available chlorine.' A good commercial sample gives 36-40 per cent of its weight of chlorine. B. P. is used in bleaching (q.v.), as a disinfectant, and to destroy mustard gas. On exposure to air it gradually deteriorates.

Bleak, fresh-water fish belonging to the Cyprinidae, in which the air-bladder opens into the gullet. The common B., *Alburnus lucidus*, is a fish with a prominent jaw and an elongated body, generally from 5 to 7 in. in length. It is common in the European rivs. N. of the Alps, and occurs in large shoals. It forms a great part of

the diet of such fish as the pike, trout, etc. Artificial pearls are manuf. from the coating of its scales.

Blechnum, genus of ferns of the Polypodiaceae, about 180 species, of which *B. spicant*, the Hardfern, is alone found in the N. hemisphere, including Britain. Others are grown in greenhouses.

Bleda (*d.* 445), King of the Huns, brother of Attila (*q.v.*). The 2 reigned together from 434 to 445, when B. was put to death.

Bleeding, discharge of blood occasioned by the rupture or cutting of arteries, veins, or capillaries. There may also be a general oozing from congested mucous surfaces, although no fissure in the walls of the vessels can be detected. Arterial B. is characterised by jerky or spurting emission and the bright scarlet colour of the fluid; in venous B. the fluid is dark red and comes in a continuous stream; capillary B. is shown by a bright red colour and a gentle flow. The methods of stopping B. for first-aid purposes involve the elevation of the wounded part, the application of cold, and pressure by fingers or bandages at suitable points. If the B. is arterial, pressure must be applied to the artery between the heart and the wound, and if the artery is some distance below the surface a tourniquet may be necessary. Venous B. is checked or stopped by pressure directly on the wound by a pad kept in position by bandages. Internal B. is best treated by keeping the patient in a recumbent position. B. as a remedial measure is seldom resorted to nowadays as compared with its continual use centuries ago. The means adopted are venesection, cupping, and leeching. *Venesection*, or the cutting of a vein, is used to relieve venous engorgement; a vein in the forearm is opened. *Cupping* means withdrawing blood by means of the reduced air pressure in a heated cup placed over a puncture in the skin. It is not now used. *Leeches* are applied over prominences where pressure can afterwards be applied to stop the B. They may either be allowed to drop off of themselves or induced to do so by the application of salt. *See* CUPPING; HAEMOPHILIA; LEECHES; VENESECTION or PHLEBOTOMY.

Bleek, Friedrich (1793-1859), Ger. biblical critic, *b.* Ahrensböck, Holstein. He studied theology at Kiel and Berlin; became a tutor at the latter univ. in 1818, and prof. of theology in 1823. In 1829 he moved to Bonn, where he was also prof. of theology till his death. His chief work is his commentary on the Hebrews, one of the best exegetical works of the 19th cent. His *Introduction to the Holy Scriptures*, 1860-2, and the *Lectures on the Apocalypse*, 1875, were trans. into English.

Bleek, Wilhelm Heinrich Immanuel (1827-75), Ger. Africanist. In 1855 he went to S. Africa to study the native languages and folklore; 1856, librarian to the Governor Sir George Grey; later became interpreter to the Department of Native Affairs; 1862, Keeper of the library founded by Grey. In 1862-9 appeared

the first two parts of his main work (unfinished), *Comparative Grammar of South African Languages*. May be regarded as founder of scientific research on Bantu languages; he also studied the Hottentot and Bushman languages. His research was continued by his sister-in-law Lucy C. Lloyd (who ed. *Specimens of Bushman Folklore*, 1911) and his daughter, Dorothy B.

Blehr, Otto (1846-1926), Norwegian politician. A Liberal, he took part in the agitation for the estab. of parl. gov. in Norway. When this had been attained in 1884, he turned his attention to the question of the separation of Norway and Sweden, and, as Prime Minister, he was leader of the movement for the peaceful settlement of that issue.

Bleiberg, Austrian vil. in the prov. of Carinthia, 8 m. W. of Villach, on the N. slope of Mt Dobratsch. It has lead mines and lead-pigment works. Pop. 3000.

Bleibtreu, Georg (1828-92), Ger. painter, *b.* Xanten, Rhenish Prussia. Pupil of Düsseldorf Academy, 1843-8, also later under Hildebrandt. In 1858 he went to Berlin, where he made his first success with scenes from the Dan. war. In 1866 he accompanied the Prussian army in the suite of Prince Frederick Charles; 1870 in that of the crown prince; 1869 member of Berlin Academy. The works for which he was celebrated consisted of battle-scenes from the wars of Frederick the Great, the Napoleonic wars, and from other wars during his lifetime.

Blekinge, prov. of Sweden, which is washed by the Baltic Sea on the E. and S. sides. It is one of the most beautiful and historically interesting parts of Sweden. It belonged to Denmark, with the exception of 1332-60, till 1648, when it was united to Sweden. The chief tn is Karlskrona. The area of B. is 1300 sq. m. Pop. 147,000.

Blenathra, *see* SADDLEBACK.

Blench Holding, *see* BLANCH.

Blende (Ger. *blenden*, to deceive), one of the prin. zinc ores, a zinc sulphide. In nature it occurs both crystalline and massive, and sometimes in a soft amorphous form. In its pure state the crystals are colourless and transparent, though mostly they are coloured by traces of iron or other metals. B. generally occurs as a yellow-brown or black mineral with a somewhat resinous lustre, associated with ores of lead. Alternative names of B. are sphalerite, false galena, and black jack. Other varieties are manganese-blende, ruby-blende, and antimony-blende.

Blénau, Fr. vil. in the dept of Yonne, on the Loing. Turenne (*q.v.*) defeated the great Condé (*q.v.*) here in 1652. Pop. 1600.

Blenheim: 1. Ger. *Blindheim*, vil. of Bavaria on the l. b. of the Danube, a short distance below Höchstädt. It is remembered as being the scene of the defeat of the French and Bavarians under Tallard on 13 Aug. 1704, by the English, under the Duke of Marlborough, allied with the Austrians under Prince Eugene. The French and Bavarians lost over 30,000 killed, wounded, and prisoners,

and the Allies about 12,000. The battle is known on the Continent as the battle of Höchstädt. Pop. of B. is 970.

2. Cap. of Marlborough co., in the S. Is., New Zealand, 15 m. from Picton, its port. There are 2 airfields nearby. Pop. 7860.

Blenheim Palace, seat of the Duke of Marlborough, near Woodstock, Oxon. It was presented to Marlborough in acknowledgment of his victory at Blenheim during the reign of Queen Anne. It stands in the royal estate of Woodstock, which also formed part of the reward. The £500,000 voted for the presentation was found to be insufficient. Its architect was Sir John Vanbrugh, whose powers are amply proclaimed by the grandeur of the massive building, the length of whose front is 348 ft. The area of the park is 2700 ac., and its boundaries 12 m. long. The trees are said to be arranged on a plan similar to the placing of Marlborough's men at Blenheim. The R. Glyme widens into an artificial lake, and is spanned by a large bridge.

Blenheim Spaniel, variety of miniature spaniel much like the King Charles, but with shorter ears and different in colouring, being pure white with brown and red markings. Its name comes from the estate of the Duke of Marlborough, where it was first bred. See SPANIEL.

Blenker, Ludwig (1812-63), Amer. soldier, b. Worms. After the revolution of 1849 he fled to U.S.A., and being made a general in the Federal army he fought with distinction throughout the Civil war.

Blenkinsop, John (1783-1831), engineer, b. near Leeds. He was a forerunner of Stephenson in the development of the locomotive. His locomotive was patented in 1811, its chief feature being a cog-wheel that fitted into a toothed rail. At a test at Hunslet, Leeds, on 24 June 1812, it covered 1½ m. in 23 min., 'without the slightest accident.'

Blennerhassett, Harman (1765-1831), Irish-American, lawyer, b. Hants, England, where his mother was staying temporarily; educ. at Trinity College, Dublin, and called to the Irish Bar, 1790; he married his niece, and ostracised for this went to America, where he bought an is., since called B. Is., in the Ohio, near W. Virginia; he supported Aaron Burr in his conspiracy, and his is. was plundered by the W. Virginia militia; he went to Canada later, where he practised as a lawyer, and returned to England in 1822, dying on Guernsey.

Blennorrhoea, excessive discharge of mucus (q.v.).

Blenny, name given to various species of percomorph of the suborder Blennioidea. They are littoral fishes found in all temperate and tropical seas in great variety; they are of small size. The B.s. are distinguished by having the pelvic fins placed before the pectoral fins, and each consists of 1 to 3 soft rays. *B. ocellaris*, butterfly blenny, is a Brit. species.

Blepharitis, inflammation of the free edges of the eyelids. B. is as a rule a chronic condition and follows infectious

diseases in children. Those who suffer from it are usually undernourished, delicate, and debilitated. The disease is characterised by the formation of crusts along the margins of the eyelids. Treatment consists in the application of penicillin ointment after first removing the crusts. Recurrences of B. are likely unless attention is paid to the general health.

Blériot, Louis (1872-1936), Fr. aviation pioneer, b. Cambrai. After unsuccessful efforts at designing biplanes in 1905, he became the brilliant pioneer of the practical monoplane, a type he started building and flying in 1907, and which culminated in the type XI in which he was the first to fly the Eng. Channel on 25 July 1909, an achievement which brought him world fame and did more than any other flight to impress the world's govs. with the vital importance of aviation. This flight brought B. many orders and caused the B. monoplane to be used the world over.

Bles, Harri met de (1480-c. 1550). Flem. artist, b. Bouvignes. He is usually identified with Harri Patenier, nephew of Joachim Patenier, whose style he imitated. He generally painted landscapes, with scriptural subjects introduced, and instead of signing his own name painted an owl in the corner. His name is understood to refer to his shock of white hair.

Blessed Virgin, Servants of the, see SERVITES.

Blessington, Marguerite, Countess of (1789-1849), Irish writer, daughter of Edmund Power, a small landowner, b. Knockbrett, Tipperary. She was compelled to marry Captain Farmer when she was only 14. His worthlessness caused her to leave him after 3 months. Not long after his death she married Charles Gardiner, Earl of Blessington, in 1818. In 1822 she toured the Continent, and while at Genoa made the acquaintance of many distinguished men, among them Byron. This acquaintance ripened into friendship. Till 1829, the year of her husband's death, she lived in Paris, and here as in London became the leader of a world of music, art, and literature. With the fortune left her she estab. a court at Gore House, Kensington. Latterly she became bankrupt and lived under the protection of the Count d'Orsay. Her *Conversations with Byron* were pub. in 1834, and she also wrote some novels and travel books. See M. Sadleir, *Blessington-D'Orsay*, 1933.

Blessington, vil. of co. Wicklow, Rep. of Ireland. Here is Poulaphouca, an artificial lake at the confluence of the rvs. Liffey and Kings, providing Ireland's second largest hydro-electric scheme.

Bletchingley, vil. of Surrey, England, 5 m. NE. of Reigate. Fuller's earth is raised in the neighbourhood. Pop. 3000.

Bletchley, urb. dist. of Bucks, England, comprising B. Fenny Stratford (q.v.), Simpson, and Water Eaton. Pop. (1955), 12,000; is being developed by expansion from London (45 m.).

Bletting, first stage in the decomposition of ripe fruits, when *blets*, or rotten spots, first appear on them. Some fruits

such as the medlar, are kept until they reach this stage to improve their flavour.

Bleuler, Eugen (1857-1939), Swiss psychiatrist, b. Zollikon, Zürich. He studied at Zürich, Berne, and Munich, qualifying in medicine in 1883. From 1888 to 1927 he was prof. of psychiatry at Zürich. Here, with his pupils, he studied the psychological aspects of mental disorder, using both the experimental methods of Wundt and the psycho-analytical procedures and theories of Freud. In 1906 he pub. *Affektivität, Suggestibilität, Paranoia*, and in 1911 introduced the concept of schizophrenia, and showed that Kraepelin's *dementia praecox* should include all the schizophrenic disorders (*Dementia Praecox oder die Gruppe der Schizophrenien*, 1911). Later he became more and more critical of psycho-analytic theory. He also wrote on the psychopathology of hallucinations, a text-book of psychiatry (1916), and *Naturgeschichte der Seele*, 1932.

Blewfields, see BLUEFIELDS RIVER.

Blewits, edible mushrooms found in autumn. *Tricholoma personatum*, with greyish cap and thick, violet-stained stem, is a pasture species; *T. nudum*, Wood B., is a clear bluish lilac when young, cap and gills becoming somewhat reddish. See AGARICUS.

Blicher, Steen Stensson (1782-1848), Dan. novelist and poet, b. near Viborg, educ. at Copenhagen. In 1819 he became pastor at Thorning, and in 1826 at Spøndrup, Jutland. Between the years 1807-9 he trans. Ossian; and the pub. of *Snaeklokken*, 1826, and *Jyske Romanzer*, the first of his Jutland tales, earned him great popularity, which was, however, surpassed by his *National Noveller*, which admirably reflect country life of Jutland. As a poet he is essentially national, and his works are full of tenderness and philosophic thought. See J. Nørvig, *Blicher Hans Liv og Vaerker*, 1943.

Blickling, vil. of Norfolk, England, near Aylsham. It is famous for its hull, which is a fine quadrangular red-brick Jacobean house, the building of which was begun by Sir Henry Hobart, Lord Chief Justice of England, who pulled down the 14th-cent. manor-house, in which Anne Boleyn spent much of her childhood. The present hall was completed in 1626 by the son of the Chief Justice, who entertained Charles II there. The W. front was rebuilt in 1729 after a fire. B. was sold by the old knight, Sir Thomas Erpingham, to Sir John Fastolf. The whole of the village of B. belongs to the National Trust. The fine park contains a lake. B. church is a Perpendicular structure on the S. side of B. park. Pop. 270.

Blickling Homilies, so called because the MS. containing them is preserved at Blickling Hall, Norfolk, consist of 19 sermons belonging to the third quarter of the 10th cent. Their style represents a transition from the prose of Alfred to that of Aelfric. Ed. by W. Morris, 1874-80, for the Early English Text Society.

Blida, tn of Algeria 25 m. by rail from Algiers. It possesses orange groves, while other products include cotton, raisins,

grain, tobacco, and cork-wood. Earthquake visitations occurred in 1828 and 1867. Pop. 67,913, including approximately 12,000 Europeans.

Bidworth, coal-mining vil. of Notts, near Mansfield, England. Pop. 4000.

Bligh, William (1754-1817), admiral, b. of a Cornish family. His name is usually connected with the mutiny of the *Bounty*. He sailed with Cook on his second voyage as sailing master, and during this voyage bread-fruit was discovered at Tahiti; from this discovery he received his nickname Bread-fruit Bligh. After seeing some active service he was sent back in command of the *Bounty* to introduce the bread-fruit plant into the W. Indies from Tahiti. He stayed at Tahiti for some 6 months, and during that time his men became so demoralised that on sailing for the W. Indies his crew mutinied, and he and his officers were cast adrift. After a voyage of over 4000 m. in an open boat they managed to reach Timor. On his return to England in 1790 he was appointed to the *Providence*, and managed at last to carry out his original project. He was present at the mutiny at the Nore in 1797, and later fought under Duncan at Camperdown, being present also and specially mentioned at the battle of Copenhagen. In 1805 he was appointed governor of New S. Wales, but his severity led to mutiny, and for 2 years he was imprisoned. The officer who led the revolt was later brought home and cashiered. In 1811 he returned to England, and was made first a rear-admiral, and later a vice-admiral. He d. in London after a courageous but somewhat stormy career. See G. Mackaness, *Life of Vice-Admiral William Bligh*, 1936, and H. V. Evans, *Rum Rebellion*, 1938.

Blighia, genus of plants named after Adm. Wm. Bligh, R.N., family Sapindaceae. *B. sapida*, the akoe-tree, is the sole species, and is a native of Guinea. It is cultivated for its fruit, the aril of the seed is pulpy, and has a pleasant subacid flavour.

Blight, term used generally to describe some insect infestation (e.g. Aphides, q.v.) or fungus infection (e.g. Potato Blight (q.v.)) of plants, and often associated with certain kinds of weather, in which the parasites increase rapidly.

Blighty (corruption of Hindustani *belati* from the Arabic *wilāyat*, meaning a prov. or distant country), word which came into use among the Brit. troops in the First World War, signifying the home country.

Blimbing, or Bilimbi, see AVERROHA.

Blind, Karl (1826-1907), Ger. author and revolutionary, b. Mannheim; he studied law at Heidelberg. He was sentenced to a term of imprisonment for his part in the revolution of 1848; but escaped to Belgium, and then to England, where he continued his revolutionary activities. The Schleswig-Holstein movement had its origin in B., who directed his efforts to the estab. of Ger. unity. He also pub. numerous historical works.

Blind, Mathilde (née Cohen) (1841-96), Brit. poetess; she adopted the name of her

stepfather, Karl B. (q.v.). At different periods she travelled in Switzerland, Egypt, and Italy, and it was her visits to Scotland that inspired her to write 2 long poems, *The Prophecy of St Oran*, 1881, and *The Heather on Fire*, 1886, which is a passionate outcry against the Highland evictions. In her epic, *The Ascent of Man*, 1888, she handles so vast a theme as Darwin's theory of evolution. As a writer of biography she is remembered for her *George Eliot*, 1893, and *Madame Roland*, 1886, whilst she showed her gift for trans. in her Eng. renderings of Strauss's *The Old Faith and New*, 1873-4, and *The Journal of Marie Bashkirtseff*, 1890. At her death she bequeathed her property to Newnham College, Cambridge.

Blind Landing, system of radio signalling as aid to landing of aircraft at the airport in conditions of low visibility. In 'instrument landing,' the aircraft flying at 2000 ft first obtains indication of correct direction of approach at a distance of about 25 m. by a radio range (q.v.). From about 5-10 m., the pilot is guided in the horizontal course by a set of beacons transmitting signals, each at distinctive modulation, and at the same time the aircraft begins to descend under the guidance of a vertical range system consisting of 2 aeriels, one above the other, with distinctive intensity patterns, transmitting signals of different modulations. On passing each marker beacon, a special coloured lamp flashing in the aircraft informs the pilot of his position. When the last beacon is passed, the aircraft should be a few ft above the runway. Sometimes a ground control is used as emergency. Here the pilot is instructed by radio signals from the ground, where a radar transmitter gives the controller the position of the aircraft at any instant.

Blind River, in Ontario, Canada, 70 m. E. of Sault Ste Marie, the site of largest and most important uranium development in N. America. Pop. 2054.

Blind Spot, that part of the retina or internal nervous coating of the eyeball where the optic nerve pierces through from the rear. The nerve fibres not having spread out at this point, light falling thereon conveys no impression; so that if a small object is so placed that the rays of light from it fall only upon this area it is not perceived as being in the field of vision. See EYE.

Blind-storey, in medieval architecture, an alternative name for the triforium (q.v.). It is called a B. in contradistinction to the clerestorey (q.v.), which is pierced with windows, because the triforium opens into a dark, enclosed space in the roof over the aisle.

Blind-worm, or **Slow-worm** (*Anguis fragilis*), wormlike reptile usually about 12 in. long, of which length half is tail. Internal traces of limbs indicate its relation to the lizards. Its nostrils are provided with shields, while its eyes are protected by scaly and movable eyelids. It possesses long and pointed teeth which incline backwards. The colour depends upon the age and varies a great deal accordingly, but usually the adult is

brown above and black underneath, while its young are white with a black stripe running along the centre of the back. They inhabit bushes and feed upon earthworms and slugs. Their bite is harmless. They are timid creatures, and their fright often causes a contraction of the muscles resulting in a rigidity so tense that endeavours to bend the creature often cause breakage. They hibernate during winter in groups of about a score.

Blindage, screen constructed of earth and timber, or other available materials, which soldiers build to protect themselves against the enemy's fire when they are in a trench.

Blindheim, see BLENHEIM.

Blindness and the Blind. *Blindness and causes of blindness*. The term means inability to see. B. may be congenital or acquired. When congenital, it may be due to a developmental fault in the embryo or to some pathological change during intra-uterine life caused by some toxin or deficiency in the maternal blood. Congenital cataract may be due to a deficiency of vitamin A, B, and B₂, and calcium in the maternal circulation, or to the toxin of some infective disease. Acquired B. may be due to injury or disease of any part of the chain of structures which, together, make up the visual mechanism (see EYE). Injuries may be of any kind from a direct, penetrating injury to an indirect one, such as a fractured skull involving the optic nerve. Diseases causing B. may be those of the eye itself or manifestations of some constitutional disease. Diabetes, for example, may cause B., and certain vascular accidents such as embolism of the retinal artery or thrombosis of the retinal vein may occur in association with diseases of the circulatory system. *Retrolental Fibroplasia*, a disease of the retina caused by an overdose of oxygen, was the cause of B. in over half of those registered as blind under one year old between 1951-4. In that period there were about 2000 cases. Now that the cause of the condition is known and since oxygen dosage in the newborn has been reduced, there have been practically no cases. Again, bacterial infection of the eye as part of a generalised infection may bring about pathological changes causing B., syphilis and tuberculosis being notable examples of this. Diseases causing B. that are purely ocular in origin may be divided into those due to bacterial infection and those due to some pathological change in the structures of the eye. Taking the world over, acute infective inflammations of the eye are still the commonest cause of B. in children and people of young and middle age. Of these conditions ophthalmia neonatorum (q.v.) (see also GONORRHOEA) and trachoma (q.v.) are outstanding. In this country, thanks to better living standards, ophthalmia neonatorum is seldom seen now, and trachoma never. Of the pathological diseases of the eye causing B., glaucoma (q.v.) and cataract (q.v.) are the commonest. Primary and secondary tumours of the eye do occur but they

are rare. The treatment of B. consists mainly in prevention and the treatment of those conditions which may give rise to it. As a rule, once B. has set in it is irreversible. Surgical removal of a cataract is an exception, although the sight is not often perfectly restored. Another exception is the amazing cures now achieved by the method of corneal grafting. The cornea (the transparent membrane covering the eyeball in front of the lens), scarred and thickened as a result of inflammatory diseases, injury or in some congenital condition, may be so opaque as to prevent the penetration of light to the retina, either completely or to an extent in which the patient can but barely distinguish between light and dark. This condition can now be relieved by removing the diseased cornea and grafting in its place a healthy cornea. The number of these operations was at first limited by the smallness of the number of healthy corneas available. It was discovered, however, that corneas removed within 2 to 10 hours after death and suitably stored could be used for corneal grafting, and under the Corneal Grafting Act, 1952, it is now possible for persons during their lifetime to bequeath or express a wish that their eyes may be used for this purpose after their death. The arrangements under the Act ensure that the person's wishes will be carried out with all propriety. As the bequeathed eyes have to be removed within 10 hours of death it is necessary that the procedure should be known beforehand, and it is wise to ask the family practitioner for information. One more condition causing B. must be mentioned, namely sympathetic ophthalmia. For some unknown reason severe injury to one eye is often followed after about 2 to 3 weeks by inflammatory changes leading to B. in the other, for which there is no known treatment. With these exceptions, the prin. treatment for B. must be that of social rehabilitation, and this has been recognised in the number of statutory and voluntary provisions which have been made for the care of the blind. In Dec. 1954 there were 106,260 registered blind persons in the Brit. Isles. This compares with the 25,840 registered in 1919; but the increase does not indicate an increase in the incidence of B. Indeed, the figures for B. in children of school age show a decrease from 37.0 per 100,000 in 1923 to 21.1 in 1950. This shows that B. is decreasing and not increasing. The larger number of registered blind persons to-day reflect a more efficient system of registration and a greater desire on the part of the blind to be registered.

Institutions for the blind. Before the 18th cent. there can be little doubt that no organised scientific effort for the relief of the blind ever manifested itself in the shape of responsible institutions either in this country or elsewhere. The first regularly organised estab. for the relief of the blind was the Hôpital Impérial des Quinze-Vingts in Paris, said to have been founded by St Louis in 1260 as an asylum for 300 of his soldiers who had lost their

sight in the crusades. This institution, its capacity trebled, is still in existence, but no instruction was ever imparted to its blind inmates. The first successful effort in systematic instruction was made in Paris by Valentin Haüy (1745-1822), whose disgust, it is said, was so excited by the public contumely to which the more ribald elements of the Parisian common folk subjected the pauper blind, that he set about devising means for rendering them, as a class, less helpless. Inspired by the success of the celebrated Abbé de l'Épée in the education of the deaf and dumb, Haüy believed that equally happy results could be effected for the blind, and it seems soon to have occurred to him that the most feasible method of instruction was by means of letters formed and printed in relief. The first outcome of Haüy's efforts was, in 1784, a book for the blind, and the foundation, under the patronage of the Philanthropic Society, of the Institut des Jeunes Aveugles, in Paris, organised under the immediate charge of Haüy himself. In 1786 Haüy gave an exhibition of the attainments of his 24 pupils before the king and royal family at Versailles, when the institution was placed on a more permanent footing by the royal bounty. Later, he was invited by the Russian Emperor to St Petersburg for the purpose of founding a similar institution in that city. In 1791 the School for the Indigent Blind was opened in Liverpool, its institution being due to the suggestions of a blind man named Edward Rushton. This school was speedily followed in 1793 by the Royal Blind Asylum in Edinburgh. After that the estab. of institutions for the blind occurs at intervals averaging no more than 2 or 3 years all over the U.K. up to 1879. The majority of them, however, are regarded primarily as asylums and not as educational estab. at all. There has been a similar progress in the U.S.A., but on a more scientific scale, for in that country every state in the Union has long since made some provision for the education of its blind. In 1869 was founded in England the Brit. and Foreign Blind Association, since 1914 known as the National Institute for the Blind, to which body and, in a lesser degree, to the Royal Normal College of Music, Norwood, and the Worcester College for the blind sons of gentlemen, were due the improvement in the methods of education of the blind.

In Great Britain there are numerous resident schools and 65 special workshops for the blind. In addition there are many home teaching societies who send teachers to visit the blind in their homes and lend embossed books. The National Lending Library, founded in 1882, holds now nearly 150,000 vols. in Braille and Moon types. There are also 36 pension societies, chief among which are the Royal Blind Pension Society, Society for Granting Annuities to the Poor Adult Blind, National Blind Relief Society, Clothworkers' and Cordwainers' Companies, Hetherington's Charity, and others, while the Gardner Trust administers the income

of a bequest of £300,000 left by Henry Gardner in 1879 for the relief of the blind.

The State and the blind—The Blind Persons Act, 1920. Relations between the State and the blind, indicative of practical sympathy, are of recent development. There is no example of state monopolies being granted to the blind, but in Germany an act of 1923 made compulsory the employment of a small percentage of disabled men, including the blind, among normal workers. In France, also, a Compulsory Employment Act was passed in 1924, but only those blind persons who lost their sight in the First World War can claim benefit under it. Here and there, too, in Europe, where there are state monopolies in handling tobacco or matches, a preference in the matter of employment has been granted to the disabled, including the blind. England goes no further than an official recommendation to gov. depts and local authorities to give preference to goods produced by workshops for the blind. The First World War, however, gave a real impetus to the movement for the emancipation of the blind, and legislation which had been for years accorded only half-hearted support was speeded up. Generally speaking, however, the countries which emerge best out of the test of state responsibility for the blind are the Eng.-speaking countries. In many states of the U.S.A. state commissions, for the welfare of the blind have been estab. and many states grant pensions to blind persons as such. In Great Britain limited state pensions are paid, while many local services are insisted upon by the State and supported by public funds. Much of this activity may have had its beginnings before the war, but they were stimulated by the return of the blinded men from the fighting forces.

The Eng. Act of 1920 was the first attempt to provide nationally and comprehensively for all sections of the blind community. The Act falls into 2 parts. The first makes provision for pensions for practically all blind persons over 50 years of age; subject to inability to perform any work for which eyesight is needed the blind were by this Act entitled to pension at the age of 50 on the same scale, according to means, as those to other 'non-contributory' persons at the age of 70 under the Old Age Pensions Acts 1908-1924 (Consolidated Act, 1936). The second part of the Act requires local authorities to make schemes, to be paid for jointly out of national and local funds, for the estab. of homes, hostels, and workshops, the payment of allowances to the unemployable blind, and the organisation of home teaching and home workers' schemes. Generally speaking, the local authorities have operated their schemes in conjunction with voluntary agencies because the latter possess both specialised knowledge and the available voluntary services required. It may be noted that the Act, while it compels local authorities to submit schemes which they will be prepared to carry out, does not compel adherence to any particular

method, but leaves the adequacy of the scheme very largely for local decision. The Act also provides for the registration of the blind persons themselves and of voluntary charities operating on behalf of the blind—the object of the latter being to give some guarantee of bona fides in the interests of the blind. By the Blind Persons Act, 1938, the pension age was lowered from 50 to 40—thus directly benefiting some 7000 blind persons between the ages 40 and 50 in England and Wales alone—and, further, blind persons (and their dependants) were, apart from exceptional needs, removed entirely from the Poor Law (now abolished by the post-war social insurance legislation) by statutory provision which brought all local authorities on the footing of those who had already exercised their option (under the Local Government Act, 1909) by declaring their obligation to assist blind persons, in their administrative schemes, exclusively under the Act of 1920. The Ministry of Health has also appointed a standing advisory committee on B., including its prevention, to carry on the work hitherto undertaken by the special committee of the Union of Counties Associations for the Blind, which therefore ceased to exist in 1938.

Education and training of the blind. The blind can best be assisted by placing them as early as possible in the most favourable circumstances to help themselves. It is uneconomical not to give the blind the best education of its kind in the trade or profession they can best follow. It is an outworn fallacy to suppose that by a sort of law of compensation the other senses of the blind are keener than those of the seeing. The senses of hearing and touch must be developed before they can be any real substitute for sight, and the earlier such development is begun, the better for the future welfare of the blind person. The spirit of the times has for the last 60 years been opposed to the purely charitable as against the economic treatment of the blind, and to the idea of increasing the size of blind asylums and thereby making ever larger demands on the public funds. For those blind who for various reasons can never maintain themselves fully—and very few who have become blind late in life can ever do so—there will always be room for charity; but it is now recognised that most of the young blind ought to receive such an education as will fit them to become useful members of society. England, however, lagged far behind America and other countries in the practical recognition of this economic truth. An efficient system of education for the blind must be founded on an adequate course of physical development. With care the blind children can soon adapt themselves without undue risk to a number of the modes of recreation of sighted children, e.g. swimming, jumping, swings, skittle-alleys, roller-skating, skipping, rowing, and so forth. A sound school curriculum should provide for classes graded to meet the requirements of various ages. When the blind child

is about 14 years of age some opinion can be formed as to whether his aptitude lies in the direction of mechanical work or handicrafts, or whether he has ability in the direction of general business or even something higher. Experience shows that the chief vocations of the blind comprise organists, teachers of music (America chiefly), organ and piano tuners, basket-working, making of brushes and brooms, the making of new and remaking of old bedding, mat-making, cork-fender making, chair-caning, mattress-making, wire-making, and various forms of plaiting, of making of stereotype plates for printing Braille, telephone operating, and, more especially for women, knitting, sewing, crocheting, and the making of fancy baskets and brushes. Massage has been found very suitable work for the blind, and an Institute of Massage by the Blind was formed in London. Blind persons have also been known to follow successfully such professions as the Church and the law. The opening up of a musical education as a field for the blind has in some countries, notably in America, been attended with great success. The prejudice in England up to 1869 against the dotted system of reading instruction for the blind, a system peculiarly favourable for musical notation, may explain England's backwardness in this respect. However, the introduction into this country of the Braille system (see below), resulted in the estab. in 1872 at Norwood of the Royal Normal College and Academy of Music for the Blind. The college embraces 3 distinct depts: (1) General education; (2) Science and practice of music; and (3) Pianoforte tuning. Special care is bestowed on the intellectual training of the pupils, experience having proved that whatever the talent of the blind pupil for music, he will only become self-supporting where his musical training has had an adequate foundation in general education. All branches of musical instruction are given, and special attention is paid to the art of teaching. In the pianoforte tuning dept, pupils are trained who have passed the age at which they might have become qualified for profitable employment in other depts. A prolonged course of careful training is, however, as necessary in this dept as in the purely musical to enable the pupil to become self-supporting. In France blind organists, tuners, and teachers are trained by the Institut National des Jeunes Aveugles, and many become independent men, exercising highly lucrative professions. In the U.S.A. large numbers of blind persons become scholars and musicians. It is recognised in that country, however, that whether in the training of the blind for a musical or any other professional career, or for competition in the labour world, first-rate masters, appliances, and institutions are required, and as liberal an education as that provided by the state for sighted people. In most countries the cost of the education of the blind is met, either partially or wholly, by the State, some local authority, or a voluntary association. In regard to schools

generally, it is conceded that boarding schools are more to be desired than day schools, home influence being prejudicial from the point of view of education; for the blind child is generally treated at home differently from the sighted children; a similar objection applies to the mingling in one class of blind and sighted children the result often being that the memory of the blind child is developed at the expense of its other faculties. The habit of uniting the blind with the deaf and dumb is also unsound policy. Recreation and healthful surroundings are a *sine qua non*, but more especially in the case of those blind children whose vitality, whether congenitally or for other reasons, is lower than that of the average child.

Types and appliances. The idea of enabling the blind to read by touch is an old one, which would naturally suggest itself to all who desired to assist them in the attainment of knowledge. The first attempts at its practical application were made as far back as the 16th cent., but were not very successful. The pioneer in the art of stamping characters on paper in relief was Haüy, who, in printing his first book in 1784, used the Italic form of the Rom. letter. In 1832 Sir Charles Lowther, obtaining some types of this kind from France, printed some parts of the Bible with his own hand. The use of the Rom. character, however, is attended with certain disadvantages, and a long controversy between its advocates and those of Fry's type, stenographic, and point systems, has resulted in the abandonment of the Rom. characters in favour either of purely arbitrary signs or of signs which in certain cases retain the crude forms of Rom. capitals. For one thing the Rom. characters were not sufficiently distinct to the touch to be easily legible by its aid alone. Hence, in 1834, Gall, of Edinburgh, introduced a new character founded upon the ordinary Rom. capitals, but with angles in lieu of curves. Alston, of Glasgow, the Rev. W. Taylor, and others, especially in America, invented and employed other modifications of the Rom. letters; but all of them, including Dr Howe's use of small Eng. letters without capitals and with angles for curves, are open to the same objection. They do not fulfil to the finger the promise they make to the eye. It is only with difficulty that they are mastered by those who become blind in middle life. Doubtless a few of the blind, chiefly among those congenitally blind or blind from early childhood, have developed an extraordinary sensibility of touch: but acuteness of touch is not natural to the blind, and can only be developed by practice, and is not to be cultivated in a high degree except by those who, being exempt from necessity for manual labour, can keep the skin of the finger tips in a condition of softness and delicacy. But even when allowance is made for increased delicacy of touch, it may still be taken as a fact that the Rom. character, in all its modifications, is read by the blind with difficulty, and the experience of Amer. states schools was a proof of this. According to ann. reports

furnished to the states legislatures in 1838, among the pupils at those schools where a Rom. letter was used, and after 5 years' instruction, one-third read fluently, one-third imperfectly, spelling the words letter by letter, and one-third failed entirely. At the Missouri Institution, on the other hand, where Braille's dotted character was employed, two-thirds of the pupils could read fluently, and one-third imperfectly, while no failures were recorded. As regards Eng. practice, Dr Fry's alphabet of ordinary capitals without their small strokes, invented in 1832, and Taylor's and Alston's

from those which they are made to represent by Frere. His method has the recommendation of being easy to acquire; but the books are bulky, which makes reading a slow process, and renders the cost of production very great. In Frere's system the lines are read alternately from left to right and from right to left, the finger on reaching the end of the first line traversing a vertical arc to the right end or beginning of the next line, the letters of which are all reversed. Moon borrowed the reversal of the alternate line from Frere, but did not reverse the letters themselves. Moon's type is still used by

BRAILLE DOTTED SYSTEM

books in Fry's type in 1836, were the last works in Roman. From 1838 onwards arbitrary signs came into use. Some of these are frankly shorthand—phonetic or stenographic. Others consist of rudimentary Rom. characters, or combinations of mere symbols and rudimentary Rom. capitals. The Lucas type is based upon ordinary shorthand, the signs representing the letters of the alphabet, contractions being used wherever possible. In the Frere phonetic system the signs represent vocal sounds. Both systems rendered the books printed in them cheaper and less bulky than those in which common type was used, but they presented difficulties to the uneduc. adult blind. Dr Moon, himself a blind man, devised in 1847 a system in which many of the Rom. letters are retained in simplified or rudimentary forms, while those which are more complicated are replaced by Frere's simple linear signs, any infringement of the latter's system being avoided by making the purely arbitrary signs selected represent different letters

home teaching societies, being, from its simplicity, more adapted to the requirements of the dull or uneduc. than that which is known as the point system, and being also more easily learnt than Braille by people who have lost their sight late in life. But practically all the other 'line' types have disappeared before the advance of the 'point' or dotted system. In the transition period, however, there was much confusion, any blind person, who had painfully acquired the power of reading one system, having to repeat his labour in order to master another, so as to be able to buy the very limited literature in embossed type on the market. In 1869, however, was formed the Brit. and Foreign Blind Association, which included among its members men of the highest ability and social standing. Five of the 6 gentlemen who at that time formed the executive council were totally blind, and the sixth was partially so. All 6 were able to read by touch at least 3 systems, and were pledged to, or peculiarly interested in, none. The

association, after extensive and persevering inquiries, came to the conclusion that the system which best met the requirements of the blind was the dotted system of M. Braille. That was introduced into the Institut des Jeunes Aveugles in 1834, and steadily grew in favour until there was scarcely a country in the civilised world in which it was not widely known and used, while at the same time a prejudiced opposition brought it about that it was scarcely heard of in the U.K. until 1860. The Braille dotted system, the introduction of which into this country was promoted by Dr Arnytage, of the Brit. and Foreign Blind Association, was invented by Louis Braille, pupil, and afterwards a prof., of the Institut National des Jeunes Aveugles, Paris. The basis or root form of Braille's character is furnished by 6 dots arranged in 3 horizontal pairs : 1, 2, and every letter of the alphabet is represented by the omission of something from this root form. The omissions are regulated on the most simple system. For all the first 10 letters, the 2 lower dots are omitted altogether, each letter being formed by the 2 upper pairs or by some further omissions from them. The next 10 letters are formed by adding the left-hand dot of the lower pair to the former combinations, e.g. B is represented by : L by : C by : and M by : and so on. The remaining letters require both dots of the lower pair. The simpler forms when standing alone represent stops, and when following a particular prefix, figures. In all there are 63 possible combinations. The same system is applied to music, and the introduction into this country of a good system of embossed musical notation lessened the difference previously existing between the prospects of blind musical pupils in this country and those of America or France. In America there were at least 2 modifications of the point type, viz. the New York point and Amer. Braille, in which the most frequently recurring letters, e.g. E, S, T, A, were represented by the least number of dots. But experiments carried out between 1905 and 1915, resulted in a modified form of Brit. Braille being adopted in the U.S.A. in 1918. This modern Amer. Braille is known as Grade 14, whereas the form of Braille used in all other Eng.-speaking countries is Grade 11. For working by Braille a simple frame with a plate of zinc or other metal has been perfected. The paper is kept in position over the plate by strips of other metal, and the worker with his stylus makes the necessary indentations in the paper through the perforations in the securing bands of metal, which, besides holding the paper firm, guide the writer's hand. When a line is completed the bands are placed lower, and the writer proceeds as before. F. Hall, the superintendent of the Jacksonville School for the Blind, brought out a Braille typewriter, and also a stereotype platemaker, which can be operated by blind workers, and by which thin copper plates can be embossed and the requisite number of copies printed. An automatic Braille typewriter was

brought out in Germany, while Wayne, of Birmingham, constructed a cheaper Braille writer. In addition to these and kindred inventions, many boards have been made to facilitate the working out by the blind of arithmetical problems, one of the best being that introduced by the Rev. W. Taylor, containing a number of star-shaped holes, into which the student can fit a square pin in 8 different positions. The board is effective also for algebra. A newspaper in Braille, the *Braille News Summary*, is pub. weekly by the National Institute for the Blind.

Many men, both sailors and soldiers, lost their sight during the First World War, and organisations to provide for their welfare were estab. in most of the countries concerned. This work was naturally continued after the Second World War. One of the earliest was the English one of St Dunstan's, founded by Sir Arthur Pearson, an institution which undertook with great success the training and care of men and women blinded on war service.

Some notable blind persons. John, King of Bohemia, who d. fighting valiantly; Ziska, the one-eyed, who lost his remaining eye in battle, but continued to fight for Bohemia; Scapinelli, the blind philologist, and one of the most accomplished scholars of his day; Count de Pagan, who studied fortification and geometry; Dr Nicholas Saunderson, lecturer on optics, and prof. of mathematics in Cambridge Univ.; Sir John Fielding, half-brother of the novelist, and chief magistrate of Bow Street police court; Huber, an eminent naturalist and inventor of glass beehives; James Holman, who is said to have travelled without an attendant through a large portion of Europe, penetrated 5000 m. into Russian dominions, performed a voyage round the world, and actually on one occasion saved the ship by taking the helm; John Milton, the poet; Dr William Moon, inventor of the Moon type; Henry Fawcett, prof. of political economy at Cambridge Univ. and postmaster-general; Louis Braille, inventor of the Braille type; the Rev. Geo. Matheson, preacher and writer of the Church of Scotland; Prescott, the Amer. historian; Alexandre Rodenbach, Belgian statesman; Leonhard Euler, astronomer; Sir Arthur Pearson, founder of St Dunstan's Home for Blinded Soldiers; Sir Ian Fraser, M.P., barrister and chairman of St Dunstan's; and Helen Keller, the Amer. blind deaf-mute, who pub. 5 books and was made LL.D. of Glasgow in 1933.

Blinn, Holbrook (1872-1927), Amer.

actor and playwright, b. San Francisco. Educ. at Stanford Univ.; appeared first in *The New South* at San Francisco and New York. Afterwards formed his own company in his native tn. Later he took his company to London, playing in *The Cat* and *the Cherub*. He achieved his greatest success as Pancho Lopez in *The Bad Man*, which toured for 3 years in U.S.A.

Bloch, Ivan Stanislavovich, see BLOCH, JEAN DE.

Bliss, Sir Arthur (1891-), composer, b. London, and educ. at Cambridge, where he studied under Charles Wood; he also studied at the Royal College of Music under Stanford and Vaughan Williams. He began by making daring experiments in unusual musical media, as in a *Rhapsody* for 2 voices singing without words and 8 instruments or *Rond* for soprano and chamber orchestra, the words of which are meaningless syllables chosen merely for their sound-values (both 1919). The latter was performed at the Salzburg International Festival in 1922. The *Colour Symphony*, produced at the Gloucester Festival the same year was for a normal orchestra, but had a novel programme in that each movement suggested a different colour and its ideological associations. But later B. settled down to work that relied on musical quality rather than sensation. Among his most important compositions are the opera *The Olympians* to a libretto by J. B. Priestley, 1949, the ballets *Checkmate*, 1937, *Miracle in the Gorbals*, 1944, and *Adam Zero*, 1946, incidental and film music, choral works to poetic anthologies (*Pastoral*, 1928, and *Morning Heroes* (Norwich Festival), 1930, the latter with an orator), *Music for Strings*, 1935, 3 concertos, 2 string Quartets, Quintets for clarinet and for oboe and strings, etc. B. was appointed prof. of music at the Univ. of California in 1940, but returned to England and was musical director of the B.B.C. in 1942-4. He was knighted in 1950 and became Master of the Queen's Music in 1953 in succession to Sir Arnold Bax.

Bliss, Tasker Howard (1853-1930). Amer. general and diplomatist. Prof. of military science, U.S. Naval War College, 1885-8; military attaché, Madrid, 1897-1898. Served in the Puerto Rican campaign in 1898, and proved himself an able administrator in Cuban affairs after the Hispano-Amer. war of 1898. Appointed to the Army War College Board in 1902, and, in that year negotiated the treaty of reciprocity with Cuba. In 1904-5, and again in 1915, was on the Joint Army and Navy Board. Held commands in the Philippines, 1908; assistant chief of staff in 1909. Commanded the Provisional Brigade on the Mexican border during the Mexican insurrection, 1911. From Sept. 1917 to May 1918 he was chief of the general staff in Washington. He represented the U.S.A. on the Supreme War Council in 1918, and was chosen as one of the 5 Amer. delegates to the Inter-Allied Peace Conference, in Paris, 1919. See F. Palmer, *Bliss, Peacemaker: the*

Life and Letters of General Tasker Howard Bliss (New York), 1934.

Blister, vesicle or bladder formed by the exudation of serous fluid between the epidermis and true skin, the result of a burn, friction, as in rowing, or the rubbing of an ill-fitting boot, and some diseases.

Blister-beetle, see CANTHARIDAE.

Blizzard, type of storm characterised by an icy biting wind and fine snow. The suddenness of its commencement and the rapidity of the consequent fall of temp., together with the blinding snow, make a B. anticipated with dread by all who have once experienced it. Probably the most disastrous B. recorded is that of 1888, which was experienced in Dakota, Kansas, and Texas. So unexpected was its attack that field labourers died on their way to shelter, quite as many from suffocation caused by the stifling snow as from the intense cold. Nearly 250 persons perished on that occasion. During the severity of the cold the R. Colorado was frozen to a thickness of 1 ft. Bs are often caused by the climatic conditions following the passage of cyclones across the E. Amer. states, and are of frequent occurrence in polar regions. The term is probably onomatopoeic, owing its origin to the noise occasioned by the violence of the wind. See METEOROLOGY.

Bloch, Ernest (1880-), Swiss musical composer, b. Geneva, of Jewish parentage; studied first under Jacques-Dalcroze (q.v.), and later in Brussels under Ysaÿe (q.v.), and at Frankfurt under Iwan Knorr. His opera *Macbeth* (1903) was produced at the Paris Opéra-Comique in 1910. It was regarded by some critics as revolutionary. In 1910 he conducted orchestral concerts in Switzerland, and produced his first symphony. In 1913 he settled in New York as teacher at the David Mannes School of Music, and in 1920 was made head of the newly estab. Cleveland Institute of Music. After a brief return to Switzerland in 1930, he returned to live in retirement in America. B. maintains a striking individuality among modern composers. His music is highly polychromatic, sometimes barbarous, and touched with a tragic passion of its own that is often distinctively Jewish. His works include a *Sacred Service* for the synagogue, 1933, sev. large-scale orchestral works, the Heb. rhapsody *Schelomo* for cello and orchestra, 1916, a *Concerto grosso* for piano and strings, 1925, a violin Concerto, 1938, 3 string Quartets, a Quintet for strings and piano, etc.

Bloch, Jean de, or Bloch, Ivan Stanislavovich (1836-1902), Polish financier, philanthropist, and writer on economics. Of humble Jewish parentage, he was educ. at the Industrial High School in Warsaw, and eventually made a fortune from his control of the railway system from the Black Sea to the Baltic. He promoted an industrial movement in Poland, becoming head of the timber and sugar trades. His book on the Russian railroads appeared in 1875, and his *Influence of Railways on the Economic Condition of Russia* in 1878. He was also a propagandist on behalf of the Jews in

Europe, and gained a reputation as writer more particularly by his book, *Is War now Impossible?*, 1898 (Eng. trans., 1899). His advocacy of universal peace was not without its influence on The Hague Convention of 1899. His pamphlet, *Lord Roberts's Campaign and its Consequences*, suggested the blockhouse scheme by which the S. African war was finally won. B. also furthered a number of scientific and philanthropic enterprises.

Bloch, Jean Richard (1884-1947), Fr. novelist and dramatist, b. Paris of Jewish parentage. His first novel *Lévy* was pub. in 1912, but he estab. his reputation with his second novel on a Jewish theme, called *Et compagnie*, trans. *And Co.* (1918). Other novels are *La Nuit kurde*, trans. *A Night in Kurdistan*, 1925, *Les Chasses de Renau*, 1927, and *Sybilla*, 1932. His play, *Le Dernier Empereur*, 1926, was performed in both Paris and Berlin, and was followed by *Offrande à la musique*, 1928, and *Naissance d'une culture*, 1938. He also wrote sev. vols. of essays, and 2 books of travel: *Sur un carao*, 1924, and *Acacouettes et bananes*, 1927. An ardent communist, B. took refuge in Russia in 1940.

Bloch, Karl Henrik (Heinrich) (1834-1890), Dan. painter, b. Copenhagen. He studied at Copenhagen Academy, went to Italy, 1852-65, gaining a scholarship for Rome, 1859. He first won a reputation for nature studies, especially those drawn from Jutland and Zealand, but took to the humorous and anecdotal painting, too common in his day, and to over-ambitious themes like his 'Prometheus.' There are 2 frescoes by him in Copenhagen Univ. See Muther, *History of Modern Painting*, 1895-6.

Bloch, Marcus Eliezer (c. 1723-99), Ger. ichthyologist, by profession a physician. His *Allgemeine Naturgeschichte der Fische*, 1782-95, is the earliest standard work on ichthyology. Although he followed the arrangement of Linnaeus, he estab. 19 new genera and 176 fresh species.

Blochmann, Henry Ferdinand (1838-1878), orientalist, studied E. languages at Leipzig and Paris. Enlisting as a private in the Brit. Army in order to have opportunities of living in India to study the languages *in situ*, he later secured the assistant professorship of Arabic and Persian at the Calcutta Madrasa. B. passed most of his life at the Madrasa, where he became principal. His prin. writings are his detailed *Contributions to the History and Geography of Bengal* and his faithful trans. of the *Ain-i-Akbari* of Abul-Fazi (first vol. only), the notes of which give a picture of the Emperor Akbar and his court.

Bloch, Alexander, see BLOK.

Bloch, Maurice (1816-1901), Fr. statistician, b. in Berlin, of Jewish descent. He was naturalized at Paris after the completion of his studies at Bonn and Giessen. He entered the Fr. ministry of agriculture in 1844; in 1852 he was appointed a member of the statistical office. After his retirement from office in 1862 he devoted himself to the compilation of

statistics. In 1880 he was elected a member of the Académie des Sciences Morales et Politiques. Among his works are *Dictionnaire de l'administration française*, 1856, *Statistique de la France*, 1860, *Dictionnaire générale de la politique*, 1862, *L'Europe politique et sociale*, 1869, and *Annuaire de l'économie politique et de la statistique* (ed. by B. from 1856).

Block-books. Xylography, or printing from engraved wooden blocks, is said to have been practised in China 5 cents. before it was known in Europe. Early in the 15th cent. many books, mostly religious, were printed in the Netherlands and in Germany by this process. As a rule each page was mainly occupied by an illustration, with a few explanatory words appended, but sometimes whole pages of text were engraved. It is not certainly known whether the books were printed by rubbing the back of the paper, when placed on the block, or whether a primitive type of press was used. One side only of the paper was printed on, and 2 blank sides were then pasted together. Hard wood was generally used, but before Gutenberg's time copper also had come into vogue. One of the best-known series of B. was the *Biblia Pauperum* (q.v.). About 1428 Laurens Coster of Haarlem printed an ed. of the *Speculum Humanæ Salvationis*, each page half picture, half text; the excellence of the latter (cut of course in reverse) is remarkable. See WOODCUTS.

Block-buster, popular name for 12,000-lb. bomb used by the R.A.F. in the Second World War, and so named because it was an obliteration bomb which caused whole blocks of buildings to disintegrate. Like the earlier 1000-pounders, it was constructed on the principle that a large bomb could be made much more destructive with a thin casing and a heavy weight of explosives, relying on the effect of blast rather than that of fragmentation. The first B.s used were those dropped on the Limoges factory where the Germans were making tanks, and production at the factory ceased immediately. After that they were carried repeatedly by Lancaster aircraft; thus the Kembs dam on the Rhine was breached by delayed-action B.s on 7 Oct. 1944, and on 12 Nov. of the same year the 45,000-ton Ger. battleship *Tirpitz* was sunk in Tromsø Fiord by B.s.

Block Island, is. in the Atlantic Ocean, 9 m. off the S. coast of the state of Rhode Is., U.S.A., forming part of the co. of Newport. Its greatest length from N. to S. is 7 m., and its width $1\frac{1}{2}$ -3 $\frac{1}{2}$ m. On its W. coast stands New Shoreham, a popular summer resort. The light on the SE. coast can be seen for over 20 m.

Block System, see RAILWAYS.

Blockade, term used in both military and maritime warfare. In military warfare it meant an operation used in the place of a siege or bombardment, and consisted of an attempt to cut off a hostile tn from all outside communications and supplies. In the military sense, therefore, a B. consisted in the possession by a military force of all means of entrance into and exit from the tn. The examples

of the B. of Paris and of Metz in the Franco-Prussian war of 1870-1 may be mentioned, although the former after being blockaded also underwent bombardment. Naval B., which is usually meant nowadays when reference is made to B., is different in many essentials from military B. Originally naval B. must have been the equivalent of military B., that is, a port which was blockaded was as effectually cut off as a town surrounded by a military B., and even in more modern times a naval B. was often only the naval supplement to a land siege. But quickly a differentiation must have grown up between naval and military B., since obviously it would be an open act of war for a neutral to attempt to cross the lines of a blockading army, whereas a neutral ship might attempt to enter a blockaded port with no knowledge that a B. was taking place and in the best of faith. So in the course of time the rights of neutrals came to be recognised, and notice was given to neutral powers of the state of B. But this in itself led to abuse: a power would notify a certain port as in a state of B. before the actual B. had taken place, and this ridiculous system reached its highest point in the huge paper B. of Napoleon's continental system and Great Britain's reply in the Orders in Council. The futility of the continental system, which forbade France or France's allies to have communication with Britain, was obvious in that Napoleon himself was dependent upon Britain for a great part of his supplies. America, as the neutral nation which really suffered most, protested strongly against this system. In the early part of the 19th cent. Great Britain and the U.S.A. asserted that in order that a B. should be binding it should also be effective, and in 1856 by the Declaration of Paris it was declared that 'B.s in order to be binding must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of an enemy.' The law as applied to the position of neutral vessels is, that neutral vessels are entitled to notification before they can be seized for violation of the B.; that this notification may be made by one of the blockading vessels, by proclamation or by notoriety. It is, however, usually recognised also that if a vessel shall have had notice in any way and attempts to violate the B., she is a good prize, but if such notice is not formal but arises from notoriety, then the rule shall be as leniently construed as possible. Amongst the subjects dealt with at The Hague Conference in 1908-9 was B., and a number of rules dealing with this subject were formulated.

Blockade in the First World War. Germany, far from being a self-supporting country, depended upon overseas imports for adequate food and clothing and, to a certain extent, munitions of war. Her problem during the First World War was to obtain these supplies while the seas were controlled by the Brit. Navy, and while on land her ter. was partly closed by hostile countries. She was fortunate, however, in having neutral

neighbours who were the cause of most of the work entailed in carrying on the economic war against her. This economic war did not conform to the estab. idea of a B., in that it was not a cordon of ships placed round the coast so much as a denial of the use of the sea anywhere as a route for supplies. The only way to raise this B. was to defeat the Brit. Navy and thereby ensure safe conduct for supplies, and Germany failed to achieve this object. In considering the question of B., the changed status of the civil pop. in a modern major war must be taken into account, together with the progress in transport. Before the First World War the civil pop. and the armed forces at war were two distinct entities, the life of the former having little bearing upon the efficiency of the latter. But during the First World War (and subsequent wars) the greater number of civilians were either directly or indirectly serving a military arm or supplying the needs of those who were thus engaged, so that one purpose of maintaining the civil pop. at home was to ensure the maintenance of the armies in the field. At the opening of the war only the ineffective terms of the Declaration of London (1909) were applied to contraband, and Germany was therefore able to obtain adequate supplies through Scandinavia and Denmark. In this connection Germany was favourably situated, for supplies from Denmark were not liable to seizure by the allied fleets and those from Scandinavia could be transported in safety via the Baltic. The inadequacy of the terms of the Declaration of London was soon apparent, but it was not until Mar. 1915 that more restrictive measures were applied. This took the form of a general B., under which, in the terms of the 'Reprisals Order,' no merchant vessel which sailed from her port of departure after 1 Mar. 1915 was allowed to proceed to a Ger. port, or if she sailed from a Ger. port after that date she was not allowed to proceed on her voyage; and after that date any merchant vessel which had goods intended for the enemy, or were enemy property, were required to discharge them at an allied port. This order also abolished the distinctions 'absolute' and 'conditional' contraband. The test now was the destination or the origin of the goods. Strictly speaking, this was not a B. According to the Declaration of London 'a blockade must not extend beyond the ports and coasts belonging to or occupied by the enemy' (Article 1) and 'the blockading force must not bar access to neutral ports or coasts' (Article 18). This action of the Brit. Gov. roused Amer. opposition, but Grey replied that no principle of international law had been violated by applying a B. in the only way in which it could be effective in cutting off the enemy's commerce with foreign countries through neutral ports. Eventually, on 7 July 1916, by an Order in Council, the Brit. Gov. informed neutral countries that as the conditions of war had changed from those which obtained when the Declaration of London was drawn up the declaration would be

withdrawn and its provisions disregarded in the economic war against Germany.

As the economic war proceeded new problems constantly arose, so that it was found necessary to set up a separate ministry, and in Feb. 1916 a ministry of B. was created, with Lord Robert Cecil (subsequently Lord Chelwood) as minister with a seat in the Cabinet. One of the first acts of the new ministry was to limit imports to neutral countries to their pre-war proportions, thus ensuring, to some extent, that they were not transferred to Germany. The ministry of B. came to an end in June 1919.

Germany's effort to defeat the stranglehold of the Brit. Navy did not begin seriously until her submarine campaign in Oct. 1914, which met at first with a fair measure of success. Von Spee's annihilation of Cradock's squadron off Coronel in Nov. 1914 lent them additional encouragement. In these successes they saw a possibility of the trade routes being once more open to them, and the slur on their navy, which the existence of a B. implied, removed. But a month later their hopes had a serious setback when Adm. Sturdee destroyed Von Spee's fleet off the Falkland Is. (q.v.). This action deprived Germany of all naval power outside her own waters, and the possibility of regaining overseas trade vanished. In spite of the vigilance of the Brit. fleet, the Ger. raider *Moeve* ran the gauntlet in Jan. 1916 and laid mines to the W. of the Orkneys, which caused the loss of a Brit. battleship. Another raider, the *Greif*, came out, but was sunk. The *Moeve* got safely back to port, after doing considerable damage. Later in the year she took to sea again, and another raider, the *Wolf*, was also successful in getting out. The submarine *Deutschland* also made successful trading trips to America, and *U 53* crossed the Atlantic and did considerable damage to merchantmen. These were, however, but isolated successes, and on 1 Feb. 1917 Germany began her 'unrestricted submarine warfare,' by which it was hoped to ruin England's food supply. This misconceived action of sinking vessels without notice helped to range the U.S.A. on the side of the Entente owing to numerous casualties among Amer. citizens, and, indirectly, Germany's answer to the B. eventually brought about her defeat on the W. front. With the U.S.A. in the war against her, Germany's hope of regaining control of the trade routes or of removing the economic pressure exerted by her enemies, vanished, and with it the need of unremitting vigilance by the Brit. warships. That the Brit. Navy made the B. effective seems beyond doubt, inasmuch as only a few Ger. vessels were able to get through and return.

Blockade in the Second World War. The effectiveness of B. was one of the most important lessons from the First World War, and its importance was increased in total war. Hence immediately the Second World War started, plans were made to revive and improve the methods that had been developed in 1914-18. A ministry of

economic warfare (q.v.) was instituted in Britain. The list of absolute contraband (q.v.) issued by the ministry included not only arms and munitions, but fuel, transport machines, and animals, articles of communication, coin and bullion, etc.; and conditional contraband, which might be seized if destined for the Ger. Gov. or its forces, comprised all kinds of food, forage, clothing, and articles and materials used in their production. The maritime B. of Germany was one of the chief weapons of the Allies from the beginning, and therefore command of the sea was vital. In this economic warfare the neutral countries occupied a position of the first importance, for they could be the means whereby Germany could deliver a deadly economic flanking attack, e.g. by obtaining unlimited iron-ore supplies from Sweden. Hence the W. neutral countries were under strong diplomatic pressure from both sides from the start of the war. As regards Amer. supplies, Roosevelt improved the Allies' position in 1939-40 by the Act of 4 Nov. 1939, which replaced the ban on supplies by the principle of 'cash and carry,' adopted for sales to all belligerents. Under this Act no arms could be carried to any belligerent in Amer. ships, and Amer. ships were not allowed to enter the war zone and so were not available to the Allies, but there was the compensating factor that this very provision was likely to prevent any major Amer. grievances from developing, as in the previous world war, against the allied B. Of course allied shipping was hampered and neutral shipping endangered by the violence of Ger. methods of sea warfare; but Ger. shipping was swept from the seas. The prin. route left open to Ger. shipping was along the Norwegian coast, but the daring of Brit. destroyers and submarines imposed a strong veto on this route. By 1940 the B. was being extended further afield. It was found that foods were being shipped to Germany via Vladivostok, and that Germany had made overtures to the Soviet and Japan for U-boat bases in the Pacific; hence allied naval counter-measures were taken in the Far East. By the spring of 1940 the economic pressure on Germany was tightened still more. For the Allies were not inclined to allow the maintenance of legal neutrality by the small nations to operate in practice to the advantage of Germany. They employed, however, none but legal means to diminish this advantage, e.g. by an extensive purchasing policy designed to withhold neutral products from Germany. New trade treaties were made which provided that the countries concerned should voluntarily limit their imports to prevent them from acting as mere channels of supply to Germany. But it was made clear that if the neutral country did not take this action voluntarily, it would be imposed on it by the allied B. It was clear by June 1940 that Britain's command of the sea could not be seriously disputed by any naval means in the power of the Axis. Only by air supremacy could they hope to challenge Brit. sea

power—hence the launching of daily air-raids on Britain. But the extension of the field of Ger. conquest in 1940 seriously increased the problem of Britain's maintenance of the B., for it gave Germany greater resources, while the downfall of France gravely diminished the blockading forces. The burden now fell on Britain alone; though the very fact that there were now fewer neutral prejudices or susceptibilities to consider was in itself an allied asset. The B. was also applied to France after the armistice of 1940. The unoccupied regions of France, as well as Spain, were subjected to import rationing at Britain's discretion. An extension of the navicert system at the end of July imposed even stricter control; and the stranglehold by sea was powerfully supported by the activities of the R.A.F.

The Ger. submarine B. of the Allies was on a far greater scale than in the First World War. Germany's surface raiders in the Atlantic were easily disposed of, but the Germans turned out submarines by mass-production much faster than the Allies could sink them, and their submarine fleet had by 1942 reached dimensions threatening the very existence of the transatlantic life-line. As compared with the position in 1918 the Allies were seriously handicapped by their deprivation of bases in S. Ireland. The damage was all the greater because the Germans then had airfields in France nearly as far W. as any in Britain, and their method was to send aircraft far out into the Atlantic, whence they wirelessed to their U-boat packs the position and direction of allied convoys. But various means were found to counteract this peril, e.g. by the application of mass-production to shipbuilding (see SHIPS AND SHIP BUILDING), and by the development of radiolocation (q.v.); and the last stage of all came in Oct. 1943, when Portugal agreed to allow the Allies to use bases in the Azores, thereby enabling convoys, especially in winter, to take more southerly routes. Among ships sailing in the main Atlantic and U.K. coastal convoys the proportion lost in 1941 was no less than 1 in 191; in 1942 it was 1 in 233; in 1943 it dropped to 1 in 344, and in the last 6 months of 1943 it was 1 in 1000. A B. of the Korean coast was made by the U.S. and Brit. fleets during the critical stages of the Korean war (q.v.) 1950-3, with telling effect. See also NAVAL OPERATIONS IN SECOND WORLD WAR.

Blockhouse, small fortified defensive building, constructed in isolated places to command a large area. The B. was garrisoned by a few troops who were able to deal with greater numbers of the enemy owing to the protection afforded by the B. They were used in the S. African war, 1899-1902, for the final drive against the Boers. In this case lines of B.s were connected by wire entanglements. In the 18th cent. B.s were mounted upon rollers or on flat-bottomed boats to give them portability on land or on rivers or lakes. See BLOCHE, JEAN DE.

Blocking Course, in architecture, a course of stones or bricks placed above the

cornice. It serves a practical purpose in bedding down the projecting cornice beneath it.

Blocksberg, see BROCKEN.

Blockship, vessel filled with concrete and sunk so as to block a harbour, channel, or fairway. In the First World War B.s were sunk at Portland and other naval harbours, so as to keep out the Ger. submarines. A number of obsolete cruisers were used as B.s in the Brit. raids on Zeebrugge and Ostend in 1918. In the Second World War they were used during the allied invasion of Normandy. In 1936 a number were used by the Egyptians to block the Suez Canal.

Bloemaert, Abraham (1564-1651), Dutch painter, b. Gorkum. He started his career while very young, and became a pupil of Joost de Beer. He studied at Paris, and later worked at Amsterdam and Utrecht, where he d. He is known for his portraits, etchings, and paintings on historical subjects. He had 4 sons, of whom the youngest, Cornelius, was noted as an engraver, and many pupils, including Honthorst and Cuyper.

Bloemfontein, cap. of the Orange Free State, S. Africa, was founded in 1846, and in 1880 was declared a municipality. It is situated at a height of 4518 ft above sea level on the R. Modder. It is connected by rail and road with Cape Town, Port Elizabeth, and Johannesburg. Among its public buildings are the Raadsaal, formerly the meeting-place of the Orange Free State Raad, now the seat of the provincial council, an Anglican cathedral, a large Dutch Reformed church, a state museum, and a public library. The tn hall was completed in 1937. It is noted for its live-stock market, the largest in S. Africa. Though its manufs. are few, its trade is very extensive. Its dry, healthy climate makes it a favourite resort of invalids. English is the common tongue. The pop. is 109,180, of whom 53,900 are Europeans. It was chosen as the seat of the Supreme Court of S. Africa in 1910, upon the formal declaration of its recognition as a prov. of the Union of S. Africa. Owing to its position (it is known as the Centro City), it is frequently used as a meeting-place for delegates from all provs. of the Union. It is an important educational centre, about 4000 students being accommodated. Grey Univ. College has, since 1916, been a constituent college of the univ. of S. Africa. Owing to the exceptionally clear atmosphere the Harvard and Michigan Univs. have built their observatories at B.

Blois, Peter of, see PETER OF BLOIS.

Blois, Fr. tn., cap. of the dept of Loir-et-Cher, on the Loire. It is the seat of a bishopric. The historic château, one of the great buildings of France, was a royal residence from the 15th to the 17th cents. The 3rd Duke of Guise (q.v.) was murdered here, and Catherine de' Medici (q.v.) d. here. The former abbey church of St Nicholas is a fine building in 12th-cent. ogival style. Charles of B. and Louis XII were b. here. It manufs. porcelain and jewellery, and has a trade in wine, wood, and grain. Pop. 26,800.

Blok, Aleksandr Aleksandrovich (1880-

1921), famous Russian poet, a leader of the younger Symbolists and the most outstanding poet of the school. At first strongly influenced by the ideas of Vladimir Soloviev (q.v.), B. began his literary career with *Poems of the Beautiful Lady*, 1905, filled with adoration of the ideal woman. Then came a reaction: in *Nocturnal Hours*, 1911, he bitterly mocked his former self and his former ideals—his poems were now devoted to pictures of city squares and restaurants filled with human wreckage. The First World War gave a new turn to his genius, filling him with love of his country. B. welcomed the 1917 revolution as the crumbling of the old bourgeois culture which repelled him. Standing close to the

Blom, Eric (1888-), Eng. musicologist. He has been music critic in turn for the *Manchester Guardian* in London, the *Birmingham Post*, and the *London Observer*. Through his books and his editing of *Music & Letters* he has earned a wider reputation for musical scholarship, culminating in his editorship of the fifth (1954) ed. of *Grove's Dictionary of Music and Musicians*. C.B.E. and Hon. D.Litt., 1955. His own works include *The Limitations of Music*, 1928, *Mozart* (Master Musicians Series), 1935, *The Music Lover's Miscellany*, 1935, *Beethoven's Pianoforte Sonatas Discussed*, 1938, *A Musical Postbag*, 1941, *Music in England* (Pelican Books), 1943, and *Everyman's Dictionary of Music*, 1954.

South African Railways and Harbours

BLOEMFONTEIN

Left Socialist Revolutionaries (see SOCIALIST REVOLUTIONARIES) he co-operated with the Bolsheviks after they seized power. In 1918 he pub. his 2 famous poems, *The Twelve*, an apotheosis of the revolution, and *The Scythians*, an appeal to the West to join revolutionary Russia. Soon, however, B. became disillusioned with the Bolshevik dictatorship, and in the address he delivered at the anniversary of Pushkin's death in 1921 he said: 'Peace and freedom are taken away . . . and the poet dies because he can no longer breathe: life has lost its meaning.' He d. a few months later. See *The Twelve*, 1920, and *The Spirit of Music*, 1946 (selected essays on art and politics), both trans.

Blok, Pieter Johann (1855-1929), Dutch historian, b. Helder and studied at Leyden. He was prof. of hist. at Groningen, 1884; at Leyden, 1894; and directed the historical studies of Queen Wilhelmina. His special study was social-political hist. of Netherlands in the Middle Ages. His pub. include *Eene Hollandische stad in de middeleeuwen*, 1883, and *Willem de eerste, Prins van Oranje*, 1919-20.

Blomberg, Werner Eduard Fritz, Baron von (1878-1946), Ger. field marshal. After serving as a staff officer during the First World War, he entered the Reichswehr Ministry in connection with the work of Ger. disarmament. He was, however, associated with Gen. von Fritsch in building up a secret army in Germany in contravention of the treaty of Versailles. When Hitler came to power B. became minister of war, but he never secured Hitler's full support. He had, in consequence, to resign from the Ministry of War in 1938, as a result of the unpopularity of his second marriage. He d. from heart failure at Nuremberg.

Blomefield, Francis (1705-52), topographer, b. Fersfield, Norfolk. He is known principally by his work, *An Essay Towards a Topographical History of the County of Norfolk* (1739-75), which gives extensive information concerning his native co. He did not live to complete it, however. It was continued by C. Parkin, who pub. it in 5 vols. From 1805 to 1810 it was again pub. in 11 vols.

Blomefield, Leonard (1800-93), naturalist, formerly Leonard Jenyns, educ. Eton

and St John's, Cambridge. In 1835 he pub. his excellent *Manual of British Vertebrate Animals*. From 1828 to 1849 he was vicar of Swaffham Bulbeck, Cambs, and, although the chair of zoology at his own univ. was offered him, he refused to give up his parochial work. In 1860 he settled at Bath and presented to the Univ. the Jenyns Library of 2000 vols., dealing mostly with natural hist., and his fine herbarium of Brit. plants.

Blomefield, Sir Thomas (1744-1822), Brit. general and colonel-commandant of the Royal Artillery, was with Adm. Hawke's fleet at Quiberon, served in the W. Indies at the capture of Martinique and Havana, and became in 1771 aide-de-camp to Gen. Conway. As brigade-major he constructed floating batteries on the Canadian lakes; he was wounded at Saratoga. In 1779 he was appointed superintendent of the Royal Brass Foundry, in which capacity he carried out much-needed reforms, substituting cast-iron and brass guns for the inferior ordnance he was obliged to condemn. In the expedition against Copenhagen in 1807 he distinguished himself by his command of the artillery, and from 1779 to his death made full use of his scientific experiments in gunnery in his work as inspector of artillery.

Blomfield, Sir Arthur William, A.R.A. (1829-99), architect; R.I.B.A. Royal Gold Medallist, 1891; b. London, son of the Bishop of London; was articled to P. C. Hardwick, and began practice 1856. He restored sev. Eng. cathedrals, including Canterbury, Chichester, Lincoln, and Salisbury. In 1887 he became architect to the Bank of England and designed the Law Courts Branch. Other works: Royal College of Music, Kensington, 1883; St Mary's Church, Portsea; the nave and S. transept of Southwark Cathedral, 1890-7; the Cathedral Library, Hereford; school chapels at Malvern and Halesbury; the Whitgift School, Croydon; the Bancroft School; Selwyn College, Cambridge; Sion College Library, London; etc.

Blomfield, Charles James (1786-1857), Eng. bishop; son of a schoolmaster at Bury St Edmunds. From his father's school he proceeded to Trinity College, Cambridge, of which he became a fellow in 1809. In 1810 he took holy orders and became incumbent of St Botolph's, Bishopsgate, 9 years later. In 1822 he was appointed archdeacon of Colchester. He was appointed Bishop of Chester in 1824, from which place, after holding office for 4 years, he was translated to London. As a classical scholar he possesses some standing, and his eds. of Aeschylus, Callimachus, and Euripides are erudite and scholarly. His work as an ecclesiastic was active and thorough. One of his objects was the building of additional churches. He personally superintended the organisation of a scheme to build 50 simultaneously.

Blomfield, Sir Reginald Theodore, R.A. (1856-1943), architect and writer on architecture; President R.I.B.A., 1912-14; Royal Gold Medallist, 1913; b. Bow, Devon, son of a clergyman. After leaving

Oxford, he was articled to his uncle, Sir A. W. B. (q.v.). His first two books—*The Formal Garden in England*, 1892, and *A History of Renaissance Architecture in England*, 1897—led to a practice which included the remodelling of sev. country mansions and their gardens, e.g. Brocklesby Park, Apethorpe, Chequers, and Mellerstain. Among his other important works were a large warehouse in Westminster for the Army and Navy Stores; the Usher Art Gallery, Public Library, and Water Tower at Lincoln; Lady Margaret Hall, Oxford; the United Univ. Club, the refacing of the Carlton Club, Lambeth Bridge, the Quadrant in Regent Street—all in London; the 'Cross of Sacrifice,' the Munin Gate, and sev. cemeteries for the War Graves Commission, 1918-26; 'The Headrow' (a new street) in Leeds. Besides the books mentioned above, he produced sev. more scholarly vols., including his *History of French Architecture from 1494 to 1774* in 4 vols.

Blommaert, Philip (1808-71), Flem. author and scholar, b. Ghent. In collaboration with Conscience he worked to secure the revival of the Flem. language. His eds. of *Theophilus* in 1836, a Flem. poem of the 14th cent., and *Oudvlaamse Gedichten* in 1851 earned him fame as an anti-French zealot. But his greatest work is his hist. of the Belgians, 1849.

Blommers, Bernardus Johannes (1845-1914), Dutch painter, b. The Hague. He painted interiors, landscapes, and scenes of humble life. In 1875 his 'Where are the Pigeons?' won him much fame. See *Roosde's Dutch Painters of the Nineteenth Century*, 1898-1901.

Blöndal, Sigfús (1874-1950), Icelandic philologist and classical scholar, chief author of the great Icelandic-Dan. Dictionary. For his other works see P. E. Olason, *Íslenskar æviskrár*.

Blondel (fl. c. 1190), Fr. minstrel, traditionally famous as the means of securing the ransom of Richard I after his imprisonment by Leopold, on his journey home from Palestine. A late 13th-cent. *Chronicle of Rheims* is the sole source of this tradition. Some poems which have survived as having been written by a B. de Nesle are attributed to him.

Blondin, Charles (1824-97), rope-walker, b. St Omer, France. His real name was Jean François Grandet. His professional career began at 5 years when his talents earned for him the title of 'the Little Wonder.' Trained at Lyons, he devoted his abilities to rope-walking, and on his successful attempt to cross Niagara Falls on a rope 1100 ft long and 160 ft above the water, achieved instantaneous popularity. He performed the same feat many times, varying it with different accompaniments, among which were those of carrying a man across on his back, performing blindfold, wheeling a barrow, and on stilts. He d. at Ealing, London. Vast crowds flocked to his performances, the gathering at his first attempt over Niagara Falls numbering over 25,000.

Blood, Thomas (c. 1628-80), Irish adventurer, commonly styled Col. B. He

received presents of estates in Ireland in return for military services rendered to the parl. side. These were forfeited at the Restoration, but he later regained possession of them from Charles II. In 1663 he tried to seize the lord-leutenant of Ireland at Dublin Castle; in 1670 he attempted to assassinate the Duke of Ormonde, possibly on Buckingham's direction. Shortly after this, he almost succeeded in thieving the crown jewels from the Tower of London (1671). Charles II visited him in prison, and through his favour B. obtained his release.

Blood, the fluid by which the tissues and organs of the body are nourished and their waste products carried away. Arterial B., which is rich in oxygen, is bright red in colour; venous B., containing little oxygen, is dark red. It is slightly heavier than water (sp. gr. 1.06), has an alkaline reaction, and has a temp. of about 100° F. The quantity contained in the human body is about one-thirteenth of the whole by weight, or about 5 quarts by volume. It has a circulatory movement, being pumped through the arteries and veins by the heart at the rate of from 72 to 130 beats per min., the amount propelled being from 150 to 190 c.c. per beat. There are 2 circuits in the B. movement; from the left ventricle the fluid proceeds through the systemic circulation, communicating with all the tissues and organs except the respiratory system; it returns to the right auricle, is passed on to the right ventricle, whence at the next beat it is propelled through the pulmonary circulation, where it becomes oxygenated, returning again to the left auricle; it is once more forced to the left ventricle, where the cycle starts anew. Viewed microscopically, the B. consists of a straw-coloured fluid containing a large number of small round red bodies called red corpuscles, and a smaller number of white corpuscles or leucocytes. The yellow fluid, called *plasma*, is very complex in composition, containing water, albumins, and other proteins, and a certain amount of mineral salts, of which sodium chloride is the most important. One of the proteins, *fibrinogen*, is converted into a stringy substance, *fibrin*, when the B. leaves the body. The threads of fibrin settle down, carrying with them the red corpuscles, until the B. becomes a jelly-like clot. This process is called coagulation, and has important uses, for in a wound the B. clots as it emerges and plugs up the injured vessels. The calcium salts in the B. are essential for the conversion of fibrinogen into fibrin, so that clotting may be prevented by adding potassium oxalate, thus forming calcium oxalate, which settles at the bottom of the fluid, so that the surface does not coagulate. After the formation of the clot, a straw-coloured liquid separates out; this residue is called *serum*, and represents the plasma minus the fibrinogen. The plasma, therefore, serves as the medium for securing the mobility of the corpuscles, and also contains substances capable of producing coagulation; it is important as a vehicle for the

transport of substances from one part of the body to another and contains in its stream all the products of the chemical processes of the body (see BIOCHEMISTRY).

Red corpuscles. These are red biconcave disks of 0.008 mm. diameter and 0.002 mm. thickness. They have a tendency to run together in rouleaux when the B. is withdrawn from the body, and are so numerous that a cubic millimetre of B. contains about 5,000,000. Hence it is that their red colour dominates the B. as a whole; the red is due to the pigment haemoglobin which is enclosed in each corpuscle by a fine membrane. In addition to the red corpuscles there are always present in the blood a small number of young red corpuscles, known as *reticulocytes* because, under staining, they show a fine network, or reticulum, in their substance. Normally the number of reticulocytes is about 20 per cent of the total red cells, except in newborn infants, when the percentage is much greater. The haemoglobin is capable of combining loosely with oxygen, so that the function of the red corpuscles is to carry oxygen from the lungs to the different parts of the body. The oxygen readily combines with substances which have a stronger affinity for it than haemoglobin, so that the haemoglobin travels back to the lungs deficient in oxygen and is darker in colour. The carbonates and other waste products are carried back dissolved in the plasma. The red corpuscles do not actually come into contact with the fibres of the tissues which they feed; the lymph or part of the colourless portion of the B. acts as an intermediary, passing through the walls of the capillaries and reaching every part of the tissues. The quantity of lymph in the body is greater than that of the B., and it has separate vessels called lymphatics which ultimately communicate with the thoracic duct, by which the lymph is returned to the B. A pale colour in the blood results from poverty of red corpuscles, and is the condition called anaemia (q.v.); the result is that the tissues and organs are not adequately nourished.

White corpuscles. The leucocytes are cells consisting of protoplasm, and number 8000 per cubic millimetre of B. They are capable of amoeboid movement, that is, a corpuscle can change its shape and engulf small particles. This property renders them indispensable to the body as scavengers or destroyers of poisonous particles and germs. When disease germs are present in the B., there is a contest between their multiplying powers and the capacity of the leucocytes for absorbing them. They are found in the lymph as well as in the B., and vary in function. They are of 5 kinds: *neutrophils* (about 5000 per cubic millimetre); *eosinophils* (about 400 per cubic millimetre); *basophils* (about 100 per cubic millimetre); *lymphocytes* (about 2500 per cubic millimetre); and *monocytes* (about 800 per cubic millimetre). In addition to the red and white cells there is normally present in B. a number (from 200,000 to 400,000 per cubic millimetre) of circular bodies about

the size of red corpuscles known as B platelets. These are related to the process of coagulation and thrombus formation and, perhaps, to the repair of endothelial tissue. The B. cells are manuf. in the marrow tissue in the bone cavities, with the exception of the lymphocytes, which come from the lymphatic system, and the red corpuscles are removed from the circulation by the liver. The rate of daily destruction of red corpuscles is such that there is a complete renewal within about 120 days. For diseases of the B. see ANAEMIA; HAEMOPHILIA; LEUCOCYT-THAEMIA; LEUCOCYTOSIS. For B. groups see BLOOD TRANSFUSION. See also CIRCULATION OF THE BLOOD.

Blood-bird (*Meliphaga sanguinolenta*), species of the Australian family Meliphagidae, or honey-eaters, birds with rather long curved bills and an extensible tongue. The male B. has a scarlet head and body.

Blood Heat (normal), see METROLOGY and TEMPERATURE.

Blood-letting, see CUPPING and VEN-SECTION.

Blood-poisoning, see PYAEMIA and SEPTICAEMIA.

Blood Pressure, pressure that must be applied to an artery in order to stop the pulse in the vessel beyond the point of pressure. The pressure is assumed to be equivalent to that to which the blood is subjected by the force of the heart and the elasticity of the vessels; it is, however, also dependent on the thickness or hardness of the vessel wall and to some extent on various other considerations. B. P. is greatest at each heart-beat (systolic pressure), and decreases between the beats (diastolic pressure). By systolic pressure is denoted the maximum internal pressure to which the arterial walls are subjected at a time corresponding to the systole of the ventricle; the lowest point to which the pressure falls between each pulse-beat is called the diastolic pressure, and corresponds to the diastole of the ventricle. The systolic pressure in children is equal to that of a mercury column about 100 mm. high; in young adults, 120; and increases with advancing age. Up to comparatively recent times B. P. measurements were, generally speaking, concerned with the systolic pressure; but the value of diastolic readings became increasingly recognized. The arterial wall is continually subjected to this diastolic pressure; it increases with the peripheral resistance and vice versa; and a loss of elasticity of the arterial system causes a diminution in diastolic pressure. If the peripheral resistance remains normal, the diastolic pressure is greater or less according as the action of the heart is rapid or slow. B. P. increases with exposure to cold, in diseases of the kidneys, in toxæmia of pregnancy (see PREGNANCY), in arteriosclerosis and disorders of the ductless glands, and may also be affected by nervous disorders. High readings up to 250-300 mm. of mercury may be recorded in advanced cases of kidney disease. B. P. declines below the normal as the result of warmth, in wasting diseases such as

pulmonary tuberculosis, and cancer of the digestive system, and cardiac failure. As regards the method of measurement B. P. is measured by means of the sphygmomanometer, which consists of a rubber bag strapped round the arm, and of which the interior communicates by 2 tubes with a pressure gauge and a hand pump. The bag is pumped up so as to constrict the arm, and the systolic pressure is taken as that at which the pulse disappears from the vessel further down the arm. In proportion as instruments for B.-P. measurements have developed in accuracy, arterial B.-P. observations in clinical medicine have played a part of increasing importance in connection with diagnosis, prognosis, and treatment.

The treatment of high B. P. (hypertension) consists, so far as is possible, in treating the cause, combined with measures designed to lower the tension. The removal of a functionless kidney is sometimes effective in those cases in which the diseased kidney is the cause of the hypertension. An operation known as sympathectomy, in which the lumbar sympathetic nerve chains (see NERVOUS SYSTEM) are severed, is performed in some cases. The sympathetic nervous system controls arterial wall tension, and the theory of sympathectomy is that it relaxes the tension. It is successful in about 20 per cent of cases. Drugs of the methonium group, which block the sympathetic ganglia, act as a kind of medical sympathectomy and are much used. More recently alkaloids derived from the plant *Rauwolfia serpentina* have been given for hypertension with promising results. One of these drugs is marketed under the name of reserpine. A low salt diet is given in hypertension.

Blood-rain, red rain which falls in Italy and S. Europe. Microscopic examination reveals red dust from the sandy deserts of N. Africa to be the cause of the phenomenon. The cause is thought to be found in the upward force of water-spouts and whirlwinds (q.v.). Among the natives of N. Africa these rainless whirlwinds are called 'devils.' The Canary Is. are subject to similar phenomena.

Blood-stains, dried and darkened residue left on clothing, etc., after contact with blood, often important as evidence in criminal actions. The problem may be to decide whether a given stain was produced by blood or not, whether the blood was that of a human being or not, or whether the stain is recent or not. The time for which a blood-stain has been in existence can only be approximately decided by the amount of hardening or the deepening of the tint. After the blood has become black, no further change can be detected. The tests to decide whether a stain was produced by blood or not may be microscopic, spectroscopic, or chemical. The stained substance is first soaked in a solution of glycerine in water to a sp. gr. of 1.028, or in normal saline solution. This softens the stains without causing other changes. Examination under the microscope should then reveal the presence of corpuscles, which, however,

are similar in shape amongst all the mammalia except the camel tribe, where they are elliptical instead of circular. Mammalian red corpuscles are distinguished from those of all other animals by the absence of a nucleus. For spectroscopic examination a solution of the suspected substance in water is prepared. The spectrum of blood exhibits 2 dark bands, one in the middle of the green rays, and the other between them and the yellow. The addition of ammonium sulphide to the solution reduces the oxy-haemoglobin to haemoglobin, and one dark band only is exhibited. The chief chemical tests are the reaction with guaiacum and the production of haemin crystals. These tests merely decide the presence of mammalian blood, and to distinguish between human and other blood it is necessary to make use of the effect of inoculating animals with the blood of a different species.

Blood Transfusion, transfer of blood from 1 individual, the donor, to a recipient. The process was known in England and France in the 17th cent. The first experiments were made with sheep, dogs, and cats, but early in the 19th cent. attempts to transfuse the blood of human beings were made in England, and later in Germany, often with disastrous results. Some of those probably received an explanation in Jansky's discovery (1907) of 4 different types of human blood, and the fact that, when 2 of these are mixed, agglutination of the red corpuscles occurs in certain cases. In modern practice samples of blood for transfusion are tested for the ABO groups and for the Rh factor (see also ONSTETRICS). The ABO system of grouping depends upon the existence on the surface of red blood cells of 2 antigens known as A and B. Some people's red cells may have antigen A on them; others may have antigen B; others may have A and B; while yet others may have neither. All human red cells are therefore classified into groups—A, B, AB, and O—according to the presence on them of either, neither, or both of these antigens. When the blood of a person whose red cells carry antigen A is mixed with a serum containing an antibody to antigen A, the antibody (anti-A) causes the antigen-A-carrying red cells to stick together, or agglutinate as it is called, into clumps. Red cells carrying antigen B react similarly with serum carrying anti-B antibody. Red cells carrying antigens A and B (group AB blood) will, of course, react with serum containing either anti-A or anti-B, while group O blood, the red cells of which carry neither A or B antigens, will not react with any serum. The presence of antibodies in human serum is governed by the rule that every person's serum contains those antibodies which will not agglutinate the red cells present in their own blood. Thus group A blood which has antigen-A-carrying red cells, has anti-B antibodies in its serum; and group B blood has anti-A serum antibodies. Group AB blood has neither anti-A nor anti-B antibodies, but group O

blood (which has no A or B antigens on its red cells) has both A and B antibodies in its serum. With this knowledge of what may occur if a recipient's serum is incompatible with a donor's red cells, it may be understood that, except in emergency, a patient is always given a transfusion of blood of his own group. In an emergency, however, group O blood can without great danger be given to anyone.

Every person, whatever his or her ABO blood group, is either Rh-positive or Rh-negative—that is, the red cells either contain or do not contain an antigen known as the Rh factor. The corresponding antibody (anti-Rh) is not normally present in the serum of Rh-negative persons, but if such a person is transfused with Rh-positive blood or bears a child whose blood is Rh-positive, he or she may as a consequence develop anti-Rh antibody in the serum. A subsequent transfusion of Rh-positive blood would then lead to a severe reaction or, in the case of a mother, a subsequent pregnancy with an Rh-positive foetus might cause the foetus to suffer from haemolytic disease.

In deciding what blood is suitable for a given recipient the prin. consideration is the absence of reaction between the red cells of the donor and the serum of the recipient. Tests are in general carried out by mixing a small quantity of the donor blood with a small quantity of standardized anti-A or anti-B serum in glass tubes. At the end of 2 hrs these tubes are examined microscopically, and from the presence or absence of agglutination the ABO group of the donor blood can be discovered. Similar tests are done to ascertain the Rh grouping. As an additional safeguard it is usual also to test for the presence of anti-A, anti-B, and Rh antibodies in the donor serum by the use of red cells known to be of groups A, B, and Rh positive. It is customary now to test the blood of all pregnant women for Rh as well as ABO. There are other and rare antigens of the Rh complex, known as C, D, and E, which may also have to be tested for, and as time goes on no doubt other rare antigens will be discovered. The problems of B. T. are greater than may appear at first sight. The taking and matching of blood is now carried out by the National Blood Transfusion Service, which is a part of the National Health Service administered under the regional hospital boards.

The original method of transfusing blood consisted in securely applying the cut end of an artery of the donor to the cut end of a vein in the recipient's forearm. The technique of this method required considerable skill. But B. T. from the artery has long been discarded, and the blood is now drawn invariably from the vein of the donor. During the First World War, when immediate transfusion was the only means of saving the life of many of the wounded, a quick and safe means of effecting it was essential. Frequently the artery and vein were connected by a sterilised cannula, a curved glass or silver tube of fine bore. A more rapid means was introduced by Capt.

O. H. Robertson, who collected the blood of the donor in a graduated bottle containing 3·8 per cent of sodium citrate solution to prevent coagulation. He then pumped the mixture from the bottle into the veins, through a needle of selected bore, and was thus able to regulate and measure the amount transfused and to give it with least inconvenience to the patient. B. T. is now invariably given by the intravenous drip method. A cannula inserted into a vein of the recipient is connected by flexible tubing to a bottle containing the blood to be transfused. The bottle is suspended above the level of the patient so that the flow of blood takes place by gravity. The rate of flow is governed by adjusting the pressure of a screw clip placed on the rubber connecting tube.

Hous and Turner (1916) discovered that blood could be preserved without deterioration for periods up to 3 weeks by keeping it in a refrigerator at a temp. just above its freezing-point, so that it is possible to have at hand reasonably large quantities for use in emergency.

B. T. has been extensively used to repair loss of blood through haemorrhage, haemophilia, and anaemia, and its use as a prophylactic against shock is increasing. It is administered before operations in cases of debility, toxæmia due to burns, and in certain kinds of gas poisoning.

During the Second World War greater use was made of B. T. than ever before. Instead of whole blood, the plasma alone was often employed, i.e. blood from which the red and white corpuscles had been removed. It was found that, if the plasma was carefully dried, it could be stored for indefinite periods, and then reconstituted by dissolving in sterile distilled water when required. A second advantage of plasma over whole blood is that it can be transferred to an individual of any blood group without causing agglutination of the corpuscles. See G. Keynes (ed.), *Blood Transfusion*, 1949, and P. L. Mollison, A. E. Mourant, and R. H. Race, *The Rhesus Blood Groups and their Clinical Effects* (Medical Research Council Memorandum No. 27).

Blood Vengeance. Among primitive tribes, where there was no central authority to maintain order and justice, each community was bound to defend itself, and this induced in every family or clan a strong feeling of solidarity for purposes of protection or retaliation. If one member of it was injured all the rest were zealous for retribution. There seems to have been practically no distinction drawn in very early times between accidental and intentional homicide. The blood feud or vendetta (q.v.) still exists in some countries and was known until recently in Corsica. Among the Hebrews, however, it was recognised that deliberate murder stood on a different footing from accidental manslaughter, and though the *goel haddam* (from *goel*, the nearest kinsman) in both cases sought for revenge, yet there were provisions made for securing to an unintentional homicide a place of refuge and a fair trial. For such the altar

of the tabernacle and the cities of refuge were sanctuaries (Exod. xxi, Num. xxxv, Deut. xix).

Blood-worm is the popular name applied to the larvae of some dipterous insects of the genus *Chironomus* and family Chironomidae. In form they are worm-like, and owing to the haemoglobin present in it their blood is red; they live in mud and sand in water, and anglers use them for bait.

Bloodflower, common name of the genus *Haemanthus* (Gk *haema*, blood; *anthos*, flower), in reference to colouring. The genus is of the Amaryllidaceae, native to S. Africa. *Asclepias* (q.v.) *curassavica*, family Asclepiadaceae, of tropical America, is also called B.

T. Fall

BLOODHOUND

Bloodhound, breed of hound, deriving its name from its finely developed sense of smell. Where this sense is employed in the tracking of a bleeding creature, the blood provides the scent necessary. The dog is able to select from a constantly moving herd of deer the wounded one, and to track it down. It is sometimes alluded to as a sleuth-hound, from the Middle-Eng. word sleuth, meaning track. It is probable that from the B. all other varieties of the hound breed are descended. Their use in sport and in the sterner purposes of man-hunting dates from the Romans. Until the abolition of the slave trade in America, their use in tracking runaway slaves was almost universal, though the variety of hound then used was not the pure B., but a type called the Cuban hound. This type is different from the true, and resembles a breed obtained by crossing mastiffs with bulldogs, but their inferiority in qualities of perceptive scent was balanced by their ferocity. It is sometimes called the Cuban mastiff. The method of the B. in retaining the scent of its quarry is to follow it steadily and slowly till it is successful in reaching the object pursued. If, however, the scent is lost, the sagacious animal carefully retreats along the unsuccessful path till the scent is found, when it makes a fresh attempt in another direction. The characteristics of the B.

are as follows: The head is long and dome-shaped, with large pendulous ears; between the eyes and above them are puckers of the skin, which add to the dog's already intelligent expression; the eyes themselves are somewhat fierce in expression, as the third lid is visible, which results in a bloodshot expression: in the purest breeds no white is visible. Its physique is strong and muscular. The colour is deep tan, occasionally with black spots.

Bloodroot (*Sanguinaria canadensis*), low-growing, N. Amer. herb, family Papaveraceae, with white flowers and blue-grey leaves; the rhizomatous root was used medicinally.

Bloodstone, dark green chalcedony (q.v.) with spots of red jasper (q.v.).

Bloody Assize, see JEFFREYS.

Bloomer Costume. About 1848 the 'Woman's Rights Movement' in America gave rise to the adoption of an attire for its members somewhat resembling that of men. In the following year, 1849, Mrs Bloomer gave her name to a costume which consisted of a short jacket, a short skirt reaching just below the knee, and a pair of 'bloomers' made on the pattern of Turkish trousers. The courage necessary to adopt this form of apparel was found wanting in many, and only a few followed Mrs Bloomer's advice.

Bloomfield, Maurice (1855-1928), Amor. orientalist and philologist, b. Bielitz (then Austria), now Bielsko (Poland). Was brought to America when 4 years old. In 1881 appointed prof. of Sanskrit and comparative philology at Johns Hopkins Univ., Baltimore. He wrote about 200 pubs. on comparative and historical grammar, and on Indian languages, literature, hist., and religion. He also ed., trans., and interpreted various Sanskrit texts. His main works are *Atharva Veda*, 1899, *Cerberus*, 1905, *A Vedic Concordance*, 1906, *Religion of the Veda*, 1908, *Rig-Veda Repetitions* (2 vols), 1916, and *The Life and Stories of the Jaina Saviour Pārśvanātha*, 1919.

Bloomfield, Robert (1766-1823), poet, b. Houlington in Suffolk. While still a boy he went to London and worked as a shoemaker in extreme poverty. His first and chief poem, *The Farmer's Boy*, was pub. in 1800 and met with great success. The Duke of Grafton got B. an appointment in the seal office and afterwards allowed him a small pension. Others of his works are *Rural Tales*, 1802, *Wild Flowers*, 1806, *The Banks of Wye*, 1811, and *May Day with the Muses*, 1822. In spite of influential friends he d. in poverty.

Bloomfield, tn of New Jersey, U.S.A., in Essex co., NW. of Newark. The manufs. include woollens, rubber products, chemicals, porcelains, cosmetics, and pharmaceuticals. It has a Presbyterian college and seminary. Pop. 49,300.

Bloomington: 1. City and cap. of McLean co., Illinois, U.S.A., in an agric. and coal-mining area, 35 m. ESE. of Peoria, with large railway shops. B. manufs. heaters, and air-conditioning and ventilating equipment. Illinois State Normal Univ. is near by. Pop. 34,200.

2. City, cap. of Monroe co., Indiana, U.S.A., 45 m. SSW. of Indianapolis. It is the seat of Indiana Univ. (15,000 students). It has limestone quarries and manufs. furniture, flour, and glass products. B. was settled in 1818. Pop. 28,200.

Hulton Picture Library

MRS BLOOMER

Bloomsburg, co. seat of Columbia co., Pennsylvania, U.S.A., on Fishing Creek, 40 m. SW. of Wilkes-Barre. It manufs. carpets, clothing, and rayon, and a state teachers' college is here. Pop. 10,630.

Bloomsbury, dist. of London bounded by Tottenham Court Road, Euston Road, Gray's Inn Road, and New Oxford Street-Holborn, noted for its fine squares and

wide streets. It takes its name (originally *Blemundsburi*) from one Blemund who owned the land in the reign of King John. Modern development begins with the building of the 4th Earl of Southampton's house and the laying out of B. Square in 1660. Some good 18th- and early 19th-cent. buildings survive. B. is noted as an intellectual centre, and between the 2 world wars there was a 'Blossomsbury Set,' including Lytton Strachey, J. M. Keynes, Roger Fry (qq.v.). It is an area of many publishing offices, hotels, and boarding houses. Among its public buildings are the Brit. Museum, Univ. College, the Senate House, Library, and other buildings of London Univ.

Blount, Charles (1654-93), deist, *b.* Upper Holloway. His *Anima Mundi*, 1679, was criticised for its scepticism, and banned by the Bishop of London. Best known is his *Philostratus concerning the Life of Apollonius Tyaneus*, 1680.

Blount (or Blunt), Edward (d. 1588-1632), Eng. printer and stationer, of St Paul's Churchyard, London; son of a London merchant tailor. His most outstanding pub. was in 1623, when, in collaboration with another printer, Isaac Jaggard, he brought out John Hemming's and Henry Condell's ed. of Shakespeare's plays, known as the first folio. B.'s name appears as one of the printers of the folio, both on the title-page and in the colophon. His first venture, as registered in extant stationers' books, was Joshua Sylvester's *The Profit of Imprisonment*, 1594. He also produced the *Hero and Leander* of Marlowe, of whom he was an intimate friend. Other famous books issued by B. were Florio's trans. of Montaigne's *Essays*, 1607, and Shelton's first Eng. trans. of *Don Quixote*, 1620. B. was also known as a translator himself, one of his best achievements being *Arts Aulica, or the Courtier's Arte*, which he trans. from the Italian of Ducci. In 1632 he collated the court comedies of Lyly for pub.

Blount, Thomas (1618-79), Eng. antiquarian, student of law and a zealous Rom. Catholic, of Orleton, Worcs. His works include *Glossographia*, a work still of value among literary antiquarians; *Nomolexicon*, a dictionary of law terms; and *Fragmenta Antiquitatis*. His *Boswell* appeared in 1894, ed. with a biography by C. G. Thomas.

Blouse (Fr. *blouse*, etymology dubious), originally a loose-fitting upper garment worn by peasants of both sexes, the favourite colour being blue. It is still worn by landworkers and station porters. The modern B. is the feminine equivalent of the shirt, and has for many years been popular with women of all countries, and especially of England and America.

Blow, John (1649-1708), Eng. musical composer, *b.* Newark-on-Trent. He was one of the first choir-boys of the chapel royal after the Restoration and was made organist there in later life. He obtained his degree of doctor of music, and was appointed organist of Westminster Abbey at the age of 19 (1668); hon. Mus.D., Canterbury, 1678; succeeded by Purcell, 1679; reinstated after Purcell's death,

1695; choirmaster at St Paul's, 1687-93. He composed the anthem *I was glad when they said unto me* at the opening of the choir of the cathedral in 1697, one of a very large number, also Anglican services, secular choral odes, and the opera *Venus and Adonis*.

Blow-fly, see BLUEBOTTLE FLY.

Blow-hole, or **Gloup**, air passage connecting a sea-cave with the land surface behind the cliffs. Waves breaking into the mouth of the cave may drive a shower of spray out through the B.

Blowing-machine, contrivance for producing a continuous discharge of compressed air. The most primitive type is the ordinary domestic bellows, which consists of a wedge-shaped chamber with collapsible leather sides; the top and bottom are rigid, and the bottom is provided with a valve opening inwardly, so that as the collapsible sides are extended, the air enters. When the top and bottom are squeezed together again, the air is prevented by the valve from escaping otherwise than by the nozzle. In the double bellows there are 2 compartments separated by a fixed partition, and an inwardly opening valve is situated in the under side of each compartment. On the machine being extended and compressed by a lever acting on the lowermost rigid board, the air enters the lower compartment, whence it can only escape to the upper one, which acts as a reservoir, a weight on the uppermost rigid board producing a fairly continuous current through the outgoing pipe from the upper compartment. For blast furnaces blowing-engines, depending upon the to-and-fro motion of a steam-driven piston, are used. There is a chamber with an inwardly opening valve on each side of the piston, so that air is expelled at each stroke. Both chambers of the cylinder communicate with a large air reservoir, so that the blast is kept uniform. Fans for compressing air depend upon the centrifugal motion of air between vanes fitted to the spokes of a rimless wheel. The fan is enclosed in a cylindrical chamber somewhat eccentrically; the air is admitted at orifices around the axle, is driven towards the circumference by the revolution of the fan, and emerges through a pipe fixed tangentially. The best results are obtained with curved vanes, the convex side towards the exit. In parts of Spain a water B. is used. A fall of water is necessary, and the arrangement includes a cistern where the water collects; a wooden shaft with a few air-holes through which air is sucked as the water falls down the shaft; and a wind chest where the air and water separate. The water flows away through an exit pipe at the bottom of the chest, and the air is forced out through a nozzle by the compression induced by the continuous descent of air mixed with the falling water. Roots's rotary blower has a chamber which consists of 2 semi-cylinders separated by a rectangular space greater in width than the radius of the cylinders. Mounted axially with the cylinders are 2 revolving pieces, shaped like a figure of eight, almost

equal in length to the diameter of the semi-cylinders. They revolve in opposite directions, being at right angles every quarter-revolution. The air enters at the base of the chamber into the space between the revolving pieces, which gradually diminishes until the air is expelled at the top of the chamber.

Blowitz, Henri Georges Stephan Adolphe Oppé (1825-1903), Anglo-Fr. journalist, b. Bohemia. He acquired, when travelling, a complete knowledge of sev. European languages, and was appointed prof. of foreign languages at the Marseilles Lycée. After his marriage, in 1859, he turned to journalism, and sev. times incurred the displeasure of the authorities. His remarkable career really begins in 1873, when he became chief Paris correspondent to *The Times*. His most sensational feat was to enable *The Times* to publish the entire text of the treaty of Berlin at the actual moment it was being signed in Germany. His memoirs were pub. in 1903.

Blowpipe, weapon employed by Indian tribes of S. America both in hunting and in war. A poisoned shaft, fixed in the end of the B. or tube, is driven out by the breath. The tube, usually about 10 ft long, is made of reed or the stem of a palm. Near Pará the poisoned arrows, made of palm spines, are 17 in. long, whilst in Peru they are only about 2 in. long.

Blowpipe, instrument used with a gas or spirit flame to quicken combustion and therefore increase the temp. of the flame area. In its usual form it is a conical vessel with the mouthpiece at the narrow end and a fine nozzle inserted towards the base.

Bloxwich, ward of the co. bor. of Walsall (q.v.).

Blubber, thick fatty covering which envelops the body of the whale and of various other marine animals such as seals and penguins. It is one of the products of the whale which are of commercial value, and is the source of sperm oil.

Blücher, Gebhard Leberecht von (1742-1819), Prussian field marshal, prince of Wahlstadt, b. Mecklenburg-Schwerin. In the year 1756 he entered the service of Sweden, and 4 years later was captured by Prussians in the Pomeranian campaign. He was persuaded by his captors to enter the service of Prussia and was given a lieutenantancy. He served in the later battles of the Seven Years War. He gained promotion to the rank of captain, but retired into private life (1773). In 1778, after the death of Frederick, he was restored to his old regiment, the Red Hussars. In the following year he became a colonel, and in 1794, as a reward for his services in the Fr. campaigns, he was made a major-general. In 1801 he became a lieutenant-general. The war of 1805-6 found him active as a cavalry leader, and as such he took part in the battle of Auerstädt, and he covered the rear of Prince Hohenlohe's army on the retreat to Pomerania. He then went northward and fought in the neighbourhood of Lübeck, being in Nov. 1806 forced to surrender to the French at Ratkau, but was

soon exchanged. During the period of Napoleonic domination he was actively in touch with the national party, and was, in 1812, banished for his pronounced opinions from the court. The beginning of the War of Liberation found him placed in high command of the Prussians, and he organized the Prussian Army, becoming commander-in-chief of the army of Silesia with 90,000 men under his command. He was full of energy and was prepared to attempt anything. He defeated Macdonald at Katzbach, and by his defeat of Marmont prepared the way for the defeat of Napoleon at Leipzig. He was made a field marshal after the defeat of Marmont, and stormed Leipzig on the last day of the battle. He persuaded the allies to carry the war into Fr. ter., and by his courage and energy in the face of defeat he ultimately triumphed and led the army of Silesia directly on to Paris. He proposed that the ravages of the French in Germany should be avenged by equal ravages in Paris, but was prevented by Wellington from carrying out his proposals. In 1814 he visited England and was welcomed everywhere enthusiastically; in the same year also he was made prince of Wahlstadt. He retired to Silesia, but was soon called from his retirement to take part in the campaign of the Hundred Days. He sustained a severe defeat at Ligny, and in this battle nearly lost his life. But he moved on and marched to the assistance of Wellington. His forced march was the means of his intervening at the critical moment in the battle of Waterloo, and of turning the defeat of the French into a headlong rout. The rout was complete and decisive owing to B.'s relentless pursuit of the enemy. B. subsequently retired to his Silesian estates where he d. See memoirs, ed. Princess E. Blücher and D. Chapman-Huston, 1932.

'Blücher,' The, cruiser of the Ger. Navy, which, with the *Seydlitz* and *Moltke*, bombarded Harlepool, Yorks, on 16 Dec. 1914. She was sunk by the British at Dogger Bank, 24 Jan. 1915.

Bludenz, Austrian tn in the prov. of Vorarlberg, on the Ill. It has a 16th-cent. church and a Renaissance castle. There is an alum industry. Pop. 9700.

Blue, Victor (1865-1928), Amer. admiral, b. Richmond co., N. Carolina. In the Sp.-Amer. war in 1898, he served with the fleet which blockaded Adm. Cervera's fleet off Santiago, Cuba. Won fame by getting ashore and learning the strength and positions of the hostile squadron. Appointed chief of the Bureau of Navigation, U.S. Navy. In the First World War he commanded the *Texas* in the N. Sea. Promoted rear-admiral in 1919.

Blue, with red and yellow (q.v.) one of the colours generally accepted by artists and others as 'primary.' Artists use as B. pigments: ultramarine, which is prepared from lapis lazuli; cobalt B., of which there are many varieties, consisting of cobalt mixed with earthy or metallic bases; indigo; Prussian B., which is ferrocyanide of iron. In dyeing the B.s form a large group of the coal-tar products.

In laundry work a B. colour is imparted to linen and cotton goods in a very faint degree to heighten the impression of whiteness; many preparations for this purpose are in use (see also COLOUR and PIGMENTS).

Blue, in sports, a man who has won the right to wear the blue cap and blazer of Oxford or Cambridge. Each of these univs. has a blues committee, which awards blues and half-blues for the chief inter-varsity contests. Full blues are awarded in rowing, cricket, rugby, soccer, tennis, boxing, athletics, and golf; in athletics the first representative in each event is a blue and the second a half-blue. Half-blues are awarded in the minor sports.

Blue-books, name given to parl. pubs., usually bound with blue covers. The idea of printing records of parl. business originated in a dispute in 1681 over the question of the Duke of York's exclusion from the throne. A statement was circulated that falsified accounts of the proceedings had been circulated, and it was therefore proposed by Sir John Hotham to print all reports. The cheap price of these pubs. has only been in vogue since 1836. From the Board of Trade a pub. is issued monthly which contains information relating to the world's trade and commerce. Ann. B. are issued by all the Brit. crown colonies and protectorates, and by the mandated ters. They give detailed information on revenue, import duties, exports and imports, currency, weights and measures, etc. The distinctive colours which mark foreign 'B.' are: America, foreign correspondence, red; German, white; French, yellow; Austrian, red; Portuguese, white; Italian, green; Japanese, grey; and Chinese, yellow.

Blue-coat School, see CHRIST'S HOSPITAL.

Blue-eye (*Lintomyza cyanotis*), species of bird of minute structure and great beauty. It is found in large numbers in New S. Wales. It belongs to the honey-eaters, and goes under the name of blue-cheeked honey-eater.

Blue-fish (*Pomatomus saltatrix*), voracious spiny-finned fish of the order Percomorphi. The E. coast of N. America is its only home. It is blue on top and whitish below, while a large black spot is seen at the base of the pectoral fins. Its food is other fish of smaller size.

Blue-gowns, Scottish term given to paupers. It originated from beadsmen who in return for a small annuity were employed by persons desirous of their efforts in prayer.

Blue Grass, or Kentucky Blue Grass, is the perennial *Poa pratensis*, and its strains, grown for pasture and lawn turf in the N. states of U.S.A., and known as Meadow Grass in Britain.

Blue Island, city in Illinois, U.S.A., adjoining Chicago on the S., in a truck-farming and dairying area. It manufs. wire, steel, and iron products, and brick. Pop. 17,600.

Blue Jay (*Cyanocitta*), Amer. genus of the Corvidae, or crow family. *C. cristata* is a beautiful bird, the plumage being blue

above, white beneath, and variegated with black and white. Like other members of its family it is a great thief, and in the spring it eats both the eggs and young of other birds, though in the summer it feeds on fruit and insects. It has a harsh and unmelodious voice.

Blue John Mine, cave of many chambers in Derbyshire, England. It is situated in Tray Cliff in the N. of the co. W. Castleton is 1½ m. distant. Blue John is a name for fluorspar (q.v.).

Blue Laws, collection of very severe laws regarding behaviour and the due keeping of the Sabbath, alleged by the Rev. Sam A. Peters in his *General History of Connecticut* to have been in force among the early colonists of New Haven and Connecticut. This allegation was at first thought to be without foundation, but they were later found, in part, to exist among the New Haven Statutes. The term is still used colloquially in reference to local ordinances concerning Sunday amusements, etc.

Blue Mountains: 1. Spur of the Dividing Range of mts in New S. Wales. They run almost parallel with the coast, 50 to 80 m. W. of Sydney. A passage was found over them leading to the Bathurst Plains in 1813. Mt Beemarang, 4100 ft, is the highest point. Parts of the roads which cross them are 3400 ft above sea level. The mts contain many popular tourist resorts and are renowned for their fine scenery. Caves exist of great size, those of Jenolan being notable.

2. Range of mts in NE. Oregon and SE. Washington, U.S.A. It extends from N. to S., passing through the co. of Umatilla. The mts are composed chiefly of granite, and their slopes are covered with great forests of pine and fir. There are gold-mines, and stock grazing and agriculture in the valleys.

3. Range of mts in Jamaica. Blue Mountain Peak is 7520 ft. The altitude of this system, whose main chain extends from E. to W., varies between 5000 and 7000 ft. It forms a popular tourist resort, being only 8 m. N. of Kingston.

4. (Kittatinny) Mt system of Pennsylvania and New Jersey, forming part of the Appalachian system. It stretches from Orange co., New York, traversing the cos. of Sussex and Warren in New Jersey. At the Delaware Water Gap the R. Delaware crosses the mts. Their structure is largely of rocks belonging to the Silurian period.

Blue Nile, see BAHR-EL-AZREK.

Blue Ox, see NYLGHAW.

Blue Peter, rectangular blue flag with a white square in its centre which is flown in a ship when she is on the point of sailing. Usually hoisted on the foremast.

Blue Pill, mercury preparation containing mercury 33 per cent, confection of roses, and powdered liquorice. It is used as a cathartic (q.v.).

Blue Print, see COPYING.

Blue Ribbon, badge of all total abstainers, who at one time styled themselves the 'B. R. Army.' The army began its career in 1878 in America,

and extended to Britain. The term probably originated from the B. R. badge which was worn by each knight of the Garter. The term is used also when speaking of some prize, as, for instance, the 'Derby' (q.v.) stakes and the Atlantic crossing (see SHIPS and SHIPBUILDING, *The Blue Riband of the Atlantic*).

Blue Ridge, easternmost chain of the Appalachian Mts of Virginia and Carolina. It is famous for the splendour of its scenery. Its highest point is the Grandfather, in N. Carolina, 5897 ft.

Blue Roach, see AZURINE.

Blue Robin, see BLUEBIRD.

Blue Shark (*Carcharinus glaucus*), species of shark, a native of tropical seas, but a frequent visitor in warm summers to the Eng. Channel, where it destroys both fish and nets. It grows to a length of at least 25 ft.

Blue-stocking, term used rather depreciatively of a woman of learning or affecting literary tastes; especially of those who air their erudition to the exclusion of more traditional womanly activities. About 1750 a literary circle was estab. in London consisting of ladies and gentlemen, among whom was a distinguished Mr Benjamin Stillingfleet, who habitually wore blue stockings—hence the name. With the changed attitude towards the education of women, and with the increasing opportunities afforded them, the term is much less frequently used.

Blue Warbler, see BLUEBIRD.

Blue-wing (*Querquedula discors*), species of Anatidae; often called the blue-winged teal. It is a brilliantly coloured bird with bright blue wing-coverts. It is a native of N. America which migrates in winter to S. America.

Bluebell, name given to *Campanula rotundifolia* in Scotland, where it grows abundantly, and is the same as the harebell of England. It belongs to the dicotyledonous family Campanulaceae and is totally different from the Eng. B., or *Endymion non-scriptus*, otherwise known as the wild hyacinth, which is a species of the monocotyledonous family Liliaceae.

Bluebird, **Blue Warbler**, and **Blue Robin**, names given to a N. Amer. bird (*Sialia sialis*). It is recognised with as much pleasure as the robin is in England, by reason of its tameness and absence of fear of human beings. It is rather larger than the robin, though its general appearance and diet closely approach it. It lays about 6 pale-blue eggs. As a migratory bird it sounds the approach of spring with its return.

Bluebottle, see CENTAUREA.

Bluebottle Fly, name given to sev. species of Muscidae, dipterous insects related to the house-fly, *Musca domestica*. They are, however, larger than the latter. A loud buzz marks its flight, and the extent of its wings across is almost an inch. Its head is black, the thorax grey, and the abdomen blue, with 3 black stripes. Its finely developed sense of smell enables it to find the flesh upon which it lays its eggs. It thrives most numerous from spring to autumn, and

is common to Great Britain and Europe. *Calliphora vomitoria* and *C. erythrocephala* are common Brit. species; and *Sarcophaga carnaria*, the flesh-fly, a member of the family Sarcophagidae, resembles the B. F. very closely.

Bluefields River, or **Escondido River**, riv. of Nicaragua flowing into the Caribbean Sea. It is joined by the Mico, and empties itself into Bluefields Bay. The tn of Bluefields is within a few m. of its mouth. The riv. is about 60 m. in length.

Bluethroat, or **Blue-breast**, name given to a genus of birds related to the redstarts and resembling the nightingale. There are 2 species: red-spotted (*Cyanocula svecica*) and white-spotted (*C. wolfi*). It possesses beauty of form and voice. Its ability to imitate the songs of other birds earned for it a Lapland name meaning a hundred tongues. The throat and upper neck are bright blue. The females are less conspicuous than the males. As a bird of passage it is known in many parts of Europe.

Blum, **Léon** (1872–1950), Fr. writer and politician; b. Paris, of Jewish descent, and educ. at the lycées Charlemagne and Henri IV. Master of requests to the Council of State from 1895, he also became well known as a critic on *Gil Blas*, *L'Humanité*, *Le Matin*, and *Comœdia*. He backed Jaurès in the Dreyfus affair, and joined the Socialists in 1899. He was elected deputy for Seine in 1919. Forcefully opposing the policy of occupation of the Ruhr, he assisted in founding, early in 1924, the combination of the left which led to the downfall of Poincaré and Millerand; and he was the real leader of the Socialists during the Herriot Ministry of 1924–5. He became Prime Minister in 1936; during his ministry various leagues of violence were disbanded and many reforms effected. He resigned in 1937, but was again Prime Minister in 1938, though only for a few weeks. After the fall of France in the Ger. invasion in 1940, B. was placed under arrest, and remained a prisoner in Ger. hands, being taken to Germany in 1944, where he was liberated by the allied armies in May of the following year. In Jan. 1946 B. was given ambassadorial status and placed in charge of financial and economic missions in U.S.A. and elsewhere. Subsequently to the Oct. referendum on the new Fr. constitution he became temporarily Prime Minister for the specific purpose of visiting London, where he laid the foundation of the existing Anglo-Fr. alliance. After 1946 his views as an elder statesman were constantly sought by members of all parties. His pubs. include *Le Livre de mes amies*, *Eliane*, *En lisant*, 1903, *Au théâtre*, 1905–11, *Du Mariage*, 1907, *Stendhal et le Bèylisme*, 1914, *L'Exercice du pouvoir*, 1937, and *A l'échelle humaine*, 1945. See R. L. Stokes, *Léon Blum*, 1937.

Blumenau, dist. and city in Santa Catarina, Brazil, situated on the R. Itajaí, 60 m. NW. of Desterro. The tn was founded as a Ger. settlement by Dr Hermann Blumenau, 1852. The climate is healthy, and tobacco, cereals, sugar,

and coffee are the chief products of the dist. Pop. (dist) 125,000; (tn) 55,000.

Blumenbach, Johann Friedrich (1752-1840), Ger. naturalist, b. Gotha; educ. at Jena and at Göttingen, where he became prof. in 1778, remaining at the univ. for about 60 years. During that time he lectured on natural hist., anatomy, medicine, and physiology. In 1785, and therefore before Cuvier, he estab. the dependence of zoology on comparative anatomy, and also made important contributions to ethnology. His works include *De Generis Humani Varietate Nativa*, 1775, *Manual of Natural History*, 1780, and *Manual of Comparative Anatomy and Physiology*, 1804, etc., many of which were trans. into sev. languages.

Blumenbachia, S. Amer. genus of Loasaceae with a hairy fruit of which *B. coronata* is grown as a greenhouse biennial, and *B. insignis* as a hardy ann. trailer in gardens.

Blumenthal, Leonhard, Count von (1810-1900), Prussian general. Member of the general staff, and chief of the staff of Schleswig-Holstein army, 1849. He served in the campaign against Denmark, 1864, and under Crown Prince Frederick William in Austrian campaign. B. was chief of the staff to Crown Prince of Prussia in Franco-Prussian war (1870-1871). In 1888 created field marshal.

Blümlialp, mt group of the Bernese Oberland, Switzerland. Chief peaks: Blümlialphorn (12,038 ft), Weisses Frau (12,012 ft), and Morgenhorn (11,927 ft).

Blundell's School, public school for boys, built in 1604 at Tiverton (q.v.) by Peter Blundell. In 1882 it was moved to the present buildings 1 in. from the tn. Blackmore was a pupil and refers to it in *Lorna Doone*.

Blundellsands, see CROSBY.

Blunden, Edmund Charles (1896-), poet and critic, b. Yalding, Kent. Educ. at Christ's Hospital and Queen's College, Oxford, he served during the First World War in France and Belgium with the Royal Sussex Regiment. His poems were pub. as early as 1914, but his first notable vol. was *The Waggoner and other Poems*, 1920, followed by *The Shepherd and other Poems of Peace and War*, 1922, for which the Hawthornden Prize was awarded. He was prof. of Eng. literature in Tokyo Univ., 1924-7. In 1931 he became fellow and tutor in Eng. literature in Merton College, Oxford, where he remained until 1943, when he joined the staff of *The Times Literary Supplement*. Later he returned to the Far E., and from 1953 was head of the Eng. dept. in the univ. of Hong Kong. His sev. vols. of poems were issued in a collected ed. in 1930, and subsequent vols. were collected in a second series, pub. in 1940. His book of war reminiscences, *Undertones of War*, 1928, enhanced his reputation as a prose-writer, subsequently maintained in a different field with his biographies of Leigh Hunt, 1930, and Shelley, 1946. Other prose works include *Christ's Hospital*, a retrospect, 1923, *On the Poems of Henry Vaughan*, 1927, *Nature in English Literature*, 1928, *The Face of England*, 1932,

Charles Lamb and his Contemporaries, 1934 (the Clark lectures delivered at Trinity College, Cambridge), *The Mind's Eye* (essays), 1934, *Keats's Publisher*, 1936, *Thomas Hardy*, 1942, and *Cricketer Country*, 1944. A later vol. of poems, *Shells by the Stream*, was pub. in 1944. In 1951 he was made a C.B.E.

Blunderbuss (perverted form from Dutch *donder*, thunder; *bus*, gun, originally box), short gun with a large bore, firing a number of balls or slugs. Its name may have been perverted to 'blunder' because practically no aim is taken with it. At short range it can do much damage among a number of objects. It is now obsolete. See also FIREARMS.

Blundeville, Randolph de, Earl of Chester (d. 1232), Eng. nobleman, succeeded as Earl of Chester in 1180. He married Constance, widow of Geoffrey, son of Henry II, in 1187; and married Clemence, sister of Geoffrey, c. 1200. He took John's, and later Henry III's, side against the barons in 1215, and with Fuik de Bréauté stormed and plundered Worcester in 1216. In 1217 he was made Earl of Lincoln, and the following year he went to the Holy Land. Later he plotted unsuccessfully against Hubert de Burgh. He took part in the siege of Nantes in 1230.

Blunt, Edward, see BLOUNT.

Blunt, John James (1794-1855), divine, b. Newcastle under Lyme, and educ. at St John's College, Cambridge. In 1839 he was made Lady Margaret prof. of divinity at Cambridge, and in 1854 he was offered, but declined, the bishopric of Salisbury. His best-known work was *Undesigned Coincidences in the Writings both of the Old and New Testaments*, 1833. See Prof. Selwyn's memoir of him, 1856.

Blunt, Wilfrid Scawen (1840-1922), poet, b. Sussex. Educ. at Stonyhurst and Oscott, he entered the Diplomatic Service and served in various Brit. legations in Europe. In 1869 he left the service and married a descendant of Lord Byron, Lady Anne Noel, who was a brilliant Arabic scholar and more famous among the Bedouin than even Lord Cromer. Together they travelled in the Middle E. and India, and B. wrote *The Future of Islam*, 1882, and other books. An opponent of Brit. imperialism, he championed the cause of Ireland and was imprisoned in 1888. He is best known for his poems, which include *Sonnets and Songs of Proteus*, 1875, and *Esther*, 1892. His *Collected Poems* were pub. in 1914, and *My Diaries* in 1920. See life by E. Finch, 1938.

Bluntschli, Johann Kaspar (1808-81), Ger. jurist, b. Zürich, and studied at the univs. of Berlin and Bonn, at the latter of which he graduated LL.D. in 1829. He then returned to Zürich and took part in the political war which was disturbing Switzerland. He became prof. of law at Zurich Univ., and also a member of the parliament. Here he was soon recognised as leader of the moderate Conservative party. The impossibility of bringing about acceptance of his views on gov. led him to resign, and in 1848 he went

to Munich, where he became prof. of constitutional law. Here he pub. his chief work on jurisprudence, the *Allgemeines Staatsrecht* (5th ed.), 1876. In 1861 B. was appointed prof. of political science at Heidelberg, where he again entered the political arena. At this time B. ranked as one of the greatest authorities on international law. In 1873 he founded the Institute of International Law at Ghent. Among his works are *Geschichte der Republik Zürich*, 1847, *Das moderne Kriege-recht*, 1866, and *Das moderne Völker-recht*, 1868.

Blushing, sudden suffusion of blood over the skin, caused by sensations of shame or modesty. Usually it affects only face and neck, but sometimes arms and chest also. It produces heat and a sense of discomfort, and serves to illustrate the intimate control exercised by the nervous system over the blood vessels.

Blysmus, genus of Cyperaceae. The Brit. flora contains 2 species, *B. compressus* or broad B., found in boggy pastures, and *B. rufus*, or narrow B., which occurs in marshes near the sea. Both are tolerably common, the latter species especially in Scotland.

Blyth: 1. Seaport and watering-place of Northumberland, England, at the mouth of the R. Blyth (20 m. long) which here enters the N. Sea, and 7 m. N. of the R. Tyne. B. exports the coal mined locally, and has large modern building works and light industries. Pop. 34,750.

2. Vil. and par. of Notts, England, 6 m. NNE. of Worksop, with a par. church, largely early Norman in style, formed from the church of the Bonedictine priory founded at B. in 1088. Later enlarged, it has a late 14th-cent. tower, and 2 medieval wooden screens. Pop. 731.

B'nai B'rith, world-wide Jewish fraternal and service organisation founded in 1843 in New York by 12 Ger. Jews under the leadership of Henry Jones. In 1956 it had 7 grand lodges in the U.S.A. and Canada, 1 in England, 1 in Israel, 1 in continental Europe, 1200 subordinate lodges, and 380,000 members. It maintains a high morality regardless of dogma, and major activities include the Anti-Defamation League (to combat racial discrimination and prejudice) and centres of Jewish culture on college campuses. It has estab. these charitable institutions: Levi Memorial Hospital, Hot Springs, Arkansas; National Jewish Hospital, Denver; and Bellefaire (for emotionally disturbed children) at Cleveland.

Boa, name popularly given to any of those large snakes of America and the Old World which, having no poison fangs, kill by constriction. Strictly the term applies only to the New World and Malagasy constrictors, the name python being proper to the others. The boas are distinguished from the pythons by the presence of teeth in the premaxillae, and the absence of supra-orbital bones. The commonest of the species is the *B. constrictor*, about 12 ft. in length, brownish-grey in colour with lines and blotches. The B. attacks small mammals and birds,

crushes the bones of its victim by pressure, and swallows it whole. A long period of torpor follows. Most of the B.s bear their young alive.

BOA

Boabdil, from the name Abu Abdullah (d. c. 1495), last Moorish King of Granada, called also *El Chico*, which means The Little. In 1482 his father, Abu'l Hassan, was dethroned and banished from the country, and B. was proclaimed king. In 1483 he invaded Castile, but was captured at Lucena, and became tributary to Ferdinand and Isabella of Castile. After that he spent sev. years in warring against his father and his uncle. In 1492 the King of Castile, after besieging Granada, captured it. B. is said to have fled to Africa, where he later d. in battle. *El último suspiro del Moro* (the last sigh of the Moor) is shown as the place from which B. last viewed Granada.

Boac, or **Boag**, tn on W. coast of Marinduque Is., Philippines. Pop. 19,687.

Boaden, James (1763-1839), Brit. author. He was editor of the *Oracle* newspaper in 1789. He studied at the Middle Temple, wrote sev. successful plays, and in 1796 pub. an exposure of the Ireland Shakespearian forgeries. In 1831 he pub. a work on Shakespearian sonnets identifying Mr W. H. with Wm Herbert (afterwards 3rd Earl of Pembroke). He also wrote lives of various actors and actresses.

Boadicea, or **Boudicca** (d. 61), Brit. queen, the wife of Prasutagus who ruled over the Iceni in E. Anglia. Dying, he made his wife and daughters joint heirs with the Rom. emperor, Nero, to his property, probably from a mistaken idea that this would save them at least some share of his possessions. In place of this, however, the royal line was treated as extinct, his queen insulted, his daughters outraged, and his subjects goaded by insult and oppression into rebellion. Suetonius Paulinus was with the legions attempting to conquer Anglesey. E. Anglia burst into rebellion. The Rom.

garrisons of St Albans and Colchester were annihilated, London was razed to the ground, and the whole of SE. Britain rose in revolt. Paulinus met the Britons at an unknown place, somewhere in the Midlands, and practically annihilated them. B. took poison, and the rebellion, which owed much to her leadership, was entirely suppressed.

Boanerges, 'sons of thunder,' name given by Christ to the 2 disciples James and John, the sons of Zebedee (Mark iii. 17).

WILD BOAR AND YOUNG

Boar, Wild. The commonest species is the *Sus scrofa*, larger in size than the domestic pig, and characterised by its long tusks, prominent pig-like snout, and short, thick, woolly hair closely interspersed with bristles, which on the neck form a thick mane. These bristles are brownish-black in colour, the shorter hairs being grey. The animal is about 3 ft in height, and far surpasses the domestic swine in strength and swiftness. It is native in Europe, and is now found over Europe, N. Africa, and parts of Asia. It was originally common in the Brit. Isles, and traces of it were found at Chartley Forest, Staffs, as late as 1683, and it survived even later in Ireland and Scotland. It is still found in most parts of the Continent, where it is common in damp and marshy ground. B.s in early times proved very destructive to crops, for they are voracious and omnivorous, and feed chiefly by night. Solid benefit was, therefore, to be gained by hunting them, and their ferocity gave the business the touch of danger necessary to make it a sport. Under the Norman kings the B. was one of those beasts the killing of which without right was punishable by death. B.-hunting was then a lordly sport, and a vivid account of its pleasures is given in the 14th-cent. poem of Sir Gawayne and the Green Knight. The B. was hunted on foot and on horseback with dogs, most commonly B.-hounds. The B.'s head was then accounted a great delicacy, and its entrance at the Christmas festivities was greeted with elaborate ceremonial and many carols. In heraldry

it is a well-known cognisance. Other species of *Sus* are known: *S. vittatus*, *S. verrucosus*, and *S. barbatus*, all Asiatic.

Boar-fish (*Cyprus*), genus of fishes chiefly found in the Mediterranean and NE. Atlantic. It has a flat oval body, similar to that of the related John Dory. Its body is carmine, with 7 transverse orange bands on the back, and the name is derived from its projecting hog-like snout.

Board, name generally given to a body of persons appointed jointly to control some public office, bank, or railway. Thus, for example, when referring collectively to the directors of a railway or a bank it is customary to refer to the B. of directors. Similarly the Lords of the Treasury form the B. of Treasury, whilst the name is or was in common employment, having the same meaning, in such terms as the B. of Guardians, the Local Gov. B., the B. of Trade, and in Scotland the School B. The chief State dept to bear this name is the B. of Trade (see TRADE, BOARD OF). The former B. of Education and the B. of Agriculture and Fisheries have been estab. as ministries (see EDUCATION, MINISTRY OF; AGRICULTURE, FISHERIES AND FOOD, MINISTRY OF). Similarly, the B. of Works, later the Office of Works and Public Buildings, is also estab. as a ministry (see WORKS, MINISTRY OF), and the former Local Gov. B. is now known as the Ministry of Health (see HEALTH, MINISTRY OF). Other important B.s are the London Passenger Transport B., the body which, in 1933, became the sole owning and organising authority for the omnibus, train, and tube system of the metropolis and suburbs (see LONDON TRANSPORT EXECUTIVE); and the Central Electricity B., which was estab. by Act of Parliament in 1926 to re-organise, unify, and develop the generation of electricity in Great Britain (see BRITISH ELECTRICITY AUTHORITY and CENTRAL ELECTRICITY BOARD).

Board of Trade Unit is now known as the kilowatt hr. It means 1000 watt-hrs.

Boarding, in naval tactics, term used for an assault made by one ship upon another. It is now, however, not much practised. B. may be performed on different parts of the ship according to the position of the ships.

Boardman, George Dana (1801-31), Amer. missionary, b. Livermore, Maine; went to India in 1825 as a Baptist missionary, and later did good work among the Burmese Karens.

Boardman, George Dana (1828-1903), Amer. Baptist minister, son of above, travelled alone from Burma to America at the age of 6. After graduating at Brown Univ. he held pastorates at Rochester and Philadelphia, and became president of the Amer. Baptist Missionary Union (1880-4).

Boarmia, genus of lepidopterous insects of the family Geometridae. All the species of these moths are of an ashy colour, or white minutely dotted with brown, and the large wings, when at rest, are placed horizontally. Many species are found near London.

Boar's Hill, vil. of Berks, England, 4 m.

N. of Abingdon. The hill itself is 550 ft high. On it is Ripon Hall, a college for candidates for holy orders in the Church of England.

Boas, Franz (1858-1942), Amer. anthropologist, b. Minden, Germany. In 1883-4 he explored Baffin Land, and the following year he became assistant curator of the Royal Ethnological Museum, Berlin. In 1886 he went to N. America and finally settled in the U.S.A., becoming, in 1899, the first prof. of anthropology at Columbia Univ. He was the pioneer of anthropological work in the U.S.A. and almost all later Amer. anthropologists of note were trained by him. He carried out extensive research among the Indians of the NW. coast, the results of which were pub. over many years in Amer. journals. He was a vigorous opponent of Nazi race theories. His books include *The Mind of Primitive Man*, 1911, *Primitive Art*, 1927, and *Race, Language, and Culture*, 1940. See R. H. Lowie, *The History of Ethnological Theory*, 1937.

Boat (O.E. *bāt*), open vessel used for travel on the water, propelled either by sail, by motor, or by oar. The term 'ship' is generally reserved for larger vessels. The origin of vessels for conveyance on water may doubtless be traced to a double genesis. When primitive man wished for some such thing, 2 means must have suggested themselves to him. He could hew down a tree and hollow it out, or he could collect wood and bind the pieces together. Hence arose the 'dug-out,' still so common a B. among savage tribes, and the raft, the construction of an elaborate form of which is described at length in the *Odyssey*. From this last come the junk and punt and all the various kinds of flat-bottomed craft. Another stage in development may be the coracle of the auct Celts, consisting of a wicker framework over which skin is stretched. By another step, the framework would be made stronger and the covering made of wood. There are differences in the ways of laying on the planks in the modern small B., viz. the planks may be laid edge to edge, so as to present a smooth exterior; the B. is then said to be carvel-built; or the planks may overlap, and the B. is described as clinker-built. Types of B.s vary in every part of the world and for every different class of work. Some are swift, some roomy, some for pleasure, some for rough weather. In the Royal Navy the following B.s are used, though here, as in other branches of service, steam and motor are taking the place of wind and oar, which now propel only the smallest B.s. The *pinnace* is generally about 35 ft long, carrying 8 oars. The *cutler*, about 30 ft long, carries more men and has greater breadth. The *gig* is used on expeditions requiring speed. It is narrower than the pinnace, is 30 ft in length, and weighs about 8 cwt. The *dinghy* is a small B. of 3 cwt., about 13 ft long, and easily rowed by 2 men. B.s vary considerably in shape and size round the coast of Great Britain. On the Thames they are lightly built, but on

the coast the necessity of pulling them over rough ground demands that they should be strong and generally clinker-built. Round the coast of Kent and Sussex short, square-sterned skiffs are in favour, and further W. along this coast the B.s get deeper and larger, and the carvel-built is still common. In the NE. of England and at the N. of Scotland, various old types of B.s survive. The *coble*, for example, is a shallow-built, flat-bottomed B. with a very curious rudder, built for launching from the beach in rough weather. These show traces of Norse and Dutch influence. Pleasure B.s of most kinds may be seen on the Thames, and the following are easily noticeable: the randan skiff about 30 ft long, 4 ft beam, for 1 sculler between 2 rowers, and various skiffs, eights, fours, gigs, and punts. These are of varying degrees of lightness, and this type finds its best expression in the racing eights seen in the Oxford and Cambridge boat race.

Boat, Life, see LIFEBOATS.

Boat-fly, name of sev. species of hemipterous insects of the family Notonectidae. They are aquatic, swim on their backs, live on animal matter, hibernate in mud, and when they dive into water carry with them a supply of air. *Notonecta glauca*, the water-boatman, is found in Britain.

Boat Race, see ROWING.

Boatbill, or **Boatbilled Heron** (*Cochlearius cochlearius*), bird belonging to the Ardeidae, or heron family, but differing from allied species in its broad, flat, brown bill. It is a night-flying bird, feeds on fish and worms, and is a native of Brazil.

Boatswain (pronounced 'bo'sun,' from *boat* and *swain*, a servant), warrant officer of the R.N. In the days of sailing ships, he had charge particularly of the boats, rigging, sails, cables, anchors, flags, and cordage. It was his duty to examine these carefully, especially when the vessel was in dock, to keep them in a state of repair, and to make report of their number and condition. By means of his whistle, which gradually came to be looked on as his badge of office, he summoned the crew to their duties. He shared in the work of the ship, and took a place in one of the watches. He himself gives no orders, but acts as the officer of the first lieutenant. His work has of course been considerably modified by the general use of steam.

Boaz, Bethlehemite and direct ancestor of Christ (Matt. i. 5); married Ruth. They were great-grandparents of David.

Boaz and Jachin, see JACHIN AND BOAZ.

Bobbin, small wooden or metal roller, flanged at both ends (rarely at one only), and bored through the axis, so that it may be placed on a spindle. The commonest form is the spool on which ordinary sewing thread is wound, and an example of the metal B. is to be found in that which carries the thread in a sewing machine. B.s of various sizes and shapes are used for the different stages of spinning flax, wool yarn, etc., the largest being those used for the slubbing frames, where the

cotton passes from the lap shape in which the carder has left it into loose strands. These are often 15 in. long. Paper tubes are now often used where B.s were originally employed. In lace-making and some other industries a peculiar type of metal B. is used.

Bobbio, It. tn in Emilia-Romagna (q.v.), on the Trebbia, 24 m. SW. of Piacenza (q.v.). The abbey of B., once a great centre of learning, was founded by St Columban (q.v.) in the 7th cent. Its famous library has been largely dispersed (chiefly to the Vatican, q.v.), but some of its documents still remain in the cathedral. Pop. (tn) 1800; (com.) 6500.

Bober, see BOBRWA.

Böblingen, Ger. tn in the Land of Baden-Württemberg (q.v.), standing between 2 lakes, 11 m. SW. of Stuttgart (q.v.). It has ant walls and towers, is a mkt tn, and has brewing and hosiery industries. Pop. 14,000.

Bobolink, name given to a N. Amer. bird of the family Icteridae. It differs from the orioles or starlings in having a long middle toe and pointed tail-feathers, and is noted for its curious song. Others of its names are rice troupial, reed-bird, skunk-bird, and rice bunting.

Bobrawa (Ger. **Bober**), riv. of Poland, which rises at the SE. foot of the Riesengebirge (q.v.), and flows NNE. past Kamienna Góra, WNW. past Jelenia Góra, and then generally NNW. past Zagan to join the Odra near Krosno (qq.v.). Length 166 m.

Bobruysk, tn on R. Berezina in the Mogilev Oblast of Belorussia. It has a timber industry. Pop. (1939) 84,000. It has been known since the 16th cent., has been Russian since 1793, and a tn since 1795; it was an important fortress until 1897. In 1944 it was the scene of a Ger. defeat. In 1944-54 it was cap. of B. Oblast, now abolished.

Bobsleigh, see TOBOGGANING.

Boc-land (from A.-S. *bōc*, a book, i.e. book-land), early Eng. method of land tenure, better described now as charter-land or deed-land. B. was folk-land which was allotted by deed to some person in private ownership by the king and council. It differs from the *ethel* (Eng. homestead), which was land cut off from the folk-land and made the perpetual possession of its owner and his descendants, and which depended on no charter for its possession. B. could be held by the king or by ecclesiastics, and less frequently by a lay subject. It was often granted in perpetuity to a church or monastery, for which it could be held in trust by a layman. During the lifetime of its owner it could be alienated or disposed of, but only by *boc*, as it had been received.

Bocage, Manuel Maria Barbosa du (1765-1805), Portuguese poet, b. Setúbal. Though from the beginning he showed a remarkable talent for versification, he entered the navy, and his adventures carried him as far as Brazil and the Indies. Before this his numerous love affairs had given plenty of scope for the exercise of his special gift, but on his

return in 1790, the style of his verse had changed to satire. He was endowed with great powers of improvisation. Though he wrote eclogues, idylls, epistles, songs, etc., it was in the sonnet that he excelled and gained a place among the best writers of this genre in Portugal. He also left a number of unfinished tragedies and some trans. His works were pub. in 8 vols. in 1875-6.

Bocage (from Lat. *boscum*, a wood), name applied to sev. dists. in France which have the same physical characteristics: cultivated fields with underwood and hedges. The Norman B., in the dept. of Calvados and Orne, has its cap. at Viré. Here was some of the severest fighting in the Normandy campaign of 1944 (see WESTERN FRONT IN SECOND WORLD WAR—INVASION OF NORMANDY). The Vendean B., in the NW. of the old prov. of Poitou, was the theatre of the counter-revolutionary risings of 1793 (see VENDEE, LA; also VENDEE, RISINGS IN THE).

Bocas del Toro: 1. Prov. cap. and port of Panama, situated in the lagoon or bay of Chiriquí. The bay forms a good natural harbour and the surrounding country is fertile, producing fruits, coconuts, and india-rubber. Pop. 2900.

2. Prov. of same name. Area 3508 sq. m.; pop. 22,100.

Bocca Tigris (Portuguese form of the Chinese *Hu-men*, Tiger Gate), part of the estuary of the Canton R. On an is. in it are the Bogue forts, taken by the British in 1841 and 1856.

Boccaccio, Giovanni (1313-75). It. novelist and poet. It is generally accepted that he was the natural son of Boccaccio di Chellino da Certaldo, a Florentine merchant, and that his mother was a Fr. girl whom his father married in Paris after B.'s birth there in 1313 or 1314. B. was educ. in Florence under Giovanni da Strada, an esteemed Florentine teacher of grammar, father of the poet of the same name. As a young man he went to Naples, where he visited the tomb of Virgil, and where it seems he was a favourite with the ladies. It is thought that he there fell in love in the church of St Laurence with a young married lady named Maria d'Aquino, natural daughter of King Robert of Naples. His frequently recurring character Fiammetta, who represents Maria, has lent colour to this and to similar stories, especially as he talks of the ladies at church in his *Fiammetta* and again in his prose novel *Filocolo*, which relates what is assumed to be the story of his love. Also there is similar internal evidence in his *Teseide*, a poem in 12 books, relating to the fabulous adventures of Theseus. This latter has the merit of being the first romantic novel to appear in the It. language in *ottava rima*, a metre adopted by Tasso and Ariosto. It is from this poem that Chaucer borrowed his *Knight's Tale*, to which Dryden gave a new name, and recast it as *Palamon and Arcite*. Also in *ottava rima* is his narrative poem, *Filostrato*, the great interest of which, for the Eng. reader, lies in the fact that Chaucer, in his *Troilus and Criseyde*, boldly adopted the main features of B.'s

plot, besides literally translating parts of B.'s poem without acknowledgment of his source. In 1341 B. returned from Naples to Florence, where he applied himself to the study of astronomy and Greek. According to some, he was in Naples again in 1344, and resided there for some years, writing many of his works and frequently appearing at court. Others say he went to Sicily to improve his knowledge of Greek, but this is less probable. What seems incontrovertible is that the Florentines, who recognised his abilities, sent him on an embassy to Romagna in 1346; but he was there only a year, for, in 1348, on the news of his father's death, he returned to Florence to take up his inheritance, a

GIOVANNI BOCCACCIO

great part of which he spent in purchasing MSS. both in Greek and Latin. In 1359 he was in Milan on a visit to Petrarch (q.v.), with whom he had formed a friendship some years earlier. He subsequently established a professorship of Greek literature in Florence. In 1365 the Florentines sent him on an embassy to Pope Urban V at Avignon, and on his return appointed him one of the Florentine magistrates, an office he retained for 2 years, when he was again sent to the Pope, this time to Rome. There is no doubt that B. was strongly influenced by Petrarch; and his numerous and varied works, which show that he was an ardent exponent of the new learning, support this view. He is best known by the *Decameron*, 1348-58, a collection of 100 prose tales, supposed to have been told by courtiers and ladies in retirement during the plague at Florence in 1348. The stories, although often adapted from traditional sources, are quite original in their treatment, wit, and realism, and are a valuable document of 14th-cent. society. The influence of the *Decameron* on It. and European literature was immense. He

also wrote numerous romances and pastorals in verse and prose, and sev. Lat. treatises. He left his valuable library to his confessor Martino da Signa for life and then to the students of the convent of the Spirita Sancta, in Florence. See A. Gustarelli, *Giovanni Boccaccio* (Milan), 1929; G. R. Silber, *Influence of Dante and Petrarch on Boccaccio's Lyrics*, 1946; F. Macmanus, *Boccaccio*, 1947.

Boccage, Marie Anne Lepage, Dame Fiquet du (1710-1802), Fr. poetess, b. Rouen. A prize won at the academy there encouraged her to publish her *Paradis terrestre*, 1748, written in imitation of Milton. She went to Ferney to visit Voltaire, who praised her fulsomely, but whether the praise was sincere or not has been disputed. Her other works are *La Colombiade*, 1756, and *Letters concerning Voltaire*, 1770.

Boccalini, Trajano (1556-1613), It. satirist and political writer; governor of sev. tns of the papal states between 1608 and 1611. He was hostile to the Sp. nation, and in fact the only gov. he did not attack was that of Venice. His *Commentaries on Tacitus* is a series of discussions reviewing the various forms of gov. His prin. work is *Ragguagli di Parnaso*, 'Dispatches from Parnassus,' 1613, a satirical work dealing in a brilliant fashion with contemporary questions and personages, both private and political. The work was extremely popular throughout the 17th cent., and trans. appeared all over Europe. It was followed by a similar collection, *La pietra del paragone politico*, left unfinished at his death.

Boccanegra, Simone (fl. 1339), Genoese statesman. He was elected doge of Genoa for life in 1339, but compelled to resign in 1344, and lived in retirement at Pisa till 1356, when he was re-elected. He gained numerous victories over the Turks, Tartars, and Moors.

Bocherini, Luigi (1743-1805), It. cellist and composer, b. Lucca; he received his first lessons from his father, a double-bass player. He went to Rome in 1757 to improve his art; was back at Lucca, 1764; in Paris, 1768, and then in Madrid, where he was patronised by the king's brother, the Infante Don Luis. He was chamber composer to Frederick William II of Prussia, 1787-97; he returned to Spain, where, after another appointment and some success as a composer, he fell on evil days. He d. in Madrid. He is considered a master of chamber music, mainly for string instruments. His vocal music includes the *Stabat Mater*, a Christmas cantata, and 2 operas, one at Lucca and another, *Clementina*, at Madrid. His other compositions include a score of symphonies and vast quantities of chamber music (2 octets, 16 sextets, 155 quintets, 102 quartets, 60 trios, 6 duets, and 33 sonatas are preserved).

Bochart, Samuel (1599-1667), Fr. theologian and philologist, pastor of a church at Caen, whose *Sacred Geography*, pub. about 1630, so added to his fame that Christina of Sweden invited him to Stockholm. In 1653 he became a prof. at the new academy of Caen, a post he held till

his death. His works include *De Animalibus Sanctae Scripturae*, 1663, and *Reply to the Letters of M. de la Barre, Jesuit*, 1662.

Boche was a common army term for a German in both world wars. It originated in Parisian slang of about 1860, where it meant a rake, or generally a 'bad lot.' In the Franco-Prussian war of 1870 it was applied, by a simple transference of ideas, to the Ger. enemy, and was similarly employed in 1914 and 1939. In the world wars the term 'Hun' was equally common, being adopted especially after the Germans' wanton destruction of historic buildings in Louvain and elsewhere. The latter word was first applied to the Germans by the Kaiser himself in 1900, when in a speech to Ger. soldiers departing for China he urged them to emulate the Huns under Attila (q.v.).

Bochnia (Ger. *Salzberg*), tn of Poland, in Kraków prov., 22 m. ESE. of Kraków (q.v.). There are salt and gypsum deposits in the vicinity. Pop. 15,000.

Bocholt, Ger. tn in the *Land* of N.-Rhine-Westphalia (q.v.), 43 m. N. by W. of Düsseldorf (q.v.), near the Dutch border. It has a Renaissance tn hall and a 15th-cent. church. There are iron-founding, textile, and engineering industries. Pop. 35,000.

Bochum, Ger. tn in the *Land* of N.-Rhine-Westphalia (q.v.), in the Ruhr (q.v.) dist., 25 m. NE. of Düsseldorf (q.v.). It was very severely damaged during the Second World War. There is a fortress, a fine 16th-cent. church, a 10th-cent. church which contains splendid medieval murals, and a well-known theatre. The tn is the centre of a rich coal-mining dist., and has a school of mining and a mining museum. There are also steel, chemical, tobacco, and brewing industries. Pop. 338,700.

Book, **Fedor von** (1880-1945), Ger. soldier, b. Kustrin, son of a distinguished general; attended the Potsdam Cadet Academy, and entered the First World War as a staff officer. In 1917 he commanded an infantry battalion, winning the *pour le mérite* decoration for valour. In 1938 he reached the rank of general and commanded the armies that invaded Austria. In the Polish campaign (1939) he commanded the N. armies invading from E. Prussia. In France (1940) he directed the thrust along the lower Somme. Promoted to rank of field marshal. Commanded the armies on the central front against Marshal Timoshenko in the Ger. invasion of Russia (1941). A fanatical, harsh, typical Prussian soldier and a military ascetic, in 1942 he was relieved of his command on account of his failure to capture Stalinград.

Bockenheim, see FRANKFURT-AM-MAIN.

Böckh, see BOECKH.

Böcking, Eduard (1802-70), Ger. lawyer, b. Trarbach. He was appointed prof. of law at Bonn in 1835, and wrote on many legal subjects. His pub. works include *Notitia Dignitatum Utriusque Imperii* (in 5 vols.), 1839-50, and *Institutiones des Römischen Privatrechts*.

Boeking, vil. of Essex, England, † m.

NE. of Braintree (q.v.), on the R. Blackwater, in Braintree urb. dist. B. has an interesting church, largely Perpendicular but dating from 1006.

Böckingen, Germany, in Württemberg-Baden, a suburb of the city of Heilbronn (q.v.).

Böcklin, Arnold (1827-1901), Swiss painter, son of a silk-worker at Basel. He studied in Düsseldorf, Brussels, and Paris, and afterwards lived for some years in Rome, where he married. In 1856 he went to Munich, where his first great success, 'Pan amongst the Reeds', was exhibited and bought for the Pinakothek. This and other mythological pictures gained him a great reputation. His weirdly imaginative art is perhaps seen to best advantage in his 'The Isle of the Dead' (Basel). He d. at San Domenico, near Florence. See studies by W. Ritter, 1895, H. Brockhaus, 1901, and J. Meier-Graefe, 1905.

Boockay, Stephen (1556-1606), Prince of Transylvania. He was the leader of a successful rebellion against the Emperor Rudolf II in 1604, and in 1605 was elected Prince of Transylvania by the Hungarian diet. Two years later a peace was concluded with the Archduke Matthias, granting freedom of religious worship to the Protestants of Hungary.

Bodaybo, tn in Irkutsk Oblast of S. Siberia, on R. Vitim, 1120 m. NE. of Irkutsk. Centre of the rich B. (or Vitim, or Lena) gold-mining area. Founded 1863, tn 1903. Near B. in 1912 a workers' strike procession was shot at by troops, causing many casualties.

Boddam, coastal par. 3 m. S. of Peterhead, Aberdeenshire, Scotland, an agric. dist. with granite quarrying and fishing. Pop. 1000.

Boddie, see BODLE.

Bode, Johann Elert (1747-1826), Ger. astronomer, b. Hamburg. In 1772 he was made astronomer of the academy at Berlin, and from 1786 to 1825 was director of the observatory there. His name is best known as the propounder of B.'s law, on the proportion of the respective distances of the planets from the sun. The law states that the proportionate distances of the planets from the sun are found by adding 4 to each term of the series 0, 3, 6, 12, 24, etc., which, omitting the first term, forms a geometric series with 772 as last term. When he first advanced this rule, which still remains empirical, it was found that a planet should occur between Mars and Jupiter, and a group was subsequently (1801) discovered there. The rule, then, holds good, excepting its application to Neptune and Pluto whose distances from the sun are less than B.'s law requires.

Bode, Wilhelm von (1845-1929), Ger. art expert. He founded the dept of Christian sculpture, Berlin, 1883, and later became director of the Prussian museums. He figured in a dispute over the genuineness of a bust he bought for the museums and which he asserted to be the work of Da Vinci. His reputation, however, did not suffer from this error, for he was considered in other countries

besides his own to be the best living authority on old masters. He continued as director of Prussian museums under the rep. till 1920, when he retired to take up the less onerous duties of curator in the Kaiser Friedrich Museum.

Bodegas, see **BARAHYO**.

Bodenbach, see **PODMOKLY**.

Bodensee, see **CONSTANCE, LAKE**.

Bodenstedt, Friedrich Martin von (1819-1892), Ger. poet, b. Peine, Hanover. In 1840 he became tutor to the family of Prince Galitzin in Moscow, and after 4 years went to Tiflis, where he studied Persian literature. From this sprang the most popular of his works, *Die Lieder des Mirza Schaffy*, 1851, a vol. of original poetry which purported to be trans. from an E. work. Its success in Germany was enormous. In 1854 he was made prof. of the Slav languages at Munich. In 1858 he gave up this post and took the chair of O.E. language and literature. During the years that followed, he pub. a trans. of the complete works of Shakespeare (1866-1872), and sev. other valuable works on Eng. literature.

Bodetalsperre, see **BLANKENBURG**.

Bodh-Gaya, see **BUDDH-GAYA**.

Bodiam, vil. of E. Sussex, England, on the R. Rother, 14 m. from Hastings. Here is B. Castle, built in 1386, the last castle to be constructed in England. Outwardly well preserved, the castle has 4 round towers, a barbican, gateway, portcullis, and a moat. It was presented to the nation by the Marquess Curzon in 1926. B. has large hop gardens. Pop. 308.

Bodichon, Barbara Leigh, née Smith (1827-90), educationist, b. Watlington, Norfolk. A strong advocate of women's rights, she took much interest in univ. education for women, being one of the founders of Girton College. She was also a talented painter of landscapes in water-colour.

Bodin, Jean (1530-96), Fr. philosopher and economist, b. Angers. Having studied law at Toulouse, he became prof. of jurisprudence at that univ., until in 1561 he came to Paris to secure the favour of the king. Before this he had trans. Oppian's *Cynegeticon* into Lat. verse with a commentary. In 1576 he was made king's advocate at Laon, and in the same year he was elected by the *tiers état* of Vermandois as its delegate to the States-General of Blois. In this assembly he defended the rights of the people against all restrictions, whether imposed by king, clergy, or nobility. In 1581 he visited England as secretary to the Duc d'Alençon, when the duke was seeking the hand of Queen Elizabeth. The remainder of his life was spent at Laon, where his influence was such that he persuaded the citizens to declare for the League in 1589 and for Henry IV in 1594. He d. of the plague. His greatest work was *Les six livres de la République*, 1576, the first important attempt in modern times to construct a complete system of political science. He also wrote a curious work on sorcery entitled *De la démonomanie des sorciers*, 1580. See R. Chauvire, *Jean Bodin*, 1914; B. Reynolds, *Proponents of Limited Monarchy*, etc., 1931.

Bodishat, see **BARLAAM AND JOSAPHAT**.
Bodle, or **Boddle**, anct. Scottish copper coin of time of Charles II, worth about one-sixth of an Eng. penny. Its name is said to be derived from Bothwell the mint master. The word only survives in the phrase 'not to care a bodle.'

Bodleian Library, univ. library of Oxford. The original univ. library, based on the collection of Humphrey, Duke of Gloucester (d. 1447), was re-formed and enlarged in 1598 by the addition of Sir Thomas Bodley's library which had been given to him by the Earl of Essex. This priceless library had originally belonged to Bishop Jerome Osorius of Faro, and had been seized by Essex while on an expedition to Cadiz. Sir Thomas Bodley (q.v.), by a private transaction in 1610 with the Stationers' Co., arranged for the gift to the library of a free copy of every new book printed by members of the company. This agreement became law in 1662 (see **COPYRIGHT LIBRARIES**) so that the B. L. has enjoyed for 50 years longer than any other library the right to a copy of every new book pub. in England, and now contains over two million vols. The library is excelled by few in Europe, and its oriental MSS. are probably unsurpassed in the world. The Radcliffe Camera originally housed in 1749 the Radcliffe Library of Physics. In 1860 this library was removed and the Camera became a reading-room for the B. L. An extension of the library has been built in Broad Street, connected with the main library by a tunnel.

Bodley, George Frederick, R.A. (1827-1907), architect, b. Hull. Pupil of Sir Gilbert Scott, he achieved the reputation of being the chief Eng. reviver of 14th-cent. Gothic. His work includes new buildings at Magdalen and Univ. Colleges, Oxford; Queen's College Chapel, and a new block at King's College, Cambridge; Marlborough College Chapel; Holy Trinity, Kensington; Eton Mission Church, Hackney Wick; churches at Eccleston, Hoar Cross, Pendlebury, etc.; and the London School Board offices. In collaboration with James Vaughan he designed the cathedral at Washington (dist. of Columbia) and the cathedrals at San Francisco and in Tasmania.

Bodley, John Edward Courtenay (1853-1925), historian, educ. at Balliol College, Oxford. He was called to the Bar in 1874. He was a corresponding member of the Fr. Institute, and wrote a number of books on France. The most important is in 2 vols.: vol. i, *The Revolution and Modern France*; vol. ii, *The Parliamentary System*, 1898. Other books are *L'Anglo-manie et les traditions françaises*, 1899, *The Church in France*, 1906, *L'Age mécanique et le déclin de l'idéalisme en France*, 1913, *The Romance of the Battle Line in France*, 1920, also *The Coronation of Edward VII*, written by His Majesty's command in 1903. See memoir by S. Leslie, 1930.

Bodley, Sir Thomas (1545-1613), diplomatist, b. Exeter, educ. at Geneva and Magdalen College, Oxford. He became a fellow of Merton College, and in the years

between 1580 and 1597 he was employed in various embassies to European countries. He returned home in 1597, and spent the rest of his life in restoring and augmenting Duke Humphrey's library at Oxford, which was later named after him. He was knighted at the accession of James I. He bequeathed almost all his possessions to the library. See BODLEIAN LIBRARY.

Bodmer, Johann Jakob (1698-1783), Swiss poet and man of letters. He was prof. of hist. at Zürich from 1725 to 1775. He founded a weekly critical periodical, which aimed at freeing literature from the shackles of pedantry. He did much by his contributions as a journalist and critic to create a Ger. national literature free from foreign influences. After his *Abhandlung vom Wunderbaren*, 1740, a literary controversy started between B. and Gottsched, which lasted for many years. B.'s works include *Noachide*, 1752, an indifferent epic poem in 12 cantos; a prose trans. of *Paradise Lost*, and eds. of Old Ger. texts. See M. Wehrli, *Bodmer und die Geschichte der Literatur*, 1936.

Bodmin, co. tn of Cornwall, 30 m. WNW. of Plymouth, England. It has some trade in agric. produce, and has numerous relics, including Rom. remains. Pop. 5849.

Bodo (Bodø), coastal tn of N. Norway, situated almost opposite the S. extremity of the Lofoten Is., co. tn of Nordland. 420 of B.'s 760 houses were destroyed by Ger. bombardment on 27 May 1940. It, now rebuilt, is a busy port. Pop. 9700.

Bodoni, Giambattista (1740-1813), It., printer, the son of a printer of Saluzzo, in Piedmont. In 1758 he went to Rome and was employed as compositor in the printing office of the Propaganda. In 1768 he was made head of the ducal printing house in Parma, whence he sent out some beautiful eds. of Gk, Lat., Fr., and It. classics. The works from his press are among the best examples known of It. typography, and are eagerly sought after by collectors.

Bod-pa, see TIBET.

Böttcher, Ludvig Adolph (1793-1874), Dan. poet, b. Copenhagen, and educ. there. He was for some time secretary to the sculptor Thorvaldsen. His poems are chiefly love-songs, but all are remarkable for delicacy and finish. His philosophy was that of the epicurean and quietist. See G. Brandes, 'L. Böttcher' in *Samlede Skrifter* II, 1905.

Böddvarson, Gudmundur (1904-), Icelandic poet. His poems are of uneven quality, but he is in the front rank of his contemporaries.

Body Cavity, term used in embryology to denote that portion of the embryo which ultimately develops into the pleural, pericardial, and peritoneal cavities, that is to say, those portions bounded by the membranes enclosing the lungs, heart, and abdomen. The ovum after fertilisation divides up into a number of cells. A cavity called the segmentation cavity then appears; an outer layer of cells, the *ectoderm*, and an inner layer, the

endoderm, are differentiated. Then there is estab. a linear streak called the *primitive streak*, consisting of thickened *ectoderm*. The *mesoderm* or middle layer then develops between *ectoderm* and *endoderm*. The *mesoderm* gradually extends over the whole of the ovum, separating the *endoderm* from the *ectoderm*, but in most mammals a cleavage appears in the *mesoderm*, which ultimately develops into the *coelom*, or B. C. In other forms the *coelom* represents the segmentation cavity. The embryonic area then develops folds at head and tail, and attains a crescent formation, the *endoderm* being represented by the yolk-sac and primitive alimentary canal held between the horns of the crescent, and the body cavity forming the body of the crescent.

Body Snatching, Body Snatchers. See RESURRECTIONISTS, or RESURRECTION MEN.

Boece, Boeis, Boyce, or Boethius, Hector (c. 1465-c. 1536), historian, b. Dundee. He received his education at Dundee and at Paris Univ. Vacating the chair of philosophy in the college of Montaigne, he was in 1500 appointed by Bishop Elphinstone to the first principalship and professorship of divinity of King's College, Aberdeen. B.'s first work, which included an account of Bishop Elphinstone, was entitled *Episcoporum Murthlacensium et Aberdonensium Vitae*, 1522. In 1527 he received from the king a pension of £50 Scots yearly. Later, when he was appointed rector of Tyrie, that pension was altered to a yearly 100 marks Scots. This he enjoyed until his death, when he was buried beside Elphinstone. He had been made doctor of divinity (Aberdeen) in 1528. He is remembered for his famous hist. of Scotland, *Scotorum Historia ab illius gentis origine*, first pub. in 17 books in Paris in 1527, and by order of James V trans. into the Scottish language by John Bellenden (pub. 1536). Wm Harrison pub. an Eng. trans. in 1577. The hist. begins with a geographical description of the country, and contains much fabulous and legendary material, including the story of Macbeth, later borrowed by Holinshed, in whose *Chronicle* Shakespeare read it.

Boeckh, Philipp August (1785-1867), Ger. philologist and antiquary, b. Karlsruhe; studied at the univ. of Halle, where as a student under Wolf he developed his philological bent. In 1807 he became prof. of philology at Heidelberg, and in 1811 he was transferred to the univ. of Berlin. His works include a monumental ed. of Pindar, 1811-21, and the first 2 vols. of the *Corpus Inscriptionum Graecarum*. See J. F. Sandys, *History of Classical Scholarship* (3rd ed.), 1921.

Boecklin, Arnold, see BÖCKLIN.

Boehm, Sir Joseph Edgar (1834-90), sculptor, b. Vienna, of Hungarian parentage. He settled in England as a moulder of coins and medals, and his work was attended with such success that he turned his whole attention to sculpture. In 1869

he executed the colossal statue of Queen Victoria for Windsor Castle, and after that time a succession of noble patrons charged him with commissions. In 1878 he was made A.R.A., and in 1881 was nominated sculptor in ordinary to the queen. In 1882 he became R.A. The effigy of the queen on the jubilee coinage of 1887 was designed by him.

Boehme, Jakob (1575-1624), Ger. mystical writer, b. near Görlitz in Upper Lusatia. He received practically no education. At about the age of 14 he was apprenticed to a shoemaker, and he remained in this trade for some considerable time. He was never possessed of much wealth, and the greater part of his life was spent in one long struggle with poverty. His first written work was the *Aurora*, a work of revelation and meditation; of the nature of God and man. The book was eagerly read, and created a considerable sensation, so much so that he was forced to appear before the local council, who confiscated his book and told him to write no more. For the next 6 years he was silent, but at the end of that time he again began to write on such subjects as repentance and resignation. In 1624 he was summoned to Dresden, where he was well received. He still, however, had to face clerical opposition. He and his chief opponent, Richter, d. within a few months of one another. His main aim in the writing of his great work *Aurora* was to attempt to explain the origin of things. His philosophy can be largely called the philosophy of contradiction. The *Unground*, or *Urground*, was the source of everything—love and sorrow, heaven and hell, sweet and bitter, and his conception of God made the Deity the beginning and source of everything rather than the goal to which the ideals of the theologian was to attain. His name is often quoted in England as Behmon, and during the 17th cent. his works were very extensively studied. See R. H. Beterling, *The Illuminate of Goerlitz or J. Böhme's Life and Philosophy*, 1923.

Boehmeria (*Boehmeria nivea*), species of Urticaceae which is a native of China and Japan. It is valuable in commerce for its long and strong bast fibres which are woven into the durable material known as grass-cloth, rhea, or ramie.

Boëllmann, Léon (1862-97), Fr. organist and composer, b. Alsace. Trained as an organist under Gigout, a teacher of church music in Paris. Appointed organist of the church of St Vincent de Paul. His *Gothic Suite* is well known, as also are his *Symphonic Variations* for cello and orchestra.

Boeotia, anct political div. of Greece between Locris and Phocis on the N., and Attica and Megara on the S. The earliest inhab. were the Minyae; they were driven out by the Boeotians, who were of Aeolian race and came from Thessaly. The prin. pursuits of the Boeotians were agric. As compared with other Greeks they were considered rough and boorish. This fact led to the term Boeotian being used as a synonym for ignorant, unlettered stupidity, despite the names of Hesiod, Pindar,

and Corinna, all of whom came from B. The dist. was divided into 5 main divs.: the basin of Lake Copais, that of Asopus, the plain of Thebes, the coast dist. of the Euboean Gulf, and that of the Corinthian Gulf. The prin. riv. was in anct times known as the Cephissus (q.v.). Formerly the Boeotian League numbered 14 great cities with Thebes at its head.

Boer Wars: 1. The war between the Brit. and the Boers of the Transvaal, S. Africa, in 1880-1, occasioned by the proclamation of the Transvaal as a rep. The most notable event of the war was the defeat of the British at Majuba Hill in 1881. Peace was made shortly afterwards. Great Britain recognising the independence of the Transvaal.

2. The war between Great Britain on the one side and the Transvaal Rep. and the Orange Free State on the other, in 1899-1902. The British at first suffered reverses, and Brit. troops were hemmed in at Ladysmith, Kimberley, and Mafeking. All 3 were ultimately relieved, the length of the sieges being: Ladysmith, 29 Oct. 1899 to 28 Feb. 1900; Kimberley, 14 Oct. 1899 to 15 Feb. 1900; Mafeking, 15 Oct. 1899 to 16 May 1900. Pretoria, the cap. of the Transvaal, was occupied by the Brit. troops under Lord Roberts on 5 June 1900. Peace was signed on 31 May 1902. The conquered countries were given self-gov., and in 1909 they were included in the Union of S. Africa by the Act of Union in that year. For details see SOUTH AFRICA, THE UNION OF.

Boerhaave, Hermann (1668-1738), Dutch physician, b. Voorhout near Leyden. In 1690 he took his philosophical degree at Leyden, and in 1693 his medical degree. He was appointed lecturer on the theory of medicine at Leyden in 1701, prof. of medicine and botany in 1709, and prof. of chem. in 1718. He was renowned throughout Europe as physician and teacher; he had a lasting influence on medicine, and the methods of instruction he introduced at Leyden became a model for Europe, the foundation of modern clinical teaching. His works include *Institutiones Medicae*, 1708, and *Aphorismi de Cognoscendis et Curandis Morbis*, 1709.

Boers (from Dutch *boer*, farmer, husbandman; cf. Eng. *boor*), name given to the Dutch settlers in S. Africa. They began to settle there in the 17th cent. and were augmented by some 200 Fr. Huguenots in 1688 and succeeding years, and later by Germans.

Boethius, Anicius Manlius Torquatus Severinus (c. 480-c. 524), Rom. philosopher and statesman, b. Rome, of a distinguished family, he received a liberal education and soon became noted for his learning, especially in Greek. He is described by Gibbon as 'the last of the Romans whom Cato or Tully could have acknowledged for their countrymen.' In 510 he became consul, and later chief of the senate. In 500 the seat of gov. of Theodoric, King of the Goths, had been fixed at Rome, and B., who had gained his confidence, was appointed *magister officiorum* in his court. He lost the favour

of Theodoric, however, by his firm stand for the rights of the Romans against the tyrannical rule of Gothic officials, and in particular by his defence of Albinus and Symmachus, who had made an attempt to assert Rom. independence. B. was accused of treason, degraded from his dignities, despoiled of his property, and after a long imprisonment at Pavia, executed by the king's command. While in captivity he produced his great work *De Consolatione Philosophiae*, which takes the form of a dialogue between the writer and Philosophy, the latter teaching the mutability of all things save virtue. This famous work is an imitation of a similar work by Marcius Capella, *De Nuptiis Philologiae et Mercurii*. Its style is based on the best Augustan models, and the prose conversation is interspersed with verse passages. While the religious tone of this work is decidedly theistic, it contains no reference to Christianity, which fact, together with the doubtful authenticity of the *De Fide Catholica* attributed to B., rather militates against the medieval canonisation of him as a Christian saint. *De Consolatione* was popular in the Middle Ages, and was trans. into A.-S. by Alfred the Great, and into English by Chaucer, and also by Queen Elizabeth I. The influence of B.'s philosophy is to be seen in much medieval literature, notably in the Fr. romance, *Le Roman de la Rose*, and Chaucer's *Troilus and Criseyde* and *The Knight's Tale*. B. trans. into Latin Aristotle's *Categories* and *Peri Hermeneias*, and it was long supposed that he also trans. the *Analytica Priora et Posteriora*, *Topica*, and *Elenchis Sophistici*; but these latter trans., like so much that was once attributed to B., are now regarded as spurious. He wrote a series of independent works on logic, manuals of arithmetic, astronomy, geometry, and music, which were largely used. His complete works have been sev. times pub., the last ed. being at Paris in 1860. See H. R. Patch, *The Tradition of Boethius: his Importance in Medieval Culture*, 1935.

Boethius, Hector, see BOECE, HECTOR.

Boston, see BOSTON.

Bofors Gun, automatic anti-aircraft gun of Swedish origin developed between 1920 and 1935 and introduced into Brit. and Amer. service at the beginning of the Second World War. Of 40 mm. calibre, it has a rate of fire of 90 rounds a min.

Bog, see BUG.

Bog, land which has become soft and spongy, from the presence of too much water. Generally it is partially composed of decomposing vegetable matter, and in this form it is common in N. countries, and particularly in Ireland. Here the B.s are sufficiently firm to bear considerable weight, and compaction below the surface forms the vegetable matter into peat, which is cut out and used both for fuel and in the composition of manures. It is estimated that over 2,000,000 ac. of the surface of Ireland are thus occupied. The greatest B. in the Brit. Is. is the B. of Allen, lying to the E. of the Shannon, chiefly in co. Kildare, Rep. of Ireland.

The name is given to a collection of B.s, separate, but grouped together as the B. of Allen. B.s, which may be from 20 to 40 ft in thickness often prove a serious menace to the prosperity of the surrounding land, for in the event of a 'B. burst' the neighbourhood may be swamped with water and covered with a deposit of peat. The surface of the Irish B.s is covered with fine green turf, and the roots are so matted together that a man may walk over them in safety provided he is accustomed to doing so. The surface is not generally level, but is usually uneven, sometimes swelling up into mounds. This gives facility for drainage, of which advantage is now being taken. In England, Chat Moss, in Lancs, is a B. which has been largely filled up, and Solway Moss should also be named.

Bog Asphodel (*Narthecium ossifragum*), species of Liliaceae, common in boggy ground throughout Britain. It has yellow flowers, a sympodial rhizome, and loculicidal capsule.

Bog Butter, fatty substance which has been discovered in peat-bogs of Ireland and Scotland, and is known technically as butyrellite. It is a form of adipocere.

Bog Iron Ore, mineral formed from deposits of limonite often found in bogs, lakes, and meadows. In composition it may be compact or spongy, and in colour it is either blackish-brown or yellowish-brown. The iron which it yields is of good quality, but there is usually little of it, and it is often mixed with sand and clay. It is found abundantly in the lakes of Norway and Sweden, in N. America, and in some parts of Scotland.

Bog Moss, or Peat Moss, see SPHAGNUM.

Bog Myrtle, or Sweet Gale (*Myrica gale*), plant which grows abundantly in bogs of Britain, especially in the highlands of Scotland. The leaves emit a fragrant odour when crushed. It bears male and female catkins, and the fruit is a wax-secreting nut.

Bog Oak, hard, black wood found in bogs, indicating that forests once flourished in the present marshy ground. In Ireland it is used for the manuf. of ornaments. The action of the antiseptic water preserves the oak well, but at the same time renders it difficult of manipulation in carving.

Bog-pimpernel, see PIMPERNEL.

Bog Plants, various plants which grow in bogs. The soil in which they grow often contains rich food materials, but is not sufficiently aerated, so that the plants cannot form nitrates; sev. of these plants, therefore, e.g. the sundew and butterwort, are carnivorous, and obtain their nitrogen from insects which they devour. Again, the water is deficient in lime and other salts, and the plants are stunted, unlike their neighbours in the marshes. Water absorption is rendered difficult by the peaty acids of the bog, and many plants have therefore the characteristics of xerophytes. Agriculture will not tolerate the soil necessary for them, and the consequent drainage of the land usually kills the plants. Many of them are extremely

beautiful, and for this reason they are grown under artificial conditions planted in gardens, in a soil composed of peaty substances and bog-mould; they receive a plentiful daily supply of water. Under their various headings the chief B. P. are discussed. From the great variety of these plants the following may be chosen as examples: bladderwort, butterwort, bilberry, bog asphodel, bog bean, bog cinquefoil, bog orchid, bog myrtle, bog pimpernel, heather, ling, grass of Parnassus, meadowsweet, marsh-marigold, lousewort, rushes of different kinds with sedges and grasses, sundew, and yellow rattle.

Bog Spavin, see *HORSE, Diseases*.
Bogardus, James (1800-74), Amer. inventor, b. New York. He was brought up to the business of a watchmaker. He invented the dry gas-meter, a pyrometer, a sounding machine for use in deep sea, a dynamometer, etc. In 1839 the Brit. Gov. accepted his method for the manuf. of postage stamps.

Bogart, Humphrey (1899-1957), Amer. actor, b. New York City; educ. at Andover Academy. He served in the U.S. Navy in the First World War; afterwards he was a brokerage house messenger, and worked with Wm A. Brady as handyman, assistant stage manager, casting director, and production manager. He made his stage debut in *Smiffy*, and after a series of plays entered motion pictures in 1932. He made his name with a series of gangster roles, e.g. in *The Petrified Forest*. Later, however, he widened his range considerably and played more sympathetic roles. Probably his best-known films were *Treasure of Sierra Madre* and *The African Queen*, his performance in the latter film winning him the Academy Award for the best actor of 1951.

Bogatzky, Karl Heinrich von (1690-1774), Ger. divine, studied theology at Jena and Halle (1715-18). Wrote *Guldenes Schatzkästlein der Kinder Gottes*, 1798, reissued repeatedly.

Bogdanov (real name Malinovskiy), **Aleksandr Aleksandrovich** (1873-1928), Russian philosopher, sociologist, economist, and politician. A Social Democrat from the 1890's, he became a Bolshevik in 1903, and was the leader (together with Lenin) of the 'stone-hard' Bolsheviks and of the whole Bolshevik faction 1904-9, then leader of the Left Bolshevik 'Vpered' ('Forward') group. He was a military surgeon during the First World War; after 1917 he was outside the Bolshevik party but exercised strong influence as a theorist of 'proletarian culture' (see PROLETCLUT). From 1923 he devoted himself to the problem of blood transfusion, and he d. after an experiment on himself. B. was greatly influenced by Mach and Avenarius, and his system of Empiricism is an attempt at a synthesis of Marxism and Empirio-criticism; his *Tectology*, or 'universal organisational science,' was an extension of Empiricism into the field of sociology. His text-books were standard works on *Marxian economics* in Russia.

Bogdanovism in a wide sense is a

'modernist' trend in Bolshevism which existed until the early 1930's and was aimed at sustaining Marxism by propping it up and supplementing it with modern ideas. B. himself performed this in epistemology and sociology, Berman in logic, S. Vol'skiy in ethics, Shulyatkov in aesthetics, Gor'kiy and Lunacharskiy in the theory of religion, Pokrovskiy in historiography, Blonskiy in the theory of education, Gusev and Kerzhentsev in the scientific organisation of labour, and Kollontay in the theory of sex relations and family. All these theories were very influential among Russian Communists until suppressed by Stalin.

Bogdanovich, Prince, see *BARCLAY DE TOLLY*.

Bögh, Erik (1822-99), Dan. poet and dramatist, b. Copenhagen. He gave up his work as teacher to become an actor and later director of the Kasino theatre. He wrote over 100 plays, mostly comedies and vaudevilles, which gained great success. His light, technically skilful verse was also very popular. His dramatic works were pub. in 7 vols. (1858-70).

Boghaz Keui, vil. of Asia Minor, in the il of Ankara, Turkey. The heights which overlook the vil. are crowned by the ruins of an ant. Persian city, generally identified with Pteria, which Croesus destroyed after crossing the Halys (see Herodotus, i. 76). Parts of the rocks are covered with sculptures, whose prin. scene shows the Persian king in a triumphal entry. It is composed of 60 figures, some of which are colossal. The rocks have been levelled by hand, though they naturally form a ring round the ruins. From cuneiform tablets discovered in the first decade of the present cent. it would appear that when the Hittite empire incorporated all or most of central Asia Minor, Cappadocia, and Syria, B. K. was the seat of authority.

Boghead Coal, or **Torbanite**, bituminous substance found near Bathgate in Scotland. It is dark brown in colour, and somewhat of the nature of cannel coal. It contains a large amount of volatile substance, and consequently is largely used in making paraffin and gas.

Bogie, name given to the framework supporting the front portion of a locomotive engine or railway carriage. The B. is pivoted to the frame of the engine or wagon, and has usually 2 pairs of wheels. By reason of the freedom of action given by the pivot, the strain and jolting caused when taking curves is greatly lessened, and the danger of the train leaving the rails reduced.

Bognor Regis, watering-place in Sussex, in the parl. div. of Chichester. The tn is well equipped with the seaside requirements, and possesses a 16th-cent. church at Bersted. By its affix of Regis it commemorates the tribute paid to it by King George V.'s physicians in selecting it for their patient's convalescence in 1929. Pop. of urban dist. 24,862.

Bogo, or **Bago**, tn on the NE. coast of the is. of Cebu, in the Philippine Is. There is a good harbour, and the

surrounding country is fertile. Pop. 26,132.

Bogomils (Slavonic, 'beloved of God'), Manichaean sect founded in Phrygia in the early 11th cent. by a monk named Tzourillas, which spread to Thrace, Bulgaria, and Macedonia, being first mentioned in Europe at Philippopolis in 1115. Alexius Comnenus obtained a full knowledge of their doctrine from their leader, the monk Basil, and then burned him in 1118. The sect survived, however, until the Muslim conquest of the Balkans in the 16th cent. The B. held that God created Satanall and Christ; Satanall rebelled and created earth and human kind, though God himself gave life to these new beings. Christ received from Mary the semblance of man, and conquered Satanall, who became known as Satan. The B. condemned marriage, forbade the eating of meat, and rejected images; held baptism as purely spiritual, and denied the real presence in the eucharist. See CATHARISTS. See also J. Heard, *Russian Church and Russian Dissent*, 1887, and M. Jugie, 'Bogomiles' in *Dictionnaire de Spiritualité*, 1937.

Bogong, int peak in Victoria, Australia, altitude 6508 ft; also the name of a model tn built by the State Electricity Commission for employees on the Kiowa hydro-electric project.

Bogor, formerly *Buitenzorg*, tn and summer resort in W. Java, Indonesia, 36 m. S. from Jakarta. It has a particularly fine climate. There are famous botanic gardens. Pop. 65,000.

Bogorodsk, see NOGINSK.

Bogotá, originally *Santa Fé de Bogotá*, city, cap. of the prov. of Cundinamarca and of the rep. of Colombia, situated on a fertile plateau 8660 ft above sea level, some 200 m. from the coast. Remote and famous, B. is a picturesque tn, and its Sp.-colonial character is stamped on its streets and plazas and in contrast there are a number of modern buildings. Its topographical situation is most pleasing, for its surroundings are watered by many lakes and streams, one of which passes through the city and plunges over the edge of the plateau at Tequendama in a cascade over 500 ft high; while from the sloping plain on which it stands rise 2 lofty mts, La Guadalupe and Monserrate, both crowned with imposing churches. The view from the summit of the latter mt., reached by funicular, is famous. It was founded by Gonzalo Ximénes de Quesada, a native of Santa Fé near Granada, in 1538, and became a bishopric in 1561, cap. of the viceroyalty of New Granada in 1598. After the declaration of independence it was finally taken by Bolívar in 1819, and became the seat of gov. of Colombia in 1831. The city is traversed by the R.s San Francisco and San Agustín, and has regular, well-paved streets crossing at right angles. The chief street, the Calle de la República, leads to the square, the Plaza de la Constitución, in which are the palace of the president, the custom-house with other gov. buildings, and the beautiful cathedral; in the centre of the plaza is a

statue of Bolívar. The Capitolio, the building occupied by the Legislature, is a spacious handsome structure. Among its features of historic interest is the marble tablet on its façade inscribed with gold letters, in memory of the Brit. Legion, the English and Irish, who aided Bolívar and Colombia to throw off the Sp. yoke. As B. is subject to earthquakes the houses are made of strong material; the tn is noted for its numerous churches. It contains also a bull-ring, the Universidad Nacional de Colombia, a museum, public library, observatory, 4 colleges of univ. status, and a military academy. Within the dist. are valuable mines and good pasture land. The manufs. are of importance, and it is the emporium for trade with the interior. Pop. 700,000.

Bohain, Fr. tn in the dept of Aisne, scene of a Ger. defeat in Oct. 1918. Household and fancy goods are manuf. Pop. 5600.

Bohea, kind of black China tea, so called from Wu-i, the name of the hilly dist. where it is grown. In the 18th cent. the word B. was in general use, but to-day is used for a poorer leaf.

Bohemia (Czech, *Čechy*; Ger. *Böhmen*), ter. of Czechoslovakia, the W. part of the rep. Until 1948 it was a prov. (area 20,102 sq. m., cap. Prague), but it is now divided into the administrative regions (*kraje*) of Prague, České Budějovice, Plzeň, Karlovy Vary, Ústí nad Labem, Liberec, Hradec Králové, Pardubice, and (part of) Jihlava (q.v.).

B. is almost completely enclosed by mts; in the NE. the Sudetic Mts (q.v.) form the boundary with Silesia (q.v.); in the NW. the Erzgebirge (q.v.) forms the boundary with Saxony (q.v.); in the SW. the Forest of Bohemia (q.v.) forms the boundary with Bavaria (q.v.); and in the E. the Moravian plateau joins B. to Moravia (q.v.). A series of terraces and plateaux, traversed S.-N. by the Vltava (q.v.), slope down from the Forest of Bohemia to the fertile basin of the Labe (see ELBE) in the N. Other rivs. of importance are the Ohře (q.v.) and the Berounka.

B. is largely composed of Azoic and Palaeozoic rocks of great antiquity; there are also marine deposits of the Triassic and Cretaceous ages, whilst outflows of volcanic material are found. About a third of the surface is forested, and some valuable timber is produced. The country is famous for its mineral springs, of which the best known are the chalybeate springs of Mariánské Lázně and Františkovy Lázně (q.v.), the warm alkaline springs of Teplice (where there are also sulphurous springs) and Karlovy Vary (q.v.), and the bitter cathartic springs of Seidlitz (see MOST). B. is rich also in industrial minerals, including uranium (Jáchymov, q.v.), coal and lignite (Kladno and Plzeň, q.v.), iron (Plzeň), lead and zinc (Příbram, q.v.), and copper, antimony, tin, and graphite. There are important metallurgical, textile (Liberec, q.v.), chemical (Děčín and Kolín, q.v.), engineering (Plzeň), glass, brewing (Plzeň),

paper, leather, and sugar-refining industries. Agriculture has been well developed; in the higher regions potatoes, oats, and sugar-beet are grown, while in the fertile riv. valleys fruit is also grown in large quantities.

History. The name B. is derived from that of the Boii (q.v.), the first known inhab. of the country. The Boii are said to have been vanquished by the Marcomanni (q.v.) shortly before the beginning of the Christian era, and in the 5th cent. the country was occupied by the Czechs (q.v.). Christianity was introduced into B. from Moravia in the

Emperor, Rudolf I (q.v.), as feuds of the empire, and Ottakar was defeated and killed at the battle of Marchfeld (q.v.) in 1278. During the reign of his son, Wenceslas II (1271-1305), B. enjoyed great prosperity. The Premyslide dynasty came to an end upon the assassination of Wenceslas III in 1306. Then Rudolf of Hapsburg and Henry of Carinthia ruled for a short time. In 1310 the Bohemians chose as their king John (see JOHN OF BOHEMIA), the son of the Ger. emperor. John was killed at Crécy (q.v.) in 1346, and was succeeded by his son, who became Ger. emperor as Charles

CARLSBAD (KARLOVY VARY)

Czech Embassy

9th cent. after the baptism of the Bohemian Prince Bořivoj by Methodius (see CYRIL and METHODIUS), and later in the same cent. B. became part of the short-lived Great Moravian kingdom of Sviatopluk (see MORAVIA). The Czech rulers belonged to the Premyslide dynasty, the greatest of whose members at this period was St Wenceslas (q.v.). Wenceslas was slain by his brother, Boleslav I, in 929. Boleslav II extended his rule into Moravia and parts of Silesia and Poland, but these foreign possessions were lost by Boleslav III, who was finally dethroned in favour of the Polish prince, Vladivoj, brother of Boleslav the Great (see POLAND, *History*). On the death of Vladivoj, the Premyslide dynasty was restored, and in 1029 Moravia was again incorporated with B. In 1198 Premysl Ottakar I was crowned King of B. He was succeeded in 1230 by Wenceslas I, whose son, Premysl Ottakar II, extended the Bohemian dominions to the Adriatic. Most of Ottakar's possessions were claimed by the Holy Rom.

IV (q.v.) in 1348. Charles ruled over the empire from Prague, founded the univ. of Prague and Vienna, and issued in 1356 the 'Golden Bull' (q.v.) regulating imperial elections. Charles's daughter, Anne, married Richard II (q.v.) of England. On Charles's death in 1378 his son, Wenceslas IV, succeeded him as King of B. and Ger. emperor. About this time the doctrines of Wycliffe (q.v.) penetrated to B., and were enthusiastically received by John Huss (q.v.). The intense ferment that resulted from the religious and national reforming zeal of Huss and Jerome of Prague (q.v.) culminated in the burning of Huss and Jerome during the Council of Constance (q.v.), and in the protracted war of the Hussites (q.v.). In 1410 Sigismund (q.v.) was elected Ger. emperor, but was not for many years acknowledged as King of B. He d. in 1437, and his successor, Albert II (q.v.), reigned for only 2 years. Albert left a posthumous son, known as Ladislav Posthumus, and in 1452 Georg

Poděbrad (q.v.) became regent for this child. When Ladislas B. in 1457, Poděbrad was elected King of B. His reign was marked by continual struggles with Matthias Corvinus (q.v.), King of Hungary. Poděbrad was succeeded in 1471 by Vladislav, son of Casimir IV (q.v.) of Poland. Vladislav, who also became King of Hungary in 1490, was an inefficient ruler, but he negotiated two important marriages: that of his son Louis to Mary, the grand-daughter of Maximilian I (q.v.), and that of his daughter Anne to Maximilian's grandson, Ferdinand. Louis (Louis II of Hungary) was killed at Mohács (q.v.) in 1526, and Ferdinand thereupon claimed the kingdoms of B. and Hungary through his wife. He was elected to the Bohemian throne, and with difficulty also obtained that of Hungary. In 1547 he succeeded in having himself declared hereditary, instead of elective, ruler of B., and thus B. became an appanage of the Hapsburgs. Ferdinand became Ger. emperor (see FERDINAND I) in 1556, and on his death he was succeeded by Rudolf II (q.v.). In 1609 the Bohemians compelled Rudolf to grant religious toleration (the Letter of Majesty), and in 1611 he was forced to abdicate the throne of B. in favour of his younger brother Matthias. In 1619 Matthias was succeeded by Ferdinand II (q.v.), grandson of Ferdinand I, though the Protestants had already offered the throne of B. to a Lutheran prince, Ferdinand V, the Elector Palatine. The famous 'defenestration' of Prague in 1618 (Lat. *fenestra*, a window) was the throwing through the windows of the Hradčany castle (see PRAGUE) of the emperor's counsellors by some of the Protestant nobles. This was the opening event of the Thirty Years War (q.v.). In the great battle of the White Mt. at Prague in 1620 (see TILLY), the Bohemian Protestants were defeated: the lands of the Protestant nobles were sequestered, and the Protestant religion was suppressed. After the treaty of Westphalia (q.v.) the hist. of B., under the rule of the emperor of Vienna, became generally co-incidental with that of Austria (see AUSTRIA, History). During the reign of Joseph II (q.v.) religious toleration was restored. In the 'year of revolutions,' 1848, a Pan-Slav congress was held in Prague, and an attempt was made to assert the anct independence of B. A rising in Prague was quickly put down, but the Vienna gov. afterwards adopted a conciliatory policy, and B. was granted a local diet in 1861. In 1897 the Bohemians agreed to take part in the deliberations of the parliament in Vienna, without prejudice to their claim that B., Moravia, and Austrian Silesia (see SILESIA) should together be accorded the same privileges as Hungary. The Czech language was compulsorily taught in schools, and there was an attempt to make a knowledge of the language obligatory for every gov. official accepting employment in B. The Bohemian question was eventually solved by the collapse of Austria-Hungary during the First World War, and the success of

the Czechoslovak movement. See also CZECHOSLOVAKIA.

See W. S. Monroe, *Bohemia and the Czechs*, 1910; Count F. Lützow, *The Hussite Wars*, 1914, and *Bohemia*, 1920; E. Boneš, *Bohemia's Case for Independence*, 1917; V. Nosek, *Independent Bohemia*, 1918, and *The Spirit of Bohemia*, 1926; C. E. Maurice, *Bohemia from the Earliest Times to the Founding of the Czechoslovakia Republic in 1918*, 1922; Elizabeth Wiskemann, *Czechs and Germans*, 1938.

Bohemia, Forest of (Ger. *Böhmerwald*; Czech. *Český Les* in NW., *Šumava* in SE.), mt range between Czechoslovakia and Bavaria, about 120 m. long and 25 m. broad. It is largely covered with dense forest, and towards Bavaria it is rugged and broken; the S. portion is called the Bavarian Forest. The highest points are Arber, 4780 ft., and Rachelberg, 4765 ft. It is crossed by 4 roads and by 3 railways.

Bohemian Brethren, see MORAVIANS.

Bohemund I (c. 1058–1111), Prince of Antioch, eldest son of Robert Guiscard, distinguished himself in the war against the Emperor of Byzantium in 1081. He was excluded from the throne of Apulia by his brother Roger, and took part in the first crusade. After the capture of Antioch (1098) he estab. himself there as prince. He was, however, imprisoned by the Turks in 1100, but after 3 years' captivity returned to Europe and renewed the war against Alexius. He married a daughter of Philip of France, and spent the rest of his life in Apulia.

Bohlen, Peter von (1796–1840), Ger. orientalist, son of a poor peasant. Orphaned at an early age, he had to earn his living as a servant, a tailor-apprentice, a waiter, and so on. At 21 he began his studies, and soon acquired some knowledge of Hebrew, Arabic, and Persian. From 1822 he studied at Bonn (Arabic with Freitag, and Sanskrit with A. W. Schlegel). In 1823 he was appointed prof. in the univ. of Königsberg. His first pub. was *Symbolae ad Interpretationem Sacr. Cod. ex lingua Persica*, 1822. His main works were *Das alte Indien* (2 vols.), 1830, *Bhartrihari's sententiae*, 1833, *Die Genesis*, 1835, and *Rituanahra . . . carmen Kālidāsi*, 1840. His vast scientific output had certain failings—he worked in too many fields (Hebrew, Arabic, Persian, Sanskrit, etc.); he had no profound knowledge of grammar; his conclusions, often based on insufficient proof, were not altogether accurate.

Böhme, or Bohm, Jakob. See BOEHME, JAKOB.

Böhmen, see BOHEMIA.

Böhmerwald, see BOHEMIA, FOREST OF.

Böhmisch-Brod, see ČESKÝ-BROD.

Böhmisch-Leipa, see ČESKÁ LIPA.

Böhmisch-Trübau, see ČESKÁ TREBOVÁ.

Bohn, Henry George (1796–1884), bookseller and publisher, b. London, where his father, a Westphalian by birth, had a second-hand bookshop. Upon his father's refusal to admit him to partnership with him Bohn set up in business for himself, and in 1841 his 'guinea catalogue'

of rare books attracted much attention. In 1846 he originated his Standard Library of reprints, and followed with a series of other libraries, until in 1853 he had issued over 600 vols. in cheap form. Many of the trans. and compilations were his own work. He ed. also Lowndes's *Bibliographer's Manual*, *The Origin and Progress of Printing*, 1857, and the *Biography and Bibliography of Shakespeare*, 1863.

Bohol, one of the Philippine Is. It is situated between Cebu and Leyte, and lies in lat. 10' N., long. 124° E. Its area is 1191 sq. m., and its pop. 449,549.

Bohr, Niels Henrik David (1885-), Dan. physicist, son of Christian B., prof. of physiology at Copenhagen. He was educ. at Gammelholme school and at Copenhagen. Univ. lecturer in physics at Copenhagen 1913, and in Manchester, 1914-16, and prof. of physics at Copenhagen, 1915, and, subsequently, director of the Institute of Theoretical Physics at Copenhagen. In 1922 he was awarded the Nobel prize for physics in respect of his research work in relation to the structure of atoms and the emission of spectra—researches allied to the experimental work of Ernest Rutherford (see RUTHERFORD, LORD), the discoverer of the nucleus of atoms. It was as a lecturer in Manchester Univ. that he began his close collaboration with Rutherford, whose ingenious and at that time warmly contested theory of atoms B. developed by his own bold experiments, and in 1917 he pub. an epoch-making series of studies on the atomic theory. This work, together with Einstein's and Planck's researches (see also QUANTUM THEORY), opened a new chapter in the hist. of physics, for he laid down a group of new principles which departed radically from classical mechanics. It led to the theory of stable electron orbits around the nucleus and explained many of the features of optical and X-ray spectra, and of the periodic system of elements. He was awarded the Nobel prize in 1922. In 1926 he was elected foreign member of the Royal Society, and was awarded the Hughes Medal in 1921 and the Copley Medal in 1938. During the Second World War he escaped from Ger.-occupied Denmark, and assisted with atom bomb research in America, returning to Denmark after the war. He has pub. numerous treatises on physics, and is chairman of the Dan. Commission of Nuclear Energy.

Böhtlingk, Otto Nikolaus von (1815-1904), Ger. Sanskritist, b. St Petersburg. His first important work was a treatise on the Sanskrit grammar by Pāṇini, 1839-1840 (revised, 1887). He pub. various articles in the *Mémoires* of the Petersburg Academy. His work *Über die Sprache der Jakuten* is the earliest scientific research on a Turki language. He ed. various Sanskrit texts, but his main works are *Sanskrit-Wörterbuch* (with R. Roth and other scholars) (7 vols.), 1853-1875, *Sanskrit-Wörterbuch in kürzerer Fassung* (7 vols.), 1879-89, *Indische Sprüche* (3 vols.), 1863-5, and *Sanskrit-Chrestomathie*, 1845.

E. E. 2

Bohun, name of a family which played a conspicuous part in Eng. hist. during the 13th and 14th cents. Their founder was Humphrey, a companion of William the Conqueror, but Humphrey (III), steward in the household of Henry I, was the first representative of note. Henry B. received the earldom of Hereford from John (1199). As their lands lay on the Welsh borders, the Bs were important Marcher barons. Humphrey (VII) was among the nobles who obtained from Edward I the Confirmatio Cartarum (1297). Humphrey (VIII), a lord ordainer, fought for Edward II at Bannockburn (1314), and was taken prisoner. The male line of the family became extinct in 1373. See ESSEX, EARLS OF.

Boiardo, see BOJANO.

Boiardo, Matteo Maria, Count of Scandiano (c. 1440-94), It. poet, b. Scandiano; educ. at the univ. of Ferrara. His intimacy with Duke Ercole led to his appointment as governor of Modena in 1481 and of Iggio in 1487. His best work is the *Orlando Innamorato*, which Ariosto imitated and continued in his *Orlando Furioso*. Berni (q.v.) pub. a revised version of it in 1542. He is known also for trans. of Herodotus, Apuleius, and Lucian, and his *Sonetti e Canzoni*: the dramatisation of Lucian's *Timon* is especially to be noted. The latest ed. of his works is by A. Zottoli, (2 vols), 1935-7. See G. Reichenbach, *Matteo Maria Boiardo* (Bologna), 1929 and E. Bigi, *La Poesia di Boiardo*, 1941.

Boie, Heinrich Christian (1744-1806), Ger. poet and critic, b. Meldorf in Schleswig-Holstein. In 1769 he became the leader of the *Göttinger Dichterbund*. His own work was mediocre, and his importance is rather as editor, and founder in 1770 with F. W. Gotter, of the *Göttinger Musenalmanach*, and later, in 1776, as editor of *Das Deutsche Museum*, a monthly magazine with a high literary standard.

Boieldieu, François Adrien (1775-1834), Fr. composer, b. Rouen. At an early age he manifested a talent for music, and at 18 composed a one-act opera which was produced at Rouen. He studied music in Paris. In 1803 he occupied the post of *maitre de chapelle* to Emperor Alexander at St Petersburg, but in 1811 returned to Paris to produce more operas, including the 2 most successful, *Jean de Paris*, 1812, and *La Dame blanche*, 1825. The latter is based on Scott's *The Monastery* and *Guy Mannering*. Other favourites among his 37 operas were *Le Calife de Bagdad*, 1810, *Ma Tante Aurore*, 1803, *Aline, Reine de Golconde*, 1804, and *Le Petit Chaperon Rouge*, 1818. He also set the choruses in Racine's *Athalie* in Russia. His last years were troubled by illness and poverty. See A. Pougin's *Boieldieu, sa vie, ses œuvres*, 1875.

Boii, powerful Celtic tribe (see CELTS), which inhabited originally part of Transalpine Gaul (see GALLIA). Later the B. settled in the dists. between the Po and the Apennines and between the Danube and the Tyrol (qq.v.). Other members of

the tribe settled in the country now named Bohemia (q.v.) after them. The B. are frequently mentioned by Caesar, Livy, and Polybius.

Boil, or **Furuncle**, abscess of hair follicle or sweat-gland (see **SKIN**). The infecting organism is practically always a staphylococcus (see **CARBUNCLE**). Like all bacterial skin infections, a B. is contagious. B.s in other parts may occur from the transference of bacteria by the fingers or other means. Infection of other people may result from direct contact or from contamination of baths, wash-basins, utensils, etc.

Boileau, Ethel Mary, Lady (1882-1942), novelist, b. London. Daughter of the Rev. J. F. Young, she was educ. privately and in Germany, and in 1905 married Sir Raymond Boileau, Bart., Deputy Lieutenant of Norfolk. Her novels, many of

polished style, than his satires. He was appointed historiographer to the king in 1677, and from that time his literary products are fewer in number; 5 new epistles and the 5th and 6th cantos of *Le Lutrin* were pub. in 1683, but they are not equal in quality to his earlier work. The *Dialogue des héros de roman*, pub. in 1713, which practically killed the vogue of romantic novels, had been written long previously. He was elected a member of the Academy, by the king's wish, in 1684. A complete ed. of his works in 4 vols. was pub. in Paris, 1870-1873. See A. F. B. Clark, *Boileau and the French Classical Critics in England*, 1925; D. Mornet, *N. Boileau*, 1941; R. Dumesnil, *Boileau*, 1943.

Boiler, vessel for converting a liquid, usually water, into vapour (steam) by boiling. The B. used with the earliest

FIG. 1. CORNISH BOILER

which deal with Scottish clan hist., include *Fire of Spring*, 1914, *Hippy Buchan*, 1925, *The Arches of the Years*, 1930, and *Clansmen*, 1936.

Boileau-Despréaux, Nicolas (1636-1711), Fr. critic and poet, b. Paris. He studied first theology and then law at the Sorbonne. He was called to the Bar in 1656, but was so disgusted at the chicanery prevalent that he threw up his profession, and lived on the small fortune which his father, who d. in 1657, had left him. His earliest work of any note was his first satire, which he pub. in 1660; 8 others followed this, and still later he wrote 4 more, bringing the number up to 12. In these works, which were modelled on Juvenal and Horace, he showed the capabilities of the Fr. language for expressive and at the same time regular verse. While writing his satires he was living in an artistic coterie which included Racine, Chapelle, and Antoine Furetière, and it was no doubt in his intercourse with them that he gained many ideas for his *Art poétique*, 1675. In this work he taught the value of artistic workmanship for its own sake, and reduced versification to rule; Pope was greatly influenced by it, and Eng. literature through Pope. In the same vol. as the *Art poétique* were included the first 4 cantos of *Le Lutrin*, and the first 4 of his *Épîtres*. *Le Lutrin*, which is one of his best-known works, is a serio-comic epic; his epistles are characterised by a graver tone, as well as a more

steam engines was a rectangular cast-iron box heated by a fire underneath. Watt's B. was an improvement: it was made of wrought iron, had an internal flue, and generated steam at a pressure of 10 lb. per sq. in. Modern B.s are built either as cylindrical shells holding the water and steam and traversed lengthwise by one or more flues, or as a system of tubes in which steam is generated, passing through the furnace gases and connected to one or more drums containing the water. Efficient combustion of the fuel, efficient heat-transfer, good circulation of the water, and, under special circumstances, quick starting, are the main demands on the design.

Cylindrical boilers. The *Cornish B.* (Fig. 1) has 1 flue passing through the cylinder, which, in the compound type, terminates beyond the fire in a plate from which fire tubes run to the back of the B. The *Lancashire B.* has 2 flues sometimes traversed by cross-water tubes. These B.s and their variants, the *Yorkshire* and the *Thompson*, are mainly used for heating and process work. They are simple in design, but slow starters and not very efficient. In the single-ended *Scotch Marine B.* the hot gases pass from the furnace to the combustion chamber and there through tubes above the furnace flue to the smokebox (Fig. 2). There may be from 1 to 4 furnaces. The double-ended B. has furnaces at both ends. This B. is largely used on cargo

vessels because of its simplicity. *Vertical B.s* (Figs. 3 and 4) are used for small engines, cranes, pumps, etc. They are simple and take up little space. One type has a vertical shell and 1 flue with cross tubes, another type has the flue divided into sev. tubes; the Cochran B.

surface consists of a series of inclined straight tubes over the furnace (see Fig. 5). Here the water is raised to a high temp., and rises through a series of separate 'headers' of serpentine form, to a horizontal steam and water drum, where the steam separates from the

FIG. 2. SINGLE-ENDED SCOTCH MARINE BOILER

has a combustion chamber and horizontal return tubes leading to an external smokebox.

Water-tube boilers. The bulk of the steam and water is contained in one or more drums, placed out of the direct path of the furnace gases, while steam is generated in a large number of tubes, connected to the drums, through which the water circulates. Water-tube B.s are almost universally employed in power stations, and in factories which require

water. The water remaining returns through the vertical tubes at the back of the B. into the inclined tubes, where it is heated, and again passes into the steam and water drum; thus a rapid circulation in one direction is kept up, and a uniform temp. maintained throughout the B. A mud drum is attached to the lowest point of the inclined water tubes, into which any matter held in suspension in the water is precipitated. In the Marine type, height and weight are saved by placing the steam and water drum transversely at the back end of the B., immediately above the back headers. The front headers are connected with the drum by horizontal tubes. The tubes are of seamless steel. Opposite the end of each tube in the headers is an opening or hand-hole through which the tube can be examined and cleaned, each opening being closed by a forged-steel door and stud. The drum is made of riveted B. plate, and the headers of forged steel, while the B. is suspended on mild-steel girders and columns; the sides of the B. are encased in brickwork. Between the inclined tubes and the drum is placed a super-heater, consisting of steel tubes bent into a U-shape and connected to 2 'collectors,' the upper of which receives the wet steam from the B., while the lower one returns the superheated steam to the stop valve above the B. The *Multi-drum Water-tube Land B.s* consist of 2 sets of drums, at the top and bottom of the B. respectively, connected by rows of water tubes. The upper or steam drums are interconnected by means of a few large tubes, which are not reckoned in the heating surface of the B.; the lower or mud drums are similarly joined. The *Stirling B.* is shaped like a distorted letter W, the drums being placed at the 5 apices, and the rows of tubes forming the body of the letter (see Fig. 6). The feed water is led into the back steam drum, and then passes down the rear bank of

FIG. 3

FIG. 4

VERTICAL BOILERS

steam for power purposes. At sea, water-tube B.s are used in the navy, and in the faster and larger steamships of the mercantile marine. The tubes are subject to internal pressure, and are heated externally by the furnace gases; there is thus no danger of the tubes collapsing, and water-tube B.s can therefore stand much higher pressure than other B.s. In the *Babcock & Wilcox B.* the heating

water tubes to the back mud drum, there being no direct water connection between the back and middle steam drums; only the steam spaces are connected. The rear bank of tubes, being in contact only with furnace gases that have been cooled by passage through the rest of the B.,

the steam drums, and so are free to expand and contract. The drums are made of riveted B. plate, with the seams away from the fire, while the tubes are weldless. The Stirling B. is a free steamer, with a good circulation, and is extensively used in power stations. The tubes of the

FIG. 5. BABCOCK AND WILCOX BOILER, LAND TYPE

serves chiefly to heat the feed water to the temp. of evaporation. The water then passes up to the middle steam drum, down to the front mud drum, and up to the front steam drum, where it disengages the steam that has been formed during the circulation. The remaining water passes across to the middle steam drum via the water-connecting tubes, where it joins with the new feed water, and passes down again to the front mud drum. The furnace gases pass over the water tubes in the opposite direction to the water, as shown in the figure. Steam is drawn off from the middle steam drum, and is taken through a superheater

Stirling B. are curved to enter the drums radially, and this means that a large number of different shapes of tube have to be kept in stock for repairs. A superheater is usually placed between the first and second banks of tubes.

The *Yarrow B.*, widely used in the Navy, is shaped like an inverted letter V, and consists of one main steam and water

FIG. 6. STIRLING BOILER

placed just behind the front bank of water tubes, before being delivered to the engines. The 3 steam drums are supported on brackets carried on mild-steel beams, which in turn are supported on mild-steel columns; these columns are built entirely independently of the brickwork, which only serves to contain the heat of the furnace. The 2 mud drums are suspended by the water tubes from

FIG. 7. YARROW BOILER

drum placed centrally over the fire grate, connected by 2 banks of inclined tubes to a couple of water or mud drums, one at each side of the grate. The furnace gases are divided, and pass through the 2 banks of tubes, then up each side of the steam drum, finally reuniting above to pass up the funnel. The tubes are nearly straight, and inclined at 45 degrees to the horizontal. The feed water is taken into

the 2 mud drums, and is made to pass up the tubes remote from the fire by means of a partition inside the drum. When it arrives in the steam drum, it mixes with the water, and joins the main circulation of the B., which is upwards in the tubes nearest the fire, and downwards in the further tubes (with the exception of the few tubes reserved for the feed water). When a superheater is fitted, it is placed outside one tube bank, in which the number of water tubes is reduced, in order to leave enough heat in the gases to superheat the steam. The superheater consists of a number of U-shaped steel tubes joining 2 cylindrical collectors. A damper is placed in the smoke uptake above the superheater, which can be closed when steam is shut off, to prevent burning the empty superheater elements. The drums of the Yarrow B. are made in 2 semi-cylindrical portions of steel plate, riveted together, the part to which the tubes are fitted being thicker than the other part. Yarrow B.s are usually oil-fired on account of cleanliness, ease of refuelling, and reduction of stokehold personnel. Yarrow B.s are very quick steamers, and give a high efficiency.

Superheaters. The efficiency of all classes of steam engine is greatly increased by the use of superheated steam (see STEAM ENGINES); that is, steam heated above the boiling-point. Superheated steam is dry and invisible. The superheater consists of a set of tubes, placed in the way of the furnace gases, through which the steam passes on its way from the B. to the engine. Superheaters are hardly ever fitted to cylindrical land B.s, and not often to Scotch marine B.s. Modern locomotive B.s nearly always carry superheaters, while certain vertical B.s, used on steam railcars, are also superheated. Water-tube B.s are fitted with superheaters as a rule.

Feed-water heaters. Heating the feed-water before it reaches the B. increases the efficiency of the B. This is done by means of steam from the engine, taken either from the exhaust, or from some intermediate point in the engine, where the steam has not finished its expansion; this is called 'bleeding' the engine, and is much practised in modern turbine plants.

Economisers. In an economiser, the B. feed-water is heated by the residual heat in the furnace gases, after they have passed through the B. and superheater. Thus heat is utilised which would otherwise be wasted up the chimney. Economisers are used on all types of land B.s, except where large steam turbines are installed (see above), and sometimes on marine B.s.

Air preheaters. The efficiency of a B. is increased by heating the air required for combustion before it reaches the fire. This is done by the residual heat in the furnace gases, after they have passed through the B. and superheater. Where an economiser is fitted there is hardly sufficient heat in the gases to make an air preheater worth while. In turbine plants, however, where feed-water heaters are installed, air preheaters are used; they

are also often used with marine B.s. Air preheaters require forced or induced draught.

Auxiliaries. Gauge glasses are fitted to the B.s of all types, so that the water-level can be read. It is usual to have 2 gauge glasses. Further, all B.s are fitted with at least 2 safety valves, which are set to the pressure which the B. is authorised to carry. They are locked in such a manner that while the weight on them can be eased, so that they may allow the steam to blow off at a lower pressure than the designed one, it is impossible to screw them up to blow off at a higher pressure. All B.s are fitted with a pressure gauge; in addition there is a stop valve, by which the steam generated is let off for use, and by shutting which the B. can be isolated; a check valve of special design, so that feed-water can enter the B., but the water and steam cannot leave the B., and a blowdown valve, by which the B. can be emptied for repairs, inspection, etc.

Firing. Fuels used include coal, wood, pulverised coal, oil, and gas. Wood is largely an emergency fuel, and gas is only used on small B.s. Coal is burnt on a grate consisting of steel or cast-iron bars; mechanical stokers are used on large steam plants, the grate being an endless chain moving slowly forward, coal being spread evenly over one end by a hopper. In another method the coal is dropped at the back of the grate and moved forward by vibration of the fire-bars. Pulverised coal (q.v.) can be treated like a gas and blown on to the furnace by a fan. Oil-firing is now the rule in the navy.

Recent developments. The modern tendency is in the direction of higher pressures, but superheat temps. do not show many signs of an increase beyond the present maximum of 850° F., due to decrease in strength, at high temps., of the steel of which superheaters, steam pipes, and turbines are constructed. Among high-pressure B.s may be mentioned the Benson B., which works at a pressure of 3200 lb. per sq. in.; at this pressure, steam has the same density as water, and is generated without ebullition—there is, in fact, no definite water line. The B. consists of a coil of steel tube, into one end of which water is forced, and from the other end of which steam issues. The Loeffler B. consists solely of a superheater and a steam accumulator (q.v.), with no B. proper. Steam at 1700 lb. per sq. in. is circulated by a pump from the accumulator through the superheater; of the superheated steam, a quarter is used for power purposes, while the other three-quarters is blown back into the water of the accumulator; the heat taken up in the superheater generates more saturated steam from the accumulator water, and this is re-circulated by the pump. In this B. there are no scaling troubles, all scale being deposited on the non-heated walls of the accumulator. The Wood B. consists of a furnace surrounded by water tubes, all of which are exposed to the direct action of the fire. So much heat

is left in the furnace gases after passing these, that a superheater, an economiser, and air preheater are fitted to utilise it. Some special B.s. for power stations have recently been built for steam generation at a rate of 290,000 lb. per hr. at 750° F. and a pressure of 1400 lb. per sq. in. (The Amer. way of expressing 'pounds per square inch' is psi). The heating surface is 42,370 sq. ft. See also SCALE; BOILER; CORROSION; ACCUMULATOR. See R. L. Batley and E. G. Barber, *Boiler Plant Technology*, 1942; H. C. Armstrong and C. V. Lewis, *Boiler Management, Maintenance, and Inspection*, 1945; S. D. Scorer (ed.), *Steam Boiler Year Book and Manual*.

Boiling Point (water), see METROLOGY and WATER.

Bois, John (1561-1644), translator of the Bible, was educ. at St John's and Magdalene colleges, Cambridge. He was one of the translators for King James's Bible in 1604, and member of the board of revision. He trans. a portion of the Apocrypha and of the sections from Chronicles to the Canticles. He also assisted in Sir Henry Savile's ed. of Chrysostom (printed in 1610-13). He became prebendary of Ely in 1615.

Bois-Brûlés, from the Fr., meaning burnt wood, or the colour of burnt wood, name given by the Fr. Canadians to those of mixed white and Indian parentage.

Bois de Boulogne, park in Paris, to the W. of the city, bordered by the Seine, and covering 2200 ac. It was enclosed c. 1800, and was given to the city by Napoleon III in 1852. In it are the racecourses of Auteuil and Longchamp (q.v.), zoological and botanical gardens, and fine drives, especially the fashionable Allée de Longchamp.

Bois-le-Duc, see 's HERTOGENBOSCH.

Boise, cap. of Idaho, U.S.A., and co. seat of Ada co., on Boise R. The largest city in the state, it is a rail and distribution centre for a gold-mining and agric. area served by B. irrigation project. Food processing and the manuf. of furniture, electrical equipment, foundry and wood products, rugs, and mattresses are important. It has a municipal airport and a veterans' hospital. Pop. 34,390.

Boissière, Sulpice (1783-1854), Fr. art collector. In conjunction with his brother Melchior and a friend Bertram he assembled the notable collection of 200 paintings, which was afterwards sold to the King of Bavaria.

Boissier, Marie Louis Gaston (1823-1908), Fr. scholar and critic, b. Nîmes. Appointed prof. of rhetoric at Angoulême in 1846, and later at the Lycée Charlemagne in Paris. In 1861 he pub. his essay on Terentius Varro, and was appointed prof. of Lat. oratory at the Collège de France. His prin. work, *Cicéron et ses amis*, 1865, was trans. into English by A. D. Jones, 1867, and has been frequently reprinted. B. was elected in 1876 to the Fr. Academy, of which in 1895 he was appointed perpetual secretary.

Boissy d'Anglas, François Antoine,

Count of (1756-1826), Fr. politician, b. St Jean-la-Chambre in Ardèche. He became a member of the States-General in 1789, and in 1794 helped to overthrow Robespierre. He was elected secretary of the Convention and member of the Committee of Public Safety. His last honours were his presidency of the Council of Five Hundred, senatorship under Napoleon, and his elevation to the peerage by Louis XVIII. Subsequently, however, he supported Napoleon during the Hundred Days and was banned from the Senate for a time afterwards. He was a writer of some note on literary subjects.

Boito, Arrigo (1842-1918), It. poet and composer, b. Padua and studied at the Milan Conservatory. For some time he worked as a journalist in Milan and Paris, and he served under Garibaldi in Austria. He travelled much in France, Germany, and Poland, and in 1868 produced his opera *Mefistofele* at La Scala in Milan. It proved a failure but was more successful when played in shorter form in 1875. His only other opera was *Nerone*. He destroyed the music of *Ero e Leandro* (an early work), and the libretto was used by Bottesini and Mancinelli; *Nerone* was produced after his death, in 1924. He wrote librettos for his own works and those of other musicians including Ponchielli's *Gioconda* and Verdi's *Otello* and *Falstaff*, and also pub. songs, novels, critiques, and dramas. Of his verse the longest piece is *Re Orso*, a narrative poem describing the atrocities of the Minotaur. In 1912 he became a member of the Senate.

Boja, see BWA.

Bojador, Cape, headland of W. Africa first doubled by Portuguese navigators in 1434.

Bojano, or Boiano, It. tn in Abruzzi e Molise (q.v.), 10 m. SW. of Campobasso (q.v.). Many buildings, including the cathedral, were severely damaged during the Second World War. Pop. 6000.

Bojer, Johan (1872-) Norwegian novelist. He is essentially a moralist and controversialist, and his novels mostly deal with social and political problems. His best-known works are *Troens magt*, 1903, *Liv*, 1911, and *Den siste Viking*, 1921, a picture of life among the Lofoten fishermen. Although lacking in depth and originality, B. has achieved great popularity, especially outside Norway. See P.-G. La Chenais, *Bojer, sa vie et ses œuvres*, 1930.

Bojnurd, dist. and tn in Persia in prov. of Khorasan; fertile soil; Shadlu Kurds were settled in the dist. in Safavid times. Pop. of tn about 9000.

Bok, Edward William (1863-1930), Amer. editor, b. Holden, Netherlands. He emigrated at the age of 6 with his parents to the U.S.A., where he attended a public school and became famous as one of the most successful magazine editors of his time. He joined Cyrus H. K. Curtis as editor of the *Ladies' Home Journal*, which he raised to a circulation of 2,000,000. Author of *The Americanisation of Edward Bok*, 1920, *A Man from Maine*, 1923, and *Twice Thirty*, 1924.

Boka Kotoraka, see HERCEGNOVI.

Boko, tn of R^r Guinea in W. Africa on the R. Nunez. About 45 m. inland, with trade in rubber and coffee.

Bokelmann, Christian Louis (Ludwig) (1844-94), Ger. *genre* painter, b. near Bremen. He was a pupil of Sohn at Düsseldorf Academy, winning fame for both serious and humorous scenes, such as 'House of Sorrow,' 1873, 'Pawnbroker's Shop,' 1876 (in Stuttgart Gallery), 'Opening of the Will,' 1879 (Berlin National Gallery), 'The Emigrants,' 1882 (Dresden Museum), and 'The Arrest' (Hanover Museum). In 1893 he was appointed prof. of Berlin Academy.

Boker, George Henry (1823-90), Amer. playwright, poet, and diplomat, b. Philadelphia. Son of a banker, he was educ. at the College of New Jersey, now Princeton. He studied law, but turned to writing. In 1848 he pub. *Calaynos*, a blank verse tragedy of medieval Spain, which made its first appearance at Sadlers Wells before being produced in Philadelphia. Other tragedies of a similar type and setting were *Leonor de Guzman*, 1853, and *Francesca da Rimini*, 1855, sometimes claimed to be the greatest Amer. tragedy of the 19th cent. In 1856 his main works were collected in *Plays and Poems*, and in 1869 appeared *Königsmark, The Legend of the Hounds, and Other Poems*. B. was famous for his sonnets, of which he wrote over 300. In 1871 he was appointed Amer. minister to Turkey, and in 1875 minister to Russia; while holding these posts he negotiated 2 important treaties. One of his last compositions was *Nydia*, a tragedy. See E. S. Bradley, *George Henry Boker, Poet and Patriot*, 1927.

Boksburg, tn in the Transvaal, S. Africa, 14 m. E. of Johannesburg, an important gold-mining centre. Pop.: White, 26,800; Bantu, 70,000.

Bol, Ferdinand (c. 1611-81), Dutch painter, b. Dordrecht. His subjects were chiefly portraiture. At one public exhibition he was declared to have excelled Rembrandt, but he degenerated into a bad imitator in his later years. Many of his pictures are to be found in the museum at Amsterdam, while his 'Four Regents of the Leprosy Hospital,' generally regarded as his masterpiece, is in the tn. hall.

Bola-bola, see BORA-BORA.

Bolama, tn on the is. of the same name, situated at the mouth of the Rio Grande, W. Africa.

Bolan Pass, in Pakistan, defile in the Hala Mts of Baluchistan leading into Sind. It is about 55 m. in length, and its greatest elevation is 5800 ft. On all sides there are steep precipices, and it is traversed by the Bolan R., frequently bridged over. A railway has been constructed through it connecting Quetta with Sibi and the Indus valley.

Bolarum, former Brit. military cantonment, now part of Secunderabad, in the state of Hyderabad, India.

Bolas (Sp., 'balls'), hunting weapon used by natives and gauchos of S. America, especially by the Paraguay Indians and natives of Argentina. There are 2

varieties constructed on slightly different principles, one being made of 2 stone or clay balls covered with leather and connected by a rope or thong of 6 or 8 ft, the other being made of 3 balls connected by 3 short thongs which unite to form a long rope. The hunters, on horseback, throw them at the animal in such a way as to entangle its legs and prevent escape.

Bolbec, Fr. tn in the dept. of Seine-Inférieure, on the Bolbec, 19 m. from Le Havre. In the 16th cent. it was a Huguenot stronghold. It has a considerable cotton spinning and weaving industry, and dyeing, printing, and sugar works. Pop. 10,500.

Bolbocerus, coleopterous insect of the family Scarabaeidae, members of which are usually called chafers. Their most common colour is brown or yellowish, and sometimes black; *B. mobilicornis*, a pitchy-black species, and *B. testaceus*, an ochre-coloured species, have been found in England.

Bolcke, Captain von, Ger. naval officer; commander of the battleship *Pommern*. At the battle of Jutland, 31 May 1916, the *Pommern* was a unit of the Ger. 2nd Battle Squadron and was sunk. B. went down with her.

Bold, Samuel (1649-1737), Eng. controversialist, made vicar of Shapwick, Dorset, in 1674. He resigned this living, and in 1688 was instituted rector of Steeple, Isle of Purbeck, to which Tyneham was united in 1721. Here he remained until 1737. In 1682 he preached and pub. a sermon against persecution, and followed it with a *Plea for Moderation towards Dissenters*, for which he was fined and imprisoned. His works include tracts defending John Locke's philosophy.

Boldrewood, Rolf, pseudonym of Thomas Alexander Browne (1826-1915), Anglo-Australian novelist, who was b. in London and crossed to Australia in 1830. He received a good education at Sydney College. In 1844 he became a squatter in Victoria, and later police magistrate and commissioner of the New S. Wales goldfields. In 1888 he pub. his most popular work, *Robbery under Arms*, which had appeared in serial form 8 years earlier, attracting little notice, and in 1894 *A Modern Buccaneer*. Other books are *Old Melbourne Memories*, 1884, *The Squatter's Dream*, 1890, and *The Miner's Right*, 1890. See also AUSTRALIAN LITERATURE.

Bole, hydrous aluminium and iron silicates, found in Armenia, Saxony, Tuscany, S. America, Ireland, and the isle of Skye in Scotland. In form the substance resembles clay, and is of a dull yellow, brown, or red colour, while it adheres to the tongue, feels greasy, is yielding, has a conchoidal fracture, and the streak is shining. The prin. varieties are Armenian and Lemnian, used as pigments and in medicine.

Bolaction Moulding, in Renaissance architecture and especially in panelling, a moulding which projects in front of the framing of the panelling.

Bolero, Sp. national dance, quicker than the fandango; the name is applicable

also to the dance music. It is in 3-4 time, and of 18th-cent. origin. The performers are usually accompanied by castanets, sometimes also by a guitar or the dancers' own voices, and the movements are expressive of the various stages of the emotions of love. The most famous examples of the adaptation of the B. for compositions of their own are Chopin's *Polero* for piano and Ravel's for orchestra.

Bolesławiec (Ger. *Bunzlau*), tn of Poland, in Wrocław prov., on the Bobrawa (q.v.), 64 in. W. by N. of Wrocław (q.v.). Until 1945 it was part of Ger. Silesia (q.v.). It has been known for its pottery since the 16th cent. There are copper mines near by. Pop. 4000 (1939: 22,455).

Boletus, family Boletaceae, genus of pore-fungi, 200 species, cosmopolitan, with conspicuous fruit-bodies, fleshy with the hymenium of the cap formed in tubes. *B. edulis* and *B. scaber* are edible; *B. satanas* poisonous. Mainly terrestrial, some mycorrhizal, in woods and meadows.

Boleyn, or Bullen, Anne (c. 1507-36), Queen of England, second wife of Henry VIII. She was the daughter of Sir Thomas B. (q.v.). Anne was a maid of honour to Mary, Henry's sister, in France, c. 1519. She returned to England, c. 1522, and quickly became the centre of attention at court. Her vivacity and charm soon attracted the king, and her family, eager for advancement, encouraged the association. Henry was already anxious because he had no male heir by his wife, Catherine of Aragon (q.v.), and may already have seriously contemplated an annulment; but it remains doubtful if he would have gone to such lengths to marry Anne had she not consistently refused to become his mistress. Henry therefore applied for an annulment of his marriage so that he could marry Anne, the position being complicated by the fact that Catherine of Aragon was the aunt of the Emperor Charles V (q.v.), whose troops had sacked Rome in 1527 and who held Pope Clement VII a virtual prisoner. While the legal proceedings dragged on inconclusively Anne was ostentatiously accorded all the honours of a queen at Henry's court; and the king's love-letters to her, still extant, throw a revealing light on the tenderer side of Henry's character. When Wolsey failed to obtain the desired divorce Henry broke with Rome, and the Eng. eccles. courts pronounced his marriage to Catherine null. Henry married Anne secretly in Jan. 1533, and she was crowned queen at Whitton the same year. Their daughter, later Elizabeth I (q.v.) was b. in September 1533. But Henry's infatuation for Anne soon began to dissipate. Her self-confidence and indiscretions mortified him, and her failure to produce the son he desired was a bitter disappointment. Catherine of Aragon d. in Jan. 1536 and Henry was already being attracted by Jane Seymour (q.v.). Quarrels between the royal couple became frequent. In May 1536 Anne was sent to the Tower and was charged with adultery and incest. Her marriage to Henry was

declared null. It was obvious that there could be only one verdict to the charges against her, although it is extremely doubtful if she was guilty of anything more than indiscreet coquetry. She was beheaded on 19th May 1536 at Tower Green. See lives by P. Friedmann, 1884, and P. Sargeant, 1934. See also H. Savage (ed.), *The Love Letters of Henry VIII*, 1949.

Boleyn, Sir Thomas, Earl of Wiltshire (1477-1539), Eng. courtier, father of Anne B. (q.v.). He became keeper of the exchange at Calais and of the foreign exchange in England in 1509. B. was employed on a number of diplomatic missions during the early part of Henry VIII's reign. He went with Poynings on an embassy to the Low Countries; in 1517 he became sheriff of Kent; 1519-20, B. went on an embassy to Francis I, negotiating the preliminary arrangements for the Field of the Cloth of Gold. In 1521 he was one of the commission by which the Duke of Buckingham was condemned. B. was created Earl of Wiltshire, 1529; Lord Privy Seal, 1530. He was ambas. to Charles V, and to France in connection with Henry's divorce from Catherine of Aragon.

Bolgary, see BULGAR.

Bolide (Gk *bolis*, a missile), fireball or meteoric body of greater brilliance and slower motion than the ordinary 'shooting star.' See AEROLITE and METEORITE.

Bolingbroke, Henry St John, Viscount (1678-1751), statesman, b. Battersea. He was educ. at Eton. He was a school-fellow of his great opponent Sir Robert Walpole, and was returned to parliament in 1701 for Wootton Bassett in Wilts. By his eloquence in debate he was soon able to command the attention of the House of Commons, and he attached himself to the Tories, at this time led by Harley. In 1704 he became secretary at war, in 1708 he retired with Harley, and in 1710 he came back to office in another of Harley's ministries. He was responsible for the treaty which was made secretly with France to end the war of the Sp. Succession. In 1712 he was made Viscount B. and Baron St John. In the meantime a quarrel had taken place between Harley (now Earl of Oxford) and B. which Swift attempted to patch up, but which in spite of all efforts still continued. The secret energies of the 2 ministers were now concentrated on the problem of Queen Anne's successor. Both appear to have been definitely pledged to the Old Pretender. The quarrel with Harley ended in victory for B., and Harley left the ministry. B. was now supreme, his extreme Tory policy was favoured by the queen, and a Jacobite restoration seemed inevitable when the queen d. suddenly, and B. was ruined by the action which led to the appointment of the Earl of Shrewsbury to the lord-treasurership. On the accession of George I he was dismissed. In 1715 he fled to Paris for fear of being impeached as one of the participants in the treaty of Utrecht. He entered the service of the Old Pretender, but was soon dismissed.

He remained in France until 1723, when he was pardoned by George I, though Walpole saw that he was excluded from the House of Lords. B. now concentrated his literary energies on bitter attacks on Walpole, becoming the centre of Tory opposition; he was also a patron of Pope. He continued his writings and his intimacy with many of the leading men of letters of the day until his death. He wrote many books, among them *Reflections on Exile, Letters on the Study of History, The True Use of Retirement*, and the *Patriot King*. His *Patriot King* was the text-book from which Bute attempted to teach George III the elementary principles of kingship. Though B.'s literary reputation has not endured, he is remembered as a brilliant orator, a skilful diplomat, and as a clever if unprincipled political intriguer. He was buried at Battersea. See lives by A. Hassall, 1889, and Sir C. Petrie, 1937.

Bolitho, Henry Hector (1898-), New Zealand biographer, b. Auckland. Taking up journalism at the age of 17, he was one of the pressmen who accompanied the Prince of Wales in his tour of the country, of which he wrote in *With the Prince in New Zealand*, 1920. In 1921 he was editor of the Sydney *Sunday News*, and in the following year he came to England, where he wrote 2 novels, *Solemn Boy*, 1927, and *Judith Silver*, 1929. He is best known for his biographies of royalty, which include *Albert the Good*, 1932, *Victoria the Widow and her Son*, 1934, *Edward VIII: his Life and Reign*, 1937, *King George VI: A Character Study*, 1937, and *Victoria and Albert*, 1938. Later works are *The Romance of Windsor Castle*, 1946, *A Century of British Monarchy*, 1951, and *A Penguin in the Pyrie*, 1955, reminiscences of the Second World War.

Bolitophagus, genus of coleopterous insects of the family Tenebrionidae; they are closely related to the meal-worm. Like other genera of this family, they live on fungi, but especially on boleti. *B. agaricola* occurs in Britain.

Bolívar, Simón (1783-1830), El Libertador, the hero of S. Amer. independence, b. in the city of Caracas, in Venezuela. He was descended on both sides from noble Venezuelan families. He studied in various European caps., especially in the law schools of Madrid, and was the witness of the final scenes in the Fr. Revolution in Paris. He married in 1801, and returned to Venezuela, where, however, he did not long remain, the death of his wife very shortly after their marriage resulting in his return to Europe (1804). His visit to the U.S.A. in 1809 resulted in his joining the party of independence in Venezuela, and he was given an important post to defend in 1811 on the declaration of Venezuelan independence. The attempted revolt was, however, a failure, and B. fled to Curaçao. In 1812 he joined the insurgents at New Granada, and at the head of a small force, forced the crossing of the R. Magdalena, and with 500 men pushed on to victory and proclaimed war to the death. His success

was only transient, and in 1814 his defeat by Boyes, and the success of the royalists generally, forced him again into exile. He went to New Granada, and from there to Kingston, where an unsuccessful attempt was made on his life. Undaunted by the ill success of a landing on the mainland in 1816, in the following year he was successful in driving the royalists before him and in reaching and making his H.Q. at Angostura. Here a congress was held in 1819, and afterwards he joined forces with the republicans of New Granada, and was entirely successful. He was now generally recognised as the hero of liberation. He succeeded in uniting Venezuela and New Granada into one rep. of Colombia, and was successful in his attacks against the Spaniards, who may be said to have been finally defeated at Carabobo in 1821. In the same year the constitution of Colombia was adopted, and B. became the first president. The next year he added Ecuador to the rep., and was later called to the help of the Peruvians, who were fighting for independence. At the end of 2 years' hard fighting their independence was won, and in 1825 the upper part of Peru changed its name to Bolivia in his honour. The constitution prepared by him for that country, however, did not prove popular owing to its arbitrary proposals, and was finally rejected by the Bolivians. He was, however, again elected president of the Colombian rep., but his dictatorial methods had roused general alarm, and the dread of a dictatorship put aside all past services. In 1829 Venezuela separated from Colombia, and in 1830 B., being voted a pension of \$3000, conditional on his residence elsewhere, resigned his power in Venezuela. His life and his fortune were given for the liberation of S. America, and his influence purified financial and judicial methods. His adoption of dictatorial methods was almost justified by his position, and he certainly was successful in creating a new spirit of independence and liberty in S. America. See V. A. Belauende, *Bolívar and the Political thought of the Spanish American Revolution*, 1938; T. Rourke, *Simón Bolívar*, 1940; E. Ludwig, *Bolívar: the Life of an Idealist*, 1948; Gerhard Masur, *Simón Bolívar* (Albuquerque, New Mexico), 1948.

Bolívar: 1. Dept of Colombia, S. America, the coastline of which forms the E. shore of the Gulf of Darien. It is densely wooded and has an area of 22,996 sq. m. Cattle-raising is important, and there are minerals, including gold, petroleum, and lime. Cap. Cartagena. Pop. 1,047,320.

2. Largest state of Venezuela, bounded on the N. by the Orinoco R., on the E. by Brit. Guiana, and on the S. by Brazil. The cap. is Ciudad B., famous in early days as Angostura. Forest industries and stockraising. Area 91,890 sq. m.; pop. 122,110.

3. A small prov. in central Ecuador. Pop. 104,570. The cap. is Guaranda.

Bolivia, the third largest political div.

of the continent of S. America. It is continuous with 5 different states, having Brazil on the N. and E., Peru and Chile on the W., and Argentina and Paraguay on the S. Its boundaries are purely conventional, following practically none of the physical features of the land, and cannot be altogether accurately stated, since they are continually the subject of dispute. It extends practically from 9° 44' to 22° 50' S. lat., and 58° to 70° W. long. Its area also cannot, owing to disputes, be accurately stated, but (excluding contested claims) is 514,155 sq. m. According to other estimates it is much more, and according to Bolivian claims,

made the unit, but most of the currency in circulation is paper.

Physical features. In B. the Andes approach closely the Brazilian uplands. In the W. dist. there are 2 main ranges, the W. Cordilleras, which divide B. from Chile, and the Cordillera Real, which is the name given to the section of the Andes on the E. side of Titicaca. In this group are found the Sorata or Illampu (23,000 ft) and the Illimani (21,185 ft). A remarkable feature of B. is the great tableland lying between the Andes and the Cordillera Real, which has an elevation of over 12,000 ft, and which contains the Lake Titicaca. The lake is about 120 m.

AYMARA INDIAN WOMEN OF BOLIVIA

L.N.A.

at least 600,000 sq. m. (the boundary between B. and Peru in the peninsula of Copacabana from the R. Suches to the N. of Lake Titicaca, has been delimited by a joint commission, and still remains to be ratified). That between Argentina and B., as determined by treaty ratified in 1889, was under review in 1925; B. ratified the substituted agreement in 1929, and Argentina in 1939. The pop. in 1900 was 1,744,568, but estimated in 1955 at 3,200,000. Its pop. may be divided into 3 fairly well-defined groups—the aborigines, Indians, who number between 200,000 and 300,000; the mestizos, natives with a slight European strain, who number nearly 1,000,000; and Europeans, who number between 600,000 and 700,000. Naturally an ill-assorted pop. such as this is liable to become a standing menace to the gov., and during the frequent disorders in B. they have often been a source of grave danger to the stability of the state. Administrative cap. La Paz (pop. 319,600). B. adopted the gold standard for its currency in 1928, when the gold boliviano was

long, and has a depth of about 120 fathoms. It lies partly in B., partly in Chile, and partly in Peru. Though B. has no coastline, it has a complete navigable water system, Lakes Titicaca and Poopó being connected by the R. Desaguadero, 200 m. in length. Although B. is usually taken to be a very mountainous country, in reality at least three-fifths of it is made up of low-lying and swampy ter. In the NE. there is an extensive plain, which is both well watered and well wooded, and is valuable for its supply of timber trees. The prin. rivs. are the Paraguay, the Pilcomayo, and, belonging to the basin of the Amazon, the Mamoré, the Beni, the Guaporé, and the Mochupa. The Cuiquite dist. forms part of the *yingas* zone, a name applied to the hot E. slopes of the Cordilleras which merge into the wooded plains of the Amazon. B. lies in the torrid zone, and its climate depends upon the elevation and not upon the lat. In the mt heights perpetual winter reigns, some of them being uninhabitable; between the elevations of 11,000 and 9000 ft the climate is of the

temperate zone; whilst in the *Yungas* zone the climate is tropical, producing all tropical fruits and vegetation. The plains are hot and moist, and covered with dense forests. The indigenous flora comprises the palm, the cinchona, the bamboo, maté, and coca. Other productions of B. are balsam, bananas, caoutchouc, vanilla, copal, coffee, cotton sugar, potatoes, and tobacco. Amongst its indigenous animals may be mentioned the llama (the beast of burden), alpaca, vicuña, guanaco, chinchilla, viscacha. All forms of S. Amer. bird life are found here.

Minerals and vegetable produce. B. is still famous for its silver-mines, but tin is now the most valuable mineral, constituting in value 90 per cent of B.'s exports. One quarter of the world's supply of tin is now mined in B. Other metals which are found in large quantities are antimony, copper, and gold; lead, mercury, bismuth, zinc, and iron are also found in fair quantities. In the S. provs. salt is found in large quantities, but coal appears to be rare. In the S. is a petroleum-bearing country of great promise. Production in 1954 was 1,700,000 barrels. Amongst the other products of the country may be mentioned wheat, barley, and other cereals, the production of which is, however, retarded, as is agriculture generally, by the lack of a good system of communications. The lower zone is remarkably adapted for the production of maize, cotton, and tobacco, but these industries are not developed. The chief agric. products, besides cereals, are potatoes, highland rice, cacao, coffee, and rubber. In 1954 B.'s total exports were valued at some \$31,000,000, and imports some \$20,100,000.

Communications. The internal communications are in general bad, in some parts of the country bridle roads forming the only means of transport. Railways are beginning to be developed, and there are now 1862 m. of railway in the country (over 1040 of which are state-owned). The prin. line is the Antofagasta and Bolivian railway (total length in B., 744 m.). Under a treaty with Chile (1904) the Arica-La Paz line (276 m., of which 150 m. are in B.) was built from La Paz to Corocoro. Two treaties concluded with Brazil in 1938 provide for joint construction of a railway from the dept of Sta Cruz de la Sierra to a point near the riv.-port of Corumbá in Brazil. By means of the railways which run through Peru to Mollendo, and through Chile to Antofagasta and Arica, B. exports its minerals, which form four-fifths of its total export. Another railway which has been of great use to B. is the Madeira-Mamoré line of Brazil, which, by circumventing the 200 m. of rapids on the Madeira R., enables the riv. system of N. B. to be linked with the Amazon and the Atlantic. Rubber and timber are transported by this route. Tupiza in the far S. is connected to the Argentine railway system, and in the SE. there is a small port, the Puerto Suárez, on the R. Paraguay. Steam boats are employed

on Lake Titicaca and the R. Desaguadero, and commercial aviation is well developed.

Constitution, etc. The first constitution was dated Oct. 1880. A new one in 1938 vested the executive in a president elected for 4 years, and not eligible for re-election until 4 years after his term had ended. There is a bi-cameral congress consisting of a senate of 27 members elected for 6 years, and a chamber of 110 deputies elected for 4 years. Under a constitution adopted in 1945 the presidential term was extended to 6 years; but a revolution of July 1946 largely overturned it. The congress elected in 1947 was charged with the task of revising the 1945 constitution. B. is divided into 9 depts. Owing to early rivalries, it has what amounts to 2 caps., Sucre being nominally the cap. and La Paz the actual seat of gov. Both have univs., that at Sucre, founded in 1624, being one of the oldest in America. The state religion is Rom. Catholic, but the principle of toleration is accepted. Education is free and supposed to be compulsory, but is in a somewhat backward state. There are, however, nearly 1600 elementary schools and 27 colleges for secondary education. Military service is compulsory, and there is a small standing army (national guard).

History. At the time of the Sp. conquest in the 16th cent. B. was part of the Inca empire. Ruins at Tiahuanaco, S. of Lake Titicaca, testify to a still earlier civilisation, that of the Aymaras. Under Sp. rule it formed part of the viceroyalty of Peru, being known as Alto Peru, or Charcas. The silver mines of Potosí gave it then a position of great importance. In 1776 it was separated from Peru and added to the viceroyalty of Buenos Aires. In the war of Independence, 1810-24, the royalists long held their ground here, but were finally defeated at the battle of Ayacucho. Independence was gained in 1825. Union with the Argentine provs. was declined, and the rep. of B. was formed, its constitution being framed by Bolívar, and Sucre becoming the first president. On Bolívar's departure, however, the constitution was overthrown and civil wars and party strife broke out. In 1838 there seemed some prospect of B. allying itself with Peru. Strained relations with Chile, arising from the working of the guano beds of the Pacific coast, were adjusted in 1866. In 1879 B. and Peru entered into a 4 years' war with Chile, which ended in their defeat. A frontier dispute with Brazil was settled in 1903, Brazil then undertaking to build the Madeira railway. In the first 10 years of this cent. B.'s exports increased in value 235 per cent, and this was still further augmented by the great demand for minerals during the First World War. In 1917 B. severed relations with Germany. Increased prosperity brought greater tranquillity for a time, but in 1928 a boundary dispute with Paraguay, its S. neighbour, brought both nations to the verge of war. The dispute was, however, submitted to an international commission for mediation in 1929.

The political situation in B. became unsettled owing to the autocratic gov. of Dr. Hernando Siles, who was elected president in 1926. In that year he suspended various civil rights which had been assured to the people by the constitution, and by an arbitrary decree invested himself with dictatorial powers, formed a ministry of his own adherents, and amended the constitution to secure his re-election. His obvious intention to continue to rule B. at all hazards caused a revolution in 1930, which, begun by students and workmen, was taken up later by the mob in La Paz and at length supported by the army, with the result that Dr. Siles had to escape from his residence on the heights overlooking the cap., while the military directorate, under Gen. Blanco Gallardo, took the reins of gov. The return to civil gov. took place early in 1931, the provisional gov. holding a presidential election, when Dr. Daniel Salamanca, the nominee of both liberal and republican parties, was elected. Various constitutional changes, designed to decentralise the gov., were carried through. It was hoped to make the estab. of dictators more difficult, but indeed the hist. of B. shows that the country has had no fewer than 70 dictators from the time of Santa Cruz in 1828, while the long bitterness of the Chaco war with Paraguay was not calculated to make the path of the liberal elements easier. The Chaco war began in 1932—though the dispute over the boundaries is of 50 years' standing—and dragged on intermittently for some years. In 1933 the League of Nations, on the suggestion of the belligerents, invited the Argentine to mediate together with Peru and Chile; but these nations declined to intervene. The war actually ended in 1935 (Oct.) when Paraguay, by the peace treaty, ceded to B. a free zone at Port Casado on the Paraguay R. But this did not really end the dispute, and the underlying cause of the war was removed only when Argentina agreed to grant landlocked B. an outlet for her oil through Argentina. In 1937 a bloodless coup was carried out by malcontents in the army, who ousted the provisional president, David Toro, and installed Col. German Busch, Chief of the General Staff, in his place. Not long afterwards the Cabinet decided to give up experiments in State Socialism, to reinstate the 1880 constitution, and to return to a democratic republican form of gov. The parliament elected in 1938 had 103 members, and almost all were members of the United Socialist Front. This parliament adopted a new constitution in May 1938, and then adjourned for a long time. Though the cabinet at this time was predominantly Socialist, the so-called Socialists were in fact a kind of fascists, and B. was then virtually under a military dictatorship. Some social legislation was passed, but there was no attempt to nationalise wealth. In Aug. 1939 President Busch was shot mysteriously and succeeded by Col. Quintanilla, who, in 1940, gave place to Gen. Penderanda.

Probably the general opinion of the country was anti-Axis. At all events in Mar. 1942 B. broke off relations with the Axis powers, and in April, a year later, declared war on them. A revolutionary movement under the National Revolutionary party, together with army officers overthrew President Penaranda in Dec. 1943, the ostensible reason being opposition to the suspension of the municipal elections and of all constitutional guarantees. A new gov. was formed under Maj. Villaroel, deputy chief of the Bolivian general staff. Victor Paz Estenssoro was elected president in May 1951, and after some resistance by a military junta, assumed office definitively on 9 April 1951. Hernán Siles became president in 1956.

Progers, *Adventures in Bolivia*, New York, 1922; A. V. L. Guise, *Six Years in Bolivia*, London, 1922; L. Niessen-Deiter, 'Land of the Condor' (in *Living Age*, 1927); H. A. Grey, *The Land of To-morrow*, London, 1927; L. Linke, *Andean Adventure*, 1944; Harold Osborne, *Bolivia, a Land Divided* (2nd ed.), R.I.I.A., London, 1955.

Boliviano, monetary unit of Bolivia. The silver B., nominally worth 1s. 7½d., is divided into 100 centavos.

Boll, old Scottish measure, used for grain. It is still in vogue in many parts of Scotland, although it is not recognised by law. It is used also in the N. cos. of England and in the Isle of Man. The wheat B. is the equivalent of 4 or 4½ bushels, and this answers for peas, beans, etc. The potato B., however, is from 8½ to 9 bushels. A B. of flour or meal is supposed to be 140 lb. avoirdupois. A B. of land is about a Scottish acre; a B. of canvas measures 35 yds.

Boll Weevil, or **Boll-worm**, name given to the larvae of various noctuid moths which attack the bolls or seed pods of the cotton plant. The common B. W. (*Heliothis armigera*) is a serious pest not only of cotton, but of many other cultivated crops in America, Asia, and Africa. The cotton weevil, which, during the last 40 years, has become such a serious plague in America, is a minute insect, the adult beetle attaining a maximum length of about ½ in., half of which is its long proboscis used for boring purposes. The eggs are laid in the buds of the cotton plant during the spring, and after passing through the larval and pupal stages, become adults capable of breeding in 2 or 3 weeks (the period of development from egg to adult; the adult, thereafter, begins to breed in about 5 days). In the winter hibernation of the beetles takes place in fields, outhouses, and rubbish heaps.

Bollandists, see **BOLLANDUS**, **JOHN VAN** and **ACTA SANCTORUM**.

Bollandus, John van (1596–1665), Jesuit of the Low Countries, has given his name to the Bollandists, a Jesuit association by whom the *Acta Sanctorum*, a collection of the lives of the saints of

the anct Roman and Greek and the modern Rom. calendar, has been pub. B. took up the work at the death of Heribert Rosweyd of Bois-le-Duc, who had already conceived the idea and d. in 1629. B. settled in Antwerp and associated himself, personally and by correspondence, with Jesuits all over Europe, enlarging the scope of the work as he amassed fresh material. In 1643 he issued the 2 vols. for Jan., and in 1658 the 3 for Feb., the work being continued after his death, and still in course of pub.

Bollène, Fr. tn in the dept of Vaucluse, with a trade in pottery, flour, and curd-board. Pop. 5200.

also known as Giam B., whilst the French call him Jean de Douai. Among his numerous works may be mentioned 'Samson killing the Philistines'; 'Statues of the Rivers Nile, Ganges, and Euphrates'; 'Neptune and Four Sirens,' for the public fountain of Bologna; a bronze 'Mercury,' at Florence; and the 'Rape of the Sabines,' also at Florence. See A. Desjardins, *La Vie et l'Œuvre de Jean Boulogne*, 1883.

Bologna: 1. Prov. of Italy, in central Emilia-Romagna (q.v.). It has a plain in the N., but its S. half contains mts of the N. Apennines (q.v.). Rivs. include the Idice, Savena, and Reno. The prov.

Bollington, tn of Cheshire, England, 3 m. N. of Macclesfield. Pop. 5320.

Bolo Pasha (Paul Bolo) (d. 1918), Fr. traitor, b. Réunion, who came to Paris and from an early age lived on his wits. He undertook sev. businesses, but they all failed. In 1905 he bigamously married a rich widow and lived lavishly in Paris; was imprisoned for financial fraud; created pasha in 1915 by the ex-khedive, to whom he proposed various financial schemes. During the First World War he turned traitor, being employed by Germany to influence the Fr. press in favour of a separate peace so that Germany would be free to attack England. He was brought to trial, sentenced to death, and was shot at Vincennes, 17 April 1918.

Bologna, Giovanni da (1524-1608), Fr. sculptor and architect, b. Douai; studied at Rome. He went to Florence, and in 1558 was attached to the court of the Medici as sculptor. He married at Bologna, and then took the name by which he is known, G. da B., having formerly been known as Jean Bologne. He is

is mainly agric. and produces rice and silk. The prin. tns include B., Castel San Pietro, and Imola (qq.v.). Area 1430 sq. m.; pop. 785,000.

2. (Etruscan Felsina; Rom. Bononia), It. city, cap. of the prov. of B., and chief tn of Emilia-Romagna, 185 m. N. by W. of Rome (q.v.). It stands at the foot of the Apennines. Etruscan in origin, B. was later an important tn of the Boii (q.v.). In 189 BC it became a Rom. colony. After the fall of the W. Empire, it was taken by the Longobards and the Franks (qq.v.). In medieval times it was a free city, and adhered to the Guelph faction (see GUELPHS AND GIBELLINES). It then passed under the domination of the Visconti (q.v.) and the Bentivoglio (see BENTIVOGLIO, GIOVANNI), and in 1506 became part of the States of the Church (q.v.). It continued in papal hands (except for the period of the Cisalpine Rep., q.v.) until 1860, when it became part of united Italy. During the Second World War the allied armies began their final assault S. of B. on 9 April 1945, and within 10 days were on the outskirts of

the city. The city was taken on 21 April (see ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON). The suburbs of the city suffered severely, but on the whole B. escaped serious damage. The medieval walls, 5-6 m. in circumference, still exist, and the general appearance of the city has changed little since the 17th cent. There are many splendid medieval, Renaissance, and baroque palaces and mansions. The archiepiscopal cathedral (12th-18th cents.) has a baroque façade. Other notable churches are: S. Petronio (14th-17th cents.), a great Gothic basilica, still unfinished, containing beautiful frescoes; S. Domenico (13th cent.), which has a magnificent chapel containing the tomb of the saint (see DOMINIC); S. Stefano, a curious group of churches of different periods, linked by cloisters and courtyards; and the Gothic church of S. Francesco, which was seriously damaged in the war. The univ. of B., founded c. 1200, developed from its famous school of law. In the Middle Ages students travelled to it from all over Europe; its medical school laid the foundations of the modern study of anatomy, and claims to have been the first school to dissect the human body. Among those who have been connected with the univ. are Dante, Petrarch, Tasso, Copernicus, and Galvani (q.v.). Of the famous towers of the city the most remarkable are the slender *degli Asinelli* (1119) which is 320 ft high, and the *Garisenda* (1110) which is 160 ft high and leans 10 ft out of the perpendicular. B. has 2 important libraries, each with over 500,000 vols., an archaeological museum, and a picture gallery which is rich in the works of artists of the Bolognese school (see ITALIAN ART). Sev. popes, including Benedict XIV (q.v.), have belonged to B., and about 200 cardinals. There are manufs. of sausages, macaroni, pottery, machinery, leather goods, paper, and musical instruments. The city is an important centre of communications, and has a trans-Appennine railway connection (by means of a tunnel) with Florence (q.v.). Pop. (city) 233,000; (com.) 349,300.

Bologna Stone, mineral originally found in clay near Bologna. It is one of the barytes group of minerals, and after being heated with charcoal, reduced to barium sulphide, and exposed to the rays of the sun it has phosphorescent qualities. This was one of the first observations of phosphorescence from inorganic matter.

Bolometer, instrument used to measure small differences in temp. and based upon the phenomenon that heat imparted to a metal increases its resistance to electricity. It was invented in 1880 by Samuel P. Langley, an Amer. physicist, who sought a more efficient instrument than the thermopile. The B. consists of a thin strip of platinum foil blackened with lamp-black and arranged to form one arm of a Wheatstone bridge, while a strip of similar resistance constitutes the other arm. The blackened strip alone is exposed to the heat rays, and the slightest increase in temp. decreases its conductivity; the equilibrium of the bridge is

therefore disturbed, and the extent of such disturbance is indicated by the deflection of the connected galvanometer. In order to attain great delicacy, the platinum strips are made exceedingly small in section, being sometimes $\frac{1}{16}$ in. wide and $\frac{1}{3200}$ in. thick. With such an instrument the inventor discovered an extension of the infra-red rays of the spectrum which could not be detected by any other instrument. It has also been used to estimate the intensity of the energy of radiant heat. After being exposed to radiation for a measured time, the rays are cut off and the increase of current necessary to produce the same increase of temp. noted. The B. has also been employed in wireless telegraph receiving apparatus. The platinum in this case is in the form of a loop of fine wire enclosed in an exhausted glass bulb after the manner of an electric incandescent lamp. Electric oscillations passing through the bulb increase the resistance of the wire and thus cause the galvanometer to deflect.

Bolor Tagh, lofty ridge of mts on the border of the Pamir plateau in central Asia. The ant kingdom of Bolor was once close to the B. T.

Bolsena (ancient Volsinii), It. tu. in Lazio (q.v.), at the NE. corner of the Lake of B. It has Etruscan (see ETRURIA) remains, but is thought to be the Rom., not the Etruscan, Volsinii (see ORVIETO). There is a 12th-cent. castle; in the 11th-cent. church of Santa Cristina there took place, in 1263, the 'Miracle of Bolsena,' a miraculous bleeding of the consecrated Host. Pop. 4800.

Bolsena, Lake of (It. Lago di Bolsena; ancient Lacus Volsinensis), It. lake, in Lazio (q.v.), 8 m. NW. of Viterbo (q.v.). Its basis is a volcanic hollow, and its shores are considered unhealthy though beautiful in scenery. Area 44 sq. m.

Bolshevism (from the Russian *bol'she*, more), radical trend in the Russian Social Democracy which later developed into a system of totalitarian dictatorship, the first successful modern totalitarian movement (see also FASCISM). The founder and main representative of B. was Lenin (q.v.), whose ideas and activities dominated B. to such an extent that it is often considered identical with Leninism; there were, however, other trends in B., the most important of which was Bogdanovism (see BOGDANOV). As early as 1920 Stalin described Leninists as that group of Marxists which switches the centre of gravity of the problem from the outward recognition of Marxism to its implementation: 'designing ways and means of realising Marxism which correspond to circumstances, changing these ways and means when circumstances change—that is what this group primarily pays attention to.' Apart from Marxism, the main theoretical sources of B. were the teaching of Chernyshevskiy (q.v.) on the role of the peasantry in a Russian social revolution, and the views of the Jacobin wing of Russian Populism (q.v.) who believed in the seizure of state power by a revolutionary minority in order to use the state

machine for the implementation of radical reforms. Starting from basic Marxist principles, B. maintains that the proletariat cannot spontaneously evolve either a socialist ideology or organisational forms necessary for bringing about a socialist revolution. The correct socialist ideology must be inculcated into the proletariat by the radical intelligentsia (q.v.), who also provide the initial cadres of professional revolutionaries and train workers suitable for this role. The problems of organisation and tactics of the party built around a core of professional revolutionaries, and of the mass organisations led by the party, occupy a central place in the theory of B., and the manner in which these problems are dealt with is the main contribution of B. to political theory in general. The problems of the Dictatorship of the Proletariat (q.v.), and the role of the Soviets (see SOVIET) and the trade unions were solved in accordance with the basic view on the role of the party. A further extension of the Marxist theory was the adaptation and reinterpretation by Lenin of J. A. Hobson's theory of imperialism; according to Lenin, Russia had reached the imperialist stage, which was the last stage in the development of capitalism, and was thus ready for a socialist revolution. After Lenin's death Stalin further developed the theory of B., combining Leninism with National B. (q.v.) which originally had nothing to do with B. or with Marxism in general, and was indeed hostile to it. The main contributions of Stalinism (q.v.) to the theory of B. were the idea of building socialism in one country first by way of its industrialisation, collectivisation of agriculture (q.v.), creation of a new Bolshevik intelligentsia to replace the old one, the Stalinist conception of the Soviet society, the theory of the moral and political unity of the Soviet people, the doctrine of Socialist Realism (q.v.), and the theory that the class struggle sharpens rather than diminishes after the estab. of a socialist society. At first very realistic, the theory of B. already in Lenin's lifetime incorporated a number of myths, and under Stalin degenerated into a series of largely fictitious dogmas.

The name B. originated from a majority obtained by Lenin at the end of the Second Congress of the Russian Social-Democratic Labour party (q.v.) in 1903, when sev. delegates had left the congress. But the main principles of B. had already been elaborated by Lenin since the 1890's in the struggle against the so-called 'Legal Marxists' and 'Economists' (q.v.), and implemented in the activities of the *Iskra* (q.v.) organisation formed by Lenin in 1900. After 1903 B. existed as a more or less organised faction (or a number of warring subfactions) within the Social-Democratic party until 1912, when the Leninists separated themselves from all other Social-Democratic trends, and formed an independent Bolshevik party. They retained the name 'Social-Democratic Labour party (Bolsheviks)' until 1918, when it was replaced by the name of 'Communist party (Bolsheviks)'; the word 'Bolsheviks' was dropped in 1952,

and the term B. is now used in Russia only in an historical sense.

The Bolsheviks took an active part in the revolution of 1905 (q.v.), but their real chance came after the Feb. Revolution (q.v.) in 1917, when the successive democratically minded coalition govts. (see PROVISIONAL GOVERNMENT) proved unable to provide the leadership necessary for a democratic reorganisation of the country in the middle of a war. In the autumn the Bolsheviks achieved a majority in a number of important Soviets, and with the help of the Red Guards (q.v.) they seized power on 7 Nov. (see OCTOBER REVOLUTION). For further hist. of B. see CHEKA; CIVIL WAR, RUSSIAN; COMINFORM; COMINTERN; COMMUNIST PARTY OF THE SOVIET UNION; CONSTITUENT ASSEMBLY, RUSSIAN; FIVE-YEAR PLANS; GREAT PURGE; LEFT OPPOSITION; MENSHEVIKS; NEW ECONOMIC POLICY; RIGHT OPPOSITION; RUSSIA, *History*; WAR COMMUNISM. Treadgold, *Lenin and his Rivals*, 1955.

Bolsover, tn in Derbyshire, England, 6 m. E. from Chesterfield, and situated upon a ridge of the Pennines. There are coal-mines in the neighbourhood, also quarries of limestone. B. Castle, which is well preserved, is a very ancient structure built in the 11th cent. Pop. 10,750.

Bolsover Stone, name given to the yellow limestone found at Bolsover in Derbyshire. It was selected for its strength, durability, and colour for the construction of the Houses of Parliament.

Bolsward, small tn in the prov. of Friesland, Netherlands, 16 m. SW. of Leeuwarden. It is situated at the junction of some canals. It trades in dairy produce and cattle, and is noted for the manuf. of worsted. The National Central Dairy School is at B. There are shipbuilding yards, brickyards, and potteries. Pop. 8,100.

Bolswert, Shelte & (1586-1659), Dutch engraver, b. Bolsward, lived at Antwerp. He was one of many who found employment in reproducing the work of Rubens, after whom he engraved more than sixty plates. He also engraved works of Seghers, Jordaens, Quellin, Diepenbeek, Rombouts, and Van Dyck, the latter's 'Crucifixion' being one of his best productions.

Bolt Head, cape on the S. coast of Devon, W. of the estuary of the Avon R. It is 400 ft high, and was acquired in 1923 by the National Trust.

Boltenia, genus of tunicates found in Australasia, the Arctic, and N. Atlantic. It belongs to the order Ascidiacea and

family Cynthiidae. The species, which includes *B. ovifera*, *B. fusiformis*, *B. reniformis*, and *B. globifera*, remains fixed to rocks and stones by the long stalk of the body, and shows few signs of life.

Bolthead, or receiver, or matraass, a glass vessel used in chemical distillations. It is long in shape, with a straight neck.

Bolton, Duke of, Eng. title held by the Paulet family from 1689 to 1794. It was first conferred upon Charles Paulet (or Powlett), Marquess of Winchester, in recognition of his services in the revolution of 1688. The title became extinct after the death of the 6th duke in 1794.

Bolton, Sir Francis John (1831-87), soldier and electrician. He enlisted in the Royal Artillery, and became captain of the 12th Foot Regiment, 1860. With Colomb he developed a system of visual signalling, also inventing oxy-calcium light for night-signalling. With Colomb and an officer of the Royal Engineers he compiled the *Army and Navy Signal Book*, used in Abyssinian campaign, 1867. One of the founders of the Society of Telegraph Engineers and Electricians, 1871. Wrote *London Water-supply*, 1884.

Bolton, Sir Richard (c. 1570-1684), lawyer, practised as a barrister in England and Ireland; in 1604 became recorder of Dublin. In 1621 he pub. *Statutes of Ireland* (from Edward II to James I); chief baron of Irish exchequer, 1625; 1639, became chancellor of Ireland. He was one of Strafford's chief advisers on introducing arbitrary gov. In 1643-4 he was chief counsellor of Ormonde, negotiating for cessation of hostilities between English and Irish, and in 1646 he signed the proclamation of a treaty of peace between Charles I and his Irish Rom. Catholic subjects. See *Contemporary History of Affairs in Ireland, 1641-52*, 1879; Carte's *Life of Ormonde*, 1736; Carte MSS., Bodleian Library.

Bolton, municipal and parl. bor. of Lancs, England, on the R. Croal, 10 m. from Manchester and 200 m. from London, with an area of 15,279 ac. B. ranks as the fourth largest tn in Lancs, following Liverpool, Manchester, and Salford in size and importance. There are over 500 ac. of parks and recreation grounds, and a number of imposing public buildings, notably the tn hall and civic centre, and the technical college. B. School, founded originally in 1524, is a public school for boys. Here is the old 'Man and Scythe' Inn; 2½ m. NW. is Smithills Hall (15th cent.), and Deane, 1½ m. from B., has an interesting church. Hall i' th' Wood, a fine example of late 15th-cent. and 16th cent. architecture, was presented to the tn in 1889 by the first Viscount Leverhulme, and is now open as a museum. It was the home of Samuel Crompton, who in 1779 invented the spinning mule and revolutionised the spinning industry. Sir Richard Arkwright, inventor of the spinning-frame (1768), also lived and worked for a number of years in B. B. is the centre of the fine-cotton industry, but there is a diversity of other trades, including general and machine engineering, constructional

engineering, and leather tanning. The textile industry is the most important and comprises cotton-spinning and weaving, the manuf. of artificial silk goods, and bleaching, dyeing, and finishing. B. returns 2 members to Parliament. Pop. 165,600.

Bolton Abbey, priory situated on the banks of the Wharfe R., in the W. Riding of Yorks, England. It was founded in 1121 by Wm de Meschines and Cicely de Romili, his wife, for the order of St Augustine, about 2 m. from its present site. The removal took place in 1151, but it was dissolved in 1540. A portion of the nave has been used as a par. church since c. 1170, but the tower, choir (with a very fine E. window), and transepts are practically all that is left of the building. The ruins are so hidden in woods that they are not noticed until the visitor is very close. The surrounding scenery is most beautiful. Wordsworth founded his poem *The White Doe of Rylstone* upon a legend connected with the old abbey.

Bolton upon Dearne, see DEARNE.

Boltraffio, or Beltraffio, Giovanni (1467-1516), It. painter and a pupil of Leonardo da Vinci. He came of a distinguished Milanese family, and for most of his life occupied various civic offices in Milan. Girolamo Casio, early in B.'s artistic career, was closely associated with B., as his portrait in the Brera Gallery (Milan) and his 'Madonna' in the Louvre show. The National Gallery has sev. works of B., notably a Madonna and Child, considered by Morelli to be B.'s best painting. There are a number of fresco medallions of holy women by B. in the nuns' choir of S. Maurizio, Milan. See Vasari, *Lives of the Painters, Sculptors, and Architects* (Everyman's Library); H. Grimm, *Life of Michael Angelo*, trans. by F. E. Bunnett (vol. i), 1896; Suida, *Leonardo und sein Kreis*, 1929.

Boltzmann, Ludwig (1844-1906), Austrian physicist, b. Vienna. He studied with Stefan in Vienna; made prof. in Graz (1869), and in Munich (1889). He gave a theoretical explanation on the basis of thermodynamics of Stefan's Law (see RADIATION) and made important contributions to the kinetic theory of gases. Maxwell and B. derived the distribution of velocities of molecules in a gas, and showed that the average kinetic energy per molecule is a multiple of $kT/2$ where T is the absolute temp. (q.v.) and k is known as B.'s constant.

Bolus, round mass of substance with medicinal qualities. It is soft and larger than a pill, though it is intended to be swallowed in the same way. The term is also applied to a mass of food about to be swallowed or a mass passing along the alimentary canal (q.v.).

Bolyai, Janos (1802-60), Hungarian mathematician. His father Fathas B. was a fellow student of Gauss (q.v.) at Göttingen. B. was educ. at Vienna Univ. and joined the army in 1823. His celebrated theory of parallels, which played so important a part in the hist. of non-Euclidean geometry (see GEOMETRY, Non-Euclidean Geometry), was written 1825-9,

and originally appeared as an appendix to one of his father's mathematical works *Tentamen* . . . in *Elementa Matheseos Purae*, 1832. B.'s appendix was sub-headed 'exhibiting the absolutely true science of spaces, independent of Axiom XI of Euclid (not to be decided *a priori*), with the geometrical quadrature of a circle in the case of its falsity.'

Bolzano: 1. Prov. of Italy, the N. part of Trentino-Alto Adige (q.v.). It is in the S. Tirol (q.v.), and a high proportion of the people are Ger. speaking. The prin. tns include B., Merano, and Bressanone (qq.v.). Area 2015 sq. m.; pop. 349,000.

2. (Ger. *Botzen*, or *Bozen*), It. tn. cap. of the prov. of B., at the confluence of the Talvera and the Isarco, 32 m. NNE. of Trent (q.v.). It is on the railway to the Brenner Pass (q.v.), and due to its strategic position suffered severe damage during the Second World War. There is a cathedral, and there are sev. medieval churches of interest, as well as palaces and monasteries. There are textile and flour manufs., and a trade in agric. produce, wine, and fruit. Pop. 77,000.

Boma, port of the Belgian Congo, formerly the cap. It is situated on the r. b. of the R. Congo, at about 40 m. from its mouth. Pop. 5000.

Bomarsund, vil. on Åhrenanmaa Is. (q.v.), now part of the rep. of Finland. Formerly under Russian rule, it was the site of a fortress commanding the Gulf of Bothnia. It was taken by the French and English on 16 Aug. 1854, who destroyed it after a bombardment lasting a week. The treaty of Paris bound the Russians not to rebuild it, and the Finnish Rep. is also under obligation to demilitarise the zone by treaty with Russia (1940).

Bomb (in warfare), originally a hollow ball or 'shell' filled with explosive and projected from special types of artillery; the term was also applied to an explosive missile or grenade (q.v.) thrown by hand, and also to any device deposited in a place where it would destroy life or property by means of an explosion. In recent times the word has been used with these meanings, and also as a general term for projectiles dropped from aeroplanes, whether designed to produce destruction by explosion, by fire, or by poison gas. With the advent of the pilotless aeroplane and guided missile carrying a charge of high explosive which is detonated as the aircraft dives and collides with its target, the word has received a natural extension of its meaning, and such weapons are called flying B.s. Still other B.s are launched and propelled by rocket action.

Aerial B.s consist of a container or case filled with high explosive, an incendiary mixture, or poison gas, and some means of detonating, igniting, or discharging the filling. *High-explosive B.s* resemble shells in being filled with T.N.T. (trinitrotoluene) or lyddite (trinitrophenol). B.s are usually streamlined, and tail fins are provided to increase their stability and accuracy in falling, causing the B. to

rotate while falling, the end of the percussion cap remaining downmost. High-explosive B.s for use against warships or land targets that are strongly protected by reinforced concrete, etc., may have a heavy case designed to penetrate the protective structure, so that the explosion occurs inside. These are fitted with a fuse with a slight delay action, and to be effective they must either be dropped from a great height, with a consequent loss of accuracy, or their penetrating power must be increased by a rocket propulsion unit fitted in their tails. Rocket-propelled B.s of smaller size have also been used extensively for attacking tanks and other vehicles, whose movements make them a difficult target for B.s dropped in the usual way. For use against tns and factories B.s need not have high penetrating power, and their cases are made comparatively light so that a larger weight of explosive can be used. The damage caused to buildings by high-explosive B.s is largely the result of blast (high-pressure atmospheric waves) and of earth tremors similar in nature to those of earthquakes. Since the total B. load of an aeroplane is higher if it carries a few large B.s rather than a larger number of small ones, there has been a tendency for larger and larger B.s to be used, the largest size being limited by the lifting capacity of the aeroplane. Thus, although few B.s heavier than 1000 lb. were used before 1941, 20,000-lb. B.s were dropped for special purposes a few years later (see *Block-Buster*). *Incendiary B.s* are usually small, as the object is to produce simultaneously a larger number of fires than can be dealt with by the defence organisation. Some incendiary B.s are made of magnesium, which, being a solid metal, requires no external case. The fillings of incendiary B.s usually consist of thermit (a mixture of aluminium powder and iron oxide), which evolves enormous heat when ignited. Oil is sometimes added in order to widen the conflagration, the action of thermit being localised. An incendiary mixture and high-explosive may be combined in the same B. *Petrol B.s* are used to fire easily inflammable objectives, such as forests, wooden buildings, or ripe crops. *Smoke B.s*, intended to produce dense screens of smoke, contain phosphorus, stannic chloride, fuming sulphuric acid, chlorosulphonic acid, or a mixture of zinc dust and carbon tetrachloride. *Atomic and Hydrogen B.s*, although not particularly large, create extraordinarily powerful blast effects. They also act as incendiaries over a wide area because of the heat radiated, and endanger life both for these reasons and because they produce burns by direct radiation. The radioactive materials released by them may also be highly dangerous. (See *ATOMIC BOMB*.)

Although the aerial B. was of relatively minor importance in the war of 1914-18, it proved one of the decisive weapons 25 years later. The Allies dropped in the European theatre of operations nearly 1,400,000 tons of B.s in 1944 alone, and

the havoc produced by their sustained bombing offensive was a major cause of the Ger. collapse in the following year, while the Jap. surrender a few months later was precipitated by the first use of atomic B.s dropped on Nagasaki and Hiroshima, resulting in casualties numbering some 100,000 killed and missing.

Bomb, in geology, name applied to a round mass of lava ejected from the crater of a volcano.

Bombaceae, family of dicotyledonous plants consisting of large trees in the tropics, mostly America. The flowers are hermaphrodite, have 5 joined sepals, 5 free petals, 5 or more stamens either free or joined to form a tube, 2 to 5 superior joined carpels, which are multicelled, and contain 2 or more ovules in each cell. The fruit often contains hairs which form a cottony substance, but are too short to be made into linen. The chief genera are *Adansonia*, *Bombax*, *Durio*, *Ochroma*, *Fachira*, and *Quararibea*.

Bombard, early form of cannon, introduced before the 15th cent., which could throw stone balls from 250 to 500 lb. in weight. The B.s were muzzle-loaders, thick, and with a wide aperture, sometimes made of wrought-iron bars hooped together.

Bombardier, non-commissioned officer in the Royal Artillery, corresponding to corporal in the line regiments. The title has now no special implication, though the rank is still equivalent to that of corporal. The name owes its origin to the bombard (q.v.). A man employed in looking after bombards, howitzers, mortars, etc., was known as a B.

Bombardier Beetle, popular name of sev. species of coleopterous insects of the family Carabidae. They obtain their name from the fact that they can emit explosively from their bodies, when alarmed, a pungent, acrid fluid. A report follows the discharge, and the fluid instantly evaporates. *Brachinus crepitans* is the commonest Brit. species and occurs in chalky dists.

Bombardment, attack upon a fort, tn, fortress, etc., by means of continuous artillery fire. A B. consists historically in a continuous attack on the buildings and undefended portions of a tn in order to harass the civil pop., and so bring pressure to bear upon the governor or commandant of the tn to induce him to surrender. A B. used in order to produce psychological pressure on the inhab. was, even before the war of 1914-18, condemned as immoral. The Hague Convention Law of War (1907) laid down the following articles in connection with B.: Art. 25. The attack or B., by whatever means, of tns, vils., dwellings, or buildings, which are undefended, is prohibited. Art. 26. The officer in command of the attacking force must, before commencing a B., except in cases of assault, do all in his power to warn the authorities. Art. 27. In sieges and B.s all necessary steps must be taken to spare, as far as possible, buildings dedicated to religion, art, science, or charitable purposes, historic

monuments, hospitals, and places where the sick and wounded are collected, provided they are not being used at the time for military purposes. It is the duty of the besieged to indicate the presence of such buildings or places by distinctive signs, which shall be notified to the enemy beforehand. Art. 28. The pillage of a tn or place even when taken by assault is prohibited. An open tn is liable to be bombarded if it is in any way defended, or if the exigencies of military necessity demand it, i.e. if it can in any way be used by the enemy as a point of vantage. The main reason for a B. has already been given as a means of inducing the civil pop. to bring influence to bear which will lead to the ultimate surrender of the tn, but this has been proved to be not always successful. The case of the siege of Strasburg may be quoted as a case in point. The B. of a fort, tn does not of a necessity mean only the B. of the fortifications. The commandant of a bombarding force has the right to range his guns over the whole of the city, saving always those buildings which are mentioned in Art. 27. Notable historical B.s are those of Sebastopol, Strasburg, Paris, Soissons, and Verdun. Strasburg may be taken as the outstanding pre-1914 example of a tn that underwent a terrific B., as the tn was bombarded continually day and night. Later, when siege operations began, the fortifications were shelled all day, and the tn itself all night. When the surrender took place nearly 800 houses had been destroyed, considerably more than half of the total number of houses were injured more or less severely, 2000 of the civil inhab. killed, and over 10,000 made homeless. Many differences of opinion have been expressed on Art. 26, some authorities holding that B. should not begin until ample warning had been given the inhab., others that a besieged or threatened tn should be prepared for B. at any time without notice. During the First World War, B.s were normally directed against entrenched positions in the open. The high degree of skill attained in defending a position with obstacles, such as bomb-proof emplacements for guns and machine-guns, and the enormous increase in the proportion of the artillery necessitated B. to reduce the enemy's means of resistance. B. sometimes lasted for a few hrs. and sometimes for days, according to the strength of the position to be attacked or action it intended the enemy to take. When surprise is the important element, a B. of more than a few min. is seldom advisable in open warfare. After an initial blow has been struck and the value of surprise decreases, B. may be employed for attrition. The nature of the shell to be used depends upon the nature of the destruction in view, e.g. whether houses, forts, barbed wire, guns, transport, troops, etc. B. of tns from aircraft was first employed by the Germans, to which the Allies retaliated.

Aerial bombardment is covered by Art. 25 of the Hague Regulations (*supra*). The words 'by any means whatever' were added by the Second Hague Conference

so as to cover B. by aircraft. None the less, it was held by some jurists that, by analogy with naval B., railway junctions, munition factories, and the like might be bombarded from the air though situated in undefended places. All belligerents resorted to such B.s during the First World War, and still more was it the practice in the Second World War. Yet the question of law is still controversial.

In 1923, arising out of the Washington Conference of 1922 on the limitation of armament, a proposed code of air warfare rules was produced. The prin. were as follows: Aerial B. for the purpose of terrorising the civilian pop., of destroying or damaging private property not of military character, or of injuring non-combatants, is prohibited; aerial B. for the purpose of enforcing compliance with requisitions in kind or payment of contributions in money is prohibited; aerial B. is legitimate only when directed at a military objective, i.e. an object of which the destruction or injury would constitute a distinct military advantage to the belligerent; and such B. is legitimate only when directed exclusively at military forces, military works, military estab. or depots, factories constituting important and well-known centres engaged in the manuf. of arms, ammunition, or distinctively military supplies; and lines of communication or transportation for military purposes. The B. of cities, tns, vils., dwellings, or buildings not in the immediate neighbourhood of the operations of land forces is prohibited. In cases where the objectives specified above are so situated that they cannot be bombarded without the indiscriminate B. of the civilian pop., the aircraft must abstain from B. In the immediate neighbourhood of the operations of land forces, the B. of cities, tns, vils., etc., is legitimate provided there is a reasonable presumption that the military concentration is important enough to justify such B., having regard to the danger this may cause to the civilian pop. A belligerent state is liable to pay compensation for injuries to person or to property caused by the violation by any of its officers or forces of these provisions. In short, these clauses substitute the test of military objectives for the obsolete distinction between defended and undefended places. In the resolution adopted by the general commission of the Disarmament Conference in July 1932 it was laid down that 'air attack against the civilian pop. shall be absolutely prohibited.' Yet the fact that neither this resolution nor the Hague Rules of 1923 have become part of international law does not mean that the matter is not governed by existing principles of law. For the immunity of non-combatants from direct attack is one of the fundamental rules of the international law of war, and it is a rule which applies with absolute cogency alike to warfare on land, at sea, and in the air. In the 1914-18 war the illegality, except by way of reprisals, of aerial B. directed exclusively against the civilian pop. for

the purpose of terrorisation or otherwise, seems to have been generally admitted by the belligerents. But this fact did not actually prevent attacks on centres of civilian pop. in the form of reprisals or of attack against military objectives situated therein. But in the ensuing world war the application of this principle of the law of war to air warfare was soon threatened by reason of the enlargement of the scope of and the changes in the character of modern total war which tends to obliterate the distinction between combatants and non-combatants; the resulting difficulty of determining what constitutes a military objective; and the technical difficulty of confining the effect of hostile air action to the intended or professed object of attack. See AERIAL WARFARE and AIR RAIDS.

Bombax, genus of Bombacaceae growing in tropical countries. It consists of large trees with a soft spongy wood frequently used for making canoes. *B. ceiba*, common silk-cotton tree, a native of W. Indies and S. America, reaches a height of 100 ft. The down in the seed-vessel is made into hats and bonnets, and is used for stuffing chairs and pillows. *B. malabriticum*, the cotton-tree of Ceylon and India, sheds its leaves in Dec. and flowers during the month it is leafless. *B. pubescens* attains a height of 20 to 30 ft, and in Brazil its tough bark is used in rope-making.

Bombay: 1. State of the Indian Union, situated on the W. coast, bounded on the N. by W. Pakistan and Rajasthan, on the E. by Madhya Pradesh, on the S. by Andhra Pradesh and Mysore and on the W. by the Arabian Sea. It has a varied climate, soil, and pop. The rich plains of Gujarat are watered by the Narbada and Tapi rvs. South, the state is divided by the W. Ghats into the coastal strip (the Konkan) and the Deccan highlands. In the NW. is the Kathiawar Peninsula (Saurashtra), a land of undulating low hills. The area gets most of its rain from the SW. monsoon—20 in. to 250 in. from June to Sept. The climate in the Deccan is agreeable, that of Gujarat and Kathiawar is very hot in summer, while B. Is. and the Konkan are only oppressive in May and Oct.

History. B. Is. was acquired by the Portuguese in 1509 and given to Charles II of England as part of the dowry of his Portuguese bride in 1661. Leased to the E. India Co. in 1668, in 1708 it became the H.Q. of the president of the company's organisation in this part of India and round it grew the Presidency of B. as areas were annexed following the wars with the Marathas. Last of all Sind (q.v.) was added in 1843. With large communities of enterprising Parsees, Mohras, and Gujaratis, B. early forged ahead in the business and industrial fields. 200 years ago a Parsee shipbuilder, Wadia, extended the shipyards, 100 years ago the cotton industry had its beginnings, a prominent figure in its early years being Tata, the Parsee to whom India later owed her first steelworks. B. Presidency also contributed to the Home Rule movement.

Tilak started preaching against Brit. rule in 1896. Constructive social and political reformers like Ranade, Gokhale, and Dadabhai Naoroji (a Parsec who became a Brit. M.P.) all hailed from this part of India, and Gandhi was born in Kathiawar and led his civil disobedience movements from Gujarat.

Sind was separated from B. in 1936, and in 1937 with prov. autonomy, B. had a Congress administration that functioned more satisfactorily than similar govts. in other provs. of India, and with independence the prov. was again happily

soil yields cotton, wheat, jowar, millet, and some sugarcane. Nagpur is noted for the loose jacket santra oranges. The Konkan is mainly rice land. Efforts are being made to develop coastal fisheries and the exploitation of sea foods. Industrially, B. City, Ahmadabad, Nagpur, Sholapur, and other cities produce over three-fourths of India's textile output, the factories employing half a million hands. B. City has important oil refineries, shipyards, motor assembly plant, and India's only atomic reactor plant. Engineering industries, chemicals,

Indian Tourist Information Office

BOMBAY: THE TAJ MAHAL HOTEL AND GATEWAY OF INDIA

spared the troubles of other areas. Sev. former princely states were merged into B. state before 1956, the chief being the Gaekwar's state of Baroda. In 1956 the Kanarese areas of the S. went to Mysore and B. was enlarged by the addition of the Maratha areas of the Nizam's Dominions and of the former Central Provs. (Madhya Pradesh) as well as of the whole of Saurashtra. The proposal to create separate Maratha and Gujarati states was given up owing to the rivalry over which state should have B. City and the disturbances which resulted.

Development. Though industrially one of the most advanced states, B.'s pop. is mainly dependent on agriculture. Main food crops are rice and wheat, jowar and bajri; and cotton, ground-nuts, and tobacco are the main cash crops. Gujarat's fine black soil yields Broach cotton—India's best. The black Deccan

sugar works, and vegetable cooking oil (vanaspati) factories employ many thousand hands, and Saurashtra is an important producer of cement. B. is the H.Q. of the Central Railway of the Indian railway network; B. Port is the most important in India; her airport at Santa Cruz is among the world's busiest.

Culture. B. is a bilingual state with 24 million Marathas and 16 million Gujaratis. Both Marathi and Gujarati belong to the Indo-Aryan group of languages with scripts akin to Devnagari (Hindi). Educationally the state is in the van of India. B. Univ. was estab. in 1857; other univs. are the Women's Univ. and the univs. of Nagpur, Poona, Ahmadabad, and Baroda. Increasing provision is being made not only for arts, but also for professional and technical courses.

Government. The governor is assisted by a council of ministers responsible to a

bicameral legislature with a Legislative Assembly of 396 and a Legislative Council of 72 members. In India's Parliament, B. State has 66 representatives in the Lower and 27 in the Upper House.

The cap. is Bombay (pop. 2,840,000). Other main towns are Ahmadabad (788,000) rivaling B. in its textile output; Nagpur (449,000) former cap. of the Central Provs.; Poona (481,000) the former Maratha cap. in the Deccan, now the site of India's Military Academy; Sholapur (266,000) with its cotton mills; Baroda (211,000) garden city and former cap. of the Gaekwars. The area is 188,240 sq. m.; pop. 47,800,000.

2. B. City, cap. of B. State, situated on a small is. which is connected with the mainland by an artificial causeway. It is the largest and safest harbour in India, and the most important. About 40 per cent of the total imports and exports of the whole of India pass through B. It occupies the best position for commerce in the whole of Asia, and after the opening of the Suez Canal, it rapidly surpassed Calcutta in its trade. The large and beautiful harbour (14 m. by 5 m.) is defended by numerous batteries, and contains 3 docks and a large dry dock. The Alexandra (50 ac.) is the largest dock in India. It has 3 docks, well equipped, and a large dry dock. Two large railway systems have their termini in the city and link it up with other commercial cities of India. At Malabar point is Gov. House. Between the Malabar and Comballa Hills rise the 5 towers of silence, where the Parsees deposit their dead. It was the Amer. war of 1861-5 that made the fortune of B., for it then became the chief cotton market of the globe. The name is a contraction of Bom Bahia, the Portuguese for good bay. Owing to its geographical position B. has been much influenced by the W. and since, under Brit. rule, Viceroys of India always first landed there, a large archway at the harbour entrance is known as the Gateway of India. In spite of suburbs expanding rapidly on the mainland, the tn of B. itself remains seriously congested, and the presence of cotton mills and other industry does nothing to relieve the situation. There are, however, fine public buildings and hotels, and every effort is made to maintain and increase the tn's amenities. It is the H.Q. of many big business houses including the world-famous industrialists, Tata's, whose hydro-electric works supply B. with power. The pop. is in the neighbourhood of 3,000,000.

Bombay Duck, or *Bummalow* (*Harpadon nehereus*), marine, pike-like fish of the family Harpadontidae. It is captured in the Indian seas and exported from Bombay in a dried state. It is used in curries.

Bombazine, material of which the warp is silk and the weft wool, though there is an inferior quality made of wool and cotton. The stuff is of fine texture, and is used in making the robes of some religious orders. Its manuf. was first introduced into England by the Dutch.

Bombelli, Raffaello, It. mathematician of the 16th cent., b. Bologna, and patronised by a bishop of Meldi. His main work is a *Treatise on Algebra*, 1572, in 3 books, the last being a set of problems. A hist. of algebra is prefixed to the works, in which the invention of the science is attributed to the Hindus. He is best known in connection with his improvement in algebraic notation.

Bomber. The first bomb-sight was invented by Lt. Riley Scott of the U.S. Army in 1911; but there were no real B. aircraft before the First World War. When the first air-raid was made against Ger. Zeppelin sheds and factories by pilots of the Brit. Royal Naval Air Service (R.N.A.S.) in 1911, they flew light reconnaissance aircraft, fitted with a 'pipe-rack' on the side of the fuselage, in which small bombs were held by pins through their fins.

It is generally accepted that the modern concept of the heavy B. had its beginnings in a demand by Adm. Sir Murray Sueter for a 'paralyser' for the R.N.A.S., which resulted in production of the twin-engined Handley Page 0/400 of 1917 and the later four-engined Handley Page V/1500. But the Germans were developing their famous Gotha B.s simultaneously, to take over the attack on England when losses of their Zeppelin airships became too heavy to sustain. Russia also operated a 'Squadron of Flying Ships' in the First World War, equipped with large *Ilya Mourometz* B.s developed from the world's first four-engined aeroplane, Igor Sikorsky's *Le Grand* of 1913. Before the end of that war, smaller single-engined day B.s, fighter-B.s, and torpedo-B.s were also in full service, and a specially armoured Sopwith Camel fighter had pioneered dive-bombing.

The next major advance came in the early 1930s, when the Amer. Boeing and Martin Co.s built the first streamlined monoplane B.s, culminating in the famous four-engined Flying Fortress of 1935, which pointed the way to later big B.s, notably the Brit. Lancaster and Halifax, and the Amer. Liberator and Superfortress, which served with distinction in the Second World War. In parallel, bombs were stowed internally instead of on external racks, and began to increase in size and destructive power, reaching a peak in the Brit. 22,000-lb. Grand Slam high explosive bomb and the U.S. atomic bombs. These weapons gave the B. command over the land and sea battles, and tactical atomic bombs are now small enough to be carried by single-seat aircraft from shore or naval carrier bases.

Great size is needed by the modern B. only when sufficient fuel has to be carried to reach distant targets, and the most efficient B.s of the mid-1950s are the medium-size Brit. Valiant, Vulcan, and Victor which fly so fast and high that they can elude virtually any defence system, each carrying a greater destructive force than all the B.s based in Britain in the Second World War added together.

The first supersonic B. is the Amer. Convair B-58 Hustler, capable of about 1200 m.p.h. and, like most modern B.s. able to be used also for photographic reconnaissance and as a 'flying tanker' to refuel other B.s. in mid-air during very long-range missions. Its alternative military loads are carried in a large container mounted under its fuselage. Already the first pilotless jet-propelled tactical B.s., refined successors of the Ger. V-1 flying bomb of 1944-5, are in service to supplement piloted B.s.; and intercontinental ballistic rocket missiles, able to carry a nuclear warload more than 5000 m. at 16,000 m.p.h. are under development as the ultimate B. aircraft. See also AEROPANE.

Bombic Acid, see SILK.

Bombus, generic name for the social bees which are popularly known as humble-bees. They belong to the family Apidae of the order Hymenoptera, and form the largest of Brit. species. The prevailing colours are yellow, red, and black. See BEES.

Bombycidae, family of lepidopterous insects composed of small, dull moths with rudimentary maxillae, small palpi, no proboscis, and no frenulum. *Bombyx mori* is the true silkworm. See also SILK and SERICULTURE.

Bombycilla, term formerly applied to some species of birds in the family Bombycillidae known as waxwings.

Bombyliidae, family of dipterous insects distinguished chiefly by the long proboscis. The body is short, stout, and very hairy, and the legs are long, slender, and weak. The species are bee-like in appearance, and are remarkable for their great swiftness in flight, during which they emit a humming sound. *Bombylius major* and *B. medius* inhabit Brit. woods and feed on nectar.

Bombyx, see SILK.

Bommelwaard, is. of the prov. of Gelderland, Netherlands, formed by the R.s. Waal and Maas, and containing the 14th-cent. castle-fortress of Loevestein. There are many small vill. on the is., as the soil is fertile.

Bomvanaland, dist. of Cape Prov. in S. Africa, part of Tembuland in Transkeian Ter.

Bon, Cape, most northerly point of the coast of N. Africa. It is on the Mediterranean Sea, 58 m. NE. of Tunis.

Bon Gaultier Ballads, name of a book of parodies of Tennyson, Mrs Browning, Macaulay, and others. 'Bon Gaultier' was the pseudonym of Sir Theodore Martin (q.v.) as a contributor to *Fraser's Magazine* and *Tait's Magazine*. In 1856 in conjunction with W. E. Aytoun (q.v.), he pub. *The Bon Gaultier Ballads*.

Bona, or Bône, seaport of Algeria in the dept. of Constantine, 140 m. W. of Tunis. It is situated at the base of a hill and enclosed by ramparts. Not much of the old tn remains, but the new tn is a prosperous Fr. city. Iron and phosphates are mined in the neighbourhood. Pop. 113,745.

Bona Dea (the good goddess), Rom. divinity, identical with the Gk Rhea

(Cybele). She is variously described as the sister, wife, or daughter of Faunus, and was herself called Fauna or Faula. She was worshipped at Rome as a chaste and prophetic divinity; her name was never heard in public, and she revealed her oracles only to females; nor was she ever seen by a man. For these reasons her festivals were celebrated only in the night by Rom. matrons in the houses of the highest officers of state. Her temple feast was on 1st May and the secret rites on the night of 3rd-4th Dec. (or May) at the house of the consul or praetor, as the sacrifices were offered on behalf of the whole Rom. people, the solemnities being conducted by the vestals. P. Clodius (q.v.) profaned the rites, entering the house of Caesar disguised as a woman, 62 BC.

Bona Notabilia, legal phrase designating goods of sufficient value to be accounted for. Where a man dies leaving goods of a sufficient amount in different dioceses, in order to prevent confusion arising from double administration, the metropolitan of the prov. (in pursuance of the jurisdiction over villi which anciently belonged to the eccles. courts) grants probate or letters of administration. The value necessary to constitute property B. N. was fixed by a canon of 1603 at £5.

Bonacci, Leonardo, see LEONARDO OF PISA.

Bonaire Island, or **Buen Aire Island**, most easterly of the Dutch W. Indian Is., situated off the N. of Venezuela, in lat. 12° 3' N. and long. 68° 25' W. Exports sisal. Area 98.45 sq. m.; pop. 5000.

Bonald, Louis Gabriel Ambroise, Vicomte de (1753-1840), Fr. philosopher and politician. He left France on the outbreak of the Revolution, and after serving in the army of the Prince de Condé, he settled at Heidelberg. In 1796 he pub. his *Théorie du pouvoir politique et religieux*, and in it prophesied the return of the Bourbons. After the Restoration he became a prominent political figure, and advocated the strongest conservative measures, attacking all reform. In 1822 he became a minister, and in the following year was raised to the peerage. After the revolution of 1830 he retired from politics, and on his refusal to take the necessary oath his peerage was taken from him.

Bonanza, originally a Sp. word meaning literally 'fair weather,' is used popularly of any lucky and successful enterprise, especially a lucky strike in a mine. The Australian slang word *bonzer*, meaning 'first-rate' is said to be derived from it.

Bonanza Creek, Yukon, Canada, a valley with rich gold deposits, opening into the Klondike near Dawson.

Bonaparte, family name made famous by Napoleon I (q.v.). In its original It. form it was Buonaparte, and in this form was retained by the whole family up to the year 1796. The family were descended from an ant. It. family who can be traced back to the 12th cent., and who settled in Corsica during the 16th cent. Charles B., the father of the famous emperor, was b. in 1746, and educ. at Pisa. In 1767 he married Letizia Ramolino, a

beautiful girl descended from an ancient Corsican family. Charles B. held several offices under the Crown of France in Corsica. He obtained for his second son, Napoleon, a place in the military school at Brienne during the period that he was resident in France as one of a deputation of Corsican nobles. In 1779 he returned to Corsica, and 6 years later *d.* at Montpellier, where he had gone for his health. His wife, Letizia, survived him by several years, and saw the rise and fall of the fortunes of the family. She spent most of her life after 1814 in Rome with her stepbrother, and *d.* in 1836, leaving a considerable fortune, which she saved during the days of Napoleon's power.

Joseph Bonaparte (1768-1844), eldest brother of Napoleon I, *b.* Corsica. He was educ. in France, and later studied law at Pisa. He left Corsica when the Paolists were victorious. He spent some time in Paris, but shortly afterwards settled in Marseilles, where he married Julie Clary. In 1796 he took part with his brother in the It. campaign, and in the following year was appointed minister at Rome. Later he became a member of the Council of the Five Hundred, representing Corsica. He retired from this position in 1799, but during the next few years took a leading part in diplomatic negotiations. He helped to negotiate a treaty with the U.S.A., and was one of the representatives of France at the negotiations which led to the treaty of Amiens in 1802. He helped also in the negotiations for the Concordat. In 1805, during the absence of Napoleon, he acted as the head of the gov. In the same year he went to Naples at the head of the Fr. army, and in the following year he was proclaimed King of Naples. In 1808 he was proclaimed King of Spain, but his title was purely nominal, and although he remained in Spain until 1813, he was continually being harassed both by the English and by Napoleon himself. On the surrender of Paris in 1814 he retired from public life, but helped his brother during the Hundred Days. After 1815 he settled in the U.S.A. In 1830 he attempted to get the claims of the Duke of Reichstadt (Napoleon II) recognized by the European powers, but failed. He afterwards resettled in Europe, dying in Florence.

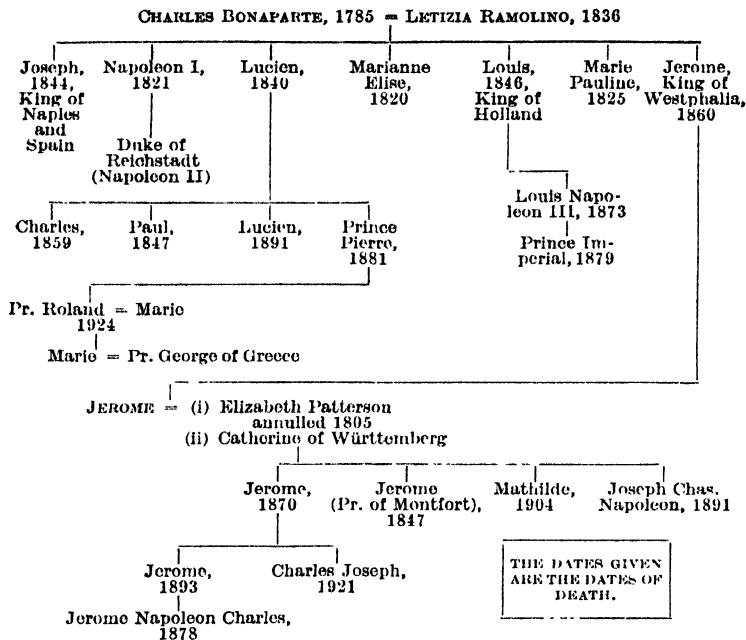

Lucien Bonaparte (1775-1840), Prince of Canino, younger brother of Napoleon I, *b.* Ajaccio, Corsica. He was originally intended for the Church, but in 1789 he became a Jacobin, and in 1794 he was for a short time imprisoned because of his extreme revolutionary ideas, but was released owing to the influence of Napoleon. In 1797 he refused a place offered him in the army of Egypt, preferring to enter the Council of the Five Hundred. In 1799 he was its president, and gave considerable help to Napoleon when Napoleon overthrew the councils on the 19th Brumaire. He was, however, essentially a democrat, and during the 6 years that intervened between the overthrow of the council and the assumption of the imperial crown by Napoleon, affairs were very strained between the brothers.

After 1804 he became one of Napoleon's ministers, but owing to personal differences with his brother was forced to retire and was given the position of minister at the Sp. court. Later he resigned his position in Madrid and returned to France. He gave further offence in 1803 by marrying the widow of a stockbroker and publicly bestowing on her the name of B. He was therefore ordered to leave Fr. ter. and retired to Italy. In 1807 he was offered the kingdoms of Naples and Spain on condition that he renounced his wife. This he refused to do. He took the papal title of Prince of Canino. He attempted to reach America, but was captured by the English and brought back to England, where he remained until 1814. During the Hundred Days he supported his brother, and after 1815 lived in Italy, where he *d.* He left 4 sons and 6 daughters.

Louis Bonaparte (1778-1846), King of Holland, brother of Napoleon I, *b.* Ajaccio, Corsica. He acted as aide-de-camp for Napoleon during the It. campaign, having received a military education at Brienne, and was also with Napoleon during the Egyptian campaign. He was married in 1802 to Napoleon's stepdaughter, Hortense Beauharnais, but the marriage was very unhappy. In 1806, Napoleon made him King of Holland. From the very outset his policy displeased Napoleon, and his attempts to govern liberally added to this displeasure. By 1809 Napoleon had resolved that his control of Holland should become real, and in 1810 Louis fled the country and went into exile in Bohemia. After 1815 Louis lived chiefly in Rome, where he took a great interest in literary and philosophic studies. His sons were: Napoleon Charles (*d.* 1807), Napoleon Louis (*d.* 1831), and Charles Louis Napoleon (Napoleon III, *d.* 1873).

Jerome Bonaparte (1784-1860), King of Westphalia, youngest brother of Napoleon, *b.* Ajaccio, Corsica; educ. at Julliy. He was a lieutenant in the Fr. Navy. In the U.S.A., although a minor, he married Elizabeth Patterson, the daughter of a Baltimore merchant, but Napoleon declared the marriage void (1805). He again took part in a naval expedition, and on his return in 1806 was made a prince of France. He took part in the Gor. campaign of 1806, and by the treaty of Tilsit (1807) was made King of Westphalia. In Aug. 1806 he married Catherine, daughter of Frederick, King of Württemberg. After the downfall of Fr. power in Germany he retired to France, and afterwards to Switzerland. In 1815 he helped Napoleon at Waterloo, commanding a part of the Fr. left wing, and showing great courage. After 1815 he lived principally in Italy and Switzerland until 1851, when on the accession of his nephew, Louis Napoleon III, he came back to France and was made a marshal and President of the Senate.

Marianne Elise Bonaparte (1777-1820), eldest sister of Napoleon I, *b.* Ajaccio, Corsica. In 1797 she married Felice Bacciochi, a wealthy Corsican officer. She was extremely ambitious, and

Napoleon gave her the principality of Lucca. In 1808 she received the grand duchy of Tuscany, and was an important influence in It. politics. Her relations with Napoleon were frequently strained. After 1815 she lived in retirement at Bologna.

Marie Pauline Bonaparte (1780-1825), sister of Napoleon I, *b.* Ajaccio, Corsica. At the age of 17 she married Gen. Leclerc, who *d.* in 1802. In 1803 she married Prince Camillo Borghese, and went to live in Rome. She soon, however, returned to Paris, where her way of life caused great scandal. In 1806 she was made a duchess. After 1815 she lived chiefly in Italy. She was Napoleon's favourite sister.

Of the other descendants of the B. family among the more important are the 3 eldest sons of Lucien, Charles Lucien, Louis Lucien, and Pierre Napoleon. The first took practically no part in politics, but distinguished himself as an ornithologist. The second was a deputy under the Second Rep., but is better known as a philologist; whilst the third, who spent the greater part of his life in politics, shot a journalist in 1870, but was later acquitted of murder.

Other members of the B. family include the following:

Napoleon Joseph Charles Paul (1822-1891), the second son of Jerome, King of

Westphalia, by his second wife, Catherine, of Württemberg. Commonly known as Prince Napoleon and 'Plon-Plon.' He commanded a div. at the Crimean war. After the death of the Prince Imperial he became the head of the Imperialists.

Napoleon Eugène Louis (1856-79), the only son of Napoleon III, *b.* Paris. He was always delicate, but took part in the early part of the Franco-Prussian war, later coming with his mother, the Empress Eugénie, to England, where they settled at Chislehurst. He was recognized as Napoleon IV by the Imperialists on the death of his father. He volunteered for service with the English during the Zulu campaign, and was killed during it on 1 June 1879. He was buried at Chislehurst.

Charles Joseph Bonaparte (1851-1921), Amer. politician, younger son of Jerome Napoleon B. and grandson of Napoleon I's youngest brother, Jerome, by his first marriage with Elizabeth Patterson of Baltimore. He was educ. at Harvard and called to the Amer. Bar. He became secretary of the navy in Theodore Roosevelt's gov. of 1905, and, later, attorney-general.

Bonaparte, Napoleon, see NAPOLEON I. **Bonar, Horatius** (1808-89), Presbyterian minister, *b.* Edinburgh, educ. at the high school and the univ. of that city. He began his work as a minister at Leith.

At the disruption in 1843 he had become the minister of the Free Church of Kelso, and from here he passed on to the Chalmers Memorial Church in Edinburgh. He was made D.D. in 1853 by the univ. of Aberdeen, and in 1883 he was moderator of the General Assembly. He ed. the *Presbyterian Review* and other papers. Among the more noted of the hymns written by him may be mentioned 'Go labour on,' 'I heard the voice of Jesus say,' and 'When the weary seeking rest.'

Bonasa, genus of grouse which belongs to the family Tetraonidae. *B. umbellus* is the ruffed grouse of N. America, which is characterized by the absence of feathers on the toes and lower part of the legs, the long rounded tail, crested head, and the ruff on its neck. *B. sylvestris* is the hazel grouse.

Bonasone, Giulio (c. 1498-post 1572), It. painter and engraver, b. Bologna; studied under Sabbatini. His reproductive work which was done almost entirely with the graver, includes prints after Michelangelo, Raphael, and Titian (qq.v.), and his style of engraving influenced Wm Blake.

Bonasus, name of the European species of bison (q.v.).

Bonaventura, Saint (1221-74), Franciscan theologian, b. Bagnorea in Tuscany. His real name was John of Fidenza. He was destined for the Church from his youth, and in 1243 he entered the Franciscan order. He studied at Paris, where in 1253 he became a teacher, succeeding his own master, John of Rochelle. In 1255 (or 1257) he became a doctor, and shortly after he was selected general of his order. On the death of Clement IV it was his influence which patched up the quarrel of the cardinals and led to the election of Gregory X, who rewarded him with the red hat of a cardinal and the bishopric of Albano. The same pope insisted upon his attendance at the Council of Lyons, where he d. a martyr to his own asceticism. He was popularly regarded as a saint before his death, but was formally canonized by Sixtus IV in 1482, and ranked as sixth amongst the doctors of the Church by Sixtus V in 1587. Danto places him amongst the saints in his *Paradiso*. His works were devoted to the defence and praise of his order, but his doctrines are in marked contrast to those of Thomas Aquinas and Roger Bacon. The purely intellectual was never to him in as high a plane as the power of the affections and the heart. He condemns the Aristotelian doctrine of the eternity of the world. The warmth of his style and his religious fervour gained for him the title of Doctor Seraphicus. Amongst his chief works may be mentioned *Itinerarium Mentis ad Deum*, *Breviloquium*, *De Reductione Artium ad Theologiam*, and *De Septem Itineribus Aeternitatis*. Amongst the eds. of his works are Rome, 1588-96, Lyons, 1668, Venice, 1751, and Rome, 1882-1902.

Bonavista, name of a tn. a bay, and a cape in Newfoundland. The tn is one of the oldest on the is., and is also a port. Its pop. is 3718. The cape is on the E.

coast, and has an altitude of 150 ft, upon which is a lighthouse with a revolving light. The bay is 30 m. wide.

Bonchurch, vil. in the Isle of Wight, England, about 1 m. from Ventnor. It is near S. Boniface's Down, and has an old and a new church, the latter containing the tomb of A. C. Swinburne. In the vicinity is Pulpit Rock. Pop. 500.

Boncourt, Louis Charles Adelaide de Chamisso de, see CHAMISSO, ADALBERT VON.

Bond, Sir Edward Augustus (1815-98), prin. librarian at the Brit. Museum from 1878, and an accomplished palaeographer, founded the Palaeographical Society in 1873. To him are due a number of the reforms and improved efficiency of sev. depts in the Brit. Museum. He ed. 4 vols. of facsimiles of A.-S. charters, and also ed. *The Speeches in the Trial of Warren Hastings*. He was knighted on 1 Jan. 1898, and d. on the following day.

Bond, Sir Robert (1857-1927), Brit. statesman, b. St John's, Newfoundland, to which place his father, John B., had moved from Torquay. He was educ. at Queen's College, Taunton, and at Edinburgh Univ., where he took honours in law. He then returned to Newfoundland, where he entered the legislature in 1882, and 2 years later was elected Speaker of the House of Assembly. In 1889 he became colonial secretary in a Liberal gov. In 1890 he assisted Lord Poncefote in his negotiations with the U.S.A. for a reciprocity treaty, and was largely responsible for the completion of the Bond-Blaine Convention. In 1900 he was appointed premier, and in 1902 completed the Hay-Bond Treaty with the U.S.A. Unfortunately it did not pass the Senate. In 1907 he attended the Imperial Conference and received the freedom of London, Bristol, and Manchester. In 1909 his gov. was defeated. Resigned leadership and seat in 1914.

Bond, William Cranch (1780-1850), Amer. astronomer, b. Portland, Maine. He erected a private observatory, and was one of the exploring party who went to the S. Seas with an Amer. expedition in 1838. On his return he was made the director of the observatory at Harvard Univ., and whilst holding that position he discovered an eighth satellite of Saturn, named Hyperion.

Bond, paper quality, see PAPER.

Bond, in law, a deed, i.e. a document under seal, by which one party, the 'obligor,' binds himself to perform or refrain from performing some act, under a penalty if he fail, to be paid to the other party, the 'obligee'; the B. to be void on the performance of the act or the payment of the penalty. If the B. is for the payment of money, the condition in the B. usually is that the B. shall become void if the obligor pays to the obligee a smaller sum, generally one-half of the sum named in the B. together with interest. A B. runs for 20 years, and action on the B. is barred after that period. If the B. is for the refraining from doing a specific act, the payment of the penalty alone will

not be sufficient; the obligor must not continue in the act, e.g. of service with another firm. The B.s of a limited company are debentures, to be repaid, at a fixed period, or from a sinking fund. Other B.s are 'bottomry B.s' for sums advanced for the continuance of a voyage, secured on the ship, to be repaid on safe arrival. B.s given by holders of confidential posts are generally known as guarantees.

Bond Street, fashionable London shopping centre, running between Piccadilly and Oxford Street. The S. section, known as Old B. S., was built c. 1686 by Sir Thomas Bond, a member of Queen Henrietta Maria's household, after whom the street was named. The N. section, New B. S., was built c. 1721.

Bonde, or **Bonder** (Old Norse *buandi*, inhab.), term meaning a member of the peasant class in Scandinavian countries. This class used to form one of the orders composing the diet, but this has not been the case since the Finnish constitutional reform of 1906, when the diet of 4 estates was succeeded by the present one-chamber Parliament.

Bonded-fibre Fabrics. The manuf. of a non-woven cloth by the bonding of cotton and other textile fibres, was introduced into the U.S.A. in 1947 and has been developed in many countries as a general utility fabric. Produced under pressure and heating, it is a porous cloth made from various types of thermoplastic fibres. See CLOTH MANUFACTURING AND FINISHING.

Bonded Warehouse, store approved by the revenue or custom authorities in which imported goods subject to duty are stored until the bondor withdraws them for exportation or pays the duty. Before the estab. of these places in England, the payment of the duties had to be settled immediately on importation. This system had many drawbacks; one of the chief was that the prices of goods were raised in order that the large duties could be paid. In 1733 the first move was made towards the B. W. scheme by Sir Robert Walpole, but in 1803 the system was finally adopted.

Bondeno, It. tn, in Emilia-Romagna (q.v.), on the Po di Volano, 11 m. WNW. of Ferrara (q.v.). Pop. 19,000.

Bonder, see **BONDE**.

Bondfield, **Margaret Grace** (1873-1953), Labour politician, b. near Chard, Somerset; daughter of Wm B., worker at a lace factory in Chard. In 1898 she became assistant secretary of the National Union of Shop Assistants. She succeeded Mary Macarthur on her death in 1921 as secretary of the National Federation of Women Workers; was chairman of the Trades Union Congress, 1923; and in Nov. 1923 was elected M.P. for Northampton. In the Labour Gov. of 1924 she was parl. secretary to the Ministry of Labour; she attended the conference of the International Labour Conference at Geneva, where her activity was prominent. She lost Northampton at the general election of 1924; but re-entered Parliament in July 1926 as member for Wallsend, which she

represented until 1931. In the Labour Gov. of 1929-31 she was Minister of Labour, thus becoming the first woman to hold Cabinet rank. While in office she was confronted with the serious problem of unemployment, and in 1929 she sponsored the Unemployment Insurance Bill—an important measure in social legislation. See life by M. A. Hamilton, 1924.

Bondome, **Ambrogio di**, see **GIOTTO**.

Bundu, dist. in Senegal, Fr. Equatorial Africa. It is situated between the R. Faleme and the upper course of the Gambia. Much of B. is plateau land and is unproductive. The lower part is more fertile and fruit grows well. The Fulahe are the prin. inhab., and their religion is Muslim. Trade is in the hands of Mandingoes (q.v.). B. was visited by Mungo Park in 1795. Pop. 1,500,000 (estimated).

Bondy, Fr. tn, a suburb of Paris, in the dept. of Seine, on the Ourcq canal. It has chemical and glass manufs. The notoriety of the former forest of B. as a haunt of cut-throats gave rise to a Fr. colloquialism. Pop. 19,500.
